Abstract

In this work we consider, in a deep analogy with Linde chaotic inflation dynamics, a simple dynamical model of the cosmological constant in full agreement with recent astronomical data.

Consider a simple, homogeneously distributed over space, scalar field $\phi$ (coupled with gravity) with corresponding total energy density

$$\rho = \frac{1}{2} (d\phi/dt)^2 + V_0 + \frac{1}{2} m^2 \phi^2 + m \phi (d\phi/dt)$$

and Lagrangian density

$$L = \frac{1}{2} (d\phi/dt)^2 - V_0 - \frac{1}{2} m^2 \phi^2 - m \phi (d\phi/dt)$$

Here $t$ represents time, $V_0$ - a constant energy density and $m$ – constant field mass.

In a stationary universe (with const scale factor $R$) dynamics of mentioned scalar field is described by the following Euler-Lagrange equation

$$\frac{d}{dt} \left( \frac{\partial L}{\partial (d\phi/dt)} \right) - \frac{\partial L}{\partial \phi} = 0$$

i.e.

$$\frac{d^2\phi}{dt^2} + m^2 \phi = 0$$

that represents usual Klein-Gordon equation. As it is well-known the same equation can be obtained as the Euler-Lagrange equation for a simpler Lagrangian density
(5) \[ l_\varphi = \frac{1}{2} (d\varphi/dt)^2 - \frac{1}{2} m^2 \varphi^2. \]

But in a non-stationary universe (with variable scale factor \( R \)) situation is principally different. Here, for Lagrangian density (2), we must use the following Lagrangian

(6) \[ L_\varphi = (4/3 \pi R^3)l_\varphi = (4/3 \pi R^3) \left( \frac{1}{2} (d\varphi/dt)^2 - V_0 - \frac{1}{2} m^2 \varphi^2 - m \varphi (d\varphi/dt) \right) \]

and corresponding dynamical Lagrange equation

(7) \[ \frac{d}{dt} \left( \frac{\partial L_\varphi}{\partial (d\varphi/dt)} \right) - \frac{\partial L_\varphi}{\partial \varphi} = 0 \]

i.e.

(8) \[ \frac{d^2 \varphi}{dt^2} + 3 \frac{(dR/dt)}{R} \left( \frac{d\varphi}{dt} - m \varphi \right) + m^2 \varphi = 0 \]

On the other hand in a non-stationary universe filled with mentioned scalar field with energy density (1) we must use the following first Friedmann equation

(9) \[ \left( \frac{dR}{dt} \right)^2/R^2 = \frac{8\pi G}{3} \left( \frac{1}{2} (d\varphi/dt)^2 + + V_0 + \frac{1}{2} m^2 \varphi^2 + m \varphi (d\varphi/dt) \right) \]

where \( G \) represents gravitational constant.

In this way we obtain (8) and (9) as two basic dynamical equations for description of mentioned non-stationary universe.

Suppose now that that in mentioned non-stationary universe dark energy dominates. In other words suppose

(10) \( \left( \frac{dR}{dt} \right)/R = \left( \Lambda/3 \right)^{1/2} \)

where \( \Lambda \) represents cosmological constant, small and positive in full agreement with recent cosmological data [7]-[11]. It, introduced in (8), (9), implies the following two equations

(11) \[ \frac{d^2 \varphi}{dt^2} + \left( 3\Lambda \right)^{1/2} \left( \frac{d\varphi}{dt} - m \varphi \right) + m^2 \varphi = 0 \]

(12) \[ \Lambda/3 = \frac{8\pi G}{3} \left( \frac{1}{2} (d\varphi/dt)^2 + V_0 + \frac{1}{2} m^2 \varphi^2 + m \varphi (d\varphi/dt) \right) \]

which must have compatible solutions.

Suppose

(13) \[ \Lambda/(8\pi G) = V_0 \]

so that (12) turns out in

(14) \[ \frac{1}{2} (d\varphi/dt)^2 + \frac{1}{2} m^2 \varphi^2 + m \varphi (d\varphi/dt) = 0 \]
or in

\[(d\phi/dt) + m\phi)^2 = 0 \ldots\]

It implies exponentially decreasing solution

\[\phi = \phi_0 \exp(-mt)\]

where \(\phi_0\) represents some constant field value.

Introduction of (16) in (11) implies

\[2m(m - (3\Lambda)^{1/2})\phi = 0 \ldots\]

or, finally,

\[m = (3\Lambda)^{1/2} \ldots\]

i.e.

\[\Lambda = m^2/3 \ldots\]

Expression (19) introduced in (13) yields

\[V_0 = m^2/(24\pi G) \ldots\]

Obviously, (16), (19), (20) represent compatible solutions of (11), (12) as the dynamical equations of a dark energy scalar field defined by

\[\rho_\phi = 1/2 (d\phi/dt)^2 + m^2/(24\pi G) + 1/2 m^2\phi^2 + m \phi (d\phi/dt)\]

\[l_\phi = 1/2 (d\phi/dt)^2 - m^2/(24\pi G) - 1/2 m^2\phi^2 - m \phi (d\phi/dt) \ldots\]

and coupled with gravity (in full agreement with recent astronomical data).

In conclusion we can shortly repeat and point out the following. In this work we consider, in a deep analogy with Linde chaotic inflation dynamics, a simple dynamical model of the cosmological constant in full agreement with recent astronomical data.
