MICROLOCAL SMOOTHING EFFECT FOR THE SCHRÖDINGER EVOLUTION EQUATION IN A GEVREY CLASS

RYUICHIRO MIZUHARA

ABSTRACT. We discuss the microlocal Gevrey smoothing effect for the Schrödinger equation with variable coefficients via the propagation property of the wave front set of homogenous type. We apply the microlocal exponential estimates in a Gevrey case to prove our result.

1. INTRODUCTION

In this paper we study the microlocal smoothness in a Gevrey class of solutions to the time-dependent Schrödinger equation with variable coefficients.

Let

\[ P = \frac{1}{2} \sum_{j,k=1}^{n} a_{jk}(x) D_j D_k + \sum_{j=1}^{n} b_j(x) D_j + c(x) \quad \left( D_j = -i \frac{\partial}{\partial x_j} \right). \]

We assume that the coefficients of \( P \) satisfy the following conditions.

Assumption (A) We assume that

- \( a_{jk}(x) \in C^\infty(\mathbb{R}^n; \mathbb{R}) \) (\( 1 \leq j, k \leq n \)),
- \( b_j(x) \in C^\infty(\mathbb{R}^n) \) (\( 1 \leq j \leq n \)), \( c(x) \in C^\infty(\mathbb{R}^n) \).
- The matrix \( (a_{jk}(x))_{1 \leq j, k \leq n} \) is symmetric and positive definite.
- There exist \( s > 1, \sigma > 0, C_0 > 0 \) and \( K_0 > 0 \) such that

\[
|\partial_\alpha^x (a_{jk}(x) - \delta_{jk})| \leq C_0 K_0^{|\alpha|} \alpha^g \langle x \rangle^{-\sigma - |\alpha|} \quad (1 \leq j, k \leq n),
\]

\[
|\partial_\alpha^x \Re b_j(x)| \leq C_0 K_0^{|\alpha|} \alpha^g \langle x \rangle^{1-\sigma - |\alpha|} \quad (1 \leq j \leq n),
\]

\[
|\partial_\alpha^x \Im b_j(x)| \leq C_0 K_0^{|\alpha|} \alpha^g \langle x \rangle^{1/(s-1) - \sigma - |\alpha|} \quad (1 \leq j \leq n),
\]

\[
|\partial_\alpha^x \Re c(x)| \leq C_0 K_0^{|\alpha|} \alpha^g \langle x \rangle^{2-\sigma - |\alpha|},
\]

\[
|\partial_\alpha^x \Im c(x)| \leq C_0 K_0^{|\alpha|} \alpha^g \langle x \rangle^{1/(s-\sigma) - |\alpha|}
\]

for \( \alpha \in \mathbb{Z}_+^n = (\mathbb{N} \cup \{0\})^n \), \( x \in \mathbb{R}^n \), where \( \mathbb{N} = \{1, 2, 3, \cdots\} \), \( \langle x \rangle = (1 + |x|^2)^{1/2} \) and \( \delta_{jk} \) is the Kronecker’s delta.
Remark. We can assume $0 < \sigma \leq 1/s$ without loss of generality.

Let $T > 0$. We consider the solution $u(t, \cdot) \in C([0, T]; L^2(\mathbb{R}^n))$ to the initial value problem

\begin{equation}
\begin{cases}
\frac{\partial u}{\partial t} + iPu = 0 & \text{in } (0, T) \times \mathbb{R}^n, \\
u(0, x) = u_0(x) & \text{in } \mathbb{R}^n,
\end{cases}
\end{equation}

where $u_0 \in L^2(\mathbb{R}^n)$.

It is well-known that solutions to the Schrödinger equation satisfy the property called a smoothing effect or gain of regularity, that is, the decay of the initial data implies the regularity of the solution at positive time. Furthermore, more the data decays more the solution is smooth.

After the pioneering work of Craig-Kappeler-Strauss [1], the microlocal structure of this phenomenon in the variable coefficients case, or more precisely the relation between the microlocal regularity of solution and the behavior of the initial data along the backward bicharacteristic, studied extensively: see e.g., [3], [6], [17], [23] for the $C^\infty$ case, [12], [14], [19], [20], [21] for the analytic case, and [10] for the Gevrey case.

In particular, Nakamura [17] introduced a new notion of wave front set, the homogenous wave front set, and extended the result of Craig-Kappeler-Strauss [1] to the case of long-range perturbations by employing the propagation theorem of homogenous wave front set. The homogenous wave front set is a conic set in the phase space. It propagates along free classical trajectories and is suitable to describe the singularity of a solution to free Schrödinger equations.

It is remarked that Ito [6] showed the essentially equivalence of the homogenous wave front set and the quadratic scattering wave front set, which is a notion for problems on scattering manifolds, used by Wunsch [23] and Hassell-Wunsch [4].

We also remark that the results on the characterization of the wave front set are obtained by Hassell-Wunsch [4], Ito-Nakamura [7], Martinez-Nakamura-Sordoni [13] and Nakamura [18].

The purpose of this paper is to refine the microlocal Gevrey smoothing phenomenon for the Schrödinger equation from a view point of the propagation of Gevrey wave front set of homogenous type. We shall prove that a theorem similar to the $C^\infty$ case or the analytic case holds for the Gevrey case. Following [12], we employ microlocal energy method to prove our result. More precisely, combining almost analytic extension of Gevrey symbols due to Jung [8] and microlocal exponential weighted estimates, we show the exponential decay of solutions in some direction on the phase space under the appropriate condition of the initial data.

We remark that our result is not a generalization of the work of Kajitani-Taglialatela [10] in which they employ the Fourier integral operator with complex-valued phase function. Indeed, they did not assume the asymptotically flatness for the metric. However we emphasize that our result can apply the case with the unbounded or complex-valued lower order terms.
We here introduce the two kinds of wave front set. Let $h, \mu > 0$. Let $T_{h, \mu} : L^2(\mathbb{R}^n) \to L^2(\mathbb{R}^{2n})$ be the global FBI transform (the Bargmann transform) defined by
\begin{equation}
T_{h, \mu}u(x, \xi) = c_{h, \mu} \int_{\mathbb{R}^n} e^{i(x-y)\cdot \xi/h - \mu |x-y|^2/2h} u(y) \, dy
\end{equation}
($c_{h, \mu} = 2^{-n/2} \mu^{n/4} (\pi h)^{-3n/4}$).

**Definition 1.** Let $s > 1, \mu > 0$, $(x_0, \xi_0) \in \mathbb{R}^n \times (\mathbb{R}^n \setminus \{0\})$, and $u \in \mathcal{S}'(\mathbb{R}^n)$. The point $(x_0, \xi_0)$ does not belong to the Gevrey wave front set of order $s$ of $u$ ($(x_0, \xi_0) \notin \mathrm{WF}_s(u)$) if there exist a neighborhood $U$ of $(x_0, \xi_0)$ and $\delta > 0, C > 0$ such that
\[
\|T_{h, \mu}u\|_{L^2(U)} \leq C \exp(-\delta/h^{1/s}) \quad (0 < h \leq 1).
\]

**Definition 2.** Let $s > 1, \mu > 0$, $(x_0, \xi_0) \in \mathbb{R}^{2n} \setminus \{0\}$ and $u \in \mathcal{S}'(\mathbb{R}^n)$. The point $(x_0, \xi_0)$ does not belong to the Gevrey homogenous wave front set of order $s$ of $u$ ($(x_0, \xi_0) \notin \mathrm{HWF}_s(u)$) if there exist a conic neighborhood $\Sigma$ of $(x_0, \xi_0)$ and $\delta > 0$ such that
\[
\|\exp\{\delta(|x|^{1/s} + |\xi|^{1/s})\} T_{1, \mu}u\|_{L^2(\Sigma)} < +\infty.
\]

**Remark.** In the case $s = 1$, they coincide with the analytic wave front set $\mathrm{WF}_s$ and the analytic homogenous wave front set $\mathrm{HWF}_s$ introduced in [12], respectively. Both definitions of $\mathrm{WF}_s$ and $\mathrm{HWF}_s$ are independent of the choice of $\mu > 0$. The usual $\mathrm{WF}_s$ is conic with respect to $\xi$. On the other hand, $\mathrm{HWF}_s$ is conic with respect to $(x, \xi)$.

We set
\begin{equation}
p(x, \xi) = \frac{1}{2} \sum_{j,k=1}^n a_{jk}(x) \xi_j \xi_k
\end{equation}
and denote its Hamilton vector field by
\[
H_p = \sum_{j=1}^n \left( \frac{\partial p}{\partial \xi_j} \frac{\partial}{\partial x_j} - \frac{\partial p}{\partial x_j} \frac{\partial}{\partial \xi_j} \right)
\]
Let $\gamma = \{(y(t), \eta(t)) : t \in \mathbb{R}\}$ be an integral curve of $H_p$, that is, a solution to
\begin{equation}
\dot{y}(t) = \frac{\partial p}{\partial \xi} (y(t), \eta(t)), \quad \dot{\eta}(t) = -\frac{\partial p}{\partial x} (y(t), \eta(t)).
\end{equation}
We say that $\gamma$ is **backward nontrapping** if
\begin{equation}
\lim_{t \to -\infty} |y(t)| = +\infty
\end{equation}
holds. It is remarked that the nontrapping condition is necessary for some kind of smoothing effect. See Doi [2] for the detail. We also remark that if $\gamma$ is backward nontrapping, then there exists the asymptotic momentum
\begin{equation}
\eta_- = \lim_{t \to -\infty} \eta(t) \in \mathbb{R}^n \setminus \{0\}
\end{equation}
under the assumption (A).

We now state our main result. It is a analogy of [12, Theorem 2.1] for the Gevrey case $s > 1$. 
Theorem 1.1. Assume that (A) holds and that $\gamma$ is backward nontrapping. Let $\eta_-$ be the asymptotic momentum as $t \to -\infty$. Assume that there exists $t_0 > 0$ such that
\begin{equation}
(-t_0\eta_-, \eta_-) \notin \text{HWF}_s(u_0),
\end{equation}
then we have
\begin{equation}
((t-t_0)\eta_-, \eta_-) \notin \text{HWF}_s(u(t, \cdot)) \quad (0 < t < \min(t_0, T)).
\end{equation}
Moreover, if $t_0 < T$, then
\begin{equation}
\gamma \cap \text{WF}_s(u(t, \cdot)) = \emptyset
\end{equation}
holds for all $t$ close enough to $t_0$.

Theorem 1.1 means that the microlocal Gevrey singularity of order $s$ appears only when the \text{HWF}_s hits $\{x = 0\}$ as in the $C^\infty$ case or the analytic case. We remark that $(0, \eta_-) \notin \text{HWF}_s(u)$ implies $(x, \eta_-) \notin \text{WF}_s(u)$ for any $x \in \mathbb{R}^n$.

From this theorem, we obtain two results on microlocal Gevrey smoothing effects. To $\gamma = \{(y(t), \eta(t)) : t \in \mathbb{R}\}$ and $\varepsilon > 0$, we associate the set
\[
\Gamma_\varepsilon = \bigcup_{t \leq 0}\{x \in \mathbb{R}^n : |x - y(t)| \leq \varepsilon(1 + |t|)\}.
\]
The first one is concerned with the rapidly decaying data.

Corollary 1.2. Assume that (A) holds and that $\gamma$ is backward nontrapping. Assume that $e^{\delta_0|x|^{1/s}}u_0 \in L^2(\Gamma_{\varepsilon_0})$ for some $\delta_0 > 0$ and $\varepsilon_0 > 0$, then we have
\[
\gamma \cap \text{WF}_s(u(t, \cdot)) = \emptyset \quad (0 < t < T).
\]
We remark that in this case the condition (1.7) is satisfied for any $t_0 > 0$.

The second one deals with the initial data satisfying the mixed momentum condition, which also asserts the microlocal smallness of the data. It is a analogy of the result by Morimoto-Robbiano-Zuily [14].

Corollary 1.3. Assume that (A) holds and that $\gamma$ is backward nontrapping. Let $\eta_-$ be the asymptotic momentum as $t \to -\infty$. Assume that there exist $\psi(\xi) \in C^\infty(\mathbb{R}^n)$ which equals to 1 in a conic neighborhood of $\eta_-$, and $\varepsilon_0 > 0$, $A_0 > 0$, $A_1 > 0$ such that
\[
\|(x \cdot D_x)^l \psi(D_x)u_0\|_{L^2(\Gamma_{\varepsilon_0})} \leq A_0A_1^lt^{2s} \quad (l \in \mathbb{N}),
\]
then we have
\[
\gamma \cap \text{WF}_s(u(t, \cdot)) = \emptyset \quad (0 < t < T).
\]

The paper is organized as follows. In Section 2 we recall the almost analytic extension of Gevrey symbols by Jung. In Section 3 we prove the microlocal exponential estimates in a Gevrey class. In Section 4 and 5 we prove Theorem 1.1 and Corollary 1.3 respectively.

Acknowledgment. The author would like to express his sincere gratitude to Hiroyuki Chihara for several discussions and valuable suggestions.
2. Almost analytic extension

In this section we define the almost analytic extension of Gevrey functions following Jung’s idea \[8\]. We extend the functions on \(\mathbb{R}^n\) to the complex strip with the parameterized width. We construct the extension to minimize the antiholomorphic derivatives of it on the complex strip.

Let \(f(x) \in C^\infty(\mathbb{R}^n)\) satisfy the following condition.

**Assumption (G)** There exist \(s > 1\), \(C > 0\), \(R > 0\) and \(a \in \mathbb{R}\) such that

\[
|\partial_x^\alpha f(x)| \leq CR^{\alpha|\alpha|}s(x)^{n-|\alpha|} \quad (\alpha \in \mathbb{Z}_+^n, x \in \mathbb{R}^n).
\]

For \(w > 0\), we set the complex domain

\[
S_w = \{a = x + iy \in \mathbb{C}^n : x \in \mathbb{R}^n, \quad |y_j| < w \quad (1 \leq j \leq n)\}.
\]

We define the almost analytic extension of \(f\) on \(S_w\) by

\[
\tilde{f}(z) = \tilde{f}(x + iy) = \sum_{|\alpha| \leq N(s,R,w)} \frac{(iy)^\alpha}{\alpha!} \partial_x^\alpha f(x),
\]

where \(N(s,R,w) = \lfloor (Rw)^{-1/(s-1)} \rfloor\). We denote by \([c]\) the greatest integer not greater than \(c \in \mathbb{R}\). It is easy to see that \(N \to +\infty\) as \(s \to 1\) or \(w \to 0\). Although the definition depends on three parameters \(s > 1\) (Gevrey index), \(R > 0\) and \(w > 0\) (width of the strip), our interest is the case where \(s\) and \(R\) are fixed and \(w\) tends to zero. Indeed, we choose \(w = \Theta(h^{1-1/s})\) (\(0 < h \ll 1\)) in the argument of section \[9\].

We see that if the function satisfies (G) then its derivatives also satisfy the conditions similar to (G) with the same constant \(s > 1\) and other \(C' > 0\), \(R' > 0\) and \(a' \in \mathbb{R}\). In other words, the index of (G) is stable under the differentiation.

The first lemma is elementary but useful in our arguments. It claims that not only \(s\) but also \(R\) is stable in a slightly modified sense.

**Lemma 2.1.** Let \(f(x)\) be a function satisfying (G). Then for any \(\beta \in \mathbb{Z}_+^n\), there exists \(C > 0\) such that

\[
|\partial_x^{\alpha + \beta} f(x)| \leq C(1 + |\alpha|)^C R^{\alpha|\alpha|}s(x)^{a-|\alpha + \beta|} \quad (\alpha \in \mathbb{Z}_+^n, x \in \mathbb{R}^n).
\]

**Proof.** It suffices to show that for any \(\beta \in \mathbb{Z}_+^n\), there exists \(C > 0\) such that

\[
(\alpha + \beta)! \leq C(1 + |\alpha|)^C \quad (\alpha \in \mathbb{Z}_+^n).
\]

We use an induction over \(|\beta|\).

In the case \(\beta = e_j\), it is easy to see that

\[
(\alpha + \beta)! = \alpha!(\alpha_j + 1) \leq (1 + |\alpha|)\alpha!.
\]

We assume that \(2.4\) holds up to \(|\beta| \leq m - 1\). In the case \(|\beta| = m\), since \(\beta_j \geq 1\) for some \(j\), we have

\[
(\alpha + \beta)! = (\alpha + e_j + \beta - e_j)!
\leq C(1 + |\alpha + e_j|)^C(\alpha + e_j)!
= C(1 + |\alpha|)^C \left(\frac{2 + |\alpha|}{1 + |\alpha|}\right)^C \alpha!(\alpha_j + 1)
\]
\[ \leq 2^C C(1 + |\alpha|)^{C+1} \alpha!, \]

which completes the proof. \(\square\)

The behavior of the almost analytic extension as \(w\) tends to 0 is stated as follows. Especially, the proof of (2.6) implies that \(N = N(s, R, w)\) is chosen to minimize \(\overline{\partial} f\) on \(S_w\).

**Proposition 2.2.** Let \(f(x)\) be a function satisfying (G) and \(\tilde{f}(x + iy)\) be its almost analytic extension on \(S_w\) defined by (2.2).

1. For any \(\alpha, \beta \in \mathbb{Z}_+^n\), there exists \(C > 0\) such that

\[
\sup_{x + iy \in S_w} \frac{\partial_x^\alpha \partial_y^\beta \tilde{f}(x + iy)}{\langle x \rangle^{a-|\alpha + \beta|}} \leq C
\]

for \(w \in (0, 1]\).

2. For any \(\alpha, \beta \in \mathbb{Z}_+^n\), there exist \(C > 0\) and \(l > 0\) such that

\[
\sup_{x + iy \in S_w} \frac{\partial_x^\alpha \partial_y^\beta \tilde{f}(x + iy)}{\langle x \rangle^{a-|\alpha + \beta|}} \leq C w^{-l} \exp \left( -\frac{\Omega}{w^{1/(s-1)}} \right)
\]

for \(w \in (0, 1]\), \(1 \leq j \leq n\), where \(\overline{\partial}_j = \frac{1}{2}(\partial_{x_j} + i\partial_{y_j})\) and \(\Omega = \frac{s - 1}{R^{1/(s-1)}}\).

**Proof.** (1) We write \(N\) instead of \(N(s, R, w)\). By the definition (2.2), we have

\[
\partial_x^\alpha \partial_y^\beta \tilde{f}(x + iy) = \sum_{|\gamma| \leq N, \gamma \geq \beta} i^{|\gamma|} \frac{y^{\gamma - \beta}}{(\gamma - \beta)!} \partial_x^{\gamma + \alpha} f(x) = \sum_{|\gamma| \leq N - |\beta|} i^{|\gamma + \beta|} \frac{y^{\gamma}}{\gamma!} \partial_x^{\gamma + \alpha + \beta} f(x).
\]

Using \(|y^\gamma| \leq w^{|\gamma|}\), Lemma 2.1 and

\[
|\partial_x^\alpha \partial_y^\beta \tilde{f}(x + iy)| \leq c_1 \langle x \rangle^{a - |\alpha + \beta|} \sum_{|\gamma| \leq N - |\beta|} (1 + |\gamma|)^{c_1} (Rw)^{|\gamma|} \left( \frac{|\gamma|}{e} \right)^{|\gamma|(s-1)}.
\]

It remains to show that the sum in the right hand side of (2.8) is uniformly bounded with respect to \(w\). Set \(M = N - |\beta|\). Then we have

\[
\text{(The sum in RHS of (2.8))} = \sum_{l=0}^{M} (1 + l)^{c_1} (Rw)^l \left( \frac{l}{e} \right)^{l(s-1)} \sum_{|\gamma| = l} 1 \leq \sum_{l=0}^{M} (1 + l)^{c_1 + n} e^{l(1-s)},
\]

where we use \(\sum_{|\gamma| = l} 1 \leq (1 + l)^n\) and \(l \leq M \leq N \leq (Rw)^{-1/(s-1)}\).
Pick up $L > 1$ and $l_0 \in \mathbb{N}$ satisfying

$$Le^{1-s} < 1 \quad \text{and} \quad (1 + l)^{c_1 + n} \leq L^l \quad (l > l_0).$$

Then if $M \gg 1$, we obtain

$$\sum_{l=0}^{M} (1 + l)^{c_1 + n} e^{l(1-s)} \leq \sum_{l=0}^{l_0} (1 + l)^{c_1 + n} e^{l(1-s)} + \sum_{l=0+1}^{M} (Le^{1-s})^l$$

which implies the claim with $0 < w \ll 1$. It is easy to see that the claim holds if $w$ is away from zero.

(2) We first observe that

$$\left( \partial_{x^j} + i \partial_{y_j} \right)^{\tilde{f}}(x + iy) = \sum_{|\gamma| = N} \sum_{\gamma_j = M} (iy)^\gamma \gamma! \partial_{x^j}^{\gamma_j} \tilde{f}(x).$$

Then, just as in showing (2.3), we deduce that for any $\alpha, \beta \in \mathbb{Z}_+^s$, there exists $c_2 > 0$ such that

$$\left| \partial_x^\alpha \partial_y^\beta \left( \partial_{x^j} + i \partial_{y_j} \right)^{\tilde{f}}(x + iy) \right| \leq c_2 (x)^{a - |\alpha + \beta| - 1} \sum_{|\gamma| = N - |\beta|} \sum_{|\gamma| = N} (1 + |\gamma|)^{c_2} (Rw)^{|\gamma|} \left( \frac{|\gamma|}{e} \right)^{|\gamma|(s-1)}$$

for $w \in (0, 1]$ and $x + iy \in S_w$. Set $M = N - |\beta|$. Then the sum in the right hand side equals to

$$(2.9) \quad (1 + M)^{c_2} \left( \frac{RwM^{s-1}}{e^{s-1}} \right)^M \sum_{|\gamma| = M} 1 \leq (1 + M)^{c_2 + n} \left( \frac{RwM^{s-1}}{e^{s-1}} \right)^M.$$

A simple calculation shows that the function $a(x) = (Rw x^{s-1} / e^{s-1})^x (x > 0)$ has the minimum

$$\exp\left( - \frac{\Omega}{w^{1/(s-1)}} \right) \quad \left( \Omega = \frac{s - 1}{R^{1/(s-1)}} \right)$$

at $x = (Rw)^{-1/(s-1)}$. Since $N = \lfloor (Rw)^{-1/(s-1)} \rfloor$ and $M = N - |\beta| \sim (Rw)^{-1/(s-1)}$ as $w$ tends to 0, we deduce that in the case of $0 < w \ll 1$ there exist $c_3 > 0$ and $c_4 > 0$ such that

$$a(M) \leq c_3 w^{-c_4} \exp\left( - \frac{\Omega}{w^{1/(s-1)}} \right).$$

Combining this and (2.9), we obtain (2.6) if $0 < w \ll 1$. We omit proof of the case $w$ away from zero. □

**Remark.** We see that the right hand side of (2.6) tends to 0 as $s \to 1$ or $w \to 0$. It is also clear that we can replace $w \in (0, 1]$ in the statement of Proposition 2.2 with $w \in (0, w_0]$ for arbitrary fixed $w_0 > 0$.  

7
3. Microlocal exponential estimates

This section is devoted to the microlocal exponential estimates in a Gevrey class. Following [12], we consider the estimates with two parameters \( h > 0 \) and \( \mu > 0 \). Roughly speaking, the former is a scaling parameter with respect to \( \xi \), and the latter is a one to \( x \). We note that the analyticity of symbols, which we cannot use in our problem, is a essential assumption in these estimates [11]. To overcome this difficulty, we use the almost analytic extension of symbols defined in the previous section. Moreover we assume the extra condition on the weight function.

We first introduce a weight function \( \psi \) and a cutoff function \( f \).

**Assumption (W1)** Let \( \psi(x, \xi) \in C^\infty(\mathbb{R}^{2n}) \) be an \( (h, \mu) \)-dependent function satisfying

- There exists \( C_1 > 1 \) such that
  \[
  \text{supp} [\psi] \subseteq \left\{ (x, \xi) \in \mathbb{R}^{2n} : \frac{1}{C_1} \leq |\xi| \leq C_1, \frac{1}{C_1 \mu} \leq \langle x \rangle \leq \frac{C_1}{\mu} \right\}
  \]
  for \( h, \mu \in (0, 1] \).
- For any \( \alpha, \beta \in \mathbb{Z}_n^+ \) there exist \( C_{\alpha\beta} > 0 \) such that
  \[
  |\partial_\xi^\alpha \partial_\eta^\beta \psi(x, \xi)| \leq C_{\alpha\beta} \mu^{|\alpha|} \quad (x, \xi \in \mathbb{R}^n, h, \mu \in (0, 1]).
  \]
- There exists \( \nu > 0 \) such that
  \[
  \sup_{(x, \xi) \in \mathbb{R}^{2n}} |\partial_x \psi(x, \xi)| < \nu, \quad \sup_{(x, \xi) \in \mathbb{R}^{2n}} |\partial_\xi \psi(x, \xi)| < \nu,
  \]
  \[
  \sup_{(x, \xi) \in \mathbb{R}^{2n}} |\psi(x, \xi)| < \frac{s - 1}{4(K_0 \nu)^{1/(s-1)}} \quad (h, \mu \in (0, 1]),
  \]
  where \( K_0 \) is the same constant as in (A).

**Remark.** The last assumption on the size of \( \psi \) seems to be strong. However this extra condition enables us to treat new error terms particular to Gevrey cases as negligible ones.

**Assumption (W2)** Let \( f(x, \xi) \in C^\infty(\mathbb{R}^{2n}) \) be an \( (h, \mu) \)-dependent function satisfying

- There exists \( C_2 > C_1 \) such that
  \[
  \text{supp} [f] \subseteq \left\{ (x, \xi) \in \mathbb{R}^{2n} : \frac{1}{C_2} \leq |\xi| \leq C_2, \frac{1}{C_2 \mu} \leq \langle x \rangle \leq \frac{C_2}{\mu} \right\}
  \]
  for \( h, \mu \in (0, 1] \).
- \( f \equiv 1 \) on \( \text{supp} [\psi] \).
- For any \( \alpha, \beta \in \mathbb{Z}_n^+ \) there exist \( C_{\alpha\beta} > 0 \) such that
  \[
  |\partial_\xi^\alpha \partial_\eta^\beta f(x, \xi)| \leq C_{\alpha\beta} \mu^{|\alpha|} \quad (x, \xi \in \mathbb{R}^n, h, \mu \in (0, 1]).
  \]
- \( f \geq 0 \) and \( \sqrt{f} \in C^\infty(\mathbb{R}^{2n}) \) satisfies the same estimates as above.

In the following we use the notation \( \partial_\mu = \mu^{-1} \partial_x + i \partial_\xi \). We set
\[
\begin{align*}
a(x, \xi) &= h^{-1} \sum_{j,k=1}^n a_{jk}(x) \xi_j \xi_k + h^{-1} \sum_{j=1}^n b_j(x) \xi_j + c(x), \\
a \psi(x, \xi) &= \tilde{a}(x - h^{1-1/s} \partial_\mu \psi(x, \xi), \xi + ih^{1-1/s} \mu \partial_\mu \psi(x, \xi)),
\end{align*}
\]
where \( \tilde{a}(x + iy, \xi) \) denotes the almost analytic extension of \( a(x, \xi) \) with respect to \( x \) defined by (2.2) with \( w = h^{1-1/s}\nu \) and \( R = K_0 \), that is,

\[
\tilde{a}(x + iy, \xi) = \sum_{|\alpha| \leq [\nu_0 h^{-1/s}]} \frac{(iy)\alpha}{\alpha!} \partial_\xi^\alpha a(x, \xi) \quad (x + iy \in S_{h^{1-1/s}, \xi} \in \mathbb{R}^n)
\]

where \( \nu_0 = (K_0 \nu)^{-1/(s-1)} \). We note that \( a_\psi(x, \xi) \) is well-defined under the conditions (A) and (W1). Indeed, \( a(x, \xi) \) is analytic in \( \xi \) and

\[
|\text{Im} (x - h^{-1/2}\partial_\mu \psi(x, \xi))| = h^{-1/2}|\partial_\xi \psi(x, \xi)| < h^{1-1/s}\nu = w.
\]

Our main result in this section is the following. We write \( T = T_{h, \mu} \) for simplicity.

**Theorem 3.1.** Assume that (A), (W1) and (W2) hold. Suppose that there exists \( d > 0 \) such that \( 0 < h/\mu \) \( \leq d \). Then there exists \( C > 0 \) such that

\[
|\langle e^{\psi/h^{1/2}} Tu, f e^{\psi/h^{1/2}} TPu \rangle - \langle e^{\psi/h^{1/2}} Tu, fa_\psi e^{\psi/h^{1/2}} Tu \rangle|
\leq C(h^{-1/2} + \mu^a + h\mu^{s-1})(\|\sqrt{f} e^{\psi/h^{1/2}} Tu\|^2 + \|u\|^2)
\]

for \( u \in L^2(\mathbb{R}^n) \).

To prove Theorem 3.1 we need some preliminaries. We see that

\[
P = h^{-2} \frac{1}{2}(hD_x)^2 + h^{-2} p_2^W(x, hD_x) + h^{-1} p_1^W(x, hD_x) + p_0^W(x, hD_x),
\]

where

\[
p_2(x, \xi) = \frac{1}{2} \sum_{j,k=1}^n (a_{jk}(x) - \delta_{jk})\xi_j\xi_k,
\]

\[
p_1(x, \xi) = \sum_{j=1}^n b_j(x)\xi_j - \frac{1}{2i} \sum_{j,k=1}^n \partial_{x_j} a_{jk}(x)\xi_k,
\]

\[
p_0(x, \xi) = p_0(x) = c(x) - \frac{1}{2i} \sum_{j=1}^n \partial_{x_j} b_j(x) - \frac{1}{8} \sum_{j,k=1}^n \partial_{x_j} \partial_{x_k} a_{jk}(x)
\]

and \( p_j^W(x, hD_x) \) denotes the Weyl-Hörmander quantization of \( p_j \), that is

\[
p_j^W(x, hD_x)u(x) = \frac{1}{(2\pi h)^n} \int_{\mathbb{R}^{2n}} e^{(x-y)\xi/h} p_j \left( \frac{x+y}{2}, \xi \right) u(y) dyd\xi
\]

for \( u \in \mathcal{S}(\mathbb{R}^n) \). Hereafter, we use the \( S(m, g) \) symbol class notation due to Hörmander [5]. We denote the set of operators with their symbol in \( S(m, g) \) by \( \text{OPS}(m, g) \).

We set

\[
a_j(x, \xi, x^*, \xi^*) = p_j(x - \xi^*, x^*) \quad (x, \xi, x^*, \xi^* \in \mathbb{R}^n)
\]

for \( j = 0, 1, 2 \). Then we have

\[
TP_j = Q_j T \quad (j = 0, 1, 2)
\]

where \( P_j = p_j^W(x, hD_x) \) and \( Q_j = a_j^W(x, \xi, hD_x, hD_\xi) \). Let \( g_1 \) be a metric on \( \mathbb{R}^{4n} \) defined by

\[
g_1 = \frac{dx^2}{\Phi^2} + \frac{d\xi^2}{\Psi^2} + \frac{d\xi^*2}{\Psi^2} + \frac{d\xi^{*2}}{\Phi^2},
\]
\[ \Phi(x, \xi, x^*, \xi^*) = \Phi(x, \xi^*) = \sqrt{1 + \frac{|x|^2}{|\xi^*|^2}}, \]

\[ \Psi(x, \xi, x^*, \xi^*) = \Psi(x, x^*) = \sqrt{1 + \frac{|\xi|^2}{|\xi - x^*|^2}}. \]

We recall that \( q_j \in S(m_j, g_1) \) \((j = 0, 1, 2)\), where

\[ m_j = \langle \xi \rangle^j \langle x \rangle^{2-j-\sigma} \langle \xi - x^* \rangle^j \langle \xi^* \rangle^{2-j-\sigma}. \]

See [12, Lemma 3.6] for the details.

We here give the fundamental lemma in the pseudodifferential calculus on the range of \( e^{\psi/h^{1/s}}T \) without the proof. It follows from [12, Lemma 3.5] and [12, Lemma B.1] with replacing \( \psi \mapsto h^{1-1/s}\psi \).

**Lemma 3.2.** Assume (W1), (W2). Suppose \( Q \in \text{OPS}(\langle \xi \rangle^a \langle x \rangle^b \langle \xi - x^* \rangle^m \langle \xi^* \rangle^l, g_1) \) with some \( a, b, m, l \in \mathbb{R} \).

1. There exists \( C > 0 \) such that

\[ |\langle e^{\psi/h^{1/s}}Tu, fe^{\psi/h^{1/s}}Tu \rangle| \leq C\mu^{-b}(\|\sqrt{\langle e^{\psi/h^{1/s}}Tu \|} + \|u\|)^2) \]

for \( u \in \mathcal{S}(\mathbb{R}^n), h, \mu \in (0, 1] \) with \( h/\mu \leq d \).

2. Suppose the symbol \( Q \) has an asymptotic expansion supported in \( \text{supp} \ [\nabla f] \). Then for any \( N > 0 \), there exists \( C > 0 \) such that

\[ |\langle e^{\psi/h^{1/s}}Tu, Qe^{\psi/h^{1/s}}Tu \rangle| \leq C(h^N\mu^N\|\sqrt{\langle e^{\psi/h^{1/s}}Tu \|}^2 + \mu^{-b}\|u\|)^2) \]

for \( u \in \mathcal{S}(\mathbb{R}^n), h, \mu \in (0, 1] \) with \( h/\mu \leq d \).

As mentioned in the above, under the assumption (A) we can define the almost analytic extension of \( p_j(x, \xi) \) with respect to \( x \) with the setting \( w = h^{1-1/s}\nu \) and \( R = K_0 \). We denote it by \( \tilde{p}_j(x + iy, \xi) \) \((x + iy \in S_{h^{1-1/s}\nu}, \xi \in \mathbb{R}^n)\). Therefore we can also define the almost analytic extension of \( q_j(x, \xi, x^*, \xi^*) \) with respect to \( \xi^* \) by

\[ \tilde{q}_j(x, \xi, x^*, \xi^* + i\eta^*) = \tilde{p}_j(x - \xi^* - i\eta^*, x^*) \quad (x, \xi, x^* \in \mathbb{R}^n, \xi^* + i\eta^* \in S_{h^{1-1/s}\nu}). \]

We note that \( \tilde{q}_j \) is analytic with respect to \( x^* \).

Set

\[ Q_{j\psi} = q^W_{j\psi}(x, \xi, hD_x, hD_\xi) \quad (j = 0, 1, 2), \]

where

\[ q_{j\psi}(x, \xi, x^*, \xi^*) = \tilde{q}_j(x, \xi, x^* + ih^{1-1/s}\partial_\xi \psi, \xi^* + ih^{1-1/s}\partial_\xi \psi) \]

\[ = \tilde{p}_j(x - \xi^* - ih^{1-1/s}\partial_\xi \psi, x^* + ih^{1-1/s}\partial_\xi \psi). \]

Then we have the next key lemma, which should be compared to (3.5) in [12], concerning the operator

\[ R_j = e^{\psi/h^{1/s}}Q_je^{-\psi/h^{1/s}} - Q_{j\psi} \quad (j = 0, 1, 2). \]

It claims that, although the estimate of the remainder term becomes a slightly bad compared to the analytic case, we can approximate the distorted operator \( e^{\psi/h^{1/s}}Q_je^{-\psi/h^{1/s}} \) with \( Q_{j\psi} \) in some sense.
Lemma 3.3. Assume (W1), (W2). There exists $C > 0$ such that

\begin{equation}
|\langle e^{\psi/h^1/s}Tu, f R_j e^{\psi/h^1/s}Tu \rangle| \leq Ch_\mu^{\sigma+j-1}(\|f e^{\psi/h^1/s}Tu\|^2 + \|u\|^2)
\end{equation}

for $u \in \mathcal{S}^\prime(\mathbb{R}^n)$, $j = 0, 1, 2$ and $h, \mu \in (0, 1]$ with $h/\mu \leq d$.

Proof. It suffices to show that

\begin{equation}
R_j \in \text{OPS} \left( h \left| \langle \xi \rangle^{j-1} \langle x \rangle^{1-j-\sigma} \langle \xi - x^* \rangle^{j+1} \langle \xi^* \rangle^{2-j-\sigma+1}, g_1 \rangle \right. \right.
+ \text{OPS} \left( h^\infty \langle \xi \rangle^{j-1} \langle x \rangle^{1-j-\sigma} \langle \xi - x^* \rangle^{j} \langle \xi^* \rangle^{1-j-\sigma}, g_1 \right).
\end{equation}

Indeed, applying Lemma 3.2 (1) to $R_j$, we obtain (3.1).

We denote by $X = (x, \xi)$, $Y = (y, \eta)$ and $X^* = (x^*, \xi^*)$ the points of $\mathbb{R}^{2n}$. We see that

\begin{align*}
e^{\psi/h^1/s}Q_{\bar{j}}e^{-\psi/h^1/s}u(X) &= \frac{1}{(2\pi h)^{2n}} \int_{\mathbb{R}^{4n}} e^{i(X-Y) \cdot X^*/h + (\psi(X) - \psi(Y))/h^{1/\sigma}} q_{\bar{j}} \left( \frac{X + Y}{2}, X^* \right) u(Y) \, dY \, dX^* \\
&= \frac{1}{(2\pi h)^{2n}} \int_{\mathbb{R}^{4n}} e^{i(X-Y) \cdot (X^* - ih^{1-1/\sigma} \phi(X,Y))/h} q_{\bar{j}} \left( \frac{X + Y}{2}, X^* \right) u(Y) \, dY \, dX^*
\end{align*}

where

\begin{align}
\phi(X, Y) &= (\phi_1(X, Y), \ldots, \phi_{2n}(X, Y)), \\
\phi_l(X, Y) &= \int_0^1 \partial_{X_l} \psi(Y_1, \ldots, Y_{l-1}, Y_l + \tau(X_l - Y_l), X_{l+1}, \ldots, X_{2n}) \, d\tau.
\end{align}

We remark that our choice of $\phi_l$ is not a standard one. For instance, $\phi_l(X, Y) \neq \phi_l(Y, X)$. However our $\phi_l$ satisfies

\begin{equation}
(X_l - Y_l)\phi_l(X, Y) = \psi(Y_1, \ldots, Y_{l-1}, X_l, X_{l+1}, \ldots, X_{2n}) - \psi(Y_1, \ldots, Y_l, X_{l+1}, \ldots, X_{2n}).
\end{equation}

In particular, $(X_l - Y_l)\phi_l(X, Y)$ is bounded on $\mathbb{R}^{4n}$ which is useful to estimate some error terms particular to the Gevrey case.

We here change the integral variables $X^*_l \mapsto X^*_l + ih^{1-1/\sigma} \phi_1$ up to $X^*_{2n} \mapsto X^*_{2n} + ih^{1-1/\sigma} \phi_{2n}$ successively in the above expression of $e^{\psi/h^1/s}Q_{\bar{j}}e^{-\psi/h^1/s}u$. Applying the Stokes formula, we have

\begin{align*}
e^{\psi/h^1/s}Q_{\bar{j}}e^{-\psi/h^1/s}u(X) &= \frac{1}{(2\pi h)^{2n}} \int_{\mathbb{R}^{4n}} e^{i(X-Y) \cdot X^*/h} q_{\bar{j}} \left( \frac{X + Y}{2}, X^* + ih^{1-1/\sigma} \phi(X, Y) \right) u(Y) \, dY \, dX^* \\
&\quad + \sum_{k=n+1}^{2n} \frac{1}{(2\pi h)^{2n}} \int_{\mathbb{R}^{4n}} e^{i(X-Y) \cdot X^*/h} r_{j,k}(X, Y, X^*) u(Y) \, dY \, dX^* \\
&= Q_{\bar{j}}^{(1)} u + Q_{\bar{j}}^{(2)} u,
\end{align*}
where
\[ r_{j,k}(X, Y, X^*) = 2i\hbar^{1-s} \phi_k(X, Y) \int_0^1 e^{\{(X-Y)-(0,\ldots,0,1-\theta)\phi_k,\phi_{k+1},\ldots,\phi_{2n})/\hbar^{1/s}} \]
\[ \times \frac{\partial \tilde{q}_j}{\partial Z_k} \left( \frac{X + Y}{2}, X^* + i\hbar^{1-s}(\phi_1, \ldots, \phi_{k-1}, \theta \phi_k, 0, \ldots, 0) \right) d\theta \]
and \( Z^* = (z^*, z^*') = X^* + iY^* = (x^* + iy^*, \xi^* + i\eta^*) \in C^{2n} \). It is remarked that \( r_{j,k} = 0 \) for \( 1 \leq k \leq n \), since \( \tilde{q}_j \) is analytic with respect to \( Z^*_k \) (\( 1 \leq k \leq n \)). In the following we shall simplify the double symbols \( \tilde{q}_j ((X + Y)/2, X^* + i\hbar^{1-s}\phi(X, Y)) \) and \( r_{j,k}(X, Y, X^*) \).

First we observe that for any \( \alpha, \beta, \gamma, \delta \in \mathbb{Z}_+^n \), there exists \( C > 0 \) such that
\[ |\partial_x^a \partial_{\xi}^b \partial_{\eta}^c \partial_{x^*}^d \partial_{\xi^*}^c \partial_{\eta^*}^d \tilde{q}_j(x, \xi, y, \eta)| \leq C \frac{\langle x - y \rangle^{a+\gamma} \langle \xi - \eta \rangle^{b+\delta}}{\langle x \rangle^a \langle \xi \rangle^b \langle y \rangle^c \langle \eta \rangle^d} \]
\( (x, \xi, y, \eta \in \mathbb{R}^n, 1 \leq l \leq 2n) \). Indeed, combining (3.3),
\[ |\partial_x^a \partial_{\xi}^b \psi(x, \xi)| \leq C \langle x \rangle^{-a} \langle \xi \rangle^{-b} \]
\( (x, \xi \in \mathbb{R}^n, \mu, \nu \in (0, 1]) \), which follows from (W1), and
\[ \langle x \rangle \langle y \rangle \leq C \langle x - y \rangle \langle (y_1, \ldots, y_{j-1}, y_j + \tau(x_j - y_j), x_{j+1}, \ldots, x_n) \rangle \]
\( (x, y \in \mathbb{R}^n, \tau \in [0, 1], 1 \leq j \leq n) \), we deduce (3.6) for \( 1 \leq l \leq n \). The case \( n + 1 \leq l \leq 2n \) can be handled in the same manner. We note that \( \phi_1 (1 \leq l \leq n) \) is independent of \( \eta \) and \( \phi_1 (n + 1 \leq l \leq 2n) \) is independent of \( x \).

Applying Proposition 2.2 (1) to \( \tilde{q}_j \), we see that for any \( \alpha, \beta, \alpha^*, \beta^*, \gamma^*, \delta^* \in \mathbb{Z}_+^n \), there exists \( C > 0 \) such that
\[ |\partial_x^a \partial_{\xi}^b \partial_{\eta}^c \partial_{x^*}^d \partial_{\xi^*}^c \partial_{\eta^*}^d \tilde{q}_j(x, \xi, x^* + iy^*, \xi^* + i\eta^*)| \]
\[ \leq C \langle x - \xi^* \rangle^{2-j-\sigma} \langle \xi - x^* \rangle^{j+\delta} \langle \xi^* \rangle^{2-j-\sigma} \]
\[ \leq \Phi(x, \xi^*) \langle \xi - \eta \rangle^{\alpha+\delta} \]
\( (x, \xi \in \mathbb{R}^n, x^* + iy^*, \xi^* + i\eta^* \in S_{h^{-1}/s}, h \in (0, 1]). \) We write
\[ \phi(X, Y) = (\phi^{(1)}(X, Y), \phi^{(2)}(X, Y)), \]
that is
\[ \phi^{(1)}(x, \xi, y, \eta) = \phi^{(1)}(x, \xi, y) = (\phi_1(x, \xi, y), \ldots, \phi_n(x, \xi, y)), \]
\[ \phi^{(2)}(x, \xi, y, \eta) = \phi^{(2)}(\xi, y, \eta) = (\phi_{n+1}(\xi, y, \eta), \ldots, \phi_{2n}(\xi, y, \eta)). \]
Combining the above estimate of \( \tilde{q}_j \) and (3.6), we deduce that for any \( \alpha, \beta, \gamma, \delta, \alpha^*, \beta^* \in \mathbb{Z}_+^n \), there exists \( C > 0 \) such that
\[ \left| \partial_x^a \partial_{\xi}^b \partial_{\eta}^c \partial_{x^*}^d \partial_{\xi^*}^c \partial_{\eta^*}^d \tilde{q}_j \left( \frac{x + y}{2}, \frac{\xi + \eta}{2}, x^* + i\hbar^{1-s} \langle \phi^{(1)}(1), \xi^* + i\hbar^{1-s} \phi^{(2)}(1) \rangle \right) \right| \]
\[ \leq C \langle \xi + \eta \rangle^{2 \langle x + y \rangle^{2-j-\sigma} \langle \phi^{(1)}(1), \xi^* + i\hbar^{1-s} \phi^{(2)}(1) \rangle \}
\[ \times \frac{\langle x - y \rangle^{a+\gamma} \langle \xi - \eta \rangle^{b+\delta}}{\langle x \rangle^a \langle \xi \rangle^b \langle y \rangle^c \langle \eta \rangle^d} \]
\[ \Phi(x, \xi^*)^{\alpha+\delta} \Phi(y, \xi^*)^{\gamma} \Phi(\xi, x^*)^{\beta} \Phi(\xi, \eta)^{\delta} \Phi(\xi, y)^{\alpha} \]
\[ (x, y \in \mathbb{R}^n, 1 \leq l \leq 2n). \]
\( (x, \xi, y, \eta, x^*, \xi^* \in \mathbb{R}^n, h, \mu \in (0, 1]) \). It follows from (3.7) that there exists a simplified symbol

(3.8) \[
\rho_j(x, \xi, x^*, \xi^*) \in S(m_j, g_1)
\]
such that

(3.9) \[
\rho_j^W(x, \xi, hD_x, hD_\xi) = Q_j^{(1)},
\]
(3.10) \[
\rho_j(x, \xi, x^*, \xi^*) - q_j\psi(x, \xi, x^*, \xi^*) \in S(h\Phi^{-1}\Psi^{-1}m_j, g_1).
\]

It is remarked that we cannot replace \( h\Phi^{-1}\Psi^{-1} \) in (3.10) by \( h^2\Phi^{-2}\Psi^{-2} \) because of the property \( \phi(X, Y) \neq \phi(Y, X) \).

We next give the estimate of \( r_{j,k}(X, Y, X^*) (n + 1 \leq k \leq 2n) \). Using (3.4), we rewrite (3.5) as

(3.11) \[
\begin{align*}
&\quad r_{j,n+l}(x, \xi, y, \eta, x^*, \xi^*) \\
&= 2ih^{1-1/s}\phi_{n+l}(x, \xi, y, \eta, x^*, \xi^*) \\
&\quad \times \int_0^1 e^{(1-\theta)|\psi(y, n_1, \ldots, n_1, \xi, \ldots, \xi| + \theta|\psi(y, n_1, \ldots, n_1, \xi, \ldots, \xi) - \psi(y, \eta)|/h^{1/s}} \\
&\quad \times \frac{\partial \tilde{q}_j}{\partial \xi^j} \left( \frac{x + y}{2}, \xi + \eta, x^* + ih^{1-1/s}\phi^{(1)}(x, \xi, \xi^*) + ih^{1-1/s}(\phi_{n+1}, \ldots, \phi_{n+l-1}, \theta_{n+l}, 0, \ldots, 0) \right) \\
&\quad \times d\theta \quad (1 \leq l \leq n).
\end{align*}
\]

Applying Proposition 2.2 (2), we see that for any \( \alpha, \beta, \alpha^*, \beta^*, \gamma^*, \delta^* \in \mathbb{Z}_+^n \), there exists \( C > 0 \) such that

(3.12) \[
\left| \partial_{x^*}^\alpha \partial_{\xi^*}^\beta \partial_{x}^{\alpha^*} \partial_{\xi}^{\beta^*} \partial_{\eta}^{\gamma^*} \partial_{\eta^*}^{\delta^*} \psi_j(x, \xi, x^* + iy^*, \xi^* + i\eta^*) \right| \leq C h^{-C} e^{-\Sigma_0/h^{1/s}} \frac{1}{\Phi(x, \xi^*)^{1+\alpha^*+\beta^*+\gamma^*}}
\]

\((x, \xi \in \mathbb{R}^n, x^* + iy^*, \xi^* + i\eta^* \in S_{h^{-1}/s}, h \in (0, 1], 1 \leq l \leq n)\), where \( \Sigma_0 = \frac{s - 1}{(K_0\nu)^{1/(s-1)}} \) and \( \tilde{\xi}^* = (\partial_{\xi^*} + \partial_{\eta^*})/2 \). We also see that

(3.13) \[
\left| \partial_{x^*}^\alpha \partial_{\xi^*}^\beta \partial_x^\gamma \partial_y^\delta \psi(Y_1, \ldots, Y_{l-1}, X_{l}, \ldots, X_{2n}) \right| \leq C \frac{1}{(x - y)^{\alpha+\gamma}|\xi - \eta|^{\beta+\delta}}
\]

\((x, \xi, y, \eta \in \mathbb{R}^n, h, \mu \in (0, 1], 1 \leq l \leq 2n)\) and, using (W1),

(3.14) \[
\left| \text{(exponential term in (3.11))} \right| \leq \exp \left( \frac{3}{(x, \xi) \in \mathbb{R}^{2n}|\psi(x, \xi)|/h^{1/s}} \right)
\]

\( \leq \exp \left( \frac{3\Sigma_0}{4h^{1/s}} \right) \)
$(y, \eta, \xi \in \mathbb{R}^n, \theta \in [0, 1], h, \mu \in (0, 1])$. Combining (3.6), (3.12), (3.13), and (3.14), we deduce that for any $(\alpha, \beta, \gamma, \delta, \alpha^*, \beta^*) \in \mathbb{Z}_+^n$, there exists $C > 0$ such that

$$\left| \frac{\partial^\beta_x \partial^\gamma_y \partial^\delta_z \partial^\alpha \partial^{\beta^*}_{x^*} r_{j,n+1}(x, \xi, y, \eta, x^*, \xi^*)}{\Phi(x, \xi^*)}\right| \leq Ch^{-C} \exp \left(-\frac{\sum_0}{4h^{1/\alpha}}\right) \frac{\left|x - y\right|^{\alpha + \gamma} \left(\xi - \eta\right)^{\beta + \delta}}{\Phi(x, \xi^*)^{\alpha + \gamma} \Phi(y, \xi^*)^{\beta + \delta} \Phi(\frac{x+y}{2}, \xi^*)^{\beta + \delta} \Phi(\xi, x^*)^{\beta + \delta} \Phi(\eta, x^*)^{\beta + \delta} \Phi(\frac{x+y}{2}, x^*)^{\alpha + \gamma}}$$

(3.15)

Assume that $j, \nu, \sigma, \xi, \zeta \in \mathbb{R}^n, h, \mu \in (0, 1], 1 \leq l \leq n$. It follows from (3.15) that there exists a simplified symbol

$$r_j(x, \xi, x^*, \xi^*) \in S(h^\infty \langle \xi \rangle \langle x \rangle^{1-j-\sigma} \langle x^* - \xi \rangle \langle \xi^* \rangle^{1-j-\sigma}, g_1)$$

such that

$$r_j^W(x, \xi, hD_x, hD_\xi) = Q_j^{(2)}.$$ \hspace{1cm} (3.16)

Then it follows from (3.8), (3.9), (3.10), (3.16) and (3.17) that we obtain (3.2), which completes the proof. \hspace{1cm} \Box

**Remark.** It is obvious that we can show a stronger result rather than (3.2) in which $O(h^\infty)$ is replaced with $O(e^{-c/h^{1/\alpha}}).

To estimate $\langle e^{\psi/h^{1/\alpha}} T u, f Q_j^\psi e^{\psi/h^{1/\alpha}} T u \rangle$, we use the following lemma. Set

$$p_j^\psi(x, \xi) = g_j^\psi(x, \xi, \xi - h^{1-1/s} \mu \partial_x \psi, h^{-1/\mu} \mu^{-1} \partial_x \psi)$$

$$= \bar{p}_j(x - h^{1-1/s} \partial_x \psi, \xi + ih^{1-1/s} \mu \partial_x \psi) \quad (j = 0, 1, 2).$$

**Lemma 3.4.** Assume (W1), (W2).

1. There exists $C > 0$ such that

$$\left| \langle e^{\psi/h^{1/\alpha}} T u, f \{ \frac{1}{2} (hD_x)^2 - \frac{\left(\xi + i h^{1-1/s} \mu \partial_x \psi, h^{-1/\mu} \mu \partial_x \psi\right)^2 + \frac{n}{4} h^2 \} \left(\frac{1}{2} (hD_x)^2 - \frac{\left(\xi + i h^{1-1/s} \mu \partial_x \psi, h^{-1/\mu} \mu \partial_x \psi\right)^2 + \frac{n}{4} h^2 \right) \right|$$

$$\leq C h^\mu (h^{1-1/s} \mu \left\| T^\psi \right\|_2^2 + \left\| u \right\|^2_2)$$

for $u \in \mathcal{S}(\mathbb{R}^n)$, $h, \mu \in (0, 1]$.

2. There exists $C > 0$ such that

$$\left| \langle e^{\psi/h^{1/\alpha}} T u, f \{ Q_j^\psi - p_j^\psi(x, \xi) \right\} e^{\psi/h^{1/\alpha}} T u \rangle$$

$$\leq C h^\mu \sigma^{j-1} \left\| T^\psi \right\|_2^2 + \left\| u \right\|^2$$

for $u \in \mathcal{S}(\mathbb{R}^n)$, $j = 0, 1, 2$ and $h, \mu \in (0, 1]$ with $h/\mu \leq d$.

**Proof.** (1) Combining the formula

$$\langle e^{g/h} T u, f e^{g/h} (hD_x)^\alpha T u \rangle$$

$$= \langle e^{g/h} T u, \left\{ \left( \xi + i \mu \partial_x g + \frac{\bar{g}}{2} h \mu \partial_x \right) \right\} e^{g/h} (hD_x)^\alpha T u \rangle \quad (\alpha \in \mathbb{Z}_+^n)$$
with the setting $g = h^{1-1/s} \psi$ and

\[
\left( \xi + ih^{1-1/s} \mu \partial_\mu \psi + \frac{i}{2} h \mu \partial_\mu \right)^2 f
\]

\[
= (\xi + ih^{1-1/s} \mu \partial_\mu \psi)^2 f - \frac{n}{2} h \mu f - \frac{1}{2} h^{1-1/s} \mu^2 (\partial_\mu^2 \psi) f
\]

\[
+ ih \mu (\xi + ih^{1-1/s} \mu \partial_\mu \psi) \partial_\mu f - \frac{1}{4} h^2 \mu \partial_\mu^2 f,
\]

we deduce the claim.

(2) For $j = 0, 1, 2$, we set

\[
q_j (x, \xi, x^*, \xi^*) - q_j^1 (x, \xi, x^*, \xi^*)
\]

\[
= q_j^1 (x, \xi, x^*, \xi^*) (x^* - \xi + h^{1-1/s} \mu \partial_\xi \psi) + q_j^2 (x, \xi, x^*, \xi^*) (\xi^* - h^{1-1/s} \mu^{-1} \partial_x \psi),
\]

where

\[
q_j^1 (x, \xi, x^*, \xi^*)
\]

\[
= \int_0^1 \frac{\partial q_j^0 (x, \xi, x^*, \xi^*)}{\partial x^*} (x, \xi, \theta x^* + (1 - \theta) (\xi - h^{1-1/s} \mu \partial_\xi \psi), \theta \xi^* + (1 - \theta) h^{1-1/s} \mu^{-1} \partial_x \psi) d \theta,
\]

\[
q_j^2 (x, \xi, x^*, \xi^*)
\]

\[
= \int_0^1 \frac{\partial q_j^0 (x, \xi, x^*, \xi^*)}{\partial \xi^*} (x, \xi, \theta x^* + (1 - \theta) (\xi - h^{1-1/s} \mu \partial_\xi \psi), \theta \xi^* + (1 - \theta) h^{1-1/s} \mu^{-1} \partial_x \psi) d \theta.
\]

Since $q_j^0 (x, \xi, x^*, \xi^*) \in S (m_j, g_1)$, we can verify that

\[
q_j^1 (x, \xi, x^*, \xi^*) \in S (\langle \xi \rangle^{j-1} \langle x \rangle^{2-j-\sigma} \langle \xi^* \rangle^{j+1} \langle \xi^* \rangle^{2-j-\sigma|+1}, g_1),
\]

\[
q_j^2 (x, \xi, x^*, \xi^*) \in S (\langle \xi \rangle^{j} \langle x \rangle^{1-j-\sigma} \langle \xi^* \rangle^{j} \langle \xi^* \rangle^{2-j-\sigma|+1}, g_1).
\]

We also set

\[
A = hD_x - \xi + h^{1-1/s} \mu \partial_\xi \psi (x, \xi),
\]

\[
B = hD_\xi - h^{1-1/s} \mu^{-1} \partial_x \psi (x, \xi)
\]

and

\[
Q_j^k = q_j^W (x, \xi, h D_x, h D_\xi) \quad (k = 1, 2),
\]

\[
R_j = Q_j^1 - q_j^1 (x, \xi, \xi - h^{1-1/s} \mu \partial_\xi \psi, h^{1-1/s} \mu^{-1} \partial_x \psi)
\]

\[
- \frac{1}{2} \{ AQ_j^1 + Q_j^1 A + BQ_j^2 + Q_j^2 B \}.
\]

Then, using the symbolic calculus, we deduce that

\[
R_j \in \text{OPS} (h^2 \langle \xi \rangle^{j-2} \langle x \rangle^{-j-\sigma} \langle \xi - x^* \rangle^{j+3} \langle \xi^* \rangle^{2-j-\sigma|+3}, g_1).
\]

Especially, applying Lemma 3.2 (1), we obtain

\[
| \langle \psi^{1/s} T u, f R_j \psi^{1/s} T u \rangle | 
\]

\[
\leq C h^2 \mu^{\sigma+j} \| \sqrt{J} \psi^{1/s} T u \|^2 + \| u \|^2 \quad (j = 0, 1, 2).
\]
Next we shall show that
\[
|\langle e^{\psi/h^{1/4}} T u, f(AQ_{j\psi}^{(1)} + Q_{j\psi}^{(1)} A + BQ_{j\psi}^{(2)} + Q_{j\psi}^{(2)} B) e^{\psi/h^{1/4}} T u \rangle | \\
\leq Ch\mu^{\sigma+j-1}(\sqrt{f e^{\psi/h^{1/4}} T u}^2 + \|u\|^2) \quad (j = 0, 1, 2).
\]

It follows from (3.19) and (3.20) that we deduce the claim of (2).

We write \( T_{\psi} = e^{\psi/h^{1/4}} T \) for abbreviation. Since
\[
(A - i\mu B) T_{\psi} u = 0,
\]
we see that
\[
T_{\psi} f(AQ_{j\psi}^{(1)} + Q_{j\psi}^{(1)} A + BQ_{j\psi}^{(2)} + Q_{j\psi}^{(2)} B) T_{\psi} = T_{\psi} (L_j^{(1)} + L_j^{(2)}) T_{\psi},
\]
where
\[
L_j^{(1)} = i f (-\mu [B, Q_{j\psi}^{(1)}] + \mu^{-1} [A, Q_{j\psi}^{(2)}]), \\
L_j^{(2)} = [f, A + i\mu B] Q_{j\psi}^{(1)} - i\mu^{-1} [f, A + i\mu B] Q_{j\psi}^{(2)}.
\]

We also see that
\[
[B, Q_{j\psi}^{(1)}] \in \text{OPS}(h(\xi^{j-2} (\xi - x^*)^j + 2 (\xi^*)^j, g_1), \\
[A, Q_{j\psi}^{(2)}] \in \text{OPS}(h(\xi^{j-2} (\xi - x^*)^j + 2 (\xi^*)^j, g_1).
\]

Combining this and Lemma 3.2(1), we have
\[
(3.21)
|\langle e^{\psi/h^{1/4}} T u, L_j^{(1)} e^{\psi/h^{1/4}} T u \rangle | \\
\leq Ch\mu^{\sigma+j-1}(\sqrt{f e^{\psi/h^{1/4}} T u}^2 + \|u\|^2) \quad (j = 0, 1, 2).
\]

It also follows from Lemma 3.2(2) that we obtain
\[
(3.22)
|\langle e^{\psi/h^{1/4}} T u, L_j^{(2)} e^{\psi/h^{1/4}} T u \rangle | \\
\leq Ch\mu^{\sigma+j-1}(\sqrt{f e^{\psi/h^{1/4}} T u}^2 + \|u\|^2) \quad (j = 0, 1, 2).
\]

Combining (3.21) and (3.22), we deduce (3.20) and which completes the proof. \( \square \)

We are now ready to prove Theorem 3.1.

**Proof of Theorem 3.1** By the definition of \( P_j \) and the relation
\[
T P_j = Q_j T = e^{-\psi/h^{1/4}} (Q_j \psi + R_j) e^{\psi/h^{1/4}} T,
\]
we have
\[
\langle e^{\psi/h^{1/4}} T u, f e^{\psi/h^{1/4}} T P u \rangle \\
= \frac{1}{2} h^{-2} \langle e^{\psi/h^{1/4}} T u, f e^{\psi/h^{1/4}} (h D_x)^2 T u \rangle \\
+ \sum_{j=0}^{2} h^{-j} \langle e^{\psi/h^{1/4}} T u, f (Q_j \psi + R_j) e^{\psi/h^{1/4}} T u \rangle.
\]

We note that
\[
\frac{1}{2} h^{-2}(\xi + ih^{1/4} \mu \partial_{\xi} \psi(x, \xi))^2 + \sum_{j=0}^{2} h^{-j} p_j \psi(x, \xi) - a_{\psi}(x, \xi)
\]

\[ \leq C(h^{-1}x^{-\sigma-1}|\xi| + (x)^{-\sigma}). \]

Combining this, Lemma 3.3 and Lemma 3.4 we obtain our claim. \[ \square \]

Finally, we give the useful corollary of Theorem 3.1

**Lemma 3.5.** Under the same assumptions as in Theorem 3.1 there exists \( C > 0 \) such that
\[
\left| \text{Im} a_\psi(x, \xi) - h^{-1-1/s} H_\psi(x, \xi) \right| \\
\leq (h^{-2/s} \mu^2 + h^{-1} \mu^{\sigma-1/s+1} + \mu^{\sigma-1/s}) \quad \text{on \ supp} \ [f]
\]
for \( h, \mu \in (0, 1] \) with \( h/\mu \leq d \).

We can show Lemma 3.5 by a Taylor expansion of \( \tilde{a}(x + z_0, \xi + \zeta_0) \) \((z_0 \in S_{h^{-1/s}}, \zeta_0 \in \mathbb{C}^n)\). We omit the proof. Combining Theorem 3.1 and Lemma 3.3 with the relation \( \sigma \leq 1/s \), we have the following estimate.

**Corollary 3.6.** Under the same assumptions as in Theorem 3.1 there exists \( C > 0 \) such that
\[
\left| \text{Im} \left( e^{\psi/h^{1/s}} T u \right) \right|
\leq C(h^{-2/s} \mu^2 + h^{-1} \mu^{\sigma-1/s+1} + \mu^{\sigma-1/s}) \| \sqrt{f} e^{\psi/h^{1/s}} T u \|^2
\]
for \( u \in L^2(\mathbb{R}^n) \), \( h, \mu \in (0, 1] \) with \( h/\mu \leq d \).

4. PROOF OF THEOREM 1.1

In this section we prove Theorem 1.1. Using microlocal exponential estimates obtained in the previous section, we can prove it in the same way as the analytic case \([12]\). We use the notation
\[
B(x_0, \xi_0; a, b) = \{(x, \xi) \in \mathbb{R}^{2n} : |x - x_0| < a, |\xi - \xi_0| < b\}.
\]

**Proof of Theorem 1.1** We suppose \( \gamma = \{(y(t), \eta(t)) : t \in \mathbb{R}\} \) is backward nontrapping and denote the asymptotic momentum by \( \eta_- = \lim_{t \to -\infty} \eta(t) \).

It follows from (1.7) that there exist a conic neighborhood \( \Gamma \) of \((-t_0 \eta_-, \eta_-)\) and \( \delta_0 > 0 \) satisfying
\[
\|e^{\delta_0 (|x|^{1/s} + |\xi|^{1/s})} T_{1,1} u_0 \|_{L^2(\Gamma)} < +\infty.
\]
Then we can find a sufficiently small \( \delta \in (0, |\eta_-|) \) and \( C > 0 \) such that
\[
\|T_{1,1} u_0 \|_{L^2(B(-h^{-1}t_0 \eta_-, \eta_-, h^{-1}t_0 \delta, h^{-1} \delta))} \leq Ce^{-\delta/h^{1/s}} \quad (0 < h \leq 1),
\]
which is equivalent to
\[
\|T_{h,h} u_0 \|_{L^2(B(-h^{-1}t_0 \eta_-, \eta_-, h^{-1}t_0 \delta, h^{-1} \delta))} \leq Ce^{-\delta/h^{1/s}} \quad (0 < h \leq 1).
\]

Pick up \( \chi_1(r) \in C^\infty(\mathbb{R}) \) satisfying
\[
\chi_1(r) = \begin{cases} 1 & (|r| \leq 1/2) \\
0 & (|r| \geq 1) \end{cases}, \quad r \chi_1'(r) \leq 0.
\]

We set \( \delta_1 = \delta/4 \). Following \([12]\), we define the weight function by
\[
\psi(t, x, \xi) = \delta \varphi(t/h, x, \xi),
\]

where \( \varphi \) is a cut-off function.
\[ \varphi(t, x, \xi) = \chi_1 \left( \frac{|x-t\xi|}{\delta_1 |t|} \right) \chi_1 \left( \frac{|\xi-\eta|}{\delta_1} \right) \]

for \( t < 0 \). We recall that
\[ \partial_t \varphi + H_p \varphi \leq C|t|^{-1-\sigma}, \]
\[ \text{supp } [\varphi(t, \cdot, \cdot)] \subset B \left( t\eta, \eta; \frac{\delta |t|}{2} \right). \]

Combining (4.1), (4.3) and the definition of \( \psi \), we have
\[ \| e^{\psi(t, \cdot, \cdot)/h^{1/s}} T_{h,\mu} u_0 \| \leq C < +\infty \quad (|t + t_0| \ll 1). \]

We next set
\[ \mu(t) = -\frac{t_0}{t} h \quad (t < 0). \]

It is easy to see that \( \mu'(t) > 0 \) and \( \mu(t) \geq h \) for \( t \in [-t_0, 0) \). Moreover, we have
\[ \| \partial_x^\mu \psi \| = O(\mu^{h\mu}), \quad \| \partial_x^\mu \psi \| = O(1), \]
\[ \text{supp } [\psi(t, \cdot, \cdot)] \subset \{(x, \xi) \in \mathbb{R}^{2n} : C^{-1} \leq |\mu x| \leq C, C^{-1} \leq |\xi| \leq C\} \]
for some \( C > 1 \). Especially, choosing \( \delta \) small again if necessary, we see that \( \psi(t, x, \xi) \) satisfies (W1).

Let \( \chi_2(r) \in C^\infty(\mathbb{R}) \) be a function satisfying
\[ \chi_2(r) = \begin{cases} 1 & (A^{-1} \leq r \leq A), \\ 0 & (r \leq (2A)^{-1}, (2A) \leq r), \end{cases} \quad 0 \leq \chi_2(r) \leq 1 \]
for some \( A > 0 \). We set
\[ f(t, x, \xi) = \chi_2(|\mu(t) x|) \chi_2(|\xi|) \]
with sufficiently large \( A \) so that \( f \equiv 1 \) on \( \text{supp } [\psi] \). We can verify that \( f(t, x, \xi) \) satisfies (W2).

For \( t \in [-t_0, 0) \), we set
\[ F(t) = \| \sqrt{f(t, \cdot, \cdot)} e^{\psi(t, \cdot, \cdot)/h^{1/s}} T_{h,\mu(t)} u(t + t_0) \|^2. \]

Then \( F(t) \) satisfies the following differential inequality.

**Lemma 4.1.** There exists \( C > 0 \) such that
\[ \frac{d}{dt} F(t) \leq A(t) F(t) + B(t) \| u(t + t_0) \|^2, \]
where
\[ A(t) = C(h^{-1/s+\sigma} |t|^{-1-\sigma} + h^{2-2/s} |t|^{-2}), \quad B(t) = C(|t|^{-1} + h^2 |t|^{-2}) \]
\((t < 0, 0 < h \leq 1)\).

**Proof of Lemma 4.1.** We write \( v(t) = u(t + t_0) \) and \( T = T_{h,\mu(t)} \). By a simple computation, we have
\[ \frac{d}{dt} F(t) = \langle e^{\psi/h^{1/s}} T(-iPv), e^{\psi/h^{1/s}} T v \rangle + \langle e^{\psi/h^{1/s}} T v, e^{\psi/h^{1/s}} T(-iPv) \rangle \\
+ \left( e^{\psi/h^{1/s}} T v, 2h^{-1/s} f \frac{\partial \psi}{\partial t} e^{\psi/h^{1/s}} T v \right). \]
\[ + \left\langle e^{\psi/h^{1/4}} \left[ \frac{\partial}{\partial t} T \right] v, f e^{\psi/h^{1/4}} T v \right\rangle + \left\langle e^{\psi/h^{1/4}} T v, f e^{\psi/h^{1/4}} \left[ \frac{\partial}{\partial t} T \right] v \right\rangle \]
\[ = F_1(t) + F_2(t) + F_3(t) + F_4(t) \]

We first consider \( F_1(t) \) and \( F_2(t) \). It follows from Corollary 3.6 that we have
\[
F_1(t) = -2 \text{Im} \left\langle e^{\psi/h^{1/4}} T v, f e^{\psi/h^{1/4}} T P v \right\rangle = 2 \left\langle e^{\psi/h^{1/4}} T v, f (h^{-1/4} \psi) e^{\psi/h^{1/4}} T v \right\rangle + r(t),
\]

where
\[
r(t) \leq C (h^{2-2/s} |t|^{-2} + h^{\sigma-1/s} |t|^{-\sigma+1/s-1}) F(t) + C (|t|^{-1} + h^\sigma |t|^{-\sigma}) \|v\|^2.
\]

Therefore, using (4.2), we have
\[
F_1(t) + F_2(t) = 2h^{-1/s} \left\langle e^{\psi/h^{1/4}} T v, f \left( h \frac{\partial \psi}{\partial t} + H_p \psi \right) e^{\psi/h^{1/4}} T v \right\rangle + r(t)
\]
\[
\leq C h^{\sigma-1/s} |t|^{-1-\sigma} F(t) + r(t).
\]

We next consider \( F_3(t) \). Replacing \( \psi \) with \( h^{1-1/s} \psi \) in the proof of [12, Lemma 4.1], we can show that
\[
F_3(t) \leq C h^{1-2/s} \mu'(t) \|e^{\psi/h^{1/4}} T v\|^2 + C h \mu'(t) \|v\|^2
\]
\[
\leq C' h^{2-2/s} |t|^{-2} F(t) + C' h^2 |t|^{-2} \|v\|^2.
\]

Finally, it is easy to see that
\[
F_4(t) \leq C |t|^{-1} \|v\|^2.
\]

Combining (4.7), (4.8), (4.9), (4.10), we deduce (4.6). \( \square \)

It follows from Gronwall’s inequality that we have
\[
F(t) \leq e^{\int_{t_0}^t A(\tau) d\tau} \left\{ F(-t_0) + \int_{-t_0}^t B(\tau) d\tau \sup_{\tau \in [0, t_0]} \|u(\tau)\|^2 \right\} \quad (-t_0 \leq t < 0).
\]

This shows that for every \( t \in (-t_0, 0) \) there exist \( C_1 > 0, C_2 > 0 \) such that
\[
F(t) \leq C_1 \exp \left( C_2 h^{\sigma-1/s} \right) \quad (0 < h \leq 1).
\]

Since
\[
\psi(t, x, \xi) = \delta \quad \text{on} \quad B \left( h^{-1} t \eta_-, \eta_-; h^{-1} |t| \frac{\delta_1}{4}, \frac{\delta_1}{4} \right),
\]
we deduce that
\[
(t \eta_-, \eta_-) \notin \text{HWF}_s(u(t + t_0)) \quad (-t_0 < t < 0),
\]
which implies (1.8).
We next show (1.9). It is easy to see that for $R \gg 1$ we have
\[
\int_{-R}^{R} A(t) dt \leq \frac{\delta}{2} h^{-1/s}, \quad \int_{-R}^{R} B(t) dt \leq C \log h.
\]
Then it follows that
\[
F(-Rh) = \| \sqrt{f(-Rh; \cdot)} e^{\psi(-Rh; \cdot)/h^{1/s}} T_{h,t_0/R} u(t_0 - Rh) \|_2^2 \leq C e^{\delta h^{1/s}}
\]
for $(0 < h \leq 1)$ for some $C > 0$. It also can be verified that for $R \gg 1$ we have
\[
\psi(-Rh, x, \xi) = \delta \quad \text{on} \quad B\left(\gamma(-R); \frac{R \delta_1}{8}, \frac{\delta_1}{8}\right).
\]
Then we see that
\[
\| T_{h,t_0/R} u(t_0 - Rh) \|^2_{L^2(B(\gamma(-R); R \delta_1/8, \delta_1/8))} \leq C e^{\delta h^{1/s}} \quad (0 < h \leq 1).
\]
It is remarked that in the above argument we can replace $-t_0$ with $t$ in a sufficiently small neighborhood of $-t_0$ by virtue of (4.4). Then we can find $\varepsilon_0 > 0$ such that
\[
\| T_{h,t_0/R} u(\tau - Rh) \|^2_{L^2(B(\gamma(-R); R \delta_1/8, \delta_1/8))} \leq C e^{\delta h^{1/s}}
\]
for $h \in (0, 1]$ and $\tau \in [-t_0 - \varepsilon_0, -t_0 + \varepsilon_0]$. In particular, we have $\gamma(-R) \notin \text{WF}_s(u(\tau))$ for $\tau \in [-t_0 - \varepsilon_0/2, -t_0 + \varepsilon_0/2]$. By the propagation theorem of the microsupport in Gevrey classes, which can be shown by the same way as the analytic case [12, Lemma 4.3] with the aid of Theorem 3.1 we can find $\varepsilon_1 > 0$ such that for any $t \in \mathbb{R}$ and $\tau \in [-t_0 - \varepsilon_1, -t_0 + \varepsilon_1]$ there exist $C > 0, \delta' > 0, \varepsilon > 0$ satisfying
\[
\| T_{h,t_0/R} u(\tau - Rh + \varepsilon t) \|^2_{L^2(B(\gamma(-R); \delta', \delta'))} \leq C e^{-\varepsilon h^{1/s}} \quad (0 < h \leq 1).
\]
In particular, we have $\gamma(t) \notin \text{WF}_s(u(\tau))$ for any $t \in \mathbb{R}$ and any $\tau \in [-t_0 - \varepsilon_1/2, -t_0 + \varepsilon_1/2]$. This shows (1.9), and completes the proof.

5. Proof of Corollary 1.3

This section deals with a microlocal smoothing property for the initial data with mixed momentum condition. We prove the following lemma which immediately implies Corollary 1.3

Lemma 5.1. Assume that (A) holds and that $\gamma$ is backward nontrapping. Let $\eta_-$ be the asymptotic momentum as $t$ tends to $-\infty$. Assume that there exist $\psi(\xi) \in C^\infty(\mathbb{R}^n)$ which equals to 1 in a conic neighborhood of $\eta_-$ and $\varepsilon_0 > 0$, $A_0 > 0$, $A_1 > 0$ satisfying
\[
\|(x \cdot D_x)^l \psi(D_x) u_0\|_{L^2(\Gamma_{\eta_0})} \leq A_0 A_1^l |t|^{2s} \quad (l \in \mathbb{N}).
\]
Then we have $(-t_0) \notin \text{HWF}_s(u_0)$ for any $t_0 > 0$.

We give the proof of Lemma 5.1 following [14]. We denote by $B_r(X_0)$ the open ball in $\mathbb{R}^d$ ($d = n$ or $2n$) of radius $r > 0$ centered at $X_0$, that is,
\[
B_r(X_0) = \{X \in \mathbb{R}^d : |X - X_0| < r\}.
\]
Our goal is to show that for an arbitrarily fixed $t_0 > 0$ there exist $C > 0$, $\delta > 0$, $r_0 > 0$ and $\lambda_0 > 0$ satisfying
\[
|T_{l_1} u_0(x, \xi)| \leq C e^{-\delta \lambda^{1/s}} \quad \text{for} \quad \lambda \geq \lambda_0, \quad (x, \xi) \in B_{\lambda_0}\left((\lambda_0 \eta_-, \lambda \eta_-)\right)
\]
under the assumption (5.1). To show this, we introduce the following operators. For \( \lambda > 0 \), we set

\[
Su_0(x, \xi; \lambda) = T_{1,1} \left[ \chi \left( \frac{x}{\lambda} + t_0 \eta_- \right) \varphi \left( \frac{D_x}{\lambda} - \eta_- \right) u_0 \right],
\]

\[
\tilde{S}u_0(x, \xi; \lambda) = T_{1,1} \left[ \chi \left( \frac{x}{\lambda} + t_0 \eta_- \right) \varphi \left( \frac{D_x}{\lambda} - \eta_- \right) w_0 \right],
\]

\[
w_0 = \chi_0 \left( \frac{x}{\lambda} + t_0 \eta_- \right) v_0, \quad v_0 = \psi(D_x) u_0,
\]

where \( \chi, \chi_0, \varphi \in C^\infty(\mathbb{R}^n) \) satisfy

\[
|\partial^\alpha_x \chi(x)| \leq A_1^{1+|\alpha|} \alpha! \chi, \quad 0 \leq \chi(x) \leq 1 \quad (\alpha \in \mathbb{Z}^n_+, x \in \mathbb{R}^n),
\]

\( \chi_0, \varphi \) also satisfy the same estimates,

\[
\chi(x) = \begin{cases} 
1 & (|x| \leq \varepsilon_1) \\
0 & (|x| \geq 2\varepsilon_1)
\end{cases}, \quad \chi_0(x) = \begin{cases} 
1 & (|x| \leq 2\varepsilon_1) \\
0 & (|x| \geq 3\varepsilon_1)
\end{cases},
\]

\[
\varphi(\xi) = \begin{cases} 
1 & (|\xi| \leq \varepsilon_2) \\
0 & (|\xi| \geq 2\varepsilon_2)
\end{cases},
\]

and \( \varepsilon_1 > 0, \varepsilon_2 > 0 \) are sufficiently small so that

\[
\psi = 1 \quad \text{on} \quad \text{supp} \left[ \varphi \left( \frac{(\cdot)}{\lambda} - \eta_- \right) \right] \quad (\lambda > 0),
\]

\[
\frac{\lambda^2}{x \cdot \xi} \leq A_3 \quad \text{for} \quad \lambda > 0, (x, \xi) \in B(-\lambda t_0 \eta_-, \lambda \eta_-; 2\varepsilon_1 \lambda, 2\varepsilon_2 \lambda),
\]

\[
\sup \left[ \chi_0 \left( \frac{(\cdot)}{\lambda} + t_0 \eta_- \right) \right] \subset \Gamma_{\varepsilon_0} \quad \text{for} \quad \lambda \gg 1.
\]

The proof of Lemma 5.1 is divided into three lemmas.

**Lemma 5.2.** There exist \( C > 0, \delta > 0 \) such that

\[
|T_{1,1} u_0(x, \xi) - Su_0(x, \xi; \lambda)| \leq Ce^{-\delta \lambda^2} \|u_0\|
\]

for \( \lambda > 0, (x, \xi) \in B(-\lambda t_0 \eta_-, \lambda \eta_-; \lambda \varepsilon_1/2, \lambda \varepsilon_2/2) \).

**Lemma 5.3.** There exist \( C > 0, \delta > 0 \) such that

\[
|Su_0(x, \xi; \lambda) - \tilde{S}u_0(x, \xi; \lambda)| \leq Ce^{-\delta \lambda^1/2} \|u_0\|
\]

for \( \lambda > 0, x, \xi \in \mathbb{R}^n \).

**Lemma 5.4.** Assume (5.1). Then there exist \( C > 0, \delta > 0 \) and \( \lambda_0 > 0 \) such that

\[
|\tilde{S}u_0(x, \xi; \lambda)| \leq Ce^{-\delta \lambda^1/2}
\]

for \( \lambda \geq \lambda_0, x, \xi \in \mathbb{R}^n \).
Proof of Lemma 5.1. It follows from (5.6), (5.7) and (5.8) that we obtain (5.2), which implies 
\((-t_0\eta_-, \eta_-) \notin \text{HWF}_s(u_0)\). □

In the rest of this section, we prove these three lemmas. We denote the Fourier transform of 
u(x) \in \mathcal{S}(\mathbb{R}^n) by
\[ \hat{u}(\xi) = \frac{1}{(2\pi)^{n/2}} \int_{\mathbb{R}^n} e^{-ix\cdot\xi} u(x) \, dx. \]

Proof of Lemma 5.2. Since \(1 = \chi \varphi + (1 - \chi) \varphi + 1 - \varphi\), we have
\[
T_{1,1}u_0(x, \xi) - Su_0(x, \xi; \lambda) = c_{1,1} \int e^{i(x-y)\cdot\xi - |x-y|^2/2} \left(1 - \chi \left(\frac{y}{\lambda} + t_0\eta_-\right)\right) \varphi \left(\frac{D_y}{\lambda} - \eta_-\right) u_0(y) \, dy
\]
\[+ c_{1,1} \int e^{i(x-y)\cdot\xi - |x-y|^2/2} \left(1 - \varphi \left(\frac{D_y}{\lambda} - \eta_-\right)\right) u_0(y) \, dy
= I + II.
\]
We note that if \(|x + \lambda t_0\eta_-| < \lambda \varepsilon_1/2\), then we have \(|x - y| \geq \lambda \varepsilon_1/2\) on the support of the integrand of the term \(I\). Therefore, using the Schwarz inequality, we have
\[
|I| \leq c_{1,1} \int e^{-\varepsilon_1^2|\lambda|^2/16} e^{-|x-y|^2/4} \left(1 - \chi \left(\frac{y}{\lambda} + t_0\eta_-\right)\right) \varphi \left(\frac{D_y}{\lambda} - \eta_-\right) u_0(y) \, dy
\]
\[\leq c_{1,1} \int e^{-\varepsilon_1^2|\lambda|^2/16} (2\pi)^{n/4}\|u_0\|
\]
We can treat the term \(II\) in the same way. Indeed, since \(T_{1,1}u(x, \xi) = e^{ix\cdot\xi} T_{1,1} \hat{u}(\xi, -x)\), we have
\[
II = e^{ix\cdot\xi} \cdot c_{1,1} \int e^{i(\xi-\eta)\cdot(y-x) - |\xi-\eta|^2/2} \left(1 - \varphi \left(\frac{\eta}{\lambda} - \eta_-\right)\right) \hat{u}_0(\eta) \, d\eta.
\]
Then it follows that
\[
|II| \leq c_{1,1} e^{-\varepsilon_1^2|\lambda|^2/16} (2\pi)^{n/4}\|\hat{u}_0\|,
\]
which completes the proof. □

Proof of Lemma 5.3. We set
\[
Iv_0(y; \lambda) = \chi \left(\frac{y}{\lambda} + t_0\eta_-\right) \varphi \left(\frac{D_y}{\lambda} - \eta_-\right) \left(\chi_0 \left(\frac{y}{\lambda} + t_0\eta_-\right) - 1\right) v_0(y).
\]
Then, using (5.3), we can verify that
\[
(5.9) \quad \tilde{S}u_0 - Su_0 = T_{1,1}[Iv_0].
\]
It suffices to show that there exist \(B_0 > 0, B_1 > 0\) such that
\[
(5.10) \quad \lambda^{2N} |Iv_0(y, \lambda)| \leq B_0 B_1^N N^{2sN} \lambda^{n/2} \|v_0\| \chi \left(\frac{y}{\lambda} + t_0\eta_-\right)
\]
for \(N \in \mathbb{N}, \lambda > 0, y \in \mathbb{R}^n\). Indeed, combining (5.9), (5.10) and \(N^N \leq e^N N!\), we have
\[
|\tilde{S}u_0 - Su_0| \leq B_2 \lambda^{n/2} B_1^N \lambda^{-2N} N^{2sN} \|v_0\|
\]
\[\leq B_2 \lambda^{n/2} \left\{\frac{N!}{(B_3 \lambda^{1/2})^N}\right\}^{2s} \|v_0\|,
\]
and
where $B_3^{-1} = B_1^{1/(2s)}e$. Choosing $N = [B_3^{1/2}]$, we deduce (5.7).

We can prove (5.10) in the same way as [14, Lemma III.4]. We recall that

$$Iv_0(y, \eta) = \frac{1}{(2\pi)^n} \chi \left( \frac{y}{\lambda} + t_0\eta_- \right) \times \int \int e^{i(y-z)\eta} \varphi \left( \frac{\eta}{\lambda} - \eta_- \right) \left( \chi_0 \left( \frac{z}{\lambda} + t_0\eta_- \right) - 1 \right) v_0(z) \, dz \, d\eta.$$

Since $\chi_0 = 1$ on $\text{supp} \chi$, we can replace $\chi_0 \left( \frac{z}{\lambda} + t_0\eta_- \right) - 1$ in the above with

$$\chi_0 \left( \frac{z}{\lambda} + t_0\eta_- \right) - \chi_0 \left( \frac{y}{\lambda} + t_0\eta_- \right),$$

which equals to

$$\sum_{1 \leq |\alpha| \leq N-1} \frac{(z-y)^{\alpha}}{\alpha! \lambda^{a|\alpha|}} (\partial_y^\alpha \chi_0) \left( \frac{y}{\lambda} + t_0\eta_- \right)$$

$$+ N \sum_{|\alpha| = N} \frac{(z-y)^{\alpha}}{\alpha! \lambda^{a|\alpha|}} \int_0^1 (1-\theta)^{N-1} (\partial_y^\alpha \chi_0) \left( \lambda \frac{\theta z + (1-\theta) y}{\lambda} + t_0\eta_- \right) d\theta.$$

Using $\chi(y) \cdot (\partial_y^\alpha \chi_0)(y) = 0$ ($|\alpha| \neq 0$) and $(z-y)^{\alpha} e^{i(y-z)\eta} = (i\partial_y)^{\alpha} e^{i(y-z)\eta}$, we deduce that

$$Iv_0(y; \lambda)$$

$$= \frac{1}{(2\pi)^n} \chi \left( \frac{y}{\lambda} + t_0\eta_- \right) \sum_{|\alpha| = N} \frac{N}{\alpha! \lambda^{2|\alpha|}} \int \int e^{i(y-z)\eta} (D_\eta^\alpha \varphi) \left( \frac{\eta}{\lambda} - \eta_- \right)$$

$$\times \left\{ \int_0^1 (1-\theta)^{N-1} (\partial_y^\alpha \chi_0) \left( \lambda \frac{\theta z + (1-\theta) y}{\lambda} + t_0\eta_- \right) d\theta \right\} v_0(z) \, dz \, d\eta.$$

Here we use the integration by parts with respect to $\eta$. By the Schwarz inequality, the Plancherel formula and the properties of $\varphi$ and $\chi_0$, we can find $B_4 > 0$ such that

$$\left| \int \int e^{i(y-z)\eta} (D_\eta \varphi) \left( \frac{\eta}{\lambda} - \eta_- \right) \left\{ \int_0^1 (\cdots) \right\} v_0(z) \, dz \, d\eta \right|$$

$$\leq B_4^{1+|\alpha|} \lambda^{N/2} \alpha^{2s|\alpha|} \|v_0\|,$$

which and (5.11) imply (5.10). \qed

Finally we give the proof of Lemma [5.4]. We set

$$I_{J,N,k}(y; \lambda) = \frac{1}{(2\pi)^{n/2}} \chi \left( \frac{y}{\lambda} + t_0\eta_- \right)$$

$$\times \int e^{iy\eta} \left( \frac{\lambda^2}{y \cdot \eta} \right)^N \left( (\eta \cdot \partial_\eta)^k \left\{ \varphi \left( \frac{\eta}{\lambda} - \eta_- \right) \right\} \right) (y \cdot \eta)^J \overline{\omega}(\eta) \, d\eta,$$

then we have

$$\lambda^{2N} \langle \overline{\omega}u_0(x, \xi; \lambda) = T_{1,1}[I_{J,N,0}w_0].$$

It is remarked that we can divide by $y \cdot \eta$ in (5.12) since we have (5.4). Corresponding to [14, Lemma III.9] and [14, Lemma III.8], we have the following results.
Lemma 5.5. There exist \( D_0 > 0, D_1 > 0 \) and \( D_2 > 0 \) such that

\[
\|I_{J,N,k}u\| \leq D_0 D_1^N D_2^J \lambda^J \sum_{l=0}^{J} N^{2s(J-l)+sk} \|y \cdot D_y l\|^l \|u\|
\]

for \( J \geq 0, N \geq J, k \leq N - J \) and \( u \in \mathcal{S}(\mathbb{R}^n) \).

Lemma 5.6. Assume (5.1). Then there exist \( E_0 > 0, E_1 > 0 \) and \( \lambda_1 > 0 \) such that

\[
\|(y \cdot D_y)^l w_0\| \leq E_0 E_1^l 2^{sl}
\]

for \( l \in \mathbb{N}, \lambda \geq \lambda_1 \).

Using these lemmas, we can estimate \( \tilde{S} u \).

Proof of Lemma 5.4. Combining Lemma 5.5 with \( J = N, k = 0 \) and Lemma 5.6, we see that

\[
\|I_{N,N,0} w_0\| \leq D_0 D_1^N D_2^N \lambda^N \sum_{l=0}^{N} N^{2s(N-l)} \|y \cdot D_y l\|^l \|u\|
\]

\[
\leq D_0 D_1^N D_2^N \lambda^N \sum_{l=0}^{N} N^{2sN} E_0 E_1^l
\]

\[
\leq D_3 D_4^N N^{2sN} \lambda^N
\]

for \( \lambda \geq \lambda_1 \). Then, using (5.13), we deduce that

\[
|\lambda^{2N} \tilde{S} u_0(x, \xi; \lambda)| \leq D_5 D_4^N N^{2sN} \lambda^n
\]

for \( \lambda \geq \lambda_1 \), which implies (5.8). \( \square \)

The proofs of Lemma 5.5 and Lemma 5.6 are similar to those of [14, Lemma III.9] and [14, Lemma III.8] respectively. We only mention the sketch of them.

Proof of Lemma 5.5. We use an induction argument for \( J \). First we can verify that there exist \( M_0 > 0, M_1 > 0 \) such that

\[
\left| (\eta \cdot \partial_\eta)^k \left\{ \varphi \left( \frac{y}{\lambda} - \eta_\cdot \right) \right\} \right| \leq M_0 M_1^k k^{sk} \quad (k \in \mathbb{N}).
\]

Combining this and (5.4), we obtain (5.14) with \( J = 0 \).

For the case of general \( J \), we make use of

\[
I_{J,N,k} u = i n I_{J-1,N,k} u - i N I_{J-1,N,k} u + i I_{J-1,N,k+1} u + i (J-1) I_{J-1,N,k} u - i I_{J-1,N,k} (nu + y \cdot \partial_y u).
\]

We omit the details. \( \square \)

Proof of Lemma 5.6. We recall that

\[
(y \cdot D_y)^l w_0 = \sum_{k=0}^{l} \binom{l}{k} (y \cdot D_y)^k \left\{ \chi_0 \left( \frac{y}{\lambda} + t_0 \eta_\cdot \right) \right\} (y \cdot D_y)^{l-k} v_0.
\]

It can be verified that there exist \( M_2 > 0, M_3 > 0 \) such that

\[
\left| (y \cdot D_y)^k \left\{ \chi_0 \left( \frac{y}{\lambda} + t_0 \eta_\cdot \right) \right\} \right| \leq M_2 M_3^k k^{sk} \quad (k \in \mathbb{N}).
\]
On the other hand, using (5.1) and (5.5), we have

\[(5.18) \quad \| (y \cdot D_y)^l v_0 \|_{L^2(B_{\sqrt{\lambda}}(-\lambda t_0\eta_\lambda))} \leq A_0 A_1^l t^{2s}\]

for \(l \in \mathbb{N}\) and \(\lambda \gg 1\). Combining (5.16), (5.17) and (5.18), we deduce (5.15). \(\square\)
