## Abstract

In the recent past, unparticle physics effects have been explored in detail in both the fermionic and bosonic sectors. We have used fermionic unparticles to study the cross-section of electron-positron annihilation to light pseudo-scalar meson pairs  $e^+e^- \rightarrow PP$ . We show that this cross-section is sensitive to the scaling dimension  $d_U < 1.4$ .

FIG. 1: Feynman diagram for  $e^+e^- \rightarrow P_1P_2$  annihilation

## I. INTRODUCTION

Unparticle physics offers promising prospects in the search for new physics beyond the Standard Model (SM) at very high energies above the TeV scale. The broken scale invariance at low energies is restored at very high energies by the non-trivial IR fixed point called Banks-Zaks (BZ) fields [1, 2]. Below the very high energy scale  $\Lambda_U$ , the renormalizable coupling of the BZ fields introduce the scale invariant "unparticles". These unparticles are massless and have a non-trivial scaling dimension  $d_U$  [1]. The unparticle scaling dimension  $d_U$  is a fractional number rather than an integer.

Recently the effects of unparticle physics on the hadronic sector have been explored [6],[7]. In this work, we illustrate the dependence of  $e^+e^- \rightarrow PP$  annihilation cross-section Fig.1 on unparticle physics.

## II. FORMALISM

We start with the effective interactions for the unparticle operators coupling to the fermions [4]

$$\frac{c_V^{ff'}}{\Lambda_U^{(d_U-1)}} \bar{f} \gamma_\mu f' O_U^\mu + \frac{c_A^{ff'}}{\Lambda_U^{(d_U-1)}} \bar{f} \gamma_\mu \gamma_5 f' O_U^\mu \quad (1)$$

where  $O_U^\mu$  is vector unparticle fields with the scaling dimension  $d_U$ ,  $c_V^{ff'}$  and  $c_A^{ff'}$  are the dimensionless vector and axial vector coupling constants for fermions.

The  $e^+e^- \rightarrow PP$  annihilation is described in Fig.1. In this process the electron and positron annihilate into an unparticle U which then converts into an outgoing back-to-back

light quark and anti-quark pair which leads to the production of two light pseudo-scalar mesons  $P_1$  and  $P_2$ . The propagator of the vector unparticle is given by [2, 6]

$$\begin{aligned} D^{\mu\nu}(P^2) &= \int d^4x e^{iP \cdot x} \langle 0 | T(O_U^\mu(x) O_U^\nu(x)) | 0 \rangle \\ &= \frac{iA_{d_U}}{2\sin(d_U\pi)} \frac{1}{(-P^2 - i\varepsilon)^{(2-d_U)}} \left( -g^{\mu\nu} + \frac{P^\mu P^\nu}{P^2} \right) \end{aligned} \quad (2)$$

To obtain Eq.(2), the vector operator  $O_U^\mu$  is assumed to satisfy the transverse condition  $\partial_\mu O_U^\mu = 0$ , where

$$A_{d_U} = \frac{16\pi^{5/2}}{(2\pi)^{2d_U}} \frac{\Gamma(d_U + 1/2)}{\Gamma(d_U - 1)\Gamma(2d_U)} \quad (3)$$

The matrix element for the  $e^+e^- \rightarrow PP$  annihilation can be written as

$$M = \bar{v}_e^s(k_2) \left( \frac{c_V^{ee}}{\Lambda_U^{(d_U-1)}} \gamma_\mu + \frac{c_A^{ee}}{\Lambda_U^{(d_U-1)}} \gamma_\mu \gamma_5 \right) u_e^{s'}(k_1) \langle P_1(p_1) P_2(p_2) | J_\nu | 0 \rangle \quad (4)$$

$$\frac{iA_{d_U}}{2\sin(d_U\pi)} \frac{1}{(-P^2 - i\varepsilon)^{(2-d_U)}} \left( -g^{\mu\nu} + \frac{P^\mu P^\nu}{P^2} \right) \quad (5)$$

where  $P^2 = (k_1 - k_2)^2$  and the current

$$J_\mu = \frac{1}{3} \left( \frac{c_V^{qq'}}{\Lambda_U^{(d_U-1)}} \bar{q} \gamma_\mu q' + \frac{c_A^{qq'}}{\Lambda_U^{(d_U-1)}} \bar{q} \gamma_\mu \gamma_5 q' \right) \quad (6)$$

The factor 1/3 is introduced for normalization purposes of the different colors of quark. The vacuum to two pseudo-scalar amplitude is usually expressed in terms of a form factor  $F^{(q)}$  [8]

$$\langle P_1(p_1) P_2(p_2) | \bar{q} \gamma_\mu q' | 0 \rangle = (p_1 - p_2)_\mu F^{(q)}(q^2) \quad (7)$$

Where  $q^2 = (p_1 - p_2)^2$ . The axial part of this amplitude is zero. For a massless electron and positron the matrix element square is reduced to

$$|M|^2 = \frac{|g_U|^2 |F^{(q)}|^2}{9} c_3^2 [(c_1^2 + c_2^2)(2k_1 \cdot q k_2 \cdot q - k_1 \cdot k_2 q^2)] \quad (8)$$

Where  $c_1 = c_V^{ee}, c_2 = c_A^{ee}, c_3 = c_V^{qq'}$  and

$$g_U = \frac{A_{d_U}}{\Lambda_U^{2(d_U-1)} 2\sin(d_U\pi)} \frac{1}{(-P^2 - i\varepsilon)^{(2-d_U)}} \quad (9)$$

FIG. 2: At  $\Lambda_U = 1\text{TeV}$ , Variation of  $\sigma(e^+e^- \rightarrow \pi^+\pi^-)/(|F^{(u)}(s)|^2)[pb]$  with the scaling dimension  $d_U$  for  $c_1 = c_2 = c_3 = 1/\sqrt{2}$ ,  $\sqrt{s} = 5$  GeV (red), 10 GeV (green) and 25 GeV (blue).

In the centre of mass (CM) frame the momenta of particles are

$$\begin{aligned}
k_1 &= (Ee, 0, 0, Ee) \\
k_2 &= (Ee, 0, 0, -Ee) \\
p_1 &= (Ee, 0, p_{cm}\sin\theta, p_{cm}\cos\theta) \\
p_2 &= (Ee, 0, -p_{cm}\sin\theta, -p_{cm}\cos\theta) \\
E_e^2 &= s/4 \\
P^2 &= -s
\end{aligned} \tag{10}$$

where the center of mass energy  $s = (k_1 + k_2)^2$ .

Finally the  $e^+e^- \rightarrow PP$  annihilation cross-section  $\sigma$  is obtained in terms of the scaling dimension, coupling constants and the form factor,

$$\sigma(e^+e^- \rightarrow P_1P_2) = \frac{s}{216\pi} \left(1 - \frac{4m_P^2}{s}\right)^{3/2} c_3^2(c_1^2 + c_2^2) |g_U|^2 |F^{(q)}(s)|^2 \tag{11}$$

As an illustration, at  $\Lambda_U = 1\text{TeV}$  the variation of  $e^+e^- \rightarrow \pi^+\pi^-$  annihilation cross-section as a function of  $d_U$  is presented in Fig.2 in unit of  $|F^{(u)}(s)|^2[pb]$  for  $c_1 = c_2 = c_3 = 1/\sqrt{2}$ . We can see from Fig.2, the variation of this annihilation cross-section is sensitive to the scaling dimension  $d_U < 1.4$  and rapidly reaches zero above  $d_U = 1.4$ . Similar range for the scaling dimension  $d_U$  has been obtained from the direct CP asymmetry  $A_{CP}(B_d \rightarrow \pi^+\pi^-)$

[6].

In this work, we have extended the scaling invariance based unparticle physics into the  $e^+e^- \rightarrow PP$  annihilation. Similar analysis can be done for  $e^+e^- \rightarrow VP/VV$  annihilation.
