# A NEW PROOF FOR THE EXISTENCE OF AN EQUIVARIANT ENTIRE SOLUTION CONNECTING THE MINIMA OF THE POTENTIAL FOR THE SYSTEM $\Delta u-W_{u}(u)=0$ 

NICHOLAS D. ALIKAKOS

#### Abstract

Recently, Giorgio Fusco and the author in 1 studied the system $\Delta u-W_{u}(u)=0$ for a class of potentials that possess several global minima and are invariant under a general finite reflection group, and established existence of equivariant solutions connecting the minima in certain directions at infinity, together with an estimate. In this paper a new proof is given which, in particular, avoids the introduction of a pointwise constraint in the minimization process.

## 1. Introduction

The study of the system

$$
\begin{equation*}
\Delta u-W_{u}(u)=0, \text { for } u: \mathbb{R}^{n} \rightarrow \mathbb{R}^{n} \tag{1}
\end{equation*}
$$

where $W: \mathbb{R}^{n} \rightarrow \mathbb{R}$ and $W_{u}:=\left(\partial W / \partial u_{1}, \ldots, \partial W / \partial u_{n}\right)^{\top}$, under symmetry hypotheses on the potential $W$ was initiated in Bronsard, Gui, and Schatzman [3], where existence for the case $n=2$ with the symmetries of the equilateral triangle was settled. About twelve years later this work was followed by Gui and Schatzman [11], where the case $n=3$ for the symmetry group of tetrahedron was established. The corresponding solutions are known as the triple junction and the quadruple junction respectively. This class of solutions is characterized by the fact that they connect the $N$ global minima of the potential $W$, that is,

$$
\begin{equation*}
\lim _{\lambda \rightarrow+\infty} u\left(\lambda \eta_{i}\right)=a_{i}, \text { for } i=1, \ldots, N \tag{2}
\end{equation*}
$$

for certain unit vectors $\eta_{i} \in \mathbb{S}^{n-1}$, where $\mathbb{S}^{n-1} \subset \mathbb{R}^{n}$ is the unit sphere. These solutions are related to minimal surface complexes, and particularly to the singular points there (see Taylor [17, Dierkes et al. [5, 6]) via the blow-down limit $u_{\varepsilon}(x):=u(x / \varepsilon)$ (see Baldo [2]). Recently in [1] certain general hypotheses on $W$ were identified and the problem was settled for general dimension $n$ and for any reflection group $G$ on $\mathbb{R}^{n}$.

In this paper we want to give a new derivation of this result, which is based on a positivity property of the gradient flow associated to (11) and comparison arguments involving subharmonic functions, ingredients already existing in [1], but now supplemented with a Kato-type inequality and the De Giorgi oscillation lemma. The present paper is self-contained. Our hope is that this simpler proof will be more adaptable to the general case of a potential $W$ without symmetry requirements. In order to bring out clearly the underlying ideas, we refrain from any generalization which could complicate the technical part.

[^0]1.1. Notation. We denote by $B_{R}$ the ball of radius $R>0$ centered at the origin and by $W_{\mathrm{E}}^{1,2}\left(B_{R} ; \mathbb{R}^{n}\right)$ the subspace of equivariant maps, that is, $u(g x)=g u(x)$, for all $g \in G$ and $x \in \mathbb{R}^{n}$. We also denote by $\langle\cdot, \cdot\rangle$ the Euclidean inner product, by $|\cdot|$ the Euclidean norm, and by $d(x, \partial D)$ the distance of $x$ from $\partial D$. In the case of finite groups $G$, the notation $|G|$ stand for the number of elements of the group.

We denote the functional associated to (1) by

$$
\begin{equation*}
J(u)=\int_{\mathbb{R}^{n}}\left\{\frac{1}{2}|\nabla u|^{2}+W(u)\right\} \mathrm{d} x \tag{3}
\end{equation*}
$$

A Coxeter group is a finite subgroup of the orthogonal group $O\left(\mathbb{R}^{n}\right)$, generated by a set of reflections. A reflection $\gamma \in G$ is associated to the hyperplane

$$
\pi_{\gamma}=\left\{x \in \mathbb{R}^{n} \mid\left\langle x, \eta_{\gamma}\right\rangle=0\right\}
$$

via

$$
\gamma x=x-2\left\langle x, \eta_{\gamma}\right\rangle \eta_{\gamma}, \text { for } x \in \mathbb{R}^{n}
$$

where $\eta_{\gamma} \in \mathbb{S}^{n-1}$ is a unit vector. Every finite subgroup of $O\left(\mathbb{R}^{n}\right)$ has a fundamental regior ${ }^{1}$, that is, a subset $F \subset \mathbb{R}^{n}$ with the following properties:
(i) $F$ is open and convex,
(ii) $F \cap g F=\varnothing$, for $I \neq g \in G$, where $I$ is the identity,
(iii) $\mathbb{R}^{n}=\cup\{g \bar{F} \mid g \in G\}$.

We choose the orientation of $\eta_{\gamma}$ so that $F \subset \mathcal{P}_{\gamma}^{+}$, where $\mathcal{P}_{\gamma}^{+}=\left\{x \in \mathbb{R}^{n} \mid\left\langle x, \eta_{\gamma}\right\rangle>\right.$ $0\}$. Then, we have

$$
\begin{equation*}
F=\cap_{\gamma \in \Gamma} \mathcal{P}_{\gamma}^{+}, \tag{4}
\end{equation*}
$$

where $\Gamma \subset G$ is the set of all reflections in $G$. Given $a \in G$, the stabilizer of $a$, denoted by $G_{a}$, is the subgroup of $G$ that fixes $a$.
1.2. The theorem ([1]). We begin with the hypotheses.

Hypothesis 1 ( $N$ nondegenerate global minima). The potential $W$ is of class $C^{2}$ and satisfies $W\left(a_{i}\right)=0$, for $i=1, \ldots, N$, and $W>0$ on $\mathbb{R}^{n} \backslash\left\{a_{1}, \ldots a_{N}\right\}$. Furthermore, there holds $v^{\top} \partial^{2} W(u) v \geq 2 c^{2}|v|^{2}$, for $v \in \mathbb{R}^{n}$ and $\left|u-a_{i}\right| \leq \bar{q}$, for some $c, \bar{q}>0$, and for $i=1, \ldots, N$.
Hypothesis 2 (Symmetry). The potential $W$ is invariant under a finite reflection group $G$ acting on $\mathbb{R}^{n}$ (Coxeter group), that is,

$$
\begin{equation*}
W(g u)=W(u), \text { for all } g \in G \text { and } u \in \mathbb{R}^{n} \tag{5}
\end{equation*}
$$

Moreover, we assume that there exists $M>0$ such that $W(s u) \geq W(u)$, for $s \geq 1$ and $|u|=M$.

We seek equivariant solutions of system (1), that is, solutions satisfying

$$
\begin{equation*}
u(g x)=g u(x), \text { for all } g \in G \text { and } x \in \mathbb{R}^{n} \tag{6}
\end{equation*}
$$

Hypothesis 3 (Location and number of global minima). Let $F \subset \mathbb{R}^{n}$ be a fundamental region of $G$. We assume that $\bar{F}$ (the closure of $F$ ) contains a single global minimum of $W$, say $a_{1}$, and let $G_{a_{1}}$ be the subgroup of $G$ that leaves $a_{1}$ fixed. Then, as it follows by the invariance of $W$, the number of the minima of $W$ is

$$
\begin{equation*}
N=\frac{|G|}{\left|G_{a_{1}}\right|} \tag{7}
\end{equation*}
$$

[^1]Hypothesis 4 ( $Q$-monotonicity). We restrict ourselves to potentials $W$ for which there is a continuous function $Q: \mathbb{R}^{n} \rightarrow \mathbb{R}$ that satisfies

$$
\begin{equation*}
Q\left(u+a_{1}\right)=|u|+H(u) \tag{8}
\end{equation*}
$$

where $H: \mathbb{R}^{n} \rightarrow \mathbb{R}$ is a $C^{2}$ function such that $H(0)=0$ and $H_{u}(0)=0$, and

$$
\begin{align*}
& Q \text { is convex, }  \tag{9a}\\
& Q(g u)=Q(u), \text { for } u \in \mathbb{R}^{n}, g \in G_{a_{1}},  \tag{9b}\\
& Q\left(u+a_{1}\right)=|u|+H(u), \text { in a neighborhood of } u=0,  \tag{9c}\\
& Q(u)>0, \text { on } \mathbb{R}^{n} \backslash\left\{a_{1}\right\}, \tag{9d}
\end{align*}
$$

and, moreover,

$$
\begin{equation*}
\left\langle Q_{u}(u), W_{u}(u)\right\rangle \geq 0, \text { in } D \backslash\left\{a_{1}\right\} \tag{10}
\end{equation*}
$$

where we have set

$$
\begin{equation*}
D:=\operatorname{Int}\left(\cup_{g \in G_{a_{1}}} g \bar{F}\right) \tag{11}
\end{equation*}
$$

Theorem 1.1 ([1]). Under Hypotheses 14, there exists an equivariant classical solution to system (11) such that
(i) $\left|u(x)-a_{1}\right| \leq K \mathrm{e}^{-k d(x, \partial D)}$, for $x \in D$ and for positive constants $k, K$,
(ii) $u(\bar{F}) \subset \bar{F}$ and $u(D) \subset D$.

In particular, $u$ connects the $N=|G| /\left|G_{a_{1}}\right|$ global minima of $W$ in the sense that

$$
\lim _{\lambda \rightarrow+\infty} u(\lambda g \eta)=g a_{1}, \text { for all } g \in G
$$

uniformly for $\eta$ in compact subsets of $D \cap \mathbb{S}^{n-1}$.

## 2. The extended Kato inequality

We begin by presenting a straightforward extension of the classical Kato inequality. We follow the presentation in [13, p. 85]. Let $\hat{Q}: \mathbb{R}^{m} \rightarrow \mathbb{R}$ be a continuous function satisfying the following assumptions.
(i) $\hat{Q}$ is convex,
(ii) $\hat{Q}>0$ and $\hat{Q}_{u} \neq 0$, for $u \neq 0$,
(iii) $\hat{Q}=|u|+H(u)$, for a $C^{2}$ function $H: \mathbb{R}^{m} \rightarrow \mathbb{R}$, such that $H(0)=0$ and $H_{u}(0)=0$.

Lemma 2.1. Let $u \in L^{\infty}\left(\mathbb{R}^{n} ; \mathbb{R}^{m}\right)$ and suppos $母^{2}$ that the distributional Laplacian $\Delta u \in L_{\mathrm{loc}}^{1}\left(\mathbb{R}^{n} ; \mathbb{R}^{m}\right)$. Then,

$$
\begin{equation*}
\Delta \hat{Q}(u) \geq\left\langle\Delta u, \hat{Q}_{u}(u)\right\rangle \tag{12}
\end{equation*}
$$

in the distributional sense, with the definition

$$
\hat{Q}_{u}(u):= \begin{cases}\nabla_{u} \hat{Q}(u), & \text { for } u \neq 0 \\ 0, & \text { for } u=0\end{cases}
$$

[^2]Remarks. The well-known Kato inequality for functions $u \in L_{\text {loc }}^{1}\left(\mathbb{R}^{n} ; \mathbb{C}\right)$ states that

$$
\begin{equation*}
\Delta|u| \geq \operatorname{Re}[(\operatorname{sgn} u) \Delta u] \tag{13}
\end{equation*}
$$

in the distributional sense. The choice $|u|=\sqrt{u \bar{u}}$ and

$$
\operatorname{sgn} u= \begin{cases}0, & \text { for } u=0 \\ \bar{u} /|u|, & \text { for } u \neq 0\end{cases}
$$

is a special case, for $\hat{Q}(u)=|u|$ and $\operatorname{Re}[u \bar{v}]=\langle u, v\rangle$.
Also, under the hypothesis $u \in W_{\mathrm{loc}}^{1,2}\left(\mathbb{R}^{n} ; \mathbb{R}^{m}\right) \cap L^{\infty}\left(\mathbb{R}^{n} ; \mathbb{R}^{m}\right)$ we note that $\hat{Q}(u(\cdot)) \in W_{\text {loc }}^{1,2}\left(\mathbb{R}^{n} ; \mathbb{R}^{m}\right)$ (see [15, p, 54] or [7, p. 130]). Therefore, (12) holds in $W_{\mathrm{loc}}^{1,2}\left(\mathbb{R}^{n} ; \mathbb{R}^{m}\right)$.

Proof. We utilize the summation convention. We first establish

$$
\begin{equation*}
\Delta \hat{Q}(u) \geq\left\langle\Delta u, \hat{Q}_{u}(u)\right\rangle \tag{14}
\end{equation*}
$$

for $u \in C^{\infty}$, except where $\hat{Q}(u)$ is not differentiable. Set

$$
\hat{Q}_{\varepsilon}(u(x))=\sqrt{\hat{Q}^{2}(u(x))+\varepsilon^{2}}, \text { for } \varepsilon>0
$$

then,

$$
\begin{equation*}
\hat{Q}_{\varepsilon} \hat{Q}_{\varepsilon, i}=\hat{Q} \hat{Q}_{, u_{k}} u_{k, i}, \text { where } \hat{Q}_{\varepsilon, i}:=\frac{\partial}{\partial x_{i}} \hat{Q}_{\varepsilon}(u(x)) \tag{15}
\end{equation*}
$$

and

$$
\begin{equation*}
\left(\hat{Q}_{\varepsilon, i}\right)^{2}=\left(\frac{\hat{Q}}{\hat{Q}_{\varepsilon}}\right)^{2}\left(\hat{Q}_{, u_{k}} u_{k, i}\right)^{2} \leq\left(\hat{Q}_{, u_{k}} u_{k, i}\right)^{2} \tag{16}
\end{equation*}
$$

Hence,

$$
\begin{equation*}
\hat{Q}_{\varepsilon, i} \hat{Q}_{\varepsilon, i} \leq\left(\hat{Q}_{, u_{k}} u_{k, i}\right)\left(\hat{Q}_{, u_{k}} u_{k, i}\right), \tag{17}
\end{equation*}
$$

therefore

$$
\begin{equation*}
\left|\nabla_{x} \hat{Q}_{\varepsilon}\right|^{2} \leq\left|\left(\nabla_{x} u\right)^{\top} \hat{Q}_{u}\right|^{2} \tag{18}
\end{equation*}
$$

Moreover,

$$
\begin{equation*}
\left(\hat{Q}_{\varepsilon} \hat{Q}_{\varepsilon, i}\right)_{, i}=\left\langle\Delta u, \hat{Q} \hat{Q}_{u}\right\rangle+\hat{Q}\left\langle\left(\partial^{2} \hat{Q}\right) u_{, i}, u_{, i}\right\rangle+\left|\left(\nabla_{x} u\right)^{\top} \hat{Q}_{u}\right|^{2} \tag{19}
\end{equation*}
$$

where $\partial^{2} \hat{Q}$ is the Hessian of $\hat{Q}$ and $u_{, i}=\left(u_{1, i}, \ldots, u_{m, i}\right)$. By convexity it follows that

$$
\left|\nabla_{x} \hat{Q}_{\varepsilon}\right|^{2}+\hat{Q}_{\varepsilon} \Delta \hat{Q}_{\varepsilon} \geq\left\langle\Delta u, \hat{Q} \hat{Q}_{u}\right\rangle+\left|\left(\nabla_{x} u\right)^{\top} \hat{Q}_{u}\right|^{2}
$$

from which, by (18),

$$
\begin{equation*}
\Delta \hat{Q}_{\varepsilon} \geq\left\langle\Delta u, \frac{\hat{Q} \hat{Q}_{u}}{\hat{Q}_{\varepsilon}}\right\rangle \tag{20}
\end{equation*}
$$

At points of smoothness we can take the limit $\varepsilon \rightarrow 0$ and obtain (14).
We proceed by mollification. Let $w \in C^{\infty}\left(\mathbb{R}^{n}\right)$, with $w \geq 0$ and $\int w(x) \mathrm{d} x=1$. For $\delta>0$ we define $w_{\delta}(x)=\delta^{-n} w\left(\delta^{-1} x\right)$ and set

$$
I_{\delta} u:=w_{\delta} * u, \text { for } \delta>0
$$

Then, $I_{\delta} u \rightarrow u$ and $\Delta\left(I_{\delta} u\right) \rightarrow \Delta u$ in $L^{1}$, as $\delta \rightarrow 0$. Applying (20) to $I_{\delta} u$ we have

$$
\begin{equation*}
\Delta \hat{Q}_{\varepsilon}\left(I_{\delta} u\right) \geq\left\langle\Delta\left(I_{\delta} u\right), \frac{\frac{\partial}{\partial u}\left(\frac{1}{2} \hat{Q}^{2}\right)\left(I_{\delta} u\right)}{\hat{Q}_{\varepsilon}\left(I_{\delta} u\right)}\right\rangle \tag{21}
\end{equation*}
$$

Taking $\delta \rightarrow 0$ and utilizing that $\hat{Q}^{2}$ is everywhere differentiable and that the fraction inside the inner product in (21) is bounded ( $L^{\infty}$ requirement for $\left.u(\cdot)\right)$, by the dominated convergence theorem we have

$$
\begin{equation*}
\Delta \hat{Q}_{\varepsilon}(u) \geq\left\langle\Delta u, \frac{\frac{\partial}{\partial u}\left(\frac{1}{2} \hat{Q}^{2}\right)(u)}{\hat{Q}_{\varepsilon}(u)}\right\rangle . \tag{22}
\end{equation*}
$$

Finally, we pass to the limit in $\mathcal{D}^{\prime}$ as $\varepsilon \rightarrow 0$.
3. The gradient flow and positivity ([1])

We define the set of positive maps (in the class of equivariant Sobolev maps)

$$
\begin{equation*}
\mathcal{U}^{\mathrm{Pos}}:=\left\{u \in W_{\mathrm{E}}^{1,2}\left(B_{R} ; \mathbb{R}^{n}\right) \mid u\left(\overline{F_{R}}\right) \subset \bar{F}\right\} \tag{23}
\end{equation*}
$$

and the set of strongly positive maps

$$
\begin{equation*}
\mathcal{U}_{0}^{\text {Pos }}:=\left\{u \in W_{\mathrm{E}}^{1,2}\left(B_{R} ; \mathbb{R}^{n}\right) \mid u\left(F_{R}\right) \subset F\right\} \tag{24}
\end{equation*}
$$

where $F_{R}=F \cap B_{R}$. Here $R>0$ and clearly the sets $\mathcal{U}^{\text {Pos }}$ and $\mathcal{U}_{0}^{\text {Pos }}$ depend on $R$.
We will utilize the gradient flow

$$
\begin{cases}\frac{\partial u}{\partial t}=\Delta u-W_{u}(u), & \text { in } B_{R} \times(0, \infty),  \tag{25}\\ \frac{\partial u}{\partial \boldsymbol{n}}=0, & \text { on } \partial B_{R} \times(0, \infty), \\ u(x, 0)=u_{0}(x), & \text { in } B_{R},\end{cases}
$$

where $\partial / \partial \boldsymbol{n}$ is the normal derivative. We note that by Hypothesis 2

$$
\begin{equation*}
\left\langle-W_{u}(u), u\right\rangle \leq 0, \text { for }|u|=M \tag{26}
\end{equation*}
$$

We will consider initial conditions in (25) satisfying in addition

$$
\begin{equation*}
\left\|u_{0}\right\|_{L^{\infty}\left(B_{R} ; \mathbb{R}^{n}\right)} \leq M \tag{27}
\end{equation*}
$$

Since $W$ is $C^{2}$ (cf. Hypothesis (1), the results in [12, Ch. 3, §3.3, §3.5] apply and provide a unique solution to (25) in $C\left(0, \infty ; W_{\mathrm{E}}^{1,2}\left(B_{R} ; \mathbb{R}^{n}\right)\right.$, which for $t>0$, as a function of $x$, is in $C^{2+\alpha}\left(\overline{B_{R}} ; \mathbb{R}^{n}\right)$ ), for some $0<\alpha<1$. Moreover, the solution satisfies the estimate

$$
\begin{equation*}
\|u(\cdot, t)\|_{L^{\infty}\left(B_{R} ; \mathbb{R}^{n}\right)} \leq M, \text { for } t \geq 0 . \tag{28}
\end{equation*}
$$

This follows from (26), (27), and by well-known invariance results [16, Ch. 14, §B].
Theorem 3.1 ([1]). Let $W$ be a $C^{2}$ potential satisfying Hypothesis , If $u_{0} \in \mathcal{U}^{\text {Pos }}$ and $\left\|u_{0}\right\|_{L^{\infty}\left(B_{R} ; \mathbb{R}^{n}\right)} \leq M$, then

$$
u\left(\cdot, t ; u_{0}\right) \in \mathcal{U}^{\text {Pos }}, \text { for } t \geq 0
$$

and, moreover,

$$
u\left(\cdot, t ; u_{0}\right) \in \mathcal{U}_{0}^{\text {Pos }}, \text { for } t>0, \text { provided } u_{0}\left(\overline{F_{R}}\right) \cap F \neq \varnothing
$$

Proof. Let $u: B_{R} \rightarrow \mathbb{R}^{n}$ be an equivariant map. We will prove that $u$ is a positive map if and only if

$$
\begin{equation*}
u\left(\overline{\left(\mathcal{P}_{\gamma}^{+}\right)_{R}}\right) \subset \overline{\mathcal{P}_{\gamma}^{+}}, \text {for all } \gamma \in \Gamma \tag{29}
\end{equation*}
$$

where $\left(\mathcal{P}_{\gamma}^{+}\right)_{R}=\mathcal{P}_{\gamma}^{+} \cap B_{R}$.
Suppose that (29) holds. Then

$$
u\left(\overline{F_{R}}\right)=u\left(\cap_{\gamma \in \Gamma} \overline{\left(\mathcal{P}_{\gamma}^{+}\right)_{R}}\right) \subset \cap_{\gamma \in \Gamma} u\left(\overline{\left(\mathcal{P}_{\gamma}^{+}\right)_{R}}\right) \subset \cap_{\gamma \in \Gamma} \overline{\mathcal{P}_{\gamma}^{+}}=\bar{F}
$$

Hence, $u$ is positive. Conversely, suppose that $u$ is a positive equivariant map on $B_{R}$. Then, equivalently, $u_{\mathrm{e}}$ defined by

$$
u_{\mathrm{e}}(x):= \begin{cases}u(x), & \text { for } x \in B_{R}  \tag{30}\\ 0, & \text { for } x \in \mathbb{R}^{n} \backslash B_{R}\end{cases}
$$

is a positive equivariant map on $\mathbb{R}^{n}$. For any $g \in G$, we have from equivariance and positivity,

$$
\begin{equation*}
u_{\mathrm{e}}(g(\bar{F}))=g\left(u_{\mathrm{e}}(\bar{F})\right) \subset g(\bar{F}) \tag{31}
\end{equation*}
$$

Now pick a $\gamma \in \Gamma$ and take an $x \in \mathcal{P}_{\gamma}^{+}$and fix it. There is a $g \in G$, denoted by $g_{x}$, such that $x \in g_{x}(\bar{F})$ and $g_{x}(F)$ is also a fundamental region. Since for each fundamenal region $F^{\prime}$ and for each reflection $\gamma$ we have either $F^{\prime} \subset \mathcal{P}_{\gamma}^{+}$or $F^{\prime} \subset-\mathcal{P}_{\gamma}^{+}$, we conclude that

$$
\begin{equation*}
g_{x}(\bar{F}) \subset \overline{\mathcal{P}_{\gamma}^{+}} \tag{32}
\end{equation*}
$$

Thus, by (31), $u_{\mathrm{e}}\left(\overline{\mathcal{P}_{\gamma}^{+}}\right) \subset \overline{\mathcal{P}_{\gamma}^{+}}$, and so (29) follows.
Now consider (25) with $u_{0} \in \mathcal{U}^{\text {Pos }}$. By the regularizing property of the equation the solution is classical for $t>0$ and by (26) it exists globally in time and belongs to $C\left(0,+\infty ; W_{\mathrm{E}}^{1,2}\left(B_{R} ; \mathbb{R}^{n}\right)\right) \cap C^{1}\left(0,+\infty ; C^{2+\alpha}\left(\overline{B_{R}} ; \mathbb{R}^{n}\right)\right.$, for some $0<\alpha<1$ (see [12]). Consider a reflection $\gamma \in \Gamma$ and set

$$
\begin{aligned}
\zeta(x, t) & =\left\langle u\left(x, t, u_{0}\right), \eta_{\gamma}\right\rangle, \text { on } B_{R} \times(0, \infty) \\
\zeta_{0}(x) & =\left\langle u_{0}(x), \eta_{\gamma}\right\rangle, \text { on } B_{R}
\end{aligned}
$$

By taking the inner product of equation (25) with $\eta_{\gamma}$, we obtain

$$
\begin{cases}\frac{\partial \zeta}{\partial t}=\Delta \zeta+c \zeta, & \text { in } B_{R} \times(0, \infty)  \tag{33}\\ \frac{\partial \zeta}{\partial \boldsymbol{n}}=0, & \text { on } \partial B_{R} \times(0, \infty) \\ \zeta(\cdot, 0)=\zeta_{0}, & \end{cases}
$$

where we have set

$$
c(x, t)=\frac{\left\langle W_{u}\left(u\left(x, t, u_{0}\right), \eta_{\gamma}\right\rangle\right.}{\zeta(x, t)}
$$

From the equivariance of $u\left(\cdot, t, u_{0}\right)$ and $W_{u}(\gamma u)=\gamma W_{u}(u)$ it follows that

$$
\begin{align*}
& \zeta(x, t)=-\zeta(\gamma x, t), \text { in } B_{R} \times(0, \infty)  \tag{34}\\
& c(x, t)=c(\gamma x, t), \text { in } B_{R} \times(0, \infty) \tag{35}
\end{align*}
$$

From the symmetry of $W$ we also have that $u \in \pi_{\gamma} \operatorname{implies} W_{u}(u) \in \pi_{\gamma}$. From this we deduce

$$
\begin{equation*}
\left\langle W_{u}(u), \eta_{\gamma}\right\rangle=\left\langle u, \eta_{\gamma}\right\rangle\left\langle\int_{0}^{1} W_{u u}\left(u+(s-1)\left\langle u, \eta_{\gamma}\right\rangle \eta_{\gamma}\right) \eta_{\gamma} \mathrm{d} s, \eta_{\gamma}\right\rangle \tag{36}
\end{equation*}
$$

Thus, the coefficient $c(x, t)$ of $\zeta$ in (33) is bounded (actually continuous) on $B_{R} \times$ $(0, \infty)$. Since $u_{0}$ is a positive map, we have $\zeta_{0} \geq 0$ for $\left\langle x, \eta_{\gamma}\right\rangle \geq 0$. Therefore, for establishing positivity it is sufficient to show that $\zeta(x, t) \geq 0$, for $x \in B_{R}^{+}=\{x \in$ $\left.B_{R} \mid\left\langle x, \eta_{\gamma}\right\rangle>0\right\}$ and $t \geq 0$. We note that by (34) there holds $\zeta(x, t)=0$ for $x \in \pi_{\gamma} \times[0, \infty)$, hence if $\zeta$ is a classical solution of (33), we have that $\zeta(x, t)$ is nonnegative on $B_{R}^{+} \times[0, \infty)$ by the maximum principle. For general $\zeta_{0} \in W^{1,2}\left(B_{R}\right)$ we approximate via mollification as in [7] §4.2, Thm. 2] and note that positivity and symmetry are preserved by the approximation process, rendering $\zeta_{0}^{\varepsilon} \in C^{\infty}\left(B_{R}\right) \cap$ $L^{\infty}\left(B_{R}\right)$, with $\zeta_{0}^{\varepsilon} \rightarrow \zeta_{0}$ in $W^{1,2}\left(B_{R}\right)$. By the classical maximum principle, there holds that $\zeta^{\varepsilon}(x, t) \geq 0$ on $B_{R}^{+} \times[0, \infty)$, and by continuous dependence for (33) in $W^{1,2}\left(B_{R}\right)$ [12, Thm. 3.4.1], we have that $\zeta^{\varepsilon}(\cdot, t) \rightarrow \zeta(\cdot, t)$ a.e. in $B_{R}$ along subsequences $\varepsilon_{n} \rightarrow 0$, hence $\zeta(x, t) \geq 0$ a.e. Finally, since $\zeta(x, t)=0$ for $x \in$ $\pi_{\gamma} \times(0, \infty)$ and since $\zeta(\cdot, t) \in C^{2+\alpha}\left(\overline{B_{R}}\right)$ for $t>0$, the Hopf boundary lemma applies on the smooth part of $\partial B_{R}^{+}$and renders

$$
\zeta(x, t)>0, \text { in } B_{R}^{+} \times(0, \infty)
$$

unless $\zeta(x, t) \equiv 0$, hence unless $\zeta_{0}(x) \equiv 0$. But the hypothesis $u_{0}\left(\overline{F_{R}}\right) \cap F \neq \varnothing$ excludes this second option.

## 4. The minimization

Let $A^{R}:=\left\{u \in W^{1,2}\left(B_{R}, \mathbb{R}^{n}\right) \mid u\left(\bar{F}_{R}\right) \subset \bar{F}\right\}$ and consider the minimization problem

$$
\min _{A^{R}} J_{B_{R}}, \text { where } J_{B_{R}}(u)=\int_{B_{R}}\left\{\frac{1}{2}|\nabla u|^{2}+W(u)\right\} \mathrm{d} x .
$$

We will argue first that the minimizer exists. We redefine $W(u)$ for $|u| \geq M+1$, so that the modified $W$ is $C^{2}$, satisfies $W(u) \geq c^{2}|u|^{2}$, for $|u| \geq M+1$ and a constant $c$, and also $W(g u)=W(u)$, for all $g \in G$. We still denote the modified potential by $W$ and the modified functional by $J_{B_{R}}$. We note that the convexity of $\bar{F}$ implies that $A^{R}$ is convex and closed in $W_{\mathrm{E}}^{1,2}\left(B_{R} ; \mathbb{R}^{n}\right)$. The modified functional $J_{B_{R}}$ satisfies all the properties required by the direct method and, as a result, a minimizer $v_{R} \in A^{R}$ exists.

Next we will show that as a consequence of Hypothesis 2 we can produce a minimizer $u_{R} \in A^{R}$, which in addition satisfies the estimate $\left|u_{R}(x)\right| \leq M$ (cf. (H3) in [3]). Due to this estimate, the values of $W$ outside $\{|u| \leq M\}$ will not matter in the considerations in the rest of the paper and, therefore, the equation that will be solved is (1) with the original unmodified potential $W$. Set

$$
\begin{equation*}
u_{R}(x)=P v_{R}(x) \tag{37}
\end{equation*}
$$

where $P v$ equals the projection on the sphere $\left\{v \in \mathbb{R}^{n}| | v \mid=M\right\}$, for points outside the sphere $(P v=M v /|v|)$, and equals the identity inside the sphere. Since $P$ is a contraction with respect to the Euclidean norm in $R^{n}$, it follows that $u_{R} \in$ $W^{1,2}\left(B_{R} ; \mathbb{R}^{n}\right)$, with $\left|\nabla u_{R}(x)\right| \leq\left|\nabla v_{R}(x)\right|$. Furthermore,

$$
u_{R}(g x)=P v_{R}(g x)=P g v_{R}(x)=g P v_{R}(x)=g u_{R}(x)
$$

hence $u_{R} \in W_{\mathrm{E}}^{1,2}\left(B_{R} ; \mathbb{R}^{n}\right)$. Clearly $u_{R}(\bar{F}) \subset \bar{F}$ and $\left|u_{R}(x)\right| \leq M$, for $x \in B_{R}$.
The fact that $u_{R}$ is also a minimizer is a consequence of Hypothesis 2 and the following calculation.

$$
\begin{aligned}
J_{B_{R}}(u) \geq & \int_{B_{R}}\left\{\frac{1}{2}\left|\nabla v_{R}\right|^{2}+W\left(v_{R}\right)\right\} \mathrm{d} x, \text { for } u \in A^{R} \\
\geq & \int_{B_{R}}\left\{\frac{1}{2}\left|\nabla u_{R}\right|^{2}+W\left(v_{R}\right)\right\} \mathrm{d} x \\
= & \int_{\left|v_{R}(x)\right| \leq M}\left\{\frac{1}{2}\left|\nabla u_{R}\right|^{2}+W\left(u_{R}\right)\right\} \mathrm{d} x \\
& +\int_{\left|v_{R}(x)\right|>M}\left\{\frac{1}{2}\left|\nabla u_{R}\right|^{2}+W\left(v_{R}\right)\right\} \mathrm{d} x \\
\geq & \int_{\left|v_{R}(x)\right| \leq M}\left\{\frac{1}{2}\left|\nabla u_{R}\right|^{2}+W\left(u_{R}\right)\right\} \mathrm{d} x \\
& \quad+\int_{\left|v_{R}(x)\right|>M}\left\{\frac{1}{2}\left|\nabla u_{R}\right|^{2}+W\left(M \frac{v_{R}}{\left|v_{R}\right|}\right)\right\} \mathrm{d} x \\
= & \int_{B_{R}}\left\{\frac{1}{2}\left|\nabla u_{R}\right|^{2}+W\left(u_{R}\right)\right\} \mathrm{d} x,
\end{aligned}
$$

where the last inequality follows from Hypothesis 2,
We will be constructing the solution by taking the limit

$$
\begin{equation*}
u(x)=\lim _{R \rightarrow \infty} u_{R}(x) \tag{38}
\end{equation*}
$$

For this purpose, we will need to show that the positivity constraint built in $A^{R}$ does not affect the Euler-Lagrange equation, and we also need certain estimates, uniform in $R$, which in particular will imply that the solution is nontrivial.

Lemma 4.1. Let $u_{R}$ be as above. Then, for $R>1$, the following hold.
(i) $J_{B_{R}}\left(u_{R}\right) \leq C R^{n-1},\left\|u_{R}\right\|_{L^{\infty}\left(B_{R} ; \mathbb{R}^{n}\right)} \leq M$, and $Q\left(u_{R}(x)\right) \leq \bar{Q}$, where $\bar{Q}:=\max _{|u| \leq M} Q(u)$,
(ii) $\Delta u_{R}-W_{u}\left(u_{R}\right)=0$, in $W_{\mathrm{loc}}^{1,2}\left(B_{R} ; \mathbb{R}^{n}\right)$,
(iii) $u_{R}$ is positive (cf. (23) ),
(iv) $\Delta Q\left(u_{R}(x)\right) \geq 0$, in $W_{\text {loc }}^{1,2}\left(D_{R}\right)$, where $D_{R}:=D \cap B_{R}$ (cf. Hypothesis 4).

Proof. For (i), define

$$
u_{\mathrm{aff}}(x):= \begin{cases}d(x ; \partial D) a_{1}, & \text { for } x \in D_{R} \text { and } d(x ; \partial D) \leq 1 \\ a_{1}, & \text { for } x \in D_{R} \text { and } d(x ; \partial D) \geq 1\end{cases}
$$

and extend it equivariantly on $B_{R}$. Clearly, $u_{\mathrm{aff}} \in A^{R}$. By the nonnegativity of $W$ and a simple calculation,

$$
\begin{equation*}
0 \leq J_{B_{R}}\left(u_{R}\right) \leq \min _{A^{R}} J_{B_{R}}(u)<J_{B_{R}}\left(u_{\mathrm{aff}}\right)<C R^{n-1} \tag{39}
\end{equation*}
$$

for some constant $C$ independent of $R$. The rest of (i) is already known.
For (ii), by Theorem 3.1 we have $u\left(\cdot, t ; u_{R}\right) \in A^{R}$, for $t \geq 0$. Since $u_{R}$ is a global minimizer of $J_{B_{R}}$ in $A^{R}$, and since $u\left(\cdot, t ; u_{R}\right) \in C^{1}\left(0, \infty ; C^{2+\alpha}\left(\overline{B_{R}}\right)\right)$, a classical
solution to (25) for $t>0$, we conclude from

$$
\begin{equation*}
\frac{\mathrm{d}}{\mathrm{~d} t} J_{B_{R}}(u(\cdot, t))=-\int_{B_{R}}\left|u_{t}\right|^{2} \mathrm{~d} x \tag{40}
\end{equation*}
$$

that $\left|u_{t}(x, t)\right|=0$, for all $x \in B_{R}$ and $t>0$. Hence, for $t>0, u(\cdot, t)$ is satisfying

$$
\begin{equation*}
\Delta u(x, t)-W_{u}(u(x, t))=0 \tag{41}
\end{equation*}
$$

By taking $t \rightarrow 0+$ and utilizing the continuity of the flow in $W^{1,2}\left(B_{R} ; \mathbb{R}^{n}\right)$ at $t=0$, $u\left(\cdot, \cdot ; u_{R}\right) \in C\left([0, \infty) ; W^{1,2}\left(B_{R} ; \mathbb{R}^{n}\right)\right)$, we obtain (ii).

Since (iii) is already known, we go on to (iv) where we obtain from (41), for $t>0$,

$$
\begin{aligned}
0 & =\left\langle Q_{u}(u(x, t)), \Delta u(x, t)\right\rangle-\left\langle Q_{u}(u(x, t)), W_{u}(u(x, t))\right\rangle \\
& =\left\langle\hat{Q}_{u}\left(u(x, t)-a_{1}\right), \Delta\left(u(x, t)-a_{1}\right)\right\rangle-\left\langle Q_{u}(u(x, t)), W_{u}(u(x, t))\right.
\end{aligned}
$$

where $Q(u)=\hat{Q}\left(u-a_{1}\right)$, while using (12) we continue to obtain

$$
\begin{align*}
0 & \leq \Delta \hat{Q}\left(u(x, t)-a_{1}\right)-\left\langle Q_{u}(u(x, t)), W_{u}(u(x, t))\right\rangle \\
& =\Delta Q(u(x, t))-\left\langle Q_{u}(u(x, t)), W_{u}(u(x, t))\right\rangle \\
& \leq \Delta Q(u(x, t)), \tag{42}
\end{align*}
$$

by Theorem 3.1, utilizing $u_{R} \in \mathcal{U}^{\text {Pos }}$, from which it follows that $u\left(\overline{D_{R}}, t\right) \subset D$, and by Hypothesis 4 particularly (10).

Thus, by the second remark following Lemma 2.1, we have

$$
\begin{equation*}
\Delta Q(u(x, t)) \geq 0, \text { in } W_{\mathrm{loc}}^{1,2}\left(D_{R}\right), \text { for } t>0 \tag{43}
\end{equation*}
$$

or, equivalently,

$$
\begin{equation*}
\int_{D_{R}} \nabla Q(u(x, t)) \nabla \phi(x) \mathrm{d} x \leq 0, \text { for all } \phi \geq 0, \phi \in W_{\mathrm{loc}}^{1,2}\left(D_{R}\right) \tag{44}
\end{equation*}
$$

We will argue that

$$
\begin{equation*}
\nabla Q(u(\cdot, t)) \rightarrow \nabla Q\left(u_{R}(\cdot)\right), \text { weakly in } L^{2}\left(B_{R}\right), \text { as } t \rightarrow 0 \tag{45}
\end{equation*}
$$

via which the proof of (iv) will be concluded. We know that

$$
\left\{\begin{array}{l}
u\left(\cdot, t ; u_{R}\right) \rightarrow u_{R}, \text { in } W^{1,2}\left(B_{R} ; \mathbb{R}^{n}\right), \text { as } t \rightarrow 0  \tag{46}\\
\left\|u\left(\cdot, t ; u_{R}\right)\right\|_{L^{\infty}\left(B_{R} ; \mathbb{R}^{n}\right)} \leq M
\end{array}\right.
$$

Hence,

$$
Q\left(u\left(\cdot, t ; u_{R}\right)\right) \rightarrow Q\left(u_{R}\right), \text { in } L^{2}\left(B_{R}\right), \text { as } t \rightarrow 0
$$

since $Q_{u}$ can be taken globally bounded. Thus,

$$
\nabla Q\left(u\left(\cdot, t ; u_{R}\right)\right) \rightarrow \nabla Q\left(u_{R}\right), \text { in } \mathcal{D}^{\prime}\left(B_{R}\right), \text { as } t \rightarrow 0
$$

However, $\left\|\nabla Q\left(u\left(\cdot, t ; u_{R}\right)\right)\right\|_{L^{2}\left(B_{R}\right)}<C$ by (46). Therefore (45) is established and the proof is complete.

The consideration in Lemma 4.1, particularly (40), together with the fact that $u_{R}$ is a global minimizer, show that $u\left(\cdot, t ; u_{R}\right)$ is an equilibrium of (25) for $t>0$, that is, a time-independent solution satisfying in addition the boundary condition $\partial u / \partial \boldsymbol{n}=0$. We can therefore replace $u_{R}$ with this equilibrium which satisfies all the properties of Lemma 4.1 and also is in $C^{2+\alpha}\left(\overline{B_{R}} ; \mathbb{R}^{n}\right)$.

Corollary 4.2. We may assume that $u_{R} \in C^{2+\alpha}\left(\overline{B_{R}} ; \mathbb{R}^{n}\right)$ is an equilibrium of (25) that satisfies all the properties of Lemma 4.1. Then,

$$
u_{R}\left(\overline{F_{R}}\right) \cap \bar{F} \neq \varnothing \quad \text { implies } \quad u_{R} \in \mathcal{U}_{0}^{\text {Pos }}
$$

Proof. This follows from Theorem 3.1 and the fact that $u_{R}$ is a time-independent solution of (25).

## 5. The comparison function $\sigma$ ( 1 )

We prove three lemmas leading to the construction of a map $\sigma$ that will play a major role in the derivation of the uniform estimates in $R$ in the following section. We let $\chi_{A}$ be the characteristic function of a set $A$.

Given numbers $l, \lambda>0$, set $L=l+\lambda$ and let $\varphi=\chi_{\overline{B_{l}}} \varphi_{1}+\chi_{\overline{B_{L} \backslash \overline{B_{l}}} \varphi_{2} \text {, where }}$ $\varphi_{1}: \overline{B_{l}} \rightarrow \mathbb{R}, \varphi_{2}: \overline{B_{L}} \backslash B_{l} \rightarrow \mathbb{R}$ are defined by

$$
\begin{cases}\Delta \varphi_{1}=c^{2} \varphi_{1}, & \text { in } B_{l}  \tag{47}\\ \varphi_{1}=\bar{q}, & \text { on } \partial B_{l}\end{cases}
$$

and

$$
\begin{cases}\Delta \varphi_{2}=0, & \text { in } B_{L} \backslash \overline{B_{l}}  \tag{48}\\ \varphi_{2}=\bar{q}, & \text { on } \partial B_{l} \\ \varphi_{2}=\bar{Q}, & \text { on } \partial B_{L}\end{cases}
$$

where $c, \bar{q}$, and $M$ below are the constants defined in Hypotheses 1 and 2 and

$$
\begin{equation*}
\bar{Q}=\max _{|u| \leq M} Q(u) \tag{49}
\end{equation*}
$$

(see Hypothesis 2 and (i) of Lemma 4.1). The map $\varphi$ is radial, that is, $\varphi_{j}(x)=$ $\phi_{j}(|x|)$, for $j=1,2$. Classical properties of Bessel functions imply that $\phi_{1}:[0, l] \rightarrow$ $\mathbb{R}$ is positive and increasing together with the first derivative $\phi_{1}^{\prime}$. The function $\phi_{2}$ : $[l, L] \rightarrow \mathbb{R}$ is increasing with decreasing first derivative $\phi_{2}^{\prime}$, by explicit calculation.

Lemma 5.1. The following hold.
(i) The function $\phi_{1}^{\prime}(l)$ is strictly increasing for $l \in(0,+\infty)$ and

$$
\begin{equation*}
\lim _{l \rightarrow+\infty} \phi_{1}^{\prime}(l)=c \bar{q} . \tag{50}
\end{equation*}
$$

(ii) There exists a strictly increasing function $h:(0,+\infty) \rightarrow(0,+\infty)$ such that

$$
\begin{equation*}
\phi_{1}(r) \leq \mathrm{e}^{h(l)(r-l)} \phi_{1}(l), \text { for } r \in[0, l] \tag{51}
\end{equation*}
$$

and $\lim _{l \rightarrow+\infty} h(l)=c$.
(iii) There is a constant $C_{0}$, independent of $l$, such that

$$
\begin{equation*}
\phi_{1}^{\prime \prime}(r) \leq C_{0}, \text { for } r \in[0, l] \tag{52}
\end{equation*}
$$

Proof. Statements (i) and (ii) are proved in [8, Lemma 2.4]. For (iii) note that

$$
\begin{equation*}
\phi_{1}^{\prime \prime}=c^{2} \phi_{1}-\frac{n-1}{r} \phi_{1}^{\prime} \leq c^{2} \psi_{1} \leq c^{2} \bar{q} \tag{53}
\end{equation*}
$$

since $\phi_{1}$ is increasing and bounded by $\bar{q}$.

An explicit computation yields, for $r \in[l, L]$,

$$
\phi_{2}^{\prime}(r)= \begin{cases}\frac{\bar{Q}-\bar{q}}{r \log (L / l)}, & \text { for } n=2  \tag{54}\\ (n-2) \frac{l^{n-2}(\bar{Q}-\bar{q})}{r^{n-1}\left(1-(l / L)^{n-2}\right)}, & \text { for } n>2\end{cases}
$$

Lemma 5.2. The following hold.
(i) Let the ratio $l / L$ be fixed. Then,

$$
\begin{equation*}
\lim _{l \rightarrow+\infty} \phi_{2}^{\prime}(l)=0 \tag{55}
\end{equation*}
$$

(ii) Let the difference $L-l=\lambda$ be fixed. Then, $\phi_{2}^{\prime}(l)$ is a decreasing function of $l \in(0,+\infty)$ and

$$
\lim _{l \rightarrow+\infty} \phi_{2}^{\prime}(r)=\frac{\bar{Q}-\bar{q}}{\lambda}, \text { for } r \in[l, l+\lambda]
$$

Moreover, there exists a constant $C_{0}$, independent of $l \in[1,+\infty)$, such that

$$
\begin{equation*}
\left|\phi_{2}^{\prime \prime}(r)\right| \leq \frac{C_{0}}{l}, \text { for } r \in[l, l+\lambda] \tag{57}
\end{equation*}
$$

Proof. Statement (i) is a straightforward consequence of (54). We prove (ii) for $n>2$. The case $n=2$ is similar. To show that $\phi_{2}^{\prime}(l)$ is decreasing, we prove that the map $f(l)=l\left(1-(l /(l+\lambda))^{n-2}\right)$ is increasing. Setting $\xi=l /(l+\lambda)$ we have

$$
f^{\prime}(l)=d(\xi):=1-(n-1) \xi^{n-2}+(n-2) \xi^{n-1}, \text { for } \xi \in[0,1)
$$

and $f^{\prime}(l)>0$, for $l \in(0,+\infty)$, follows from $d(0)=1, d(1)=0$, and $d^{\prime}(\xi)<0$, for $\xi \in(0,1)$. The limit (56) follows from (54). The last statement of the lemma follows from

$$
\phi_{2}^{\prime \prime}(r)=-(n-1) \frac{l^{n-1}}{r^{n}} \phi_{2}^{\prime}(l)
$$

Let $\varphi$ be as before and let $\delta>0$ be a small number. Denote by $\vartheta: B_{l+\delta} \backslash \overline{B_{l-\delta}} \rightarrow$ $\mathbb{R}$ the solution of the problem

$$
\begin{cases}\Delta \vartheta=0, & \text { in } B_{l+\delta} \backslash \overline{B_{l-\delta}}  \tag{58}\\ \vartheta=\varphi, & \text { on } \partial\left(B_{l+\delta} \backslash \overline{B_{l-\delta}}\right)\end{cases}
$$

We have $\vartheta(x)=\theta(|x|))$, where $\theta:[l-\delta, l+\delta] \rightarrow \mathbb{R}$ satisfies

$$
\theta^{\prime}(r)= \begin{cases}\frac{\phi_{2}(l+\delta)-\phi_{1}(l-\delta)}{r \log \frac{l-\delta}{l-\delta}}, & \text { for } n=2  \tag{59}\\ (n-2) \frac{(l-\delta)^{n-2}\left(\phi_{2}(l+\delta)-\phi_{1}(l-\delta)\right)}{r^{n-1}\left(1-\left(\frac{l-\delta}{l+\delta}\right)^{n-2}\right)}, & \text { for } n>2\end{cases}
$$

Lemma 5.3. There exist positive constants $l_{0}, \lambda, \delta, \bar{q}^{\prime}<\bar{q}, \delta^{\prime}, \mu$, such that $l \geq l_{0}$, $L=l+\lambda$ implies
(i) $\phi_{1}^{\prime}(l)>\phi_{2}^{\prime}(l)+\mu$,
(ii) $\vartheta<\varphi$, in $B_{l+\delta} \backslash \overline{B_{l-\delta}}$,
(iii) The map $\sigma: \overline{B_{L}} \rightarrow \mathbb{R}$ defined by $\sigma=\chi_{B_{l-\delta} \cup\left(\overline{B_{L}} \backslash \overline{B_{l+\delta}}\right)} \varphi+\chi_{\overline{B_{l+\delta}} \backslash B_{l-\delta}} \vartheta$ satisfies

$$
\begin{equation*}
\sigma \leq \bar{q}^{\prime}<\bar{q}, \text { in } \overline{B_{l+\delta^{\prime}}} \tag{60}
\end{equation*}
$$

Proof. Letting the ratio $\rho=l / L$ be fixed, then (50) and (55) imply that there is an $l_{0}$ such that (i) holds for $l=l_{0}$ and some $\mu>0$. Fixing $\lambda=l_{0}((l / \rho)-1)$, then (i) holds for all $l \geq l_{0}$. This follows from Lemmas 5.1 and (ii) of Lemma 5.2, which imply that $\phi_{1}^{\prime}(l)$ is increasing and $\phi_{2}^{\prime}(l)$ is decreasing for fixed $\lambda$. From (59), the relation

$$
\phi_{2}(l+\delta)-\phi_{1}(l-\delta)=\left(\phi_{2}^{\prime}(l)+\phi_{1}^{\prime}(l)\right) \delta+o(\delta),
$$

which holds uniformly in $l$ since $\phi_{1}(l)=\phi_{2}(l)=\bar{q}$, and

$$
\log \frac{l+\delta}{l-\delta}=2 \frac{\delta}{l}+o(\delta), \quad\left(\frac{l-\delta}{l+\delta}\right)^{n-2}=1-2(n-2) \frac{\delta}{l}+o(\delta)
$$

it follows that

$$
\begin{align*}
\left|\theta^{\prime}(r)-\frac{1}{2}\left(\phi_{2}^{\prime}(l)+\phi_{1}^{\prime}(l)\right)\right| & \leq C \delta, \text { for } r \in[l-\delta, l+\delta],  \tag{61}\\
\left|\theta^{\prime \prime}\right| & \leq \frac{C}{l}, \text { for } r \in[l-\delta, l+\delta] \tag{62}
\end{align*}
$$

for some constant $C>0$, independent of $l \in\left[l_{0},+\infty\right.$ ). From (i) and (61), and the bounds on $\phi_{1}^{\prime \prime}, \phi_{2}^{\prime \prime}, \theta^{\prime \prime}$, it follows that there is a small $\delta>0$, independent of $l \in\left[l_{0},+\infty\right)$, such that

$$
\begin{cases}\theta^{\prime}(r)<\phi_{1}^{\prime}(r), & \text { for } r \in[l-\delta, l] \\ \theta^{\prime}(r)>\phi_{2}^{\prime}(r), & \text { for } r \in[l, l+\delta]\end{cases}
$$

This and $\theta(l-\delta)=\phi_{1}(l-\delta), \theta(l+\delta)=\phi_{2}(l+\delta)$, prove (ii). The existence of the number $\bar{q}^{\prime}<\bar{q}$ and $0<\delta^{\prime}<\delta$, independent of $l \in\left[l_{0},+\infty\right)$, follows by the same arguments and from the existence of the limits (50) and (56).

## 6. Uniform estimates in $R$

In this section we will make use of special notation. We denote by $B_{R}\left(x_{R}\right)$ the ball of radius $R>0$ centered at $x_{R}$. As before, $B_{R}$ denotes the ball of radius $R>0$ centered at the origin and $D_{4 R}=D \cap B_{4 R}$, with $x_{R}$ a point in $D_{4 R}$ such that $B_{R}\left(x_{R}\right) \subset D_{4 R}$. The function $u_{4 R}$ is the minimizer for the functional $J_{B_{4 R}}$ in Corollary 4.2.

Set

$$
\begin{equation*}
v_{R}(x):=\frac{Q\left(u_{4 R}(x)\right)-\bar{q} / 2}{\bar{Q}-\bar{q} / 2}, \text { for } x \in B_{R}\left(x_{R}\right) \tag{63}
\end{equation*}
$$

where $\bar{q}$ as in Hypothesis 1, $\bar{Q}$ as in Lemma 4.1. Hypothesis 2, with $\bar{Q}>\bar{q} / 2$. We will also rescale the dependent variable via $y=\left(x-x_{R}\right) / R$ and define

$$
\begin{equation*}
\hat{v}_{R}(y):=v_{R}\left(R y+x_{R}\right)=v_{R}(x), \text { for } y \in \hat{B}_{1} \tag{64}
\end{equation*}
$$

where $\hat{B}_{1}:=\left\{y \in \mathbb{R}^{n}| | y \mid<1\right\}, B_{1}:=\left\{x \in \mathbb{R}^{n}| | x \mid<1\right\}$, and $B_{R}^{+}\left(x_{R}\right):=\{x \in$ $\left.B_{R}\left(x_{R}\right) \mid v_{R}(x) \geq 0\right\}, B_{R}^{-}\left(x_{R}\right):=\left\{x \in B_{R}\left(x_{R}\right) \mid v_{R}(x) \leq 0\right\}$, and analogously, $\hat{B}_{1}^{+}:=\left\{y \in \hat{B}_{1} \mid \hat{v}_{R}(y) \geq 0\right\}, B_{1}^{-}:=\left\{y \in \hat{B}_{1} \mid \hat{v}_{R}(y) \leq 0\right\}$. Notice that $\hat{B}_{1}^{+}, \hat{B}_{1}^{-}$ depend on $R$.

By definition

$$
\begin{equation*}
Q\left(u_{4 R}(x)\right) \geq \frac{\bar{q}}{2}, \text { on } B_{R}^{+}\left(x_{R}\right) \tag{65}
\end{equation*}
$$

By positivity ((iii) of Lemma 4.1) and equivariance, there holds $u_{4 R}\left(B_{R}\left(x_{R}\right)\right) \subset$ $u_{4 R}\left(D_{4 R}\right) \subset \bar{D}$. Hence,

$$
\begin{equation*}
W\left(u_{4 R}(x)\right) \geq \varepsilon_{0}(\bar{q})>0, \text { on } B_{R}^{+}\left(x_{R}\right), \tag{66}
\end{equation*}
$$

since $a_{1}$ is the unique zero of $W$ in $\bar{D}$ (Hypotheses 3, (4).
Lemma 6.1. The following estimate holds for the Lebesgue measure of $\hat{B}_{1}^{-}$.

$$
\begin{equation*}
\left|\hat{B}_{1}^{-}\right| \geq\left|\hat{B}_{1}\right|-\frac{C}{\varepsilon_{0}(\bar{q}) R} \tag{67}
\end{equation*}
$$

where $C$ is a constant depending only on the constant $C$ in (i) of Lemma 4.1 and the dimension $n$.

Proof. We have

$$
\begin{aligned}
C R^{n-1} & \geq \int_{B_{4 R}} W\left(u_{4 R}(x)\right) \mathrm{d} x \quad(\text { by }(\text { i }) \text { of Lemma 4.1) }) \\
& \geq \int_{B_{R}^{+}\left(x_{R}\right)} W\left(u_{4 R}(x)\right) \mathrm{d} x \quad(\text { by } W \geq 0) \\
& \geq \varepsilon_{0}(\bar{q})\left|B_{R}^{+}\left(x_{R}\right)\right| \quad(\text { by }(66)) .
\end{aligned}
$$

Therefore,

$$
\frac{C}{R} \geq \varepsilon_{0}(\bar{q}) \frac{\left|B_{R}^{+}\left(x_{R}\right)\right|}{R^{n}}=\varepsilon_{0}(\bar{q})\left|\hat{B}_{1}^{+}\right|
$$

hence

$$
\left|\hat{B}_{1}^{-}\right|=\left|\hat{B}_{1}\right|-\left|\hat{B}_{1}^{+}\right| \geq\left|\hat{B}_{1}\right|-\frac{C}{\varepsilon_{0}(\bar{q}) R}
$$

Remark. The lemma above is a direct consequence of the basic integral estimate in (i) Lemma 4.1 and the assumption that in $D$ the potential has a unique zero. Estimate (67) states that the minimizer $u_{4 R}(x)$ on a set of large measure in $B_{R}\left(x_{R}\right)$ is close to $a_{1}$, the zero of $W$, for $R \rightarrow \infty$.

The point in the next lemma is that the subharmonicity of $Q\left(u_{4 R}(x)\right)$ in $D$ (by (iv) of Lemma 4.1) via a classical result of De Giorgi (see Appendix) allows us to obtain a pointwise estimate in the ball $B_{R / 2}\left(x_{R}\right)$ of half the radius.
Lemma 6.2. Fix a $\delta \in(0,1)$. Then, for $R$ large enough such that

$$
\begin{equation*}
1-\frac{1}{\varepsilon_{0}(\bar{q})} \frac{C}{R} \frac{1}{c_{0}} \geq 1-\delta \tag{68}
\end{equation*}
$$

we have the estimate

$$
\begin{equation*}
\sup _{B_{R / 2}\left(x_{R}\right)} Q\left(u_{4 R}(x)\right) \leq \frac{\bar{q}}{2}+\mu(1-\delta)\left(\bar{Q}-\frac{\bar{q}}{2}\right) \tag{69}
\end{equation*}
$$

where $\mu(\cdot)$ is defined in the Appendix, with $\mu(1-\delta)<1$.
Here $C$ is the constant in Lemma 6.1 and $c_{0}$ is the volume of the unit ball in $\mathbb{R}^{n}$.

Proof. Note that $\Delta_{y} \hat{v}_{R} \geq 0$ in $\hat{B}_{1}$ and $\hat{v}_{R} \leq 1$, in $\hat{B}_{1}$, by (iv) and (i) of Lemma 4.1 respectively, and moreover

$$
\frac{\left|\hat{B}_{1}^{-}\right|}{\left|\hat{B}_{1}\right|} \geq 1-\frac{1}{\varepsilon_{0}(\bar{q})} \frac{C}{R} \frac{1}{c_{0}} \geq 1-\delta
$$

by (67). Hence, by the lemma in the Appendix,

$$
\sup _{\hat{B}_{1 / 2}} \hat{v}_{R}(y) \leq \mu(1-\delta)<1
$$

which is equivalent to (69).

Next we will iterate. The number $\delta$ is fixed in Lemma 6.2 and we select $k$ as the minimal integer with the property

$$
\begin{equation*}
\frac{\bar{q}}{2}+(\mu(1-\delta))^{k}\left(\bar{Q}-\frac{\bar{q}}{2}\right)<\bar{q} \tag{70}
\end{equation*}
$$

Clearly $k$ depends only on $\delta$. Finally we choose $R_{0}=R_{0}(\delta)$ such that

$$
\begin{equation*}
1-\frac{1}{\varepsilon_{0}(\bar{q})} \frac{C}{R} \frac{1}{\left|\hat{B}_{1 / 2^{k}}\right|} \geq 1-\delta, \text { for } R \geq R_{0} \tag{71}
\end{equation*}
$$

with $C$ as in Lemma 6.2.
From now on, $R$, in the definition of $A^{R}$ and in the definition of the minimizer $u_{R}$, is assumed to satisfy (71), and free otherwise. For such an $R$ we define

$$
\left\{\begin{array}{l}
\bar{Q}_{0}:=\bar{Q} \\
\bar{Q}_{i}:=\frac{\bar{q}}{2}+\mu\left(a^{*}\right)\left(\bar{Q}_{i-1}-\frac{\bar{q}}{2}\right) \\
v_{i}(x):=\frac{Q\left(u_{4 R}(x)\right)-\bar{q} / 2}{\bar{Q}_{i-1}-\bar{q} / 2}, \text { for } x \in B_{R / 2^{i}}\left(x_{R}\right) \\
\hat{v}_{i}(y):=v_{i}(R y), \text { for } y \in \hat{B}_{1 / 2^{i}}
\end{array}\right.
$$

for $i=1,2, \ldots, k$ and $a^{*}=1-\delta$.
We notice that (71) implies all the corresponding inequalities for $i=1,2, \ldots, k$ and, particular, (68).

Lemma 6.3. For an integer $k=k(\delta)$, as in (70), and for $R \geq R_{0}(\delta)$, as in (71), the following estimate holds.

$$
\begin{equation*}
\sup _{B_{R / 2^{k}}\left(x_{R}\right)} Q\left(u_{4 R}(x)\right) \leq \frac{\bar{q}}{2}+\left(\mu\left(a^{*}\right)\right)^{k}\left(\bar{Q}-\frac{\bar{q}}{2}\right)<\bar{q} \tag{72}
\end{equation*}
$$

Proof. We make the simple observation that

$$
\begin{equation*}
\sup _{B_{R / 2^{i}}\left(x_{R}\right)} Q\left(u_{4 R}(x)\right) \leq \frac{\bar{q}}{2}+\left(\mu\left(a^{*}\right)\right)^{i}\left(\bar{Q}-\frac{\bar{q}}{2}\right) \tag{73}
\end{equation*}
$$

holds for $i=1,2, \ldots, k$.
We note that for $i=1$ this is just (69). Let us establish (73) for $i=2$. We may assume that $k \geq 3$ since otherwise we have the estimate we need, hence
$\bar{Q}_{1}>\bar{q} / 2$. We have $Q\left(u_{4 R}(x)\right) \leq \bar{Q}_{1}$, on $B_{R / 2}\left(x_{R}\right)$, by (69), and $Q\left(u_{4 R}(x)\right) \geq \bar{q} / 2$, on $B_{R / 2}^{+}\left(x_{R}\right)$, by definition. Hence,

$$
\begin{aligned}
C R^{n-1} & \geq \int_{B_{R}^{+}\left(x_{R}\right)} W\left(u_{4 R}(x)\right) \mathrm{d} x \\
& \geq \int_{B_{R / 2}^{+}\left(x_{R}\right)} W\left(u_{4 R}(x)\right) \mathrm{d} x \quad(\text { cf. Proof of Lemma 6.1) } \\
& \geq \varepsilon_{0}(\bar{q})\left|B_{R / 2}^{+}\left(x_{R}\right)\right| \quad(\text { by (66) }) .
\end{aligned}
$$

Therefore,

$$
\frac{C}{R} \geq \varepsilon_{0}(\bar{q}) \frac{\left|B_{R / 2}^{+}\left(x_{R}\right)\right|}{R^{n}}=\varepsilon_{0}(\bar{q})\left|\hat{B}_{1 / 2}^{+}\right|
$$

hence,

$$
\left|\hat{B}_{1 / 2}^{-}\right|=\left|\hat{B}_{1 / 2}\right|-\left|\hat{B}_{1 / 2}^{+}\right| \geq\left|\hat{B}_{1 / 2}\right|-\frac{C}{\varepsilon_{0}(\bar{q}) R}
$$

It follows that

$$
\begin{equation*}
\frac{\left|\hat{B}_{1 / 2}^{-}\right|}{\left|\hat{B}_{1 / 2}\right|} \geq 1-\frac{C}{\varepsilon_{0}(\bar{q}) R\left|\hat{B}_{1 / 2}\right|} \geq 1-\delta \tag{74}
\end{equation*}
$$

by (71).
On the other hand, $\Delta_{y} \hat{v}_{2}(y) \geq 0$ in $\hat{B}_{1 / 2}$ and $\hat{v}_{2} \leq 1$, in $\hat{B}_{1 / 2}$, hence, by the lemma in the Appendix,

$$
\sup _{\hat{B}_{1 / 2^{2}}} \hat{v}_{2}(y) \leq \mu\left(a^{*}\right)
$$

which equivalently gives

$$
\sup _{B_{R / 2^{2}}\left(x_{R}\right)} Q\left(u_{4 R}(x)\right) \leq \frac{\bar{q}}{2}+\mu\left(a^{*}\right)\left(\bar{Q}_{1}-\frac{\bar{q}}{2}\right)
$$

or

$$
\sup _{B_{R / 2^{2}}\left(x_{R}\right)} Q\left(u_{4 R}(x)\right) \leq \frac{\bar{q}}{2}+\mu\left(a^{*}\right)^{2}\left(\bar{Q}-\frac{\bar{q}}{2}\right) .
$$

By repeating this process for $i=3, \ldots, k$, we obtain (72).
So far we have established that

$$
\begin{equation*}
\sup _{B_{R^{*}}\left(x_{R}\right)} Q\left(u_{4 R}(x)\right) \leq \bar{q} \tag{75}
\end{equation*}
$$

where $R^{*}=R / 2^{k}$, for $R \geq R_{0}$, and an integer $k$ independent of $R$. Utilizing the comparison function $\sigma$ in Section 5it is possible to show that the ball $B_{R^{*}}\left(x_{R}\right)$ in the supremum in (75) can be replaced by a large set $D_{R}^{*}$ which includes all of $D_{4 R}$ with the exception of a strip along the boundary $\partial D$ of width $d_{0}$ independent of $R$, for $R \geq R_{0}$, that is,

$$
\begin{equation*}
D_{R}^{*} \supset\left\{x \in D_{4 R} \mid d\left(x, \partial D_{4 R}\right) \geq d_{0}\right\} \tag{76}
\end{equation*}
$$

for some $d_{0}>0$, which depends on $l_{0}$ in Lemma 5.3.
Lemma 6.4. The following estimate holds.

$$
\begin{equation*}
\sup _{D_{R}^{*}} Q\left(u_{4 R}\right) \leq \bar{q} \tag{77}
\end{equation*}
$$

where $D_{R}^{*}$ has the properties stated above.

Proof. First we note that by Hypotheses (1) (4,

$$
\left\langle Q_{u}(u), W_{u}(u)\right\rangle \geq c^{2} Q(u), \text { for }\left|u-a_{1}\right| \leq \bar{q}
$$

which implies, via Lemma 2.1, (ii) of Lemma 4.1, and (75), the estimate

$$
\begin{equation*}
\Delta Q\left(u_{4 R}\right) \geq\left\langle\Delta u_{4 R}, Q_{u}\left(u_{4 R}\right)\right\rangle=\left\langle W_{u}\left(u_{4 R}\right), Q_{u}\left(u_{4 R}\right)\right\rangle \geq c^{2} Q\left(u_{4 R}\right) \tag{78}
\end{equation*}
$$

in $W_{\text {loc }}^{1,2}\left(B_{R^{*}}\left(x_{R}\right)\right)$.
Next we refer to Section 5. Consider a ball $B_{l}(\xi)$, tangent to $\partial B_{R^{*}}\left(x_{R}\right)$ and with its center $\xi$ inside $B_{R^{*}}\left(x_{R}\right)$, and also consider the concentric ball $B_{L}(\xi)$. Notice that $B_{l}(\xi)$ is the translation of $B_{l}$ and $B_{L}(\xi)$ the translation $B_{L}$. Similarly consider the translations of $\varphi_{1}, \varphi_{2}, \vartheta$, which we still denote by the same symbols.

We now observe by (47), (75), and (78), that

$$
\left\{\begin{array} { l l } 
{ \Delta \varphi _ { 1 } = c ^ { 2 } \varphi _ { 1 } , } & { \text { in } B _ { l } ( \xi ) , } \\
{ \varphi _ { 1 } = \overline { q } , } & { \text { on } \partial B _ { l } ( \xi ) , }
\end{array} \quad \left\{\begin{array}{ll}
\Delta Q\left(u_{4 R}\right) \geq c^{2} Q\left(u_{4 R}\right), & \text { in } B_{l}(\xi) \\
Q\left(u_{4 R}\right) \leq \bar{q}, & \text { on } \partial B_{l}(\xi)
\end{array}\right.\right.
$$

hence, by the maximum principle for $W^{1,2}$ solutions (see [9), we have

$$
\begin{equation*}
Q\left(u_{4 R}\right) \leq \varphi_{1}, \text { in } B_{l}(\xi) \tag{79}
\end{equation*}
$$

Also, by (48), (i) and (iv) of Lemma 4.1 and (75),

$$
\left\{\begin{array} { l l } 
{ \Delta \varphi _ { 2 } = 0 , } & { \text { in } B _ { L } ( \xi ) \backslash \overline { B _ { l } ( \xi ) } , } \\
{ \varphi _ { 2 } = \overline { q } , } & { \text { on } \partial B _ { l } ( \xi ) , } \\
{ \varphi _ { 2 } = \overline { Q } , } & { \text { on } \partial B _ { L } ( \xi ) , }
\end{array} \quad \left\{\begin{array}{ll}
\Delta Q\left(u_{4 R}\right) \geq 0, & \text { in } B_{L}(\xi), \\
Q\left(u_{4 R}\right) \leq \varphi_{2}, & \text { on } \partial\left(B_{L}(\xi) \backslash \overline{B_{l}(\xi)}\right),
\end{array}\right.\right.
$$

hence,

$$
\begin{equation*}
Q\left(u_{4 R}\right) \leq \varphi_{2}, \text { in } B_{L}(\xi) \backslash \overline{B_{l}(\xi)} \tag{80}
\end{equation*}
$$

We deduce therefore by Lemma 5.3 that

$$
\begin{cases}Q\left(u_{4 R}\right) \leq \varphi, & \text { in } B_{L}(\xi),  \tag{81}\\ Q\left(u_{4 R}\right) \leq \vartheta, & \text { in } B_{l+\delta}(\xi) \backslash \overline{B_{l-\delta}(\xi)}, \\ Q\left(u_{4 R}\right) \leq \sigma \leq \bar{q}^{\prime}<\bar{q}, & \text { in } \overline{B_{l+\delta^{\prime}}(\xi)}\end{cases}
$$

Thus, we see from (iii) of (81) that the estimate (75) holds on a set larger than $B_{R^{*}}\left(x_{R}\right)$. Clearly, by repeating this process we obtain (77).

We are now able to finish the proof of the theorem.
Proof of Theorem 1.1. First note that if $q: D_{R}^{*} \rightarrow \mathbb{R}$ is the solution to

$$
\begin{equation*}
\Delta q=c^{2} q, \text { in } D_{R}^{*}, q=\bar{q}^{\prime}, \text { on } D_{R}^{*} \tag{82}
\end{equation*}
$$

then,

$$
\begin{equation*}
q(x) \leq K \mathrm{e}^{-k d\left(x, \partial D_{R}^{*}\right)}, \text { for } x \in D_{R}^{*} \tag{83}
\end{equation*}
$$

for positive constants $K, k$, independent of $R$.
Indeed, by the maximum principle, there holds $q \leq \bar{q}^{\prime}$. It follows that if $\varphi$ is the solution of equation (82) on the ball with center $x$ and radius $d\left(x, \partial D_{R}^{*}\right)$ and with boundary condition $\varphi=\bar{q}^{\prime}$, we have $q \leq \varphi$. This and the estimate (51) in (ii) of Lemma [5.1]imply (83). Moreover, we note that if $d_{0}>0$ is as in (76), then

$$
\begin{equation*}
q(x) \leq K \mathrm{e}^{-k d\left(x, \partial D_{4 R}\right)}, \text { in } B_{d_{0}}(x) \subset D_{4 R} \tag{84}
\end{equation*}
$$

since $d\left(x, \partial D_{4 R}\right) \leq d\left(x, \partial D_{R}^{*}\right)+d_{0}$. This last inequality follows from (76) with a new constant $K$.

Now utilizing (75) and $\Delta Q\left(u_{4 R}\right) \geq c^{2} Q\left(u_{4 R}\right)$, in $W_{\text {loc }}^{1,2}\left(D_{R}^{*}\right)$, by (78), we obtain by comparing with (82) that $Q\left(u_{4 R}(x)\right) \leq q(x)$, for $x \in D_{R}^{*}$, and, therefore, by (84) and (9c),

$$
\begin{equation*}
\left|u_{4 R}(x)-a_{1}\right| \leq K \mathrm{e}^{-k d\left(x, \partial D_{4 R}\right)} \tag{85}
\end{equation*}
$$

The uniform bound in (i) of Lemma 4.1 and elliptic regularity, via a diagonal argument, allow us to pass to the limit along a subsequence in $R$ and capture a function

$$
u(x)=\lim _{R_{n} \rightarrow \infty} u_{R_{n}}(x)
$$

The uniform bound (85) implies that the limit function satisfies the exponential estimate in the theorem and is also a solution to

$$
\Delta u-W_{u}(u)=0, \text { in } \mathbb{R}^{n}
$$

by (ii) of Lemma 4.1 (and the comment after its proof). Clearly, also $u \in \mathcal{U}^{\mathrm{Pos}}$.
Finally we argue the strong positivity for $u(x)$ with respect to $D$. Take now an open connected set $U \subset D$ which contains some points far enough from $\partial D$ so that by the exponential estimate there holds $u(U) \cap D \neq \varnothing$. Define $\Gamma^{\prime}:=\{\gamma \in \Gamma \mid$ $\left.\pi_{\gamma} \cap D \neq \varnothing\right\}$; then, $D=\cap_{\gamma \in \Gamma \backslash \Gamma^{\prime}} \mathcal{P}_{\gamma}^{+}$(see Lemmas 2.1 and 5.1 in [1]). As in the second part of the proof of Theorem (3.1, particularly (33), set $z(x)=\left\langle u(x), \eta_{\gamma}\right\rangle$, for $x \in U$ and $\gamma \in \Gamma \backslash \Gamma^{\prime}$. Then,

$$
\left\{\begin{array}{ll}
\Delta z+c z=0, & \text { in } U \\
z \geq 0, & \text { in } U .
\end{array} \quad\right. \text { (by positivity) }
$$

By a well-known variant of the strong maximum principle, there holds $z>0$ in $U$, unless $z \equiv 0$. Triviality is excluded by $u(U) \cap D \neq \varnothing$ above. From this, strong positivity follows.

The proof is complete.

## Appendix

We state a special case of the De Giorgi oscillation lemma which was originally established for general elliptic operators $\mathcal{L} u:=\operatorname{div}(A(x) \nabla u)$, with bounded, measurable coefficients (see [4, p. 195]).

Lemma (De Giorgi). Consider the ball $\hat{B}_{1}=\left\{y \in \mathbb{R}^{n}| | y \mid \leq 1\right\}$ and a function $\hat{v}=\hat{v}(y)$ which satisfies
(i) $\Delta_{y} \hat{v} \geq 0$, in $W_{\text {loc }}^{1,2}\left(\hat{B}_{1}\right)$,
(ii) $\hat{v} \leq 1$, in $\hat{B}_{1}$,
(iii) $\left|\hat{B}_{1}^{-}\right| /\left|\hat{B}_{1}\right| \geq a^{*}>0$, for $\hat{B}_{1}^{-}=\left\{y \in \hat{B}_{1} \mid \hat{v}(y) \leq 0\right\}$,
where $|\Omega|$ is the Lebesgue measure of the set $\Omega$. Then,

$$
\sup _{\hat{B}_{1 / 2}} \hat{v} \leq \mu\left(a^{*}\right)<1
$$

Notice that the statement of the lemma is invariant under the scaling $y \rightarrow \lambda y$, for $\lambda>0$, hence $\hat{B}_{1}$ can be replaced by $\hat{B}_{\lambda}$ and $\hat{B}_{1 / 2}$ by $\hat{B}_{\lambda / 2}$, without affecting $\mu\left(a^{*}\right)$.

## Acknowledgments

Thanks are due to Giorgio Fusco for discussions on the contents of the paper, to Panagiotis Smyrnelis for pointing out two errors in a former version of the manuscript, and to Apostolos Damialis for his suggestions for improving the presentation.
