# A Linear-Quadratic Optimal Control Problem for Mean-Field Stochastic Differential Equations* 

Jiongmin Yong<br>Department of Mathematics, University of Central Florida, Orlando, FL 32816, USA.

February 18, 2022

#### Abstract

A Linear-quadratic optimal control problem is considered for mean-field stochastic differential equations with deterministic coefficients. By a variational method, the optimality system is derived, which turns out to be a linear mean-field forward-backward stochastic differential equation. Using a decoupling technique, two Riccati differential equations are obtained, which are uniquely solvable under certain conditions. Then a feedback representation is obtained for the optimal control.

Keywords. Mean-field stochastic differential equation, linear-quadratic optimal control, Riccati differential equation, feedback representation.

## 1 Introduction.

Let $(\Omega, \mathcal{F}, \mathbb{P}, \mathbb{F})$ be a complete filtered probability space, on which a one-dimensional standard Brownian motion $W(\cdot)$ is defined with $\mathbb{F} \equiv\left\{\mathcal{F}_{t}\right\}_{t \geq 0}$ being its natural filtration augmented by all the $\mathbb{P}$-null sets. Consider the following controlled linear stochastic differential equation (SDE, for short):

$$
\left\{\begin{align*}
d X(s)= & \{A(s) X(s)+B(s) u(s)+\widehat{A}(s) \mathbb{E}[X(s)]+\widehat{B}(s) \mathbb{E}[u(s)]\} d s  \tag{1.1}\\
& +\left\{A_{1}(s) X(s)+B_{1}(s) u(s)+\widehat{A}_{1}(s) \mathbb{E}[X(s)]+\widehat{B}_{1}(s) \mathbb{E}[u(s)]\right\} d W(s), \quad s \in[0, T] \\
X(0)= & x
\end{align*}\right.
$$

where $A(\cdot), B(\cdot), \widehat{A}(\cdot), \widehat{B}(\cdot), A_{1}(\cdot), B_{1}(\cdot), \widehat{A}_{1}(\cdot), \widehat{B}_{1}(\cdot)$ are given deterministic matrix valued functions. In the above, $X(\cdot)$, valued in $\mathbb{R}^{n}$, is the state process, and $u(\cdot)$, valued in $\mathbb{R}^{m}$, is the control process.

We note that $\mathbb{E}[X(\cdot)]$ and $\mathbb{E}[u(\cdot)]$ appear in the state equation. Such an equation is referred to as a linear controlled mean-field (forward) SDE (MF-FSDE, for short). MF-FSDEs can be used to describe particle systems at mesoscopic level, which is of great importance in applications. Historically, the latercalled McKean-Vlasov SDE, a kind of MF-FSDE, was suggested by Kac [18] in 1956 as a stochastic toy model for the Vlasov kinetic equation of plasma and the study of which was initiated by McKean [24] in 1966. Since then, many authors made contributions on McKean-Vlasov type SDEs and applications, see, for examples, Dawson [13], Dawson-Gärtner [14], Gártner [15], Scheutzow [29], Graham [16], Chan

[^0][10], Chiang [11], Ahmed-Ding [1], to mention a few. In recent years, related topics and problems have attracted more and more researchers' attentions, see, for examples, Veretennikov [32], Huang-MalhaméCaines [17], Mahmudov-McKibben [23], Buckdahn-Djehiche-Li-Peng [8], Buckdahn-Li-Peng [9], BorkarKumar [6], Crisan-Xiong [12], Kotelenez-Kurtz [20], Kloeden-Lorenz [19], and so on. More interestingly, control problems of McKean-Vlasov equation or MF-FSDEs were investigated by Ahmed-Ding [2], Ahmed [3], Buckdahn-Djehiche-Li [7], Park-Balasubramaniam-Kang [28], Andersson-Djehiche [4], Meyer-Brandis-Oksendal-Zhou [25], and so on. This paper can be regarded as an addition to the study of optimal control for MF-FSDEs.

For the state equation (1.1), we introduce the following:

$$
\mathcal{U}[0, T]=L_{\mathbb{F}}^{2}\left(0, T ; \mathbb{R}^{m}\right) \triangleq\left\{u:[0, T] \times\left.\Omega \rightarrow \mathbb{R}^{m}\left|\mathbb{E} \int_{0}^{T}\right| u(s)\right|^{2} d s<\infty\right\}
$$

Any $u(\cdot) \in \mathcal{U}[0, T]$ is called an admissible control. Under mild conditions, one can show that (see below) for any $(x, u(\cdot)) \in \mathbb{R}^{n} \times \mathcal{U}[0, T]$, (1.1) admits a unique solution $X(\cdot)=X(\cdot ; x, u(\cdot))$. We introduce the following cost functional:

$$
\begin{align*}
J(x ; u(\cdot))=\mathbb{E}\left\{\int_{0}^{T}\right. & {[\langle Q(s) X(s), X(s)\rangle+\langle\widehat{Q}(s) \mathbb{E}[X(s)], \mathbb{E}[X(s)]\rangle+\langle R(s) u(s), u(s)\rangle}  \tag{1.2}\\
& +\langle\widehat{R}(s) \mathbb{E}[u(s)], \mathbb{E}[u(s)]\rangle] d s+\langle G X(T), X(T)\rangle+\langle\widehat{G} \mathbb{E}[X(T)], \mathbb{E}[X(T)]\rangle\}
\end{align*}
$$

with $Q(\cdot), R(\cdot), \widehat{Q}(\cdot), \widehat{R}(\cdot)$ being suitable deterministic symmetric matrix-valued functions, and $G, \widehat{G}$ being symmetric matrices. Our optimal control problem can be stated as follows:

Problem (MF). For given $x \in \mathbb{R}^{n}$, find a $\bar{u}(\cdot) \in \mathcal{U}[0, T]$ such that

$$
\begin{equation*}
J(x ; \bar{u}(\cdot))=\inf _{u(\cdot) \in \mathcal{U}[0, T]} J(x ; u(\cdot)) \tag{1.3}
\end{equation*}
$$

Any $\bar{u}(\cdot) \in \mathcal{U}[0, T]$ satisfying the above is called an optimal control and the corresponding state process $\bar{X}(\cdot) \equiv X(\cdot ; x, \bar{u}(\cdot))$ is called an optimal state process; the pair $(\bar{X}(\cdot), \bar{u}(\cdot))$ is called an optimal pair.

From the above-listed literature, one has some motivations for the inclusion of $\mathbb{E}[X(\cdot)]$ and $\mathbb{E}[u(\cdot)]$ in the state equation. We now briefly explain a motivation of including $\mathbb{E}[X(\cdot)]$ and $\mathbb{E}[u(\cdot)]$ in the cost functional. We recall that for a classical LQ problem with the state equation

$$
\left\{\begin{array}{l}
d X(s)=[A(s) X(s)+B(s) u(s)] d s+\left[A_{1}(s) X(s)+B_{1}(s) u(s)\right] d W(s), \quad s \in[0, T]  \tag{1.4}\\
X(0)=x
\end{array}\right.
$$

one has the following cost functional

$$
\begin{equation*}
J_{0}(x ; u(\cdot))=\mathbb{E}\left\{\int_{0}^{T}\left[\left\langle Q_{0}(s) X(s), X(s)\right\rangle+\left\langle R_{0}(s) u(s), u(s)\right\rangle\right] d s+\left\langle G_{0} X(T), X(T)\right\rangle\right\} \tag{1.5}
\end{equation*}
$$

For such a corresponding optimal control problem, it is natural to hope that the optimal state process and/or control process are not too sensitive with respect to the possible variation of the random events. One way to achieve this is try to make the variations $\operatorname{var}[X(\cdot)]$ and $\operatorname{var}[u(\cdot)]$ small. Therefore, one could include the var $[X(\cdot)]$ and $\operatorname{var}[u(\cdot)]$ in the cost functional. Consequently, one might want to replace (1.6) by the following:

$$
\begin{gather*}
\widehat{J}_{0}(x ; u(\cdot))=\mathbb{E}\left\{\int_{0}^{T}\left[\left\langle Q_{0}(s) X(s), X(s)\right\rangle+q(s) \operatorname{var}[X(s)]+\left\langle R_{0}(s) u(s), u(s)\right\rangle+\rho(s) \operatorname{var}[u(s)]\right] d s\right.  \tag{1.6}\\
\left.+\left\langle G_{0} X(T), X(T)\right\rangle+g \operatorname{var}[X(T)]\right\}
\end{gather*}
$$

for some (positive) weighting factors $q(\cdot), \rho(\cdot)$, and $g$. Since

$$
\operatorname{var}[X(s)]=\mathbb{E}|X(s)|^{2}-(\mathbb{E}[X(s)])^{2}
$$

and similar things hold for $\operatorname{var}[X(T)]$ and $\operatorname{var}[u(s)]$, we see that

$$
\begin{aligned}
& \widehat{J}_{0}(x ; u(\cdot))=\mathbb{E}\left\{\int _ { 0 } ^ { T } \left[\left\langle\left[Q_{0}(s)+q(s) I\right] X(s), X(s)\right\rangle-q(s)(\mathbb{E}[X(s)])^{2}+\left\langle\left[R_{0}(s)+\rho(s) I\right] u(s), u(s)\right\rangle\right.\right. \\
&\left.\left.-\rho(s)(\mathbb{E}[u(s)])^{2}\right] d s+\left\langle\left[G_{0}+g I\right] X(T), X(T)\right\rangle-g(\mathbb{E}[X(T)])^{2}\right\}
\end{aligned}
$$

Clearly, the above is a special case of (1.2) with

$$
\begin{aligned}
& Q(\cdot)=Q_{0}(\cdot)+q(\cdot) I, \quad R(\cdot)=R_{0}(\cdot)+\rho(\cdot) I, \quad G=G_{0}+g I, \\
& \widehat{Q}(\cdot)=-q(\cdot) I, \quad \widehat{R}(\cdot)=-\rho(\cdot) I, \quad \widehat{G}=-g I
\end{aligned}
$$

Note that in the above case, $\widehat{Q}(\cdot), \widehat{R}(\cdot)$, and $\widehat{G}$ are not positive semi-definite. Because of this, we do not assume the positive semi-definiteness for $\widehat{Q}(\cdot), \widehat{R}(\cdot)$, and $\widehat{G}$.

The purpose of this paper is to study Problem (MF). We will begin with the well-posedness of the state equation and the solvability of Problem (MF) in Section 2. Then, in Section 3, we will establish necessary and sufficient conditions for optimal pairs. Naturally, a linear backward stochastic differential equation of mean-filed type (MF-BSDE, for short) will be derived. Consequently, the optimality system turns out to be a coupled mean-field type forward-backward stochastic differential equation (MF-FBSDE, for short). Inspired by the invariant imbedding [5], and the Four-Step Scheme [22], we derive two Riccati differential equations in Section 4, so that the optimal control is represented as a state feedback form. Well-posedness of these Riccati equations will be established. We also present a direct verification of optimality for the state feedback control by means of completing squares. In Section 5, we will look at a modified LQ problem which is one motivation of the current paper.

## 2 Preliminaries.

In this section, we make some preliminaries. First of all, for any Euclidean space $H=\mathbb{R}^{n}, \mathbb{R}^{n \times m}, \mathcal{S}^{n}$ (with $\mathcal{S}^{n}$ being the set of all $(n \times n)$ symmetric matrices), we let $L^{p}(0, t ; H)$ be the set of all $H$-valued functions that are $L^{p}$-integrable, $p \in[1, \infty]$. Next, we introduce the following spaces:

$$
\begin{aligned}
& \mathcal{X}_{t} \equiv L_{\mathcal{F}_{t}}^{2}\left(\Omega ; \mathbb{R}^{n}\right)=\left\{\xi: \Omega \rightarrow \mathbb{R}^{n} \mid \xi \text { is } \mathcal{F}_{t} \text {-measurable, } \mathbb{E}|\xi|^{2}<\infty\right\} \text {, } \\
& \mathcal{U}_{t} \equiv L_{\mathcal{F}_{t}}^{2}\left(\Omega ; \mathbb{R}^{m}\right)=\left\{\eta: \Omega \rightarrow \mathbb{R}^{m} \mid \eta \text { is } \mathcal{F}_{t} \text {-measurable, } \mathbb{E}|\eta|^{2}<\infty\right\}, \\
& L_{\mathbb{F}}^{2}\left(0, t ; \mathbb{R}^{n}\right)=\left\{X:[0, t] \times \Omega \rightarrow \mathbb{R}^{n} \mid X(\cdot) \text { is } \mathbb{F} \text {-adapted, } \mathbb{E} \int_{0}^{t}|X(s)|^{2} d s<\infty\right\}, \\
& \mathcal{X}[0, t] \equiv C_{\mathbb{F}}\left([0, t] ; \mathbb{R}^{n}\right)=\left\{X:[0, t] \rightarrow \mathcal{X}_{t} \mid X(\cdot) \text { is } \mathbb{F}\right. \text {-adapted, } \\
& \left.s \mapsto X(s) \text { is continuous, } \sup _{s \in[0, t]} \mathbb{E}|X(s)|^{2}<\infty\right\}, \\
& \widehat{\mathcal{X}}[0, t] \equiv L_{\mathbb{F}}^{2}\left(\Omega ; C\left([0, t] ; \mathbb{R}^{n}\right)\right)=\left\{X:[0, t] \times \Omega \rightarrow \mathbb{R}^{n} \mid X(\cdot) \text { is } \mathbb{F}\right. \text {-adapted, } \\
& \left.X(\cdot) \text { has continuous paths, } \mathbb{E}\left[\sup _{s \in[0, t]}|X(s)|^{2}\right]<\infty\right\} .
\end{aligned}
$$

Note that in the definition of $\mathcal{X}[0, t]$, the continuity of $s \mapsto X(s)$ means that as a map from $[0, t]$ to $\mathcal{X}_{t}$, it is continuous. Whereas, in the definition of $\widehat{\mathcal{X}}[0, t], X(\cdot)$ has continuous paths means that for almost sure $\omega \in \Omega, s \mapsto X(s, \omega)$ is continuous. It is known that

$$
\widehat{\mathcal{X}}[0, t] \subseteq \mathcal{X}[0, t] \subseteq L_{\mathbb{F}}^{2}\left(0, t ; \mathbb{R}^{n}\right), \quad \widehat{\mathcal{X}}[0, t] \neq \mathcal{X}[0, t] \neq L_{\mathbb{F}}^{2}\left(0, t ; \mathbb{R}^{n}\right)
$$

We now introduce the following assumptions for the coefficients of the state equation.
(H1) The following hold:

$$
\left\{\begin{array}{l}
A(\cdot), \widehat{A}(\cdot), A_{1}(\cdot), \widehat{A}_{1}(\cdot) \in L^{\infty}\left(0, T ; \mathbb{R}^{n \times n}\right),  \tag{2.1}\\
B(\cdot), \widehat{B}(\cdot), B_{1}(\cdot), \widehat{B}_{1}(\cdot) \in L^{\infty}\left(0, T ; \mathbb{R}^{n \times m}\right) .
\end{array}\right.
$$

(H1)' The following hold:

$$
\begin{cases}A(\cdot), \widehat{A}(\cdot) \in L^{2}\left(0, T ; \mathbb{R}^{n \times n}\right), & A_{1}(\cdot), \widehat{A}_{1}(\cdot) \in L^{\infty}\left(0, T ; \mathbb{R}^{n \times n}\right),  \tag{2.2}\\ B(\cdot), \widehat{B}(\cdot) \in L^{2}\left(0, T ; \mathbb{R}^{n \times m}\right), & B_{1}(\cdot), \widehat{B}_{1}(\cdot) \in L^{\infty}\left(0, T ; \mathbb{R}^{n \times m}\right)\end{cases}
$$

(H1)" The following hold:

$$
\begin{cases}A(\cdot), \widehat{A}(\cdot) \in L^{1}\left(0, T ; \mathbb{R}^{n \times n}\right), & A_{1}(\cdot), \widehat{A}_{1}(\cdot) \in L^{2}\left(0, T ; \mathbb{R}^{n \times n}\right),  \tag{2.3}\\ B(\cdot), \widehat{B}(\cdot) \in L^{2}\left(0, T ; \mathbb{R}^{n \times m}\right), & B_{1}(\cdot), \widehat{B}_{1}(\cdot) \in L^{\infty}\left(0, T ; \mathbb{R}^{n \times m}\right)\end{cases}
$$

Clearly, (H1) implies (H1)' which further implies (H1)". Namely, (H1)" is the weakest assumption among the above three. Whereas, (H1) is the most common assumption. For the weighting matrices in the cost functional, we introduce the following assumption.
(H2) The following hold:

$$
\begin{equation*}
Q(\cdot), \widehat{Q}(\cdot) \in L^{\infty}\left(0, T ; \mathcal{S}^{n}\right), \quad R(\cdot), \widehat{R}(\cdot) \in L^{\infty}\left(0, T ; \mathcal{S}^{m}\right), \quad G, \widehat{G} \in \mathcal{S}^{n} \tag{2.4}
\end{equation*}
$$

(H2) ${ }^{\prime}$ In addition to (H2), the following holds:

$$
\left\{\begin{array}{l}
Q(s), Q(s)+\widehat{Q}(s) \geq 0, \quad R(s), R(s)+\widehat{R}(s) \geq 0, \quad s \in[0, T]  \tag{2.5}\\
G, G+\widehat{G} \geq 0
\end{array}\right.
$$

(H2) ${ }^{\prime \prime}$ In addition to (H2), the following holds: For some $\delta>0$,

$$
\left\{\begin{array}{l}
Q(s), Q(s)+\widehat{Q}(s) \geq 0, \quad R(s), R(s)+\widehat{R}(s) \geq \delta I, \quad s \in[0, T]  \tag{2.6}\\
G, G+\widehat{G} \geq 0
\end{array}\right.
$$

From (1.4), we see that $\widehat{Q}(\cdot), \widehat{R}(\cdot)$, and $\widehat{G}$ are not necessarily positive semi-definite. Therefore, in (H2), we do not mention positive-definiteness of the involved matrices and matrix-valued functions.

Now, for any $X(\cdot) \in L_{\mathbb{F}}^{2}\left(0, T ; \mathbb{R}^{n}\right)$ and any $u(\cdot) \in \mathcal{U}[0, T]$, we define

$$
\left\{\begin{align*}
& {[\mathcal{A} X(\cdot)](t)=\int_{0}^{t} }(A(s) X(s)+\widehat{A}(s) \mathbb{E}[X(s)]) d s  \tag{2.7}\\
& \quad+\int_{0}^{t}\left(A_{1}(s) X(s)+\widehat{A}_{1}(s) \mathbb{E}[X(s)]\right) d W(s), \quad t \in[0, T] \\
& {[\mathcal{B} u(\cdot)](t)=\int_{0}^{t}(B(s) u(s)+\widehat{B}(s) \mathbb{E}[u(s)]) d s } \\
&+\int_{0}^{t}\left(B_{1}(s) u(s)+\widehat{B}_{1}(s) \mathbb{E}[u(s)]\right) d W(s), \quad t \in[0, T]
\end{align*}\right.
$$

The following result is concerned with operators $\mathcal{A}$ and $\mathcal{B}$.
Lemma 2.1. The following estimates hold as long as the involved norms on the right hand sides are meaningful: For any $t \in[0, T]$,

$$
\begin{align*}
\|\mathcal{A} X(\cdot)\|_{\widehat{\mathcal{X}}[0, t]}^{2} \leq C & {\left[\|A(\cdot)\|_{L^{2}\left(0, t ; \mathbb{R}^{n \times n}\right)}^{2}+\|\widehat{A}(\cdot)\|_{L^{2}\left(0, t ; \mathbb{R}^{n \times n}\right)}^{2}\right.}  \tag{2.8}\\
& \left.+\left\|A_{1}(\cdot)\right\|_{L^{\infty}\left(0, t ; \mathbb{R}^{n \times n}\right)}^{2}+\left\|\widehat{A}_{1}(\cdot)\right\|_{L^{\infty}\left(0, t ; \mathbb{R}^{n \times n}\right)}^{2}\right]\|X(\cdot)\|_{L_{\mathbf{F}}^{2}\left(0, t ; \mathbb{R}^{n}\right)}^{2}, \\
\|\mathcal{A} X(\cdot)\|_{\widehat{\mathcal{X}}[0, t]}^{2} \leq & C\left[\|A(\cdot)\|_{L^{1}\left(0, t ; \mathbb{R}^{n \times n}\right)}^{2}+\|\widehat{A}(\cdot)\|_{L^{1}\left(0, t ; \mathbb{R}^{n \times n}\right)}^{2}\right.  \tag{2.9}\\
& \left.\quad+\left\|A_{1}(\cdot)\right\|_{L^{2}\left(0, t ; \mathbb{R}^{n \times n}\right)}^{2}+\left\|\widehat{A}_{1}(\cdot)\right\|_{L^{2}\left(0, t ; \mathbb{R}^{n \times n}\right)}^{2}\right]\|X(\cdot)\|_{\mathcal{X}[0, t]}^{2},
\end{align*}
$$

and

$$
\begin{align*}
\|\mathcal{B} u(\cdot)\|_{\widehat{\mathcal{X}}[0, t]}^{2} \leq C[ & \|B(\cdot)\|_{L^{2}\left(0, t ; \mathbb{R}^{n \times n}\right)}^{2}+\|\widehat{B}(\cdot)\|_{L^{2}\left(0, t ; \mathbb{R}^{n \times n}\right)}^{2}  \tag{2.10}\\
& \left.+\left\|B_{1}(\cdot)\right\|_{L^{\infty}\left(0, t ; \mathbb{R}^{n \times n}\right)}^{2}+\left\|\widehat{B}_{1}(\cdot)\right\|_{L^{\infty}\left(0, t ; \mathbb{R}^{n \times n}\right)}^{2}\right]\|u(\cdot)\|_{\mathcal{U}[0, t]}^{2}
\end{align*}
$$

Hereafter, $C>0$ represents a generic constant which can be different from line to line.
Proof. For any $t \in(0, T]$, and any $X(\cdot) \in L_{\mathbf{F}}^{2}\left(0, t ; \mathbb{R}^{n}\right)$,

$$
\begin{aligned}
& \mathbb{E}\left(\sup _{s \in[0, t]}|[\mathcal{A} X(\cdot)](s)|\right) \leq C\left\{\mathbb{E}\left(\int_{0}^{t}|A(s)||X(s)| d s\right)^{2}+\left(\int_{0}^{t}|\widehat{A}(s)||\mathbb{E}[X(s)]| d s\right)^{2}\right. \\
& \left.\quad+\mathbb{E} \int_{0}^{t}\left|A_{1}(s)\right|^{2}|X(s)|^{2} d s+\int_{0}^{t}\left|\widehat{A}_{1}(s)\right|^{2}|\mathbb{E}[X(s)]|^{2} d s\right\} \\
& \leq C \\
& \quad C\left\{\mathbb{E}\left[\left(\int_{0}^{t}|A(s)|^{2} d s\right)\left(\int_{0}^{t}|X(s)|^{2} d s\right)\right]+\left(\int_{0}^{t}|\widehat{A}(s)|^{2} d s\right)\left(\int_{0}^{t}|\mathbb{E}[X(s)]|^{2} d s\right)\right. \\
& \left.\quad+\left(\sup _{s \in[0, t]}\left|A_{1}(s)\right|\right)^{2} \int_{0}^{t} \mathbb{E}|X(s)|^{2} d s+\left(\sup _{s \in[0, t]}\left|\widehat{A}_{1}(s)\right|^{2}\right) \int_{0}^{t} \mathbb{E}|X(s)|^{2} d s\right\} \\
& \leq C\left\{\left(\int_{0}^{t}|A(s)|^{2} d s\right)+\left(\int_{0}^{t}|\widehat{A}(s)|^{2} d s\right)+\sup _{s \in[0, t]}\left|A_{1}(s)\right|^{2}+\sup _{s \in[0, t]}\left|\widehat{A}_{1}(s)\right|^{2}\right\} \int_{0}^{t} \mathbb{E}|X(s)|^{2} d s
\end{aligned}
$$

Thus, estimate (2.8) holds. Next, for any $X(\cdot) \in \mathcal{X}[0, t]$, making use of Burkholder-Davis-Gundy's inequality ([34]), we have

$$
\begin{aligned}
& \mathbb{E}\left(\sup _{s \in[0, t]}|[\mathcal{A} X(\cdot)](s)|^{2}\right) \leq \leq\left\{\mathbb{E}\left(\int_{0}^{t}|A(s)||X(s)| d s\right)^{2}+\left(\int_{0}^{t}|\widehat{A}(s)||\mathbb{E}[X(s)]| d s\right)^{2}\right. \\
&\left.+\mathbb{E} \int_{0}^{t}\left|A_{1}(s)\right|^{2}|X(s)|^{2} d s+\int_{0}^{t}\left|\widehat{A}_{1}(s)\right|^{2}|\mathbb{E}[X(s)]|^{2} d s\right\} \\
& \leq C\left\{\left(\int_{0}^{t}|A(s)| d s\right)\left(\int_{0}^{t}|A(s)| \mathbb{E}|X(s)|^{2} d s\right)+\left(\int_{0}^{t}|\widehat{A}(s)| d s\right)^{2}\left(\sup _{s \in[0, t]}|\mathbb{E}[X(s)]|^{2}\right)\right. \\
&\left.+\int_{0}^{t}\left|A_{1}(s)\right|^{2} \mathbb{E}|X(s)|^{2} d s+\int_{0}^{t}\left|\widehat{A}_{1}(s)\right|^{2} \mathbb{E}|X(s)|^{2} d s\right\} \\
& \leq C\left[\left(\int_{0}^{t}|A(s)| d s\right)^{2}+\right.\left.\left(\int_{0}^{t}|\widehat{A}(s)| d s\right)^{2}+\int_{0}^{t}\left|A_{1}(s)\right|^{2} d s+\int_{0}^{t}\left|\widehat{A}_{1}(s)\right|^{2} d s\right]\left(\sup _{s \in[0, t]} \mathbb{E}|X(s)|^{2}\right) .
\end{aligned}
$$

Hence, (2.9) follows.
Similar to the proof of (2.8), we can prove (2.10).
The above lemma leads to the following corollary.

Corollary 2.2. If (H1)" holds, then $\mathcal{A}: \mathcal{X}[0, T] \rightarrow \widehat{\mathcal{X}}[0, T]$ and $\mathcal{B}: \mathcal{U}[0, T] \rightarrow \widehat{\mathcal{X}}[0, T]$ are bounded. Further, if (H1)' holds, then $\mathcal{A}: L_{\mathbb{F}}^{2}\left(0, T ; \mathbb{R}^{n}\right) \rightarrow \widehat{\mathcal{X}}[0, T]$ is also bounded. In particular, all the above hold if (H1) holds.

Next, we define

$$
\left\{\begin{align*}
I_{T} X(\cdot) & =X(T),  \tag{2.11}\\
\mathcal{A}_{T} X(\cdot) & =I_{T} \mathcal{A} X(\cdot) \equiv[\mathcal{A} X(\cdot)](T) \\
& =\int_{0}^{T}(A(s) X(s)+\widehat{A}(s) \mathbb{E}[X(s)]) d s+\int_{0}^{T}\left(A_{1}(s) X(s)+\widehat{A}_{1}(s) \mathbb{E}[X(s)]\right) d W(s), \\
\mathcal{B}_{T} u(\cdot) & =I_{T} \mathcal{B} u(\cdot) \equiv[\mathcal{B} u(\cdot)](T) \\
& =\int_{0}^{T}(B(s) u(s)+\widehat{B}(s) \mathbb{E}[u(s)]) d s+\int_{0}^{T}\left(B_{1}(s) u(s)+\widehat{B}_{1}(s) \mathbb{E}[u(s)]\right) d W(s) .
\end{align*}\right.
$$

It is easy to see that

$$
I_{T}: \mathcal{X}[0, T] \rightarrow \mathcal{X}_{T}
$$

is bounded. According to Lemma 2.1, we have the following result.
Corollary 2.3. If (H1)" holds, then $\mathcal{A}_{T}: \mathcal{X}[0, T] \rightarrow \mathcal{X}_{T}$ and $\mathcal{B}_{T}: \mathcal{U}[0, T] \rightarrow \mathcal{X}_{T}$ are bounded. Further, if (H1)' holds, then $\mathcal{A}_{T}: L_{\mathbb{F}}^{2}\left(0, T ; \mathbb{R}^{n}\right) \rightarrow \mathcal{X}_{T}$ is also bounded. In particular, all the above hold if (H1) holds.

Recall that if $\xi \in \mathcal{X}_{T}$, then there exists a unique $\zeta(\cdot) \in L_{\mathbb{F}}^{2}\left(0, T ; \mathbb{R}^{n}\right)$ such that

$$
\xi=\mathbb{E} \xi+\int_{0}^{T} \zeta(s) d W(s) .
$$

We denote

$$
\zeta(s)=D_{s} \xi, \quad s \in[0, T],
$$

and call it the Malliavin derivative of $\xi([27])$. Next, we have the following results which give representation of the adjoint operators of $\mathcal{A}, \mathcal{B}, \mathcal{A}_{T}$, and $\mathcal{B}_{T}$.

Proposition 2.4. The following hold:

$$
\left\{\begin{array}{l}
\left(\mathcal{A}^{*} Y\right)(s)=\int_{s}^{T}\left(A(s)^{T} Y(t)+\widehat{A}(s)^{T} \mathbb{E}[Y(t)]+A_{1}(s)^{T} D_{s} Y(t)+\widehat{A}_{1}(s)^{T} \mathbb{E}\left[D_{s} Y(t)\right]\right) d t,  \tag{2.12}\\
\left(\mathcal{B}^{*} Y\right)(s)=\int_{s}^{T}\left(B(s)^{T} Y(t)+\widehat{B}(s)^{T} \mathbb{E}[Y(t)]+B_{1}(s)^{T} D_{s} Y(t)+\widehat{B}_{1}(s)^{T} \mathbb{E}\left[D_{s} Y(t)\right]\right) d t, \\
\left(\mathcal{A}_{T}^{*} \xi\right)(s)=A(s)^{T} \xi+\widehat{A}(s)^{T} \mathbb{E} \xi+A_{1}(s)^{T} D_{s} \xi+\widehat{A}_{1}(s)^{T} \mathbb{E}\left[D_{s} \xi\right], \\
\left(\mathcal{B}_{T}^{*} \xi\right)(s)=B(s)^{T} \xi+\widehat{B}(s)^{T} \mathbb{E} \xi+B_{1}(s)^{T} D_{s} \xi+\widehat{B}_{1}(s)^{T} \mathbb{E}\left[D_{s} \xi\right] .
\end{array}\right.
$$

Proof. For any $Y(\cdot) \in L_{\mathbb{F}}^{2}\left(0, T ; \mathbb{R}^{n}\right)$,

$$
\begin{aligned}
& \left\langle X, \mathcal{A}^{*} Y\right\rangle=\langle\mathcal{A} X, Y\rangle=\mathbb{E} \int_{0}^{T}\langle[\mathcal{A} X](t), Y(t)\rangle d t \\
& =\mathbb{E} \int_{0}^{T}\left\langle\int_{0}^{t}(A(s) X(s)+\widehat{A}(s) \mathbb{E}[X(s)]) d s+\int_{0}^{t}\left(A_{1}(s) X(s)+\widehat{A}_{1}(s) \mathbb{E}[X(s)]\right) d W(s), Y(t)\right\rangle d t \\
& =\mathbb{E} \int_{0}^{T} \int_{s}^{T}\langle A(s) X(s)+\widehat{A}(s) \mathbb{E}[X(s)], Y(t)\rangle d t d s+\mathbb{E} \int_{0}^{T} \int_{s}^{T}\left\langle A_{1}(s) X(s)+\widehat{A}_{1}(s) \mathbb{E}[X(s)], D_{s} Y(t)\right\rangle d t d s \\
& =\mathbb{E} \int_{0}^{T}\left\langle X(s), \int_{s}^{T}\left(A(s)^{T} Y(t)+\widehat{A}(s)^{T} \mathbb{E}[Y(t)]+A_{1}(s)^{T} D_{s} Y(t)+\widehat{A}_{1}(s)^{T} \mathbb{E}\left[D_{s} Y(t)\right]\right) d t\right\rangle d s .
\end{aligned}
$$

Thus, the representation of $\mathcal{A}^{*}$ follows. Similarly, we can obtain the representation of $\mathcal{B}^{*}$.
Next, for any $\xi \in \mathcal{X}_{T}$,

$$
\begin{aligned}
& \left\langle X, \mathcal{A}_{T}^{*} \xi\right\rangle=\left\langle\mathcal{A}_{T} X, \xi\right\rangle \\
& =\mathbb{E}\left\langle\int_{0}^{T}(A(s) X(s)+\widehat{A}(s) \mathbb{E}[X(s)]) d s, \xi\right\rangle+\mathbb{E}\left\langle\int_{0}^{T}\left(A_{1}(s) X(s)+\widehat{A}_{1}(s) \mathbb{E}[X(s)]\right) d W(s), \xi\right\rangle \\
& =\mathbb{E} \int_{0}^{T}\left\langle X(s), A(s)^{T} \xi+\widehat{A}(s)^{T} \mathbb{E} \xi+A_{1}(s)^{T} D_{s} \xi+\widehat{A}_{1}(s)^{T} \mathbb{E}\left[D_{s} \xi\right]\right\rangle d s .
\end{aligned}
$$

Therefore, the representation of $\mathcal{A}_{T}^{*}$ follows. Similarly, we can obtain the representation of $\mathcal{B}_{T}^{*}$.
For completeness, let us also prove the following result.
Proposition 2.5. It holds

$$
\begin{equation*}
I_{T}^{*} \xi=\xi \delta_{\{T\}}, \quad \forall \xi \in \mathcal{X}_{T}, \tag{2.13}
\end{equation*}
$$

where $\delta_{\{T\}}$ is the Dirac measure at $T$, and

$$
\begin{equation*}
\mathbb{E}^{*} x=x^{T} \mathbb{E}, \quad \forall x \in \mathbb{R}^{n} \tag{2.14}
\end{equation*}
$$

Proof. First of all, since $I_{T}: \mathcal{X}[0, T] \rightarrow \mathcal{X}_{T}$ is bounded, we have $I_{T}^{*}: \mathcal{X}_{T}^{*} \equiv \mathcal{X}_{T} \rightarrow \mathcal{X}[0, T]^{*}$. For any $\xi \in \mathcal{X}_{T}$, and any $Y(\cdot) \in \mathcal{X}[0, T]$, we have

$$
\left\langle I_{T}^{*} \xi, Y(\cdot)\right\rangle=\left\langle\xi, I_{T} Y(\cdot)\right\rangle=\mathbb{E}\langle\xi, Y(T)\rangle=\mathbb{E} \int_{0}^{T}\langle Y(s), \xi\rangle \delta_{T}(d s)
$$

Next, since $\mathbb{E}: \mathcal{X}_{T} \rightarrow \mathbb{R}$ is bounded, we have $\mathbb{E}^{*}: \mathbb{R} \rightarrow \mathcal{X}_{T}$. For any $\xi \in \mathcal{X}_{T}$ and $x \in \mathbb{R}$,

$$
\left\langle\mathbb{E}^{*} x, \xi\right\rangle=\langle x, \mathbb{E} \xi\rangle=\mathbb{E}\langle x, \xi\rangle=x^{T} \mathbb{E} \xi
$$

This completes the proof.
With operators $\mathcal{A}$ and $\mathcal{B}$, we can write the state equation (1.1) as follows:

$$
\begin{equation*}
X=x+\mathcal{A} X+\mathcal{B} u \tag{2.15}
\end{equation*}
$$

We now have the following result for the well-posedness of the state equaton.
Proposition 2.6. Let (H1) hold. Then for any $(x, u(\cdot)) \in \mathbb{R}^{n} \times \mathcal{U}[0, T]$, state equation (1.1) admits a unique solution $X(\cdot) \equiv X(\cdot ; x, u(\cdot)) \in \widehat{\mathcal{X}}[0, T]$.

Proof. For any $X(\cdot) \in \mathcal{X}[0, T]$ and $u(\cdot) \in \mathcal{U}[0, T]$, by (2.9), we have

$$
\mathbb{E}\left[\sup _{s \in[0, t]}|(\mathcal{A} X)(s)|^{2}\right] \leq \alpha(t) \mathbb{E}\left[\sup _{s \in[0, t]}|X(s)|^{2}\right],
$$

with $\alpha(t) \in(0,1)$ when $t>0$ is small. Hence, by contraction mapping theorem, we obtain well-posedness of the state equation on $[0, t]$. Then by a usual continuation argument, we obtain the well-posedness of the state equation on $[0, T]$.

From (2.9), we see that if for some $\varepsilon>0$,

$$
\left\{\begin{array}{lr}
A(\cdot), \widehat{A}(\cdot) \in L^{1+\varepsilon}\left(0, T ; \mathbb{R}^{n \times n}\right), & A_{1}(\cdot), \widehat{A}_{1}(\cdot) \in L^{2+\varepsilon}\left(0, T ; \mathbb{R}^{n \times n}\right),  \tag{2.16}\\
B(\cdot), \widehat{B}(\cdot) \in L^{2}\left(0, T ; \mathbb{R}^{n \times m}\right), & B_{1}(\cdot), \widehat{B}_{1}(\cdot) \in L^{\infty}\left(0, T ; \mathbb{R}^{n \times m}\right),
\end{array}\right.
$$

then the result of Proposition 2.6 holds. It is ready to see that (2.16) is stronger than (H1)" and weaker than (H1)'. In what follows, for convenient, we will assume (H1). However, we keep in mind that (H1) can actually be relaxed.

Proposition 2.6 tells us that under, say, (H1), the operator $I-\mathcal{A}: \widehat{\mathcal{X}}[0, T] \rightarrow \widehat{\mathcal{X}}[0, T]$ is invertible and the solution $X$ to the state equation corresponding to $(x, u(\cdot)) \in \mathbb{R}^{n} \times \mathcal{U}[0, T]$ is given by

$$
X=(I-\mathcal{A})^{-1} x+(I-\mathcal{A})^{-1} \mathcal{B} u
$$

Note that

$$
\begin{aligned}
& I_{T}\left[(I-\mathcal{A})^{-1} x+(I-\mathcal{A})^{-1} \mathcal{B} u\right]=I_{T} X=X(T)=x+\mathcal{A}_{T} X+\mathcal{B}_{T} u \\
& =\left[I+\mathcal{A}_{T}(I-\mathcal{A})^{-1}\right] x+\left[\mathcal{A}_{T}(I-\mathcal{A})^{-1} \mathcal{B}+\mathcal{B}_{T}\right] u .
\end{aligned}
$$

Therefore,

$$
I_{T}(I-\mathcal{A})^{-1}=I+\mathcal{A}_{T}(I-\mathcal{A})^{-1}, \quad I_{T}(I-\mathcal{A})^{-1} \mathcal{B}=\mathcal{A}_{T}(I-\mathcal{A})^{-1} \mathcal{B}+\mathcal{B}_{T} .
$$

Now, let

$$
\left\{\begin{array}{lll}
{[\mathcal{Q} X(\cdot)](s)=Q(s) X(s),} & s \in[0, T], & \forall X(\cdot) \in L_{\mathbb{F}}^{2}\left(0, T ; \mathbb{R}^{n}\right), \\
{[\widehat{\mathcal{Q}} \varphi(\cdot)](s)=\widehat{Q}(s) \varphi(s), \quad s \in[0, T],} & \forall \varphi(\cdot) \in L^{2}\left(0, T ; \mathbb{R}^{n}\right), \\
{[\mathcal{R} u(\cdot)](s)=R(s) u(s), \quad s \in[0, T],} & \forall u(\cdot) \in \mathcal{U}[0, T], \\
{[\widehat{\mathcal{R}} \psi(\cdot)](s)=\widehat{R}(s) \psi(s), \quad s \in[0, T],} & \forall \psi(\cdot) \in L^{2}\left(0, T ; \mathbb{R}^{m}\right), \\
\mathcal{G} \xi=G \xi, \quad \forall \xi \in \mathcal{X}_{T}, & \widehat{\mathcal{G}} x=\widehat{G} x, & \forall x \in \mathbb{R}^{n} .
\end{array}\right.
$$

Then the cost functional can be written as

$$
\begin{align*}
& J(x ; u(\cdot))=\langle\mathcal{Q} X, X\rangle+\langle\widehat{\mathcal{Q}} \mathbb{E} X, \mathbb{E} X\rangle+\langle\mathcal{R} u, u\rangle+\langle\widehat{\mathcal{R}} \mathbb{E} u, \mathbb{E} u\rangle+\langle\mathcal{G} X(T), X(T)\rangle+\langle\widehat{\mathcal{G}} \mathbb{E} X(T), \mathbb{E} X(T)\rangle \\
& =\left\langle\mathcal{Q}\left[(I-\mathcal{A})^{-1} x+(I-\mathcal{A})^{-1} \mathcal{B} u\right],(I-\mathcal{A})^{-1} x+(I-\mathcal{A})^{-1} \mathcal{B} u\right\rangle \\
& +\left\langle\widehat{\mathcal{Q}} \mathbb{E}\left[(I-\mathcal{A})^{-1} x+(I-\mathcal{A})^{-1} \mathcal{B} u\right], \mathbb{E}\left[(I-\mathcal{A})^{-1} x+(I-\mathcal{A})^{-1} \mathcal{B} u\right]\right\rangle+\langle\mathcal{R} u, u\rangle+\langle\widehat{\mathcal{R}} \mathbb{E} u, \mathbb{E} u\rangle  \tag{2.17}\\
& +\left\langle\mathcal{G}\left\{\left[I+\mathcal{A}_{T}(I-\mathcal{A})^{-1}\right] x+\left[\mathcal{A}_{T}(I-\mathcal{A})^{-1} \mathcal{B}+\mathcal{B}_{T}\right] u\right\},\left[I+\mathcal{A}_{T}(I-\mathcal{A})^{-1}\right] x+\left[\mathcal{A}_{T}(I-\mathcal{A})^{-1} \mathcal{B}+\mathcal{B}_{T}\right] u\right\rangle \\
& \left.+\left\langle\widehat{\mathcal{G}} \mathbb{E}\left\{I+\mathcal{A}_{T}(I-\mathcal{A})^{-1}\right] x+\left[\mathcal{A}_{T}(I-\mathcal{A})^{-1} \mathcal{B}+\mathcal{B}_{T}\right] u\right\}, \mathbb{E}\left\{\left[I+\mathcal{A}_{T}(I-\mathcal{A})^{-1}\right] x+\left[\mathcal{A}_{T}(I-\mathcal{A})^{-1} \mathcal{B}+\mathcal{B}_{T}\right] u\right\}\right\rangle \\
& \equiv\left\langle\Theta_{2} u, u\right\rangle+2\left\langle\Theta_{1} x, u\right\rangle+\left\langle\Theta_{0} x, x\right\rangle,
\end{align*}
$$

where

$$
\begin{aligned}
& \Theta_{2}= \mathcal{R}+\mathbb{E}^{*} \widehat{\mathcal{R}} \mathbb{E}+\mathcal{B}^{*}\left(I-\mathcal{A}^{*}\right)^{-1} \mathcal{Q}(I-\mathcal{A})^{-1} \mathcal{B}+\mathcal{B}^{*}\left(I-\mathcal{A}^{*}\right)^{-1} \mathbb{E}^{*} \widehat{\mathcal{Q}} \mathbb{E}(I-\mathcal{A})^{-1} \mathcal{B} \\
&+\left[\mathcal{B}^{*}\left(I-\mathcal{A}^{*}\right)^{-1} \mathcal{A}_{T}^{*}+\mathcal{B}_{T}^{*}\right] \mathcal{G}\left[\mathcal{A}_{T}(I-\mathcal{A})^{-1} \mathcal{B}+\mathcal{B}_{T}\right]+\left[\mathcal{B}^{*}\left(I-\mathcal{A}^{*}\right)^{-1} \mathcal{A}_{T}^{*}+\mathcal{B}_{T}^{*}\right] \mathbb{E}^{*} \widehat{\mathcal{G}} \mathbb{E}\left[\mathcal{A}_{T}(I-\mathcal{A})^{-1} \mathcal{B}+\mathcal{B}_{T}\right] \\
&= \mathcal{R}+\mathbb{E}^{*} \widehat{\mathcal{R}} \mathbb{E}+\mathcal{B}^{*}\left(I-\mathcal{A}^{*}\right)^{-1}\left(\mathcal{Q}+\mathbb{E}^{*} \widehat{\mathcal{Q}} \mathbb{E}\right)(I-\mathcal{A})^{-1} \mathcal{B} \\
&+\left[\mathcal{B}^{*}\left(I-\mathcal{A}^{*}\right)^{-1} \mathcal{A}_{T}^{*}+\mathcal{B}_{T}^{*}\right]\left(\mathcal{G}+\mathbb{E}^{*} \widehat{\mathcal{G}} \mathbb{E}\right)\left[\mathcal{A}_{T}(I-\mathcal{A})^{-1} \mathcal{B}+\mathcal{B}_{T}\right], \\
& \Theta_{1}= \mathcal{B}^{*}\left(I-\mathcal{A}^{*}\right)^{-1} \mathcal{Q}(I-\mathcal{A})^{-1}+\mathcal{B}^{*}\left(I-\mathcal{A}^{*}\right)^{-1} \mathbb{E}^{*} \widehat{\mathcal{Q}} \mathbb{E}(I-\mathcal{A})^{-1} \\
&+\left[\mathcal{B}^{*}\left(I-\mathcal{A}^{*}\right)^{-1} \mathcal{A}_{T}^{*}+\mathcal{B}_{T}^{*}\right] \mathcal{G}\left[I+\mathcal{A}_{T}(I-\mathcal{A})^{-1}\right] \\
&+\left[\mathcal{B}^{*}\left(I-\mathcal{A}^{*}\right)^{-1} \mathcal{A}_{T}^{*}+\mathcal{B}_{T}^{*}\right] \mathbb{E}^{*} \widehat{\mathcal{G}} \mathbb{E}\left[I+\mathcal{A}_{T}(I-\mathcal{A})^{-1}\right] \\
&=\mathcal{B}^{*}\left(I-\mathcal{A}^{*}\right)^{-1}\left(\mathcal{Q}+\mathbb{E}^{*} \widehat{\mathcal{Q}} \mathbb{E}\right)(I-\mathcal{A})^{-1}+\left[\mathcal{B}^{*}\left(I-\mathcal{A}^{*}\right)^{-1} \mathcal{A}_{T}^{*}+\mathcal{B}_{T}^{*}\right]\left(\mathcal{G}+\mathbb{E}^{*} \widehat{\mathcal{G}} \mathbb{E}\right)\left[I+\mathcal{A}_{T}(I-\mathcal{A})^{-1}\right], \\
& \Theta_{0}=\left(I-\mathcal{A}^{*}\right)^{-1} \mathcal{Q}(I-\mathcal{A})^{-1}+\left(I-\mathcal{A}^{*}\right)^{-1} \mathbb{E}^{*} \widehat{\mathcal{Q}} \mathbb{E}(I-\mathcal{A})^{-1} \\
&+\left[I+\left(I-\mathcal{A}^{*}\right)^{-1} \mathcal{A}_{T}^{*}\right] \mathcal{G}\left[I+\mathcal{A}_{T}(I-\mathcal{A})^{-1}\right]+\left[I+\left(I-\mathcal{A}^{*}\right)^{-1} \mathcal{A}_{T}^{*}\right] \mathbb{E}^{*} \widehat{\mathcal{G}} \mathbb{E}\left[I+\mathcal{A}_{T}(I-\mathcal{A})^{-1}\right] \\
&=\left(I-\mathcal{A}^{*}\right)^{-1}\left(\mathcal{Q}+\mathbb{E}^{*} \widehat{\mathcal{Q} \mathbb{E})(I-\mathcal{A})^{-1}+\left[I+\left(I-\mathcal{A}^{*}\right)^{-1} \mathcal{A}_{T}^{*}\right]\left(\mathcal{G}+\mathbb{E}^{*} \widehat{\mathcal{G}} \mathbb{E}\right)\left[I+\mathcal{A}_{T}(I-\mathcal{A})^{-1}\right] .} .\right.
\end{aligned}
$$

Consequently, for any $u(\cdot), v(\cdot) \in \mathcal{U}[0, T]$, and $x \in \mathbb{R}^{n}$,

$$
\begin{align*}
& J(x ;v(\cdot))=J(x ; u(\cdot)+[v(\cdot)-u(\cdot)]) \\
&=\left\langle\Theta_{2}[u+(v-u)], u+(v-u)\right\rangle+2\left\langle\Theta_{1} x, u+(v-u)\right\rangle+\left\langle\Theta_{0} x, x\right\rangle  \tag{2.18}\\
& \quad=\left\langle\Theta_{2} u, u\right\rangle+2\left\langle\Theta_{1} x, u\right\rangle+\left\langle\Theta_{0} x, x\right\rangle+2\left\langle\Theta_{2} u+\Theta_{1} x, v-u\right\rangle+\left\langle\Theta_{2}(v-u), v-u\right\rangle \\
& \quad=J(x ; u(\cdot))+2\left\langle\Theta_{2} u+\Theta_{1} x, v-u\right\rangle+\left\langle\Theta_{2}(v-u), v-u\right\rangle
\end{align*}
$$

We now present the following result whose proof is standard, making use of the above (see [26] for details).
Proposition 2.7. If $u(\cdot) \mapsto J(x ; u(\cdot))$ admits a minimum, then

$$
\begin{equation*}
\Theta_{2} \geq 0 \tag{2.19}
\end{equation*}
$$

Conversely, if in addition to (2.19), one has

$$
\begin{equation*}
\Theta_{1} x \in \Theta_{2}(\mathcal{U}[0, T]) \tag{2.20}
\end{equation*}
$$

then $u(\cdot) \mapsto J(x ; u(\cdot))$ admits a minimum $\bar{u}(\cdot) \in \mathcal{U}[0, T]$. Further, if

$$
\begin{equation*}
\Theta_{2} \geq \delta I \tag{2.21}
\end{equation*}
$$

for some $\delta>0$, then for any given $x \in \mathbb{R}^{n}, u(\cdot) \mapsto J(x ; u(\cdot))$ admits a unique minimum.
By the definition of $\Theta_{2}$, we see that (2.19) is implied by the following:

$$
\begin{equation*}
\mathcal{R}+\mathbb{E}^{*} \widehat{\mathcal{R}} \mathbb{E} \geq 0, \quad \mathcal{Q}+\mathbb{E}^{*} \widehat{\mathcal{Q}} \mathbb{E} \geq 0, \quad \mathcal{G}+\mathbb{E}^{*} \widehat{\mathcal{G}} \mathbb{E} \geq 0 \tag{2.22}
\end{equation*}
$$

and (2.21) is implied by

$$
\begin{equation*}
\mathcal{R}+\mathbb{E}^{*} \widehat{\mathcal{R}} \mathbb{E} \geq \delta I, \quad \mathcal{Q}+\mathbb{E}^{*} \widehat{\mathcal{Q}} \mathbb{E} \geq 0, \quad \mathcal{G}+\mathbb{E}^{*} \widehat{\mathcal{G}} \mathbb{E} \geq 0 \tag{2.23}
\end{equation*}
$$

for some $\delta>0$. Now, we would like to present more direct conditions under which (2.19) and (2.21) hold, respectively.

Proposition 2.8. Let (H1) and (H2) hold. Then (2.19) holds. Further, if (H2)" holds for some $\delta>0$, then (2.21) holds and Problem (MF) admits a unique solution.

Proof. For any $\xi \in \mathcal{X}_{T}$,

$$
\begin{aligned}
& \mathbb{E}[\langle G \xi, \xi\rangle+\langle\widehat{G} \mathbb{E}[\xi], \mathbb{E}[\xi]\rangle]=\mathbb{E}[\langle G(\xi-\mathbb{E}[\xi]), \xi-\mathbb{E}[\xi]\rangle+\langle(G+\widehat{G}) \mathbb{E}[\xi], \mathbb{E}[\xi]\rangle] \geq 0 \\
& \mathbb{E}[\langle Q(s) \xi, \xi\rangle+\langle\widehat{Q}(s) \mathbb{E}[\xi], \mathbb{E}[\xi]\rangle]=\mathbb{E}[\langle Q(s)(\xi-\mathbb{E}[\xi]), \xi-\mathbb{E}[\xi]\rangle+\langle[Q(s)+\widehat{Q}(s)] \mathbb{E}[\xi], \mathbb{E}[\xi]\rangle] \geq 0
\end{aligned}
$$

and for any $\eta \in \mathcal{U}_{T}$,

$$
\mathbb{E}[\langle R(s) \eta, \eta\rangle+\langle\widehat{R}(s) \mathbb{E}[\eta], \mathbb{E}[\eta]\rangle]=\mathbb{E}[\langle R(s)(\eta-\mathbb{E}[\eta]), \eta-\mathbb{E}[\eta]\rangle+\langle[R(s)+\widehat{R}(s)] \mathbb{E}[\eta], \mathbb{E}[\eta]\rangle] \geq 0
$$

Thus, (2.19) holds. Next, if (H2) ${ }^{\prime \prime}$ holds, then

$$
\begin{aligned}
& \mathbb{E}[\langle R(s) \eta, \eta\rangle+\langle\widehat{R}(s) \mathbb{E}[\eta], \mathbb{E}[\eta]\rangle]=\mathbb{E}[\langle R(s)(\eta-\mathbb{E}[\eta]), \eta-\mathbb{E}[\eta]\rangle+\langle[R(s)+\widehat{R}(s)] \mathbb{E}[\eta], \mathbb{E}[\eta]\rangle] \\
& \quad \geq \delta \mathbb{E}\left[|\eta-\mathbb{E}[\eta]|^{2}+|\mathbb{E}[\eta]|^{2}\right]=\delta \mathbb{E}|\eta|^{2}
\end{aligned}
$$

Hence, (2.21) holds.

## 3 Optimality Conditions.

In this section, we first derive a necessary condition for optimal pair of Problem (MF).
Theorem 3.1. Let (H1) and (H2) hold. Let $(\bar{X}(\cdot), \bar{u}(\cdot))$ be an optimal pair of Problem (MF). Then the following mean-field backward stochastic differential equation (MF-BSDE, for short) admits a unique adapted solution $(Y(\cdot), Z(\cdot))$ :

$$
\left\{\begin{array}{l}
d Y(s)=-\left(A(s)^{T} Y(s)+A_{1}(s)^{T} Z(s)+\widehat{A}(s)^{T} \mathbb{E}[Y(s)]+\widehat{A}_{1}(s)^{T} \mathbb{E}[Z(s)]\right.  \tag{3.1}\\
\\
\quad+Q(s) \bar{X}(s)+\widehat{Q}(s) \mathbb{E}[\bar{X}(s)]) d s+Z(s) d W(s), \quad s \in[0, T], \\
Y(T)=G \bar{X}(T)+\widehat{G} \mathbb{E}[\bar{X}(T)],
\end{array}\right.
$$

such that

$$
\begin{gather*}
R(s) \bar{u}(s)+B(s)^{T} Y(s)+B_{1}(s)^{T} Z(s)+\widehat{R}(s) \mathbb{E}[\bar{u}(s)]+\widehat{B}(s)^{T} \mathbb{E}[Y(s)]+\widehat{B}_{1}(s)^{T} \mathbb{E}[Z(s)]=0,  \tag{3.2}\\
s \in[0, T], \quad \text { a.s. }
\end{gather*}
$$

Proof. Let $(\bar{X}(\cdot), \bar{u}(\cdot))$ be an optimal pair of Problem (MF). For any $u(\cdot) \in \mathcal{U}[0, T]$, let $X(\cdot)$ be the state process corresponding to the zero initial condition and the control $u(\cdot)$. Then we have

$$
\begin{aligned}
& 0=\mathbb{E}\left\{\int_{0}^{T}\right. {[\langle Q(s) \bar{X}(s), X(s)\rangle+\langle\widehat{Q}(s) \mathbb{E}[\bar{X}(s)], \mathbb{E}[X(s)]\rangle+\langle R(s) \bar{u}(s), u(s)\rangle} \\
&+\langle\widehat{R}(s) \mathbb{E}[\bar{u}(s)], \mathbb{E}[u(s)]\rangle] d s+\langle G \bar{X}(T), X(T)\rangle+\langle\widehat{G} \mathbb{E}[\bar{X}(T)], \mathbb{E}[X(T)]\rangle\} \\
&=\mathbb{E}\left\{\int_{0}^{T}[\langle Q(s) \bar{X}(s)+\widehat{Q}(s) \mathbb{E}[\bar{X}(s)], X(s)\rangle+\langle R(s) \bar{u}(s)+\widehat{R}(s) \mathbb{E}[\bar{u}(s)], u(s)\rangle] d s\right. \\
&+\langle G \bar{X}(T)+\widehat{G} \mathbb{E}[\bar{X}(T)], X(T)\rangle\},
\end{aligned}
$$

On the other hand, by [9], we know that (3.1) admits a unique adapted solution $(Y(\cdot), Z(\cdot))$. Then

$$
\begin{aligned}
& \mathbb{E}\langle X(T), G \bar{X}(T)+\widehat{G} \mathbb{E}[\bar{X}(T)]\rangle=\mathbb{E}\langle X(T), Y(T)\rangle \\
&=\mathbb{E}\left\{\int_{0}^{T}(\langle A(s) X(s)+B(s) u(s)+\widehat{A}(s) \mathbb{E}[X(s)]+\widehat{B}(s) \mathbb{E}[u(s)], Y(s)\rangle\right. \\
&-\left\langle X(s), A(s)^{T} Y(s)+A_{1}(s)^{T} Z(s)+\widehat{A}(s)^{T} \mathbb{E}[Y(s)]+\widehat{A}_{1}(s)^{T} \mathbb{E}[Z(s)]+Q(s) \bar{X}(s)+\widehat{Q}(s) \mathbb{E}[\bar{X}(s)]\right\rangle \\
&\left.\left.+\left\langle A_{1}(s) X(s)+B_{1}(s) u(s)+\widehat{A}_{1}(s) \mathbb{E}[X(s)]+\widehat{B}_{1}(s) \mathbb{E}[u(s)], Z(s)\right\rangle\right) d s\right\} \\
&=\mathbb{E}\{ \int_{0}^{T}(-\langle X(s), Q(s) \bar{X}(s)+\widehat{Q}(s) \mathbb{E}[\bar{X}(s)]\rangle \\
&\left.\left.\quad+\left\langle u(s), B(s)^{T} Y(s)+B_{1}(s)^{T} Z(s)+\widehat{B}(s)^{T} \mathbb{E}[Y(s)]+\widehat{B}_{1}(s)^{T} \mathbb{E}[Z(s)]\right\rangle\right) d s\right\} .
\end{aligned}
$$

Hence,

$$
\mathbb{E} \int_{0}^{T}\left(\left\langle u(s), B(s)^{T} Y(s)+B_{1}(s)^{T} Z(s)+\widehat{B}(s)^{T} \mathbb{E}[Y(s)]+\widehat{B}_{1}(s)^{T} \mathbb{E}[Z(s)]+R(s) \bar{u}(s)+\widehat{R}(s) \mathbb{E}[\bar{u}(s)]\right\rangle\right) d s=0,
$$

which leads to

$$
R(s) \bar{u}(s)+B(s)^{T} Y(s)+B_{1}(s)^{T} Z(s)+\widehat{R}(s) \mathbb{E}[\bar{u}(s)]+\widehat{B}(s)^{T} \mathbb{E}[Y(s)]+\widehat{B}_{1}(s)^{T} \mathbb{E}[Z(s)]=0
$$

This completes the proof.

From the above, we end up with the following optimality system: (with $s$ suppressed)

$$
\left\{\begin{array}{l}
d \bar{X}=(A \bar{X}+B \bar{u}+\widehat{A} \mathbb{E}[\bar{X}]+\widehat{B} \mathbb{E}[\bar{u}]) d s+\left(A_{1} \bar{X}+B_{1} \bar{u}+\widehat{A}_{1} \mathbb{E}[\bar{X}]+\widehat{B}_{1} \mathbb{E}[\bar{u}]\right) d W(s),  \tag{3.3}\\
d Y=-\left(A^{T} Y+A_{1}^{T} Z+Q \bar{X}+\widehat{A}^{T} \mathbb{E}[Y]+\widehat{A}_{1}^{T} \mathbb{E}[Z]+\widehat{Q} \mathbb{E}[\bar{X}]\right) d s+Z d W(s) \\
X(0)=x, \quad Y(T)=G \bar{X}(T)+\widehat{G} \mathbb{E}[\bar{X}(T)] \\
R \bar{u}+\widehat{R} \mathbb{E}[\bar{u}]+B^{T} Y+B_{1}^{T} Z+\widehat{B}^{T} \mathbb{E}[Y]+\widehat{B}_{1}^{T} \mathbb{E}[Z]=0
\end{array}\right.
$$

This is called a (coupled) forward-backward stochastic differential equations of mean-field type (MF-FBSDE, for short). Note that the coupling comes from the last relation (which is essentially the maximum condition in the usual Pontryagin type maximum principle). The 4-tuple $(\bar{X}(\cdot), \bar{u}(\cdot), Y(\cdot), Z(\cdot))$ of $\mathbb{F}$-adapted processes satisfying the above is called an adapted solution of (3.3). We now look at the sufficiency of the above result.

Theorem 3.2. Let (H1), (H2), and (2.19) hold. Suppose $(\bar{X}(\cdot), \bar{u}(\cdot), Y(\cdot), Z(\cdot))$ is an adapted solution to the MF-FBSDE (3.3). Then $(\bar{X}(\cdot), \bar{u}(\cdot))$ is an optimal pair.

Proof. Let $(\bar{X}(\cdot), \bar{u}(\cdot), Y(\cdot), Z(\cdot))$ be an adapted solution to the MF-FBSDE. For any $u(\cdot) \in \mathcal{U}[0, T]$, let

$$
X_{1}(\cdot) \equiv X(\cdot ; 0, u(\cdot)-\bar{u}(\cdot))
$$

Then

$$
X(s ; x, u(\cdot))=\bar{X}(s)+X_{1}(s), \quad s \in[0, T]
$$

Hence, (suppressing $s$ )

$$
\begin{aligned}
& J(x ; u(\cdot))-J(x ; \bar{u}(\cdot)) \\
& =2 \mathbb{E}\left\{\int_{0}^{T}\left[\left\langle Q \bar{X}, X_{1}\right\rangle+\left\langle\widehat{Q} \mathbb{E}[\bar{X}], \mathbb{E}\left[X_{1}\right]\right\rangle+\langle R \bar{u}, u-\bar{u}\rangle+\langle\widehat{R} \mathbb{E}[\bar{u}], \mathbb{E}[u-\bar{u}]\rangle\right] d s\right. \\
& \left.\quad+\left\langle G \bar{X}(T), X_{1}(T)\right\rangle+\left\langle\widehat{G} \mathbb{E}[\bar{X}(T)], \mathbb{E}\left[X_{1}(T)\right]\right\rangle\right\} \\
& \quad+\mathbb{E}\left\{\int_{0}^{T}\left[\left\langle Q X_{1}, X_{1}\right\rangle+\left\langle\widehat{Q} \mathbb{E}\left[X_{1}\right], \mathbb{E}\left[X_{1}\right]\right\rangle+\langle R(u-\bar{u}), u-\bar{u}\rangle+\langle\widehat{R} \mathbb{E}[u-\bar{u}], \mathbb{E}[u-\bar{u}]\rangle\right] d s\right. \\
& \left.\quad+\left\langle G X_{1}(T), X_{1}(T)\right\rangle+\left\langle\widehat{G} \mathbb{E}\left[X_{1}(T)\right], \mathbb{E}\left[X_{1}(T)\right]\right\rangle\right\} \\
& =2 \mathbb{E}\left\{\int_{0}^{T}\left[\left\langle X_{1}, Q \bar{X}+\widehat{Q} \mathbb{E}[\bar{X}]\right\rangle+\langle u-\bar{u}, R \bar{u}+\widehat{R} \mathbb{E}[\bar{u}]\rangle\right] d s+\left\langle X_{1}(T), G \bar{X}(T)+\widehat{G} \mathbb{E}[\bar{X}(T)]\right\rangle\right\} \\
& \quad+J(0 ; u(\cdot)-\bar{u}(\cdot)) .
\end{aligned}
$$

Note that

$$
\begin{aligned}
& \mathbb{E}\langle \left.X_{1}(T), G \bar{X}(T)+\widehat{G} \mathbb{E}[\bar{X}(T)]\right\rangle=\mathbb{E}\left\langle X_{1}(T), Y(T)\right\rangle \\
&=\mathbb{E}\{ \left\{\int _ { 0 } ^ { T } \left(\left\langle A X_{1}+B(u-\bar{u})+\widehat{A} \mathbb{E}\left[X_{1}\right]+\widehat{B} \mathbb{E}[u-\bar{u}], Y\right\rangle\right.\right. \\
&-\left\langle X_{1}, A^{T} Y+A_{1}^{T} Z+\widehat{A}^{T} \mathbb{E}[Y]+\widehat{A}_{1}^{T} \mathbb{E}[Z]+Q \bar{X}+\widehat{Q} \mathbb{E}[\bar{X}]\right\rangle \\
&\left.\left.+\left\langle A_{1} X_{1}+B_{1}(u-\bar{u})+\widehat{A}_{1} \mathbb{E}\left[X_{1}\right]+\widehat{B}_{1} \mathbb{E}[u-\bar{u}], Z\right\rangle\right) d s\right\} \\
&=\mathbb{E}\left\{\int_{0}^{T}\left(-\left\langle X_{1}, Q \bar{X}+\widehat{Q} \mathbb{E}[\bar{X}]\right\rangle+\left\langle u-\bar{u}, B^{T} Y+B_{1}^{T} Z+\widehat{B}^{T} \mathbb{E}[Y]+\widehat{B}_{1}^{T} \mathbb{E}[Z]\right\rangle\right) d s\right\} .
\end{aligned}
$$

Thus,

$$
\begin{aligned}
& J(x ; u(\cdot))-J(x ; \bar{u}(\cdot)) \\
& =2 \mathbb{E} \int_{0}^{T}\left\langle u-\bar{u}, R \bar{u}+\widehat{R} \mathbb{E}[\bar{u}]+B^{T} Y+B_{1}^{T} Z+\widehat{B}^{T} \mathbb{E}[Y]+\widehat{B}_{1}^{T} \mathbb{E}[Z]\right\rangle d s+J(0 ; u(\cdot)-\bar{u}(\cdot)) \\
& =J(0 ; u(\cdot)-\bar{u}(\cdot))=\left\langle\Theta_{2}(u-\bar{u}), u-\bar{u}\right\rangle \geq 0
\end{aligned}
$$

Hence, $(\bar{X}(\cdot), \bar{u}(\cdot))$ is optimal.
We have the following corollary.
Corollary 3.3. Let (H1) and (H2)" hold. Then MF-FBSDE (3.3) admits a unique adapted solution $(\bar{X}(\cdot), \bar{u}(\cdot), Y(\cdot), Z(\cdot))$ of which $(\bar{X}(\cdot), \bar{u}(\cdot))$ is the unique optimal pair of Problem (MF).

Proof. We know from Proposition 2.8 that under (H1) and (H2)", Problem (MF) admits a unique optimal pair $(\bar{X}(\cdot), \bar{u}(\cdot))$. Then by Theorem 3.1, for some $(Y(\cdot), Z(\cdot))$, the 4-tuple $(\bar{X}(\cdot), \bar{u}(\cdot), Y(\cdot), Z(\cdot))$ is an adapted solution to MF-FBSDE (3.3). Next, if (3.3) has another adapted solution $(\widetilde{X}(\cdot), \widetilde{u}(\cdot), \widetilde{Y}(\cdot), \widetilde{Z}(\cdot))$. Then by Theorem 3.2, $(\widetilde{X}(\cdot), \widetilde{u}(\cdot))$ must be an optimal pair of Problem (MF). Hence, by the uniqueness of the optimal pair of Problem (MF), we must have

$$
\widetilde{X}(\cdot)=\bar{X}(\cdot), \quad \widetilde{u}(\cdot)=\bar{u}(\cdot)
$$

Then by the uniqueness of MF-BSDE (3.1), one must have

$$
\widetilde{Y}(\cdot)=Y(\cdot), \quad \widetilde{Z}(\cdot)=Z(\cdot)
$$

proving the corollary.

## 4 Decoupling the MF-FBSDE and Riccati Equations

From Corollary 3.3, we see that under (H1) and (H2)", to solve Problem (MF), we need only to solve MFFBSDE (3.3). To solve (3.3), we use the idea of decoupling inspired by the Four-Step Scheme ([21, 22]). More precisely, we have the following result. For simplicity, we have suppressed the time variable $s$ below.

Theorem 4.1. Let (H1) and (H2)" hold. Then the unique adapted solution $(\bar{X}(\cdot), \bar{u}(\cdot), Y(\cdot), Z(\cdot))$ of MF-FBSDE (3.3) admits the following representation:

$$
\left\{\begin{align*}
\bar{u}= & -K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)(\bar{X}-\mathbb{E}[\bar{X}])-K_{1}^{-1}\left[(B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right] \mathbb{E}[\bar{X}]  \tag{4.1}\\
Y= & P(\bar{X}-\mathbb{E}[\bar{X}])+\Pi \mathbb{E}[\bar{X}] \\
Z= & {\left[P A_{1}-P B_{1} K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)\right](\bar{X}-\mathbb{E}[\bar{X}]) } \\
& +\left[P\left(A_{1}+\widehat{A}_{1}\right)-P\left(B_{1}+\widehat{B}_{1}\right) K_{1}^{-1}\left((B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right)\right] \mathbb{E}[\bar{X}]
\end{align*}\right.
$$

where

$$
\begin{equation*}
K_{0}=R+B_{1}^{T} P B_{1}, \quad K_{1}=R+\widehat{R}+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right) \tag{4.2}
\end{equation*}
$$

and $P(\cdot)$ and $\Pi(\cdot)$ are solutions to the following Riccati equations, respectively:

$$
\left\{\begin{array}{l}
P^{\prime}+P A+A^{T} P+A_{1}^{T} P A_{1}+Q-\left(P B+A_{1}^{T} P B_{1}\right) K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)=0, \quad s \in[0, T]  \tag{4.3}\\
P(T)=G
\end{array}\right.
$$

and

$$
\left\{\begin{align*}
\Pi^{\prime}+ & \Pi\left[(A+\widehat{A})-(B+\widehat{B}) K_{1}^{-1}\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right]  \tag{4.4}\\
& +\left[(A+\widehat{A})^{T}-\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right) K_{1}^{-1}(B+\widehat{B})^{T}\right] \Pi-\Pi(B+\widehat{B}) K_{1}^{-1}(B+\widehat{B})^{T} \Pi \\
& +\left(A_{1}+\widehat{A}_{1}\right)^{T}\left[P-P\left(B_{1}+\widehat{B}_{1}\right) K_{1}^{-1}\left(B_{1}+\widehat{B}_{1}\right)^{T} P\right]\left(A_{1}+\widehat{A}_{1}\right)+Q+\widehat{Q}=0, \quad s \in[0, T] \\
\Pi(T) & =G+\widehat{G}
\end{align*}\right.
$$

Finally, $\bar{X}(\cdot)$ solves the following closed-loop system

$$
\left\{\begin{align*}
d \bar{X} & =\left\{\left[A-B K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)\right](\bar{X}-\mathbb{E}[\bar{X}])\right.  \tag{4.5}\\
& \left.+\left[(A+\widehat{A})-(B+\widehat{B}) K_{1}^{-1}\left((B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right)\right] \mathbb{E}[\bar{X}]\right\} d t \\
& +\left\{\left[A_{1}-B_{1} K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)\right](\bar{X}-\mathbb{E}[\bar{X}])\right. \\
& \left.+\left[\left(A_{1}+\widehat{A}_{1}\right)-\left(B_{1}+\widehat{B}_{1}\right) K_{1}^{-1}\left((B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right)\right] \mathbb{E}[\bar{X}]\right\} d W(t) \\
\bar{X}(0) & =x
\end{align*}\right.
$$

Proof. First of all, under (H1) and (H2) ", Riccati equation (4.3) admits a unique solution $P(\cdot)$ which is positive definite matrix valued $([34])$. With such a function $P(\cdot), K_{1}$ defined in (4.2) is positive definite. Next, we note that

$$
\begin{aligned}
P & -P\left(B_{1}+\widehat{B}_{1}\right) K_{1}^{-1}\left(B_{1}+\widehat{B}_{1}\right)^{T} P \\
& =P-P\left(B_{1}+\widehat{B}_{1}\right)\left[R+\widehat{R}+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right)\right]^{-1}\left(B_{1}+\widehat{B}_{1}\right)^{T} P \equiv P-P \widetilde{B}\left(\widetilde{R}+\widetilde{B}^{T} P \widetilde{B}\right)^{-1} \widetilde{B}^{T} P \\
& =P^{\frac{1}{2}}\left[I-P^{\frac{1}{2}} \widetilde{B} \widetilde{R}^{-\frac{1}{2}}\left(I+\widetilde{R}^{-\frac{1}{2}} \widetilde{B}^{T} P^{\frac{1}{2}} P^{\frac{1}{2}} \widetilde{B} \widetilde{R}^{-\frac{1}{2}}\right)^{-1} \widetilde{R}^{-\frac{1}{2}} \widetilde{B}^{T} P^{\frac{1}{2}}\right] P^{\frac{1}{2}} \equiv P^{\frac{1}{2}}\left[I-\Gamma\left(I+\Gamma^{T} \Gamma\right)^{-1} \Gamma^{T}\right] P^{\frac{1}{2}} \\
= & P^{\frac{1}{2}}\left(I+\Gamma \Gamma^{T}\right)^{-1} P^{\frac{1}{2}} \equiv P^{\frac{1}{2}}\left(I+P^{\frac{1}{2}} \widetilde{B} \widetilde{R}^{-1} \widetilde{B}^{T} P^{\frac{1}{2}}\right)^{-1} P^{\frac{1}{2}} \equiv P^{\frac{1}{2}}\left[I+P^{\frac{1}{2}}\left(B_{1}+\widehat{B}_{1}\right)(R+\widehat{R})^{-1}\left(B_{1}+\widehat{B}_{1}\right)^{T} P^{\frac{1}{2}}\right]^{-1} P^{\frac{1}{2}} \geq 0 .
\end{aligned}
$$

In the above, we have denoted

$$
\widetilde{B}=B_{1}+\widehat{B}_{1}, \quad \widetilde{R}=R+\widehat{R}, \quad \Gamma=P^{\frac{1}{2}} \widetilde{B} \widetilde{R}^{\frac{1}{2}}
$$

and used the fact

$$
I-\Gamma\left(I+\Gamma^{T} \Gamma\right)^{-1} \Gamma^{T}=\left(I+\Gamma^{T} \Gamma\right)^{-1}
$$

Hence, Riccati equation (4.4) is equivalent to the following:

$$
\left\{\begin{array}{l}
\Pi^{\prime}+\Pi\left[(A+\widehat{A})-(B+\widehat{B}) K_{1}^{-1}\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right]  \tag{4.6}\\
\quad+\left[(A+\widehat{A})^{T}-\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right) K_{1}^{-1}(B+\widehat{B})^{T}\right] \Pi-\Pi(B+\widehat{B}) K_{1}^{-1}(B+\widehat{B})^{T} \Pi \\
\quad+\left(A_{1}+\widehat{A}_{1}\right)^{T} P^{\frac{1}{2}}\left[I+P^{\frac{1}{2}}\left(B_{1}+\widehat{B}_{1}\right)(R+\widehat{R})^{-1}\left(B_{1}+\widehat{B}_{1}\right)^{T} P^{\frac{1}{2}}\right]^{-1} P^{\frac{1}{2}}\left(A_{1}+\widehat{A}_{1}\right)+Q+\widehat{Q}=0 \\
\Pi(T)=G+\widehat{G}
\end{array}\right.
$$

Since

$$
\begin{aligned}
& G+\widehat{G} \geq 0 \\
& \left(A_{1}+\widehat{A}_{1}\right)^{T} P^{\frac{1}{2}}\left[I+P^{\frac{1}{2}}\left(B_{1}+\widehat{B}_{1}\right)(R+\widehat{R})^{-1}\left(B_{1}+\widehat{B}_{1}\right)^{T} P^{\frac{1}{2}}\right]^{-1} P^{\frac{1}{2}}\left(A_{1}+\widehat{A}_{1}\right)+Q+\widehat{Q} \geq 0
\end{aligned}
$$

according to [34], Riccati equation (4.4) admits a unique solution $\Pi(\cdot)$ which is also positive definite matrix valued.

Now, suppose $(\bar{X}(\cdot), \bar{u}(\cdot), Y(\cdot), Z(\cdot))$ is the adapted solution to (3.3). Assume that

$$
\begin{equation*}
Y(s)=P(s) X(s)+\widehat{P}(s) \mathbb{E}[X(s)], \quad s \in[0, T] \tag{4.7}
\end{equation*}
$$

for some deterministic and differentiable functions $P(\cdot)$ and $\widehat{P}(\cdot)$ such that

$$
\begin{equation*}
P(T)=G, \quad \widehat{P}(T)=\widehat{G} \tag{4.8}
\end{equation*}
$$

For the time being, we do not assume that $P(\cdot)$ is the solution to (4.3). Then (suppressing $s$ )

$$
\begin{align*}
& \left(-A^{T} Y-A_{1}^{T} Z-Q \bar{X}-\widehat{A}^{T} \mathbb{E}[Y]-\widehat{A}_{1}^{T} \mathbb{E}[Z]-\widehat{Q} \mathbb{E}[\bar{X}]\right) d s+Z d W(s) \\
& =d Y=d(P \bar{X}+\widehat{P} \mathbb{E}[\bar{X}]) \\
& =\left[P^{\prime} \bar{X}+P(A \bar{X}+B \bar{u}+\widehat{A} \mathbb{E}[\bar{X}]+\widehat{B} \mathbb{E}[\bar{u}])+\widehat{P}^{\prime} \mathbb{E}[\bar{X}]+\widehat{P}((A+\widehat{A}) \mathbb{E}[\bar{X}]+(B+\widehat{B}) \mathbb{E}[\bar{u}])\right] d s  \tag{4.9}\\
& \quad+P\left(A_{1} \bar{X}+B_{1} \bar{u}+\widehat{A}_{1} \mathbb{E}[\bar{X}]+\widehat{B}_{1} \mathbb{E}[\bar{u}]\right) d W(s) \\
& =\left[\left(P^{\prime}+P A\right) \bar{X}+P B \bar{u}+\left(\widehat{P}^{\prime}+\widehat{P}(A+\widehat{A})+P \widehat{A}\right) \mathbb{E}[\bar{X}]+(\widehat{P}(B+\widehat{B})+P \widehat{B}) \mathbb{E}[\bar{u}]\right] d s \\
& \quad+P\left(A_{1} \bar{X}+B_{1} \bar{u}+\widehat{A}_{1} \mathbb{E}[\bar{X}]+\widehat{B}_{1} \mathbb{E}[\bar{u}]\right) d W(s)
\end{align*}
$$

Comparing the diffusion terms, we should have

$$
\begin{equation*}
Z=P\left(A_{1} \bar{X}+B_{1} \bar{u}+\widehat{A}_{1} \mathbb{E}[\bar{X}]+\widehat{B}_{1} \mathbb{E}[\bar{u}]\right) \tag{4.10}
\end{equation*}
$$

This yields from (3.2) that

$$
\begin{aligned}
0= & R \bar{u}+\widehat{R} \mathbb{E}[\bar{u}]+B^{T} Y+\widehat{B}^{T} \mathbb{E}[Y]+B_{1}^{T} Z+\widehat{B}_{1}^{T} \mathbb{E}[Z] \\
= & R \bar{u}+\widehat{R} \mathbb{E}[\bar{u}]+B^{T}(P \bar{X}+\widehat{P} \mathbb{E}[\bar{X}])+\widehat{B}^{T}(P+\widehat{P}) \mathbb{E}[\bar{X}] \\
& +B_{1}^{T} P\left(A_{1} \bar{X}+B_{1} \bar{u}+\widehat{A}_{1} \mathbb{E}[\bar{X}]+\widehat{B}_{1} \mathbb{E}[\bar{u}]\right)+\widehat{B}_{1}^{T} P\left(\left(A_{1}+\widehat{A}_{1}\right) \mathbb{E}[\bar{X}]+\left(B_{1}+\widehat{B}_{1}\right) \mathbb{E}[\bar{u}]\right) \\
= & \left(R+B_{1}^{T} P B_{1}\right) \bar{u}+\left(\widehat{R}+B_{1}^{T} P \widehat{B}_{1}+\widehat{B}_{1}^{T} P B_{1}+\widehat{B}_{1}^{T} P \widehat{B}_{1}\right) \mathbb{E}[\bar{u}]+\left(B^{T} P+B_{1}^{T} P A_{1}\right) \bar{X} \\
& +\left(B^{T} \widehat{P}+\widehat{B}^{T}(P+\widehat{P})+B_{1}^{T} P \widehat{A}_{1}+\widehat{B}_{1}^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right) \mathbb{E}[\bar{X}] .
\end{aligned}
$$

Taking $\mathbb{E}$, we obtain

$$
\begin{aligned}
0 & =\left[R+\widehat{R}+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right)\right] \mathbb{E}[\bar{u}]+\left[(B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right] \mathbb{E}[\bar{X}] \\
& \equiv K_{1} \mathbb{E}[\bar{u}]+\left[(B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right] \mathbb{E}[\bar{X}]
\end{aligned}
$$

Assuming

$$
K_{1} \equiv K_{1}(P) \triangleq R+\widehat{R}+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right)
$$

to be invertible, one gets

$$
\mathbb{E}[\bar{u}]=-K_{1}^{-1}\left[(B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right] \mathbb{E}[\bar{X}]
$$

Then we have

$$
\begin{aligned}
0= & \left(R+B_{1}^{T} P B_{1}\right) \bar{u}+\left(\widehat{R}+B_{1}^{T} P \widehat{B}_{1}+\widehat{B}_{1}^{T} P B_{1}+\widehat{B}_{1}^{T} P \widehat{B}_{1}\right) \mathbb{E}[\bar{u}]+\left(B^{T} P+B_{1}^{T} P A_{1}\right) \bar{X} \\
& +\left(B^{T} \widehat{P}+\widehat{B}^{T}(P+\widehat{P})+B_{1}^{T} P \widehat{A}_{1}+\widehat{B}_{1}^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right) \mathbb{E}[\bar{X}] \\
\equiv & K_{0} \bar{u}+\left(B^{T} P+B_{1}^{T} P A_{1}\right) \bar{X}++\left(B^{T} \widehat{P}+\widehat{B}^{T}(P+\widehat{P})+B_{1}^{T} P \widehat{A}_{1}+\widehat{B}_{1}^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right) \mathbb{E}[\bar{X}] \\
& -\left(\widehat{R}+B_{1}^{T} P \widehat{B}_{1}+\widehat{B}_{1}^{T} P B_{1}+\widehat{B}_{1}^{T} P \widehat{B}_{1}\right) K_{1}^{-1}\left[(B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right] \mathbb{E}[\bar{X}] .
\end{aligned}
$$

Consequently, by assuming

$$
K_{0} \equiv K_{0}(P) \triangleq R+B_{1}^{T} P B_{1}
$$

to be invertible, we obtain

$$
\begin{align*}
\bar{u}= & -K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right) \bar{X}-K_{0}^{-1}\left(B^{T} \widehat{P}+\widehat{B}^{T}(P+\widehat{P})+B_{1}^{T} P \widehat{A}_{1}+\widehat{B}_{1}^{T} P\left(A_{1}+\widehat{A_{1}}\right)\right) \mathbb{E}[\bar{X}] \\
& +K_{0}^{-1}\left(\widehat{R}+B_{1}^{T} P \widehat{B}_{1}+\widehat{B}_{1}^{T} P B_{1}+\widehat{B}_{1}^{T} P \widehat{B}_{1}\right) K_{1}^{-1}\left[(B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{\left.\left.A_{1}\right)\right] \mathbb{E}[\bar{X}]}\right.\right. \\
=- & K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right) \bar{X}-K_{0}^{-1}\left(B^{T} \widehat{P}+\widehat{B}^{T}(P+\widehat{P})+B_{1}^{T} P \widehat{A}_{1}+\widehat{B}_{1}^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right) \mathbb{E}[\bar{X}] \\
& +K_{0}^{-1}\left(K_{1}-K_{0}\right) K_{1}^{-1}\left[(B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right] \mathbb{E}[\bar{X}] \\
=- & K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right) \bar{X}-K_{0}^{-1}\left(B^{T} \widehat{P}+\widehat{B}^{T}(P+\widehat{P})+B_{1}^{T} P \widehat{A}_{1}+\widehat{B}_{1}^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right) \mathbb{E}[\bar{X}]  \tag{4.11}\\
& +K_{0}^{-1}\left[(B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A_{1}}\right)\right] \mathbb{E}[\bar{X}] \\
& -K_{1}^{-1}\left[(B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{\left.\left.A_{1}\right)\right] \mathbb{E}[\bar{X}]}\right.\right. \\
=- & K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right) \bar{X}+K_{0}^{-1}\left[B^{T} P+B_{1}^{T} P A_{1}\right] \mathbb{E}[\bar{X}] \\
& -K_{1}^{-1}\left[(B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right] \mathbb{E}[\bar{X}] .
\end{align*}
$$

Here, we note that

$$
\begin{aligned}
K_{1}-K_{0} & =R+\widehat{R}+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right)-R-B_{1}^{T} P B_{1} \\
& =\widehat{R}+B_{1}^{T} P \widehat{B}_{1}+\widehat{B}_{1}^{T} P B_{1}+\widehat{B}_{1}^{T} P \widehat{B}_{1}
\end{aligned}
$$

Hence, comparing the drift terms in (4.9), we have

$$
\begin{aligned}
& 0=\left(P^{\prime}+P A\right) \bar{X}+P B \bar{u}+\left(\widehat{P}^{\prime}+\widehat{P}(A+\widehat{A})+P \widehat{A}\right) \mathbb{E}[\bar{X}]+(\widehat{P}(B+\widehat{B})+P \widehat{B}) \mathbb{E}[\bar{u}] \\
& +A^{T}(P \bar{X}+\widehat{P} \mathbb{E}[\bar{X}])+A_{1}^{T} P\left(A_{1} \bar{X}+B_{1} \bar{u}+\widehat{A}_{1} \mathbb{E}[\bar{X}]+\widehat{B}_{1} \mathbb{E}[\bar{u}]\right) \\
& +\widehat{A}^{T}(P+\widehat{P}) \mathbb{E}[\bar{X}]+\widehat{A}_{1}^{T} P\left[\left(A_{1}+\widehat{A}_{1}\right) \mathbb{E}[\bar{X}]+\left(B_{1}+\widehat{B}_{1}\right) \mathbb{E}[\bar{u}]\right]+Q \bar{X}+\widehat{Q} \mathbb{E}[\bar{X}] \\
& =\left[P^{\prime}+P A+A^{T} P+A_{1}^{T} P A_{1}+Q\right] \bar{X}+\left(P B+A_{1}^{T} P B_{1}\right) \bar{u} \\
& +\left[\widehat{P}^{\prime}+\widehat{P}(A+\widehat{A})+(A+\widehat{A})^{T} \widehat{P}+P \widehat{A}+\widehat{A}^{T} P+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)-A_{1}^{T} P A_{1}+\widehat{Q}\right] \mathbb{E}[\bar{X}] \\
& +\left[\widehat{P}(B+\widehat{B})+P \widehat{B}+A_{1}^{T} P \widehat{B}_{1}+\widehat{A}_{1}^{T} P\left(B_{1}+\widehat{B}_{1}\right)\right] \mathbb{E}[\bar{u}] \\
& =\left[P^{\prime}+P A+A^{T} P+A_{1}^{T} P A_{1}+Q\right] \bar{X} \\
& +\left(P B+A_{1}^{T} P B_{1}\right)\left\{-K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right) \bar{X}+K_{0}^{-1}\left[B^{T} P+B_{1}^{T} P A_{1}\right] \mathbb{E}[\bar{X}]\right. \\
& \left.-K_{1}^{-1}\left[(B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right] \mathbb{E}[\bar{X}]\right\} \\
& +\left[\widehat{P}^{\prime}+\widehat{P}(A+\widehat{A})+(A+\widehat{A})^{T} \widehat{P}+P \widehat{A}+\widehat{A}^{T} P+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)-A_{1}^{T} P A_{1}+\widehat{Q}\right] \mathbb{E}[\bar{X}] \\
& +\left[\widehat{P}(B+\widehat{B})+P \widehat{B}+A_{1}^{T} P \widehat{B}_{1}+\widehat{A}_{1}^{T} P\left(B_{1}+\widehat{B}_{1}\right)\right] \\
& \cdot\left\{-K_{1}^{-1}\left[(B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right] \mathbb{E}[\bar{X}]\right\} \\
& =\left[P^{\prime}+P A+A^{T} P+A_{1}^{T} P A_{1}+Q-\left(P B+A_{1}^{T} P B_{1}\right) K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)\right] \bar{X} \\
& +\left\{\widehat{P}^{\prime}+\widehat{P}(A+\widehat{A})+(A+\widehat{A})^{T} \widehat{P}+P \widehat{A}+\widehat{A}^{T} P+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)-A_{1}^{T} P A_{1}+\widehat{Q}\right. \\
& +\left(P B+A_{1}^{T} P B_{1}\right) K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right) \\
& \left.-\left[(P+\widehat{P})(B+\widehat{B})+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right)\right] K_{1}^{-1}\left[(B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right]\right\} \mathbb{E}[\bar{X}] .
\end{aligned}
$$

Therefore, by choosing $P(\cdot)$ to be the solution to Riccati equation (4.3), we have that $K_{0}$ and $K_{1}$ are positive
definite, and the above leads to

$$
\begin{aligned}
& \left\{\widehat{P}^{\prime}+\widehat{P}(A+\widehat{A})+(A+\widehat{A})^{T} \widehat{P}+P \widehat{A}+\widehat{A}^{T} P+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)-A_{1}^{T} P A_{1}+\widehat{Q}\right. \\
& +\left(P B+A_{1}^{T} P B_{1}\right) K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right) \\
& \left.-\left[(P+\widehat{P})(B+\widehat{B})+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right)\right] K_{1}^{-1}\left[(B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}\right)\right]\right\} \mathbb{E}[\bar{X}]=0 .
\end{aligned}
$$

Now, if $\widehat{P}(\cdot)$ satisfies the following:

$$
\begin{aligned}
0= & \widehat{P}^{\prime}+\widehat{P}(A+\widehat{A})+(A+\widehat{A})^{T} \widehat{P}+P \widehat{A}+\widehat{A}^{T} P+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)-A_{1}^{T} P A_{1}+\widehat{Q} \\
& +\left(P B+A_{1}^{T} P B_{1}\right) K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right) \\
& -\left[(P+\widehat{P})(B+\widehat{B})+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right)\right] K_{1}^{-1}\left[(B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A_{1}}\right)\right] \\
= & \widehat{P}^{\prime}+\widehat{P}\left[A+\widehat{A}-(B+\widehat{B}) K_{1}^{-1}\left((B+\widehat{B})^{T} P+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right)\right] \\
& +\left[(A+\widehat{A})^{T}-\left(P(B+\widehat{B})+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right)\right) K_{1}^{-1}(B+\widehat{B})^{T}\right] \widehat{P}-\widehat{P}(B+\widehat{B}) K_{1}^{-1}(B+\widehat{B})^{T} \widehat{P} \\
& +P \widehat{A}+\widehat{A}^{T} P+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)-A_{1}^{T} P A_{1}+\widehat{Q}+\left(P B+A_{1}^{T} P B_{1}\right) K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right) \\
& -\left[P(B+\widehat{B})+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right)\right] K_{1}^{-1}\left[(B+\widehat{B})^{T} P+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right],
\end{aligned}
$$

then $(Y(\cdot), Z(\cdot))$ defined by (4.7) and (4.10) with $\bar{u}(\cdot)$ given by (4.11) satisfies the MF-BSDE in (3.3). Hence, we introduce the following Riccati equation for $\widehat{P}(\cdot)$ :

$$
\left\{\begin{array}{l}
\widehat{P}^{\prime}+\widehat{P}\left[A+\widehat{A}-(B+\widehat{B}) K_{1}^{-1}\left((B+\widehat{B})^{T} P+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right)\right]  \tag{4.12}\\
\quad+\left[(A+\widehat{A})^{T}-\left(P(B+\widehat{B})+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right)\right) K_{1}^{-1}(B+\widehat{B})^{T}\right] \widehat{P} \\
\quad-\widehat{P}(B+\widehat{B}) K_{1}^{-1}(B+\widehat{B})^{T} \widehat{P}+P \widehat{A}+\widehat{A}^{T} P+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)-A_{1}^{T} P A_{1}+\widehat{Q} \\
\quad+\left(P B+A_{1}^{T} P B_{1}\right) K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right) \\
\quad-\left[P(B+\widehat{B})+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right)\right] K_{1}^{-1}\left[(B+\widehat{B})^{T} P+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right]=0 \\
\widehat{P}(T)=\widehat{G}
\end{array}\right.
$$

The solvability of this Riccati equation is not obvious since $\widehat{G}$ is just assumed to be symmetric, and

$$
\begin{aligned}
\widetilde{Q} \equiv & P \widehat{A}+\widehat{A}^{T} P+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)-A_{1}^{T} P A_{1}+\widehat{Q}+\left(P B+A_{1}^{T} P B_{1}\right) K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right) \\
& -\left[P(B+\widehat{B})+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right)\right] K_{1}^{-1}\left[(B+\widehat{B})^{T} P+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right]
\end{aligned}
$$

is also just symmetric. To look at the solvability of such a Riccati equation, we let

$$
\Pi=P+\widehat{P}
$$

Then

$$
\Pi(T)=G+\widehat{G} \geq 0
$$

and consider the following

$$
\begin{aligned}
0= & P^{\prime}+P A+A^{T} P+A_{1}^{T} P A_{1}+Q-\left(P B+A_{1}^{T} P B_{1}\right) K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right) \\
& +\widehat{P}^{\prime}+\widehat{P}(A+\widehat{A})+(A+\widehat{A})^{T} \widehat{P}+P \widehat{A}+\widehat{A}^{T} P+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)-A_{1}^{T} P A_{1}+\widehat{Q} \\
& +\left(P B+A_{1}^{T} P B_{1}\right) K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right) \\
& -\left[(P+\widehat{P})(B+\widehat{B})+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right)\right] K_{1}^{-1}\left[(B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right] \\
= & \Pi^{\prime}+P(A+\widehat{A})+(A+\widehat{A})^{T} P+Q+\widehat{Q}+(\Pi-P)(A+\widehat{A})+(A+\widehat{A})^{T}(\Pi-P)+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right) \\
& -\left[\Pi(B+\widehat{B})+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right)\right] K_{1}^{-1}\left[(B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right] \\
= & \Pi^{\prime}+\Pi\left[(A+\widehat{A})-(B+\widehat{B}) K_{1}^{-1}\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right] \\
& +\left[(A+\widehat{A})^{T}-\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right) K_{1}^{-1}(B+\widehat{B})^{T}\right] \Pi-\Pi(B+\widehat{B}) K_{1}^{-1}(B+\widehat{B})^{T} \Pi \\
& +\left(A_{1}+\widehat{A}_{1}\right)^{T}\left[P-P\left(B_{1}+\widehat{B}_{1}\right) K_{1}^{-1}\left(B_{1}+\widehat{B}_{1}\right)^{T} P\right]\left(A_{1}+\widehat{A}_{1}\right)+Q+\widehat{Q} .
\end{aligned}
$$

Thus, $\Pi(\cdot)$ is the solution to Riccati equation (4.4). Consequently, Riccati equation (4.12) admits a unique solution $\widehat{P}(\cdot)=\Pi(\cdot)-P(\cdot)$. Then we obtain (from (4.7) and (4.11))

$$
Y=P(\bar{X}-\mathbb{E}[\bar{X}])+\Pi \mathbb{E}[\bar{X}]
$$

and

$$
\bar{u}=-K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)(\bar{X}-\mathbb{E}[\bar{X}])-K_{1}^{-1}\left[(B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A_{1}}\right)\right] \mathbb{E}[\bar{X}]
$$

Also, from (4.10), it follows that

$$
\begin{aligned}
Z= & P\left(A_{1} \bar{X}+B_{1} \bar{u}+\widehat{A}_{1} \mathbb{E}[\bar{X}]+\widehat{B}_{1} \mathbb{E}[\bar{u}]\right) \\
= & P A_{1} \bar{X}-P B_{1}\left\{K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)(\bar{X}-\mathbb{E}[\bar{X}])+K_{1}^{-1}\left[(B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right] \mathbb{E}[\bar{X}]\right\} \\
& +P \widehat{A}_{1} \mathbb{E}[\bar{X}]-P \widehat{B}_{1} K_{1}^{-1}\left[(B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right] \mathbb{E}[\bar{X}] \\
= & {\left[P A_{1}-P B_{1} K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)\right](\bar{X}-\mathbb{E}[\bar{X}]) } \\
& +\left[P\left(A_{1}+\widehat{A}_{1}\right)-P\left(B_{1}+\widehat{B}_{1}\right) K_{1}^{-1}\left((B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right)\right] \mathbb{E}[\bar{X}] .
\end{aligned}
$$

Hence, (4.1) follows. Plugging the above representations into the state equation, we obtain

$$
\begin{aligned}
d \bar{X}= & \left\{A \bar{X}-B\left[K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)(\bar{X}-\mathbb{E}[\bar{X}])-K_{1}^{-1}\left((B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right) \mathbb{E}[\bar{X}]\right]\right. \\
& \left.+\widehat{A} \mathbb{E}[\bar{X}]-\widehat{B} K_{1}^{-1}\left[(B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right] \mathbb{E}[\bar{X}]\right\} d t \\
& +\left\{A_{1} \bar{X}-B_{1}\left[K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)(\bar{X}-\mathbb{E}[\bar{X}])-K_{1}^{-1}\left((B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right) \mathbb{E}[\bar{X}]\right]\right. \\
& \left.+\widehat{A}_{1} \mathbb{E}[\bar{X}]-\widehat{B}_{1} K_{1}^{-1}\left[(B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right] \mathbb{E}[\bar{X}]\right\} d W(t) \\
= & \left\{\left[A-B K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)\right](\bar{X}-\mathbb{E}[\bar{X}])\right. \\
& \left.+\left[(A+\widehat{A})-(B+\widehat{B}) K_{1}^{-1}\left((B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right)\right] \mathbb{E}[\bar{X}]\right\} d t \\
& +\left\{\left[A_{1}-B_{1} K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)\right](\bar{X}-\mathbb{E}[\bar{X}])\right. \\
& \left.+\left[\left(A_{1}+\widehat{A}_{1}\right)-\left(B_{1}+\widehat{B}_{1}\right) K_{1}^{-1}\left((B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right)\right] \mathbb{E}[\bar{X}]\right\} d W(t) .
\end{aligned}
$$

This gives the closed-loop system (5.15). From the above derivation, we see that if $\bar{X}(\cdot)$ is a solution to (5.15), and $(\bar{u}(\cdot), Y(\cdot), Z(\cdot))$ are given by $(4.1)$, then $(\bar{X}(\cdot), \bar{u}(\cdot), Y(\cdot), Z(\cdot))$ is an adapted solution to MFFBSDE (3.3). By Corollary 3.3, we know that such a constructed 4-tuple $(\bar{X}(\cdot), \bar{u}(\cdot), Y(\cdot), Z(\cdot))$ is the unique solution to (3.3).

The following is a direct verification of optimality of state feedback control.
Theorem 4.2. Let (H1) and (H2)" hold. Let $P(\cdot)$ and $\Pi(\cdot)$ be the solutions to the Riccati equations (4.3) and (4.4), respectively. Then the state feedback control $\bar{u}(\cdot)$ given in (4.1) is the optimal control of Problem (MF). Moreover, the optimal value of the cost is given by

$$
\begin{equation*}
\inf _{u(\cdot) \in \mathcal{U}[0, T]} J(x ; u(\cdot))=\langle\Pi(0) x, x\rangle, \quad \forall x \in \mathbb{R}^{n} \tag{4.13}
\end{equation*}
$$

Proof. Let $P(\cdot)$ and $\Pi(\cdot)$ be the solutions to the Riccati equations (4.3) and (4.4), respectively and denote $K_{0}$ and $K_{1}$ as in (4.2), which are positive definite. Let $\widehat{P}(\cdot)=\Pi(\cdot)-P(\cdot)$. Then $\widehat{P}(\cdot)$ solves (4.12). Now, we observe

$$
\begin{aligned}
& J(x ; u(\cdot))-\langle\Pi(0) x, x\rangle=J(x ; u(\cdot))-\langle[P(0)+\widehat{P}(0)] x, x\rangle \\
& =\mathbb{E} \int_{0}^{T}\{\langle Q X, X\rangle+\langle\widehat{Q} \mathbb{E}[X], \mathbb{E}[X]\rangle+\langle R u, u\rangle+\langle\widehat{R} \mathbb{E}[u], \mathbb{E}[u]\rangle \\
& +\left\langle P^{\prime} X, X\right\rangle+2\langle P(A X+B u+\widehat{A} \mathbb{E}[X]+\widehat{B} \mathbb{E}[u]), X\rangle \\
& +\left\langle P\left(A_{1} X+B_{1} u+\widehat{A}_{1} \mathbb{E}[X]+\widehat{B}_{1} \mathbb{E}[u]\right), A_{1} X+B_{1} u+\widehat{A}_{1} \mathbb{E}[X]+\widehat{B}_{1} \mathbb{E}[u]\right\rangle \\
& \left.+\left\langle\widehat{P}^{\prime} \mathbb{E}[X], \mathbb{E}[X]\right\rangle+2\langle\widehat{P} \mathbb{E}[X],(A+\widehat{A}) \mathbb{E}[X]+(B+\widehat{B}) \mathbb{E}[u]\rangle\right\} d s \\
& =\mathbb{E} \int_{0}^{T}\left\{\left\langle\left(P^{\prime}+P A+A^{T} P+A_{1}^{T} P A_{1}+Q\right) X, X\right\rangle+2\left\langle u,\left(B^{T} P+B_{1}^{T} P A_{1}\right) X\right\rangle+\left\langle\left(R+B_{1}^{T} P B_{1}\right) u, u\right\rangle\right. \\
& +\langle\widehat{Q} \mathbb{E}[X], \mathbb{E}[X]\rangle+\langle\widehat{R} \mathbb{E}[u], \mathbb{E}[u]\rangle+2\langle P(\widehat{A} \mathbb{E}[X]+\widehat{B} \mathbb{E}[u]), \mathbb{E}[X]\rangle \\
& +2\left\langle P\left(A_{1} \mathbb{E}[X]+B_{1} \mathbb{E}[u]\right), \widehat{A}_{1} \mathbb{E}[X]+\widehat{B}_{1} \mathbb{E}[u]\right\rangle+\left\langle P\left(\widehat{A}_{1} \mathbb{E}[X]+\widehat{B}_{1} \mathbb{E}[u]\right), \widehat{A}_{1} \mathbb{E}[X]+\widehat{B}_{1} \mathbb{E}[u]\right\rangle \\
& \left.+\left\langle\widehat{P}^{\prime} \mathbb{E}[X], \mathbb{E}[X]\right\rangle+2\langle\widehat{P} \mathbb{E}[X],(A+\widehat{A}) \mathbb{E}[X]+(B+\widehat{B}) \mathbb{E}[u]\rangle\right\} d s \\
& =\mathbb{E} \int_{0}^{T}\left\{\left\langle\left(P^{\prime}+P A+A^{T} P+A_{1}^{T} P A_{1}+Q\right) X, X\right\rangle+2\left\langle u,\left(B^{T} P+B_{1}^{T} P A_{1}\right) X\right\rangle+\left\langle K_{0} u, u\right\rangle\right. \\
& +\left\langle\left[\widehat{P}^{\prime}+P \widehat{A}+\widehat{A}^{T} P+\widehat{A}_{1}^{T} P A_{1}+A_{1}^{T} P \widehat{A}_{1}+\widehat{A}_{1}^{T} P \widehat{A}_{1}+\widehat{P}(A+\widehat{A})+(A+\widehat{A})^{T} \widehat{P}+\widehat{Q}\right] \mathbb{E}[X], \mathbb{E}[X]\right\rangle \\
& +\left\langle\left(\widehat{R}+\widehat{B}_{1}^{T} P B_{1}+B_{1}^{T} P \widehat{B}_{1}+\widehat{B}_{1}^{T} P \widehat{B}_{1}\right) \mathbb{E}[u], \mathbb{E}[u]\right\rangle \\
& \left.+2\left\langle\mathbb{E}[u],\left[\widehat{B}^{T} P+\widehat{B}_{1}^{T} P A_{1}+\left(B_{1}+\widehat{B}_{1}\right)^{T} P \widehat{A}_{1}+(B+\widehat{B})^{T} \widehat{P}\right] \mathbb{E}[X]\right\rangle\right\} d s \\
& =\mathbb{E} \int_{0}^{T}\left\{\left\langle\left(P^{\prime}+P A+A^{T} P+A_{1}^{T} P A_{1}+Q\right) X, X\right\rangle+2\left\langle u-\mathbb{E}[u],\left(B^{T} P+B_{1}^{T} P A_{1}\right)(X-\mathbb{E}[X])\right\rangle\right. \\
& +\left\langle K_{0}(u-\mathbb{E}[u]), u-\mathbb{E}[u]\right\rangle \\
& +\left\langle\left(\widehat{P}^{\prime}+P \widehat{A}+\widehat{A}^{T} P+\widehat{A}_{1}^{T} P A_{1}+A_{1}^{T} P \widehat{A}_{1}+\widehat{A}_{1}^{T} P \widehat{A}_{1}\right.\right. \\
& \left.\left.+\widehat{P}(A+\widehat{A})+(A+\widehat{A})^{T} \widehat{P}+\widehat{Q}\right) \mathbb{E}[X], \mathbb{E}[X]\right\rangle+\left\langle K_{1} \mathbb{E}[u], \mathbb{E}[u]\right\rangle \\
& \left.\left.+2\left\langle\mathbb{E}[u],(B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P A_{1}+\left(B_{1}+\widehat{B}_{1}\right)^{T} P \widehat{A}_{1}\right) \mathbb{E}[X]\right\rangle\right\} d s
\end{aligned}
$$

$$
\begin{aligned}
&= \mathbb{E} \\
& \int_{0}^{T}\left\{\left\langle\left[P^{\prime}+P A+A^{T} P+A_{1}^{T} P A_{1}+Q-\left(P B+A_{1} P B_{1}\right) K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)\right] X, X\right\rangle\right. \\
&+\left|K_{0}^{\frac{1}{2}}\left[u-\mathbb{E}[u]+K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)(X-\mathbb{E}[X])\right]\right|^{2} \\
&+\left\langle\left[\widehat{P}^{\prime}+P \widehat{A}+\widehat{A}^{T} P+\widehat{A}_{1}^{T} P A_{1}+A_{1}^{T} P \widehat{A}_{1}+\widehat{A}_{1}^{T} P \widehat{A}_{1}+\widehat{P}(A+\widehat{A})+(A+\widehat{A})^{T} \widehat{P}+\widehat{Q}\right.\right. \\
&+\left(P B+A_{1} P B_{1}\right) K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right) \\
&-\left((P+\widehat{P})(B+\widehat{B})+A_{1}^{T} P\left(B_{1}+\widehat{B}_{1}\right)+\widehat{A}_{1}^{T} P\left(B_{1}+\widehat{B}_{1}\right)\right) K_{1}^{-1} \\
&\left.\left.\cdot\left((B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P A_{1}+\left(B_{1}+\widehat{B}_{1}\right)^{T} P \widehat{A}_{1}\right)\right] \mathbb{E}[X], \mathbb{E}[X]\right\rangle \\
&\left.+\left|K_{1}^{\frac{1}{2}}\left[\mathbb{E}[u]+K_{1}^{-1}\left((B+\widehat{B})^{T}(P+\widehat{P})+\left(B_{1}+\widehat{B}_{1}\right)^{T} P A_{1}+\left(B_{1}+\widehat{B}_{1}\right)^{T} P \widehat{A}_{1}\right) \mathbb{E}[X]\right]\right|^{2}\right\} d s \\
&=\mathbb{E} \int_{0}^{T}\left\{\left|K_{0}^{\frac{1}{2}}\left[u-\mathbb{E}[u]+K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)(X-\mathbb{E}[X])\right]\right|^{2}\right. \\
&\left.+\left|K_{1}^{\frac{1}{2}}\left[\mathbb{E}[u]+K_{1}^{-1}\left((B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P A_{1}+\left(B_{1}+\widehat{B}_{1}\right)^{T} P \widehat{A_{1}}\right) \mathbb{E}[X]\right]\right|^{2}\right\} d s \geq 0 .
\end{aligned}
$$

Then our claim follows.
We see that Riccati equation (4.4) can be written as follows:

$$
\begin{cases}\Pi^{\prime}+\Pi(A+\widehat{A})+(A+\widehat{A})^{T} \Pi+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)+Q+\widehat{Q}  \tag{4.1.1}\\ -\left[\Pi(B+\widehat{B})+\left(A_{1}+\widehat{A}_{1}\right)^{T} P\left(B_{1}+\widehat{B}_{1}\right)\right] K_{1}^{-1}\left[(B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right]=0 \\ & s \in[0, T] \\ \Pi(T)=G+\widehat{G}\end{cases}
$$

When

$$
\widehat{A}=\widehat{A}_{1}=0, \quad \widehat{B}=\widehat{B}_{1}=0, \quad \widehat{Q}=0, \quad \widehat{R}=0, \quad \widehat{G}=0
$$

we have

$$
K_{0}=K_{1}=R+B_{1}^{T} P B_{1},
$$

and the Riccati equation for $\Pi(\cdot)$ can be written as

$$
\left\{\begin{array}{l}
\Pi^{\prime}+\Pi A+A^{T} \Pi-\left(\Pi B+A_{1}^{T} P B_{1}\right) K_{0}^{-1}\left(B^{T} \Pi+B_{1}^{T} P A_{1}\right)+A_{1}^{T} P A_{1}+Q=0, \\
\Pi(T)=G .
\end{array}\right.
$$

Then

$$
\begin{aligned}
0= & (\Pi-P)^{\prime}+(\Pi-P) A+A^{T}(\Pi-P)-\left(\Pi B+A_{1}^{T} P B_{1}\right) K_{0}^{-1}\left(B^{T} \Pi+B_{1}^{T} P A_{1}\right) \\
& +\left(P B+A_{1}^{T} P B_{1}\right) K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right) \\
= & (\Pi-P)^{\prime}+(\Pi-P) A+A^{T}(\Pi-P)-(\Pi-P) B K_{0}^{-1}\left(B^{T} \Pi+B_{1}^{T} P A_{1}\right) \\
& -\left(P B+A_{1}^{T} P B_{1}\right) K_{0}^{-1} B^{T}(\Pi-P) .
\end{aligned}
$$

Therefore, by uniqueness, we have

$$
\Pi=P .
$$

Consequently, the feedback control can be written as

$$
\begin{aligned}
\bar{u} & =-K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)(\bar{X}-\mathbb{E}[\bar{X}])-K_{1}^{-1}\left[(B+\widehat{B})^{T} \Pi+\left(B_{1}+\widehat{B}_{1}\right)^{T} P\left(A_{1}+\widehat{A}_{1}\right)\right] \mathbb{E}[\bar{X}], \\
& =-K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)(\bar{X}-\mathbb{E}[\bar{X}])-K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right) \mathbb{E}[\bar{X}] \\
& =-K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right) \bar{X} .
\end{aligned}
$$

This recovers the result for classical LQ problem ([34]).

## 5 A Modification of Standard LQ Problems.

In this section, we are going to look at a special case which was mentioned in the introduction. For convenience, let us rewrite the state equation here:

$$
\left\{\begin{array}{l}
d X(s)=[A(s) X(s)+B(s) u(s)] d s+\left[A_{1}(s) X(s)+B_{1}(s) u(s)\right] d W(s)  \tag{5.1}\\
X(0)=x
\end{array}\right.
$$

with the cost functional:

$$
\begin{equation*}
J_{0}(x ; u(\cdot))=\mathbb{E}\left[\int_{0}^{T}\left(\left\langle Q_{0}(s) X(s), X(s)\right\rangle+\left\langle R_{0}(s) u(s), u(s)\right\rangle\right) d s+\left\langle G_{0} X(T), X(T)\right\rangle\right] \tag{5.2}
\end{equation*}
$$

Classical LQ problem can be stated as follows.
Problem (LQ). For any given $x \in \mathbb{R}^{n}$, find a $\bar{u}(\cdot) \in \mathcal{U}[0, T]$ such that

$$
\begin{equation*}
J_{0}(x ; \bar{u}(\cdot))=\inf _{u(\cdot) \in \mathcal{U}[0, T]} J_{0}(x ; u(\cdot)) \tag{5.3}
\end{equation*}
$$

The following result is standard (see [34]).
Theorem 5.1. Let (H1) hold and

$$
\begin{equation*}
Q_{0}(s) \geq 0, \quad R_{0}(s) \geq \delta I, \quad s \in[0, T] ; \quad G_{0} \geq 0 \tag{5.4}
\end{equation*}
$$

Then Problem (LQ) admits a unique optimal pair $\left(\bar{X}_{0}(\cdot), \bar{u}_{0}(\cdot)\right)$. Moreover, the following holds:

$$
\begin{equation*}
\bar{u}_{0}(s)=-\left[R_{0}(s)+B_{1}(s)^{T} P_{0}(s) B(s)\right]^{-1}\left[B(s)^{T} P_{0}(s)+B_{1}(s)^{T} P_{0}(s) A_{1}(s)\right] \bar{X}_{0}(s), \quad s \in[0, T] \tag{5.5}
\end{equation*}
$$

where $P_{0}(\cdot)$ is the solution to the following Riccati equation:

$$
\left\{\begin{array}{l}
P_{0}^{\prime}+P_{0} A+A^{T} P_{0}+A_{1}^{T} P_{0} A_{1}+Q_{0}  \tag{5.6}\\
\quad-\left(P_{0} B+A_{1}^{T} P_{0} B_{1}\right)\left(R_{0}+B_{1}^{T} P_{0} B_{1}\right)^{-1}\left(B^{T} P_{0}+B_{1}^{T} P_{0} A_{1}\right)=0, \quad s \in[0, T] \\
P_{0}(T)=G_{0}
\end{array}\right.
$$

and $\bar{X}(\cdot)$ is the solution to the following closed-loop system:

$$
\left\{\begin{align*}
d \bar{X}_{0}(s)= & {\left[A-B\left(R_{0}+B_{1}^{T} P_{0} B_{1}\right)^{-1}\left(B^{T} P_{0}+B_{1}^{T} P_{0} A\right)\right] \bar{X}(s) d s }  \tag{5.7}\\
& +\left[A_{1}-B_{1}\left(R_{0}+B_{1}^{T} P_{0} B_{1}\right)\left(B^{T} P_{0}+B_{1}^{T} P_{0} A_{1}\right)\right] \bar{X}(s) d W(s), \quad s \in[0, T] \\
\bar{X}_{0}(0)= & x
\end{align*}\right.
$$

We now introduce the following modified cost functional:

$$
\begin{align*}
& \widehat{J}_{0}(x ; u(\cdot))=\mathbb{E}\left[\int_{0}^{T}\left(\left\langle Q_{0}(s) X(s), X(s)\right\rangle+\left\langle R_{0}(s) u(s), u(s)\right\rangle\right) d s+\left\langle G_{0} X(T), X(T)\right\rangle\right] \\
& +\mathbb{E}\left[\int_{0}^{T}(q(s) \operatorname{var}[X(s)]+\rho(s) \operatorname{var}[u(s)]) d s+g \operatorname{var}[X(T)]\right.  \tag{5.8}\\
& =\mathbb{E}\left\{\int _ { 0 } ^ { T } \left[\left\langle\left(Q_{0}(s)+q(s) I\right) X(s), X(s)\right\rangle-q(s)|\mathbb{E}[X(s)]|^{2}+\left\langle\left(R_{0}(s)+\rho(s) I\right) u(s), u(s)\right\rangle\right.\right. \\
& \left.\left.\quad-\rho(s)|\mathbb{E}[u(s)]|^{2}\right] d s+\left\langle\left(G_{0}+g I\right) X(T), X(T)\right\rangle-g|\mathbb{E}[X(T)]|^{2}\right\},
\end{align*}
$$

with $q(\cdot), \rho(\cdot) \in L^{\infty}(0, T), g \in[0, \infty)$ such that

$$
\begin{equation*}
q(s), \rho(s) \geq 0, \quad s \in[0, T] \tag{5.9}
\end{equation*}
$$

Also, of course, we assume that

$$
\begin{equation*}
\int_{0}^{T}[q(s)+\rho(s)] d s+g>0 \tag{5.10}
\end{equation*}
$$

We want to compare the above Problem (LQ) with the following problem:
Problem (LQ) ${ }^{\prime}$. For any given $x \in \mathbb{R}^{n}$, find a $\bar{u}(\cdot) \in \mathcal{U}[0, T]$ such that

$$
\begin{equation*}
\widehat{J}_{0}(x ; \bar{u}(\cdot))=\inf _{u(\cdot) \in \mathcal{U}[0, T]} \widehat{J}_{0}(x ; u(\cdot)) . \tag{5.11}
\end{equation*}
$$

We refer to the above Problem (LQ) as a modified LQ problem. This is a special case of Problem (MF) with

$$
\left\{\begin{array}{l}
\widehat{A}=\widehat{A}_{1}=0, \quad \widehat{B}=\widehat{B}_{1}=0 \\
Q=Q_{0}+q I, \quad \widehat{Q}=-q I, \quad R=R_{0}+\rho I, \quad \widehat{R}=-\rho I, \quad G=G_{0}+g I, \quad \widehat{G}=-g I
\end{array}\right.
$$

Then the Riccati equations are

$$
\left\{\begin{array}{l}
P^{\prime}+P A+A^{T} P+A_{1}^{T} P A_{1}+Q_{0}+q I  \tag{5.12}\\
\quad-\left(P B+A_{1}^{T} P B_{1}\right)\left(R_{0}+\rho I+B_{1}^{T} P B_{1}\right)^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)=0, \quad s \in[0, T] \\
P(T)=G_{0}+g I
\end{array}\right.
$$

and

$$
\left\{\begin{array}{l}
\Pi^{\prime}+\Pi A+A^{T} \Pi+A_{1}^{T} P A_{1}+Q_{0}-\left(\Pi B+A_{1}^{T} P B_{1}\right)\left(R_{0}+B_{1}^{T} P B_{1}\right)^{-1}\left(B^{T} \Pi+B_{1}^{T} P A_{1}\right)=0, \quad s \in[0, T]  \tag{5.13}\\
\Pi(T)=G_{0}
\end{array}\right.
$$

The optimal control is given by

$$
\begin{gather*}
\bar{u}=-\left(R_{0}+\rho I+B_{1}^{T} P B_{1}\right)^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)(\bar{X}-\mathbb{E}[\bar{X}])  \tag{5.14}\\
-\left(R_{0}+B_{1}^{T} P B_{1}\right)^{-1}\left(B^{T} \Pi+B_{1}^{T} P A_{1}\right) \mathbb{E}[\bar{X}]
\end{gather*}
$$

and the closed-loop system reads

$$
\left\{\begin{align*}
d \bar{X}=\{ & {\left[A-B\left(R_{0}+\rho I+B_{1}^{T} P B_{1}\right)^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)\right](\bar{X}-\mathbb{E}[\bar{X}]) }  \tag{5.15}\\
& \left.+\left[A-B\left(R_{0}+B_{1}^{T} P B_{1}\right)^{-1}\left(B^{T} \Pi+B_{1}^{T} P A_{1}\right)\right] \mathbb{E}[\bar{X}]\right\} d s \\
& +\left\{\left[A_{1}-B_{1} K_{0}^{-1}\left(B^{T} P+B_{1}^{T} P A_{1}\right)\right](\bar{X}-\mathbb{E}[\bar{X}])\right. \\
& \left.+\left[A_{1}-B_{1} K_{1}^{-1}\left(B^{T} \Pi+B_{1}^{T} P A_{1}\right)\right] \mathbb{E}[\bar{X}]\right\} d W(s), \\
\bar{X}(0)= & x
\end{align*}\right.
$$

By the optimality of $\bar{u}_{0}(\cdot)$ and $\bar{u}(\cdot)$, we have that

$$
\begin{equation*}
\left\langle P_{0}(0) x, x\right\rangle=J_{0}\left(x ; \bar{u}_{0}(\cdot)\right) \leq J_{0}(x ; \bar{u}(\cdot)) \tag{5.16}
\end{equation*}
$$

and

$$
\begin{align*}
& \langle\Pi(0) x, x\rangle=J_{0}(x ; \bar{u}(\cdot))+\mathbb{E}\left[\int_{0}^{T}(q(s) \operatorname{var}[\bar{X}(s)]+\rho(s) \operatorname{var}[\bar{u}(s)]) d s+g \operatorname{var}[\bar{X}(T)]\right] \\
& =\widehat{J}_{0}(x ; \bar{u}(\cdot)) \leq \widehat{J}_{0}\left(x ; \bar{u}_{0}(\cdot)\right) \\
& =J_{0}\left(x ; \bar{u}_{0}(\cdot)\right)+\mathbb{E}\left[\int_{0}^{T}\left(q(s) \operatorname{var}\left[\bar{X}_{0}(s)\right]+\rho(s) \operatorname{var}\left[\bar{u}_{0}(s)\right]\right) d s+g \operatorname{var}\left[\bar{X}_{0}(T)\right]\right]  \tag{5.17}\\
& \leq J_{0}(x ; \bar{u}(\cdot))+\mathbb{E}\left[\int_{0}^{T}\left(q(s) \operatorname{var}\left[\bar{X}_{0}(s)\right]+\rho(s) \operatorname{var}\left[\bar{u}_{0}(s)\right]\right) d s+g \operatorname{var}\left[\bar{X}_{0}(T)\right]\right] .
\end{align*}
$$

This implies

$$
\begin{align*}
& \mathbb{E}\left[\int_{0}^{T}(q(s) \operatorname{var}[\bar{X}(s)]+\rho(s) \operatorname{var}[\bar{u}(s)]) d s+g \operatorname{var}[\bar{X}(T)]\right]  \tag{5.18}\\
& \leq \mathbb{E}\left[\int_{0}^{T}\left(q(s) \operatorname{var}\left[\bar{X}_{0}(s)\right]+\rho(s) \operatorname{var}\left[\bar{u}_{0}(s)\right]\right) d s+g \operatorname{var}\left[\bar{X}_{0}(T)\right]\right]
\end{align*}
$$

Hence,

$$
J_{0}(x ; \bar{u}(\cdot))-J_{0}\left(x ; \bar{u}_{0}(\cdot)\right)
$$

is the price for the decrease

$$
\begin{aligned}
& \mathbb{E}\left[\int_{0}^{T}\left(q(s) \operatorname{var}\left[\bar{X}_{0}(s)\right]+\rho(s) \operatorname{var}\left[\bar{u}_{0}(s)\right]\right) d s+g \operatorname{var}\left[\bar{X}_{0}(T)\right]\right] \\
& -\mathbb{E}\left[\int_{0}^{T}(q(s) \operatorname{var}[\bar{X}(s)]+\rho(s) \operatorname{var}[\bar{u}(s)]) d s+g \operatorname{var}[\bar{X}(T)]\right.
\end{aligned}
$$

of the (weighted) variances of the optimal state-control pair $\left(\bar{X}_{0}(\cdot), \bar{u}_{0}(\cdot)\right)$. Moreover, (5.17) further implies that

$$
\begin{aligned}
& J_{0}(x ; \bar{u}(\cdot))-J_{0}\left(x ; \bar{u}_{0}(\cdot)\right) \\
& \leq \mathbb{E}\left[\int_{0}^{T}\left(q(s) \operatorname{var}\left[\bar{X}_{0}(s)\right]+\rho(s) \operatorname{var}\left[\bar{u}_{0}(s)\right]\right) d s+g \operatorname{var}\left[\bar{X}_{0}(T)\right]\right] \\
& \quad-\mathbb{E}\left[\int_{0}^{T}(q(s) \operatorname{var}[\bar{X}(s)]+\rho(s) \operatorname{var}[\bar{u}(s)]) d s+g \operatorname{var}[\bar{X}(T)] .\right.
\end{aligned}
$$

The above roughly means that the amount increased in the cost is "covered" by the amount decreased in the weighted variance of the optimal state-control pair.

We now look at a simple case to illustrate the above. Let us look at a one-dimensional controlled linear SDE:

$$
\left\{\begin{array}{l}
d X(s)=b u(s) d s+X(s) d W(s)  \tag{5.19}\\
X(0)=x
\end{array}\right.
$$

with cost functionals:

$$
\begin{equation*}
J_{0}(x ; u(\cdot))=\mathbb{E}\left[\int_{0}^{T}|u(s)|^{2} d s+g_{0}|X(T)|^{2}\right] \tag{5.20}
\end{equation*}
$$

and

$$
\begin{align*}
\widehat{J}_{0}(x ; u(\cdot)) & =\mathbb{E}\left\{\int_{0}^{T}|u(s)|^{2} d s+g_{0}|X(T)|^{2}+g \operatorname{var}[X(T)]\right\}  \tag{5.21}\\
& =\mathbb{E}\left\{\int_{0}^{T}|u(s)|^{2} d s+\left(g_{0}+g\right)|X(T)|^{2}-g(\mathbb{E}[X(T)])^{2}\right\}
\end{align*}
$$

where $g_{0} \geq 0$ and $g>0$. As above, we refer to the optimal control problem associated with (5.19) and (5.20) as the standard $L Q$ problem, and to that associated with (5.19) and (5.17) as the modified LQ problem. The Riccati equation for the standard LQ problem is

$$
\left\{\begin{array}{l}
p_{0}^{\prime}(s)+p_{0}(s)-b^{2} p_{0}(s)^{2}=0, \quad s \in[0, T]  \tag{5.22}\\
p_{0}(T)=g_{0}
\end{array}\right.
$$

A straightforward calculation shows that

$$
\begin{equation*}
p_{0}(s)=\frac{e^{T-s} g_{0}}{\left(e^{T-s}-1\right) b^{2} g_{0}+1}>0, \quad s \in[0, T] \tag{5.23}
\end{equation*}
$$

The optimal control is

$$
\begin{equation*}
\bar{u}_{0}(s)=-b p_{0}(s) \bar{X}_{0}(s), \quad s \in[0, T] \tag{5.24}
\end{equation*}
$$

and the closed-loop system is

$$
\left\{\begin{array}{l}
d \bar{X}_{0}(s)=-b^{2} p_{0}(s) \bar{X}_{0}(s) d s+\bar{X}_{0}(s) d W(s), \quad s \in[0, T]  \tag{5.25}\\
\bar{X}_{0}(0)=x
\end{array}\right.
$$

Thus,

$$
\begin{equation*}
\bar{X}_{0}(s)=x e^{-b^{2} \int_{0}^{s} p_{0}(\tau) d \tau-\frac{1}{2} s+W(s)}, \quad s \in[0, T] . \tag{5.26}
\end{equation*}
$$

Consequently,

$$
\begin{equation*}
\mathbb{E}\left[\bar{X}_{0}(T)\right]=x e^{-b^{2} \int_{0}^{T} p_{0}(\tau) d \tau-\frac{1}{2} T+\frac{1}{2} T}=x e^{-b^{2} \int_{0}^{T} p_{0}(\tau) d \tau} \tag{5.27}
\end{equation*}
$$

and

$$
\begin{equation*}
\mathbb{E}\left[\bar{X}_{0}(T)^{2}\right]=x^{2} e^{-2 b^{2} \int_{0}^{T} p_{0}(\tau) d \tau-T+2 T}=x^{2} e^{-2 b^{2} \int_{0}^{T} p_{0}(\tau) d \tau+T} \tag{5.28}
\end{equation*}
$$

Hence,

$$
\begin{equation*}
\operatorname{var}\left[\bar{X}_{0}(T)\right]=\mathbb{E}\left[\bar{X}_{0}(T)^{2}\right]-\left(\mathbb{E}\left[\bar{X}_{0}(T)\right]\right)^{2}=x^{2} e^{-2 b^{2} \int_{0}^{T} p_{0}(\tau) d \tau}\left(e^{T}-1\right) \tag{5.29}
\end{equation*}
$$

Also, the optimal expected cost is

$$
\begin{equation*}
J_{0}\left(x ; \bar{u}_{0}(\cdot)\right)=p_{0}(0) x^{2}=\frac{e^{T} g_{0}}{\left(e^{T}-1\right) b^{2} g_{0}+1} x^{2} \tag{5.30}
\end{equation*}
$$

Next, for the modified LQ peoblem, the Riccati equations are:

$$
\left\{\begin{array}{l}
p^{\prime}(s)+p(s)-b^{2} p(s)^{2}=0,  \tag{5.31}\\
p(T)=g_{0}+g
\end{array}\right.
$$

and

$$
\left\{\begin{array}{l}
\pi^{\prime}(s)-b^{2} \pi^{2}(s)+p(s)=0, \quad s \in[0, T]  \tag{5.32}\\
\pi(T)=g_{0}
\end{array}\right.
$$

Clearly,

$$
\begin{equation*}
p(s)=\frac{e^{T-s}\left(g_{0}+g\right)}{\left(e^{T-s}-1\right) b^{2}\left(g_{0}+g\right)+1}>\frac{e^{T-s} g_{0}}{\left(e^{T-s}-1\right) b^{2} g_{0}+1}=p_{0}(s)>0, \quad s \in[0, T] \tag{5.33}
\end{equation*}
$$

We now show that

$$
\begin{equation*}
p_{0}(s)<\pi(s)<p(s), \quad s \in[0, T] . \tag{5.34}
\end{equation*}
$$

In fact,

$$
\left\{\begin{array}{l}
\frac{d}{d s}\left[\pi(s)-p_{0}(s)\right]-b^{2}\left[\pi(s)+p_{0}(s)\right]\left[\pi(s)-p_{0}(s)\right]+p(s)-p_{0}(s)=0, \quad s \in[0, T] \\
\pi(T)-p_{0}(T)=0
\end{array}\right.
$$

Thus,

$$
\pi(s)-p_{0}(s)=\int_{s}^{T} e^{-\int_{s}^{t} b^{2}\left[\pi(\tau)+p_{0}(\tau)\right] d \tau}\left[p(t)-p_{0}(t)\right] d t>0, \quad s \in[0, T)
$$

Next,

$$
\left\{\begin{array}{l}
\frac{d}{d s}[p(s)-\pi(s)]-b^{2}[p(s)+\pi(s)][p(s)-\pi(s)]=0, \quad s \in[0, T] \\
p(T)-\pi(T)=g
\end{array}\right.
$$

Hence,

$$
p(s)-\pi(s)=e^{-\int_{s}^{T} b^{2}[p(\tau)+\pi(\tau)] d \tau} g>0, \quad s \in[0, T] .
$$

This proves (5.34). Note that the optimal control of modified LQ problem is given by

$$
\bar{u}(s)=-b p(s)(\bar{X}(s)-\mathbb{E}[\bar{X}(s)])-b \pi(s) \mathbb{E}[\bar{X}(s)], \quad s \in[0, T]
$$

and the closed-loop system is

$$
\left\{\begin{array}{l}
d \bar{X}(s)=-\left[b^{2} p(s)(\bar{X}(s)-\mathbb{E}[\bar{X}(s)])+b^{2} \pi(s) \mathbb{E}[\bar{X}(s)]\right] d s+\bar{X}(s) d W(s), \quad s \in[0, T]  \tag{5.35}\\
\bar{X}(0)=x
\end{array}\right.
$$

Thus,

$$
\frac{d}{d s}(\mathbb{E}[\bar{X}(s)])=-b^{2} \pi(s) \mathbb{E}[\bar{X}(s)]
$$

which leads to

$$
\begin{equation*}
\mathbb{E}[\bar{X}(s)]=e^{-b^{2}} \int_{0}^{s} \pi(\tau) d \tau x, \quad s \in[0, T] \tag{5.36}
\end{equation*}
$$

On the other hand, by Itô's formula,

$$
d\left[\bar{X}^{2}\right]=\left\{-2\left[b^{2} p \bar{X}(\bar{X}-\mathbb{E}[\bar{X}])+b^{2} \pi \bar{X} \mathbb{E}[\bar{X}]\right]+\bar{X}^{2}\right\} d s+[\cdots] d W
$$

Then

$$
\begin{aligned}
& d\left(\mathbb{E}\left[\bar{X}^{2}\right]\right)=\left\{-2 b^{2} p\left[\mathbb{E}\left[\bar{X}^{2}\right]-(\mathbb{E}[\bar{X}])^{2}\right]-2 b^{2} \pi(\mathbb{E}[\bar{X}])^{2}+\mathbb{E}\left[\bar{X}^{2}\right]\right\} d s \\
& \quad=\left\{\left(1-2 b^{2} p\right) \mathbb{E}\left[\bar{X}^{2}\right]+2 b^{2}(p-\pi)(\mathbb{E}[\bar{X}])^{2}\right\} d s \\
& \quad=\left\{\left(1-2 b^{2} p\right) \mathbb{E}\left[\bar{X}^{2}\right]+2 b^{2}(p-\pi) e^{-2 b^{2} \int_{0}^{s} \pi(\tau) d \tau} x^{2}\right\} d s
\end{aligned}
$$

Hence,

$$
\begin{aligned}
& \mathbb{E}\left[\bar{X}^{2}(s)\right]=e^{s-2 b^{2}} \int_{0}^{s} p(\tau) d \tau \\
& x^{2}\left[1+\int_{0}^{s} e^{-t+2 \int_{0}^{t} p(\tau) d \tau} 2 b^{2}[p(t)-\pi(t)] e^{-2 b^{2} \int_{0}^{t} \pi(\tau) d \tau} d t\right] \\
& =e^{s-2 b^{2} \int_{0}^{s} p(\tau) d \tau} x^{2}\left[1+\int_{0}^{s} e^{-t+2 b^{2} \int_{0}^{t}[p(\tau)-\pi(\tau)] d \tau} 2 b^{2}[p(t)-\pi(t)] d t\right] \\
& =e^{s-2 b^{2} \int_{0}^{s} p(\tau) d \tau} x^{2}\left[e^{-s+2 b^{2} \int_{0}^{s}[p(\tau)-\pi(\tau)] d \tau}+\int_{0}^{s} e^{-t+2 b^{2} \int_{0}^{t}[p(\tau)-\pi(\tau)] d \tau} d t\right] \\
& =\left[e^{-2 b^{2} \int_{0}^{s} \pi(\tau) d \tau}+\int_{0}^{s} e^{s-t-2 b^{2} \int_{t}^{s} p(\tau) d \tau-2 b^{2} \int_{0}^{t} \pi(\tau) d \tau} d t\right] x^{2}
\end{aligned}
$$

It follows that

$$
\begin{aligned}
\operatorname{var}[\bar{X}(s)] & =\left[e^{-2 b^{2} \int_{0}^{s} \pi(\tau) d \tau}+\int_{0}^{s} e^{s-t-2 b^{2} \int_{t}^{s} p(\tau) d \tau-2 b^{2} \int_{0}^{s} \pi(\tau) d \tau} d t\right] x^{2}-\left(e^{-2 b^{2} \int_{0}^{t} \pi(\tau) d \tau}\right) x^{2} \\
& =\left[\int_{0}^{s} e^{s-t-2 b^{2} \int_{t}^{s} p(\tau) d \tau-2 b^{2} \int_{0}^{t} \pi(\tau) d \tau} d t\right] x^{2}
\end{aligned}
$$

Consequently, noting $p_{0}(s)<p(s)$, we have

$$
\begin{align*}
\operatorname{var}[\bar{X}(T)] & =\left[\int_{0}^{T} e^{T-t-2 b^{2} \int_{t}^{T} p(\tau) d \tau-2 b^{2} \int_{0}^{t} p_{0}(\tau) d \tau} d t\right] x^{2}<\left[\int_{0}^{T} e^{T-t-2 b^{2} \int_{t}^{T} p_{0}(\tau) d \tau-2 b^{2} \int_{0}^{t} p_{0}(\tau) d \tau} d t\right] x^{2}  \tag{5.37}\\
& =\left[\int_{0}^{T} e^{T-t-2 b^{2} \int_{0}^{T} p_{0}(\tau) d \tau} d t\right] x^{2}=\left[e^{-2 b^{2} \int_{0}^{T} p_{0}(\tau) d \tau} \int_{0}^{T} e^{T-t} d t\right] x^{2}=\operatorname{var}\left[\bar{X}_{0}(T)\right]
\end{align*}
$$

On the other hand, we claim that

$$
\begin{equation*}
p_{0}(s)>\frac{g_{0}}{g_{0}+g} p(s), \quad s \in[0, T) \tag{5.38}
\end{equation*}
$$

In fact, by letting $\widetilde{p}=\frac{g_{0}}{g_{0}+g} p$, we have

$$
\left\{\begin{array}{l}
\widetilde{p}(s)+\widetilde{p}(s)-b^{2} \widetilde{p}(s)^{2}-\frac{g_{0} g}{\left(g_{0}+g\right)^{2}} p(s)^{2}=0 \\
\widetilde{p}(T)=g_{0}
\end{array}\right.
$$

Then

$$
\left\{\begin{array}{l}
{\left[p_{0}^{\prime}(s)-\widetilde{p}^{\prime}(s)\right]+\left[p_{0}(s)-\widetilde{p}(s)\right]-b^{2}\left[p_{0}(s)+\widetilde{p}(s)\right]\left[p_{0}(s)-\widetilde{p}(s)\right]+\frac{g_{0} g}{\left(g_{0}+g\right)^{2}} p(s)^{2}=0} \\
p_{0}(T)-\widetilde{p}(T)=0
\end{array}\right.
$$

This leads to (5.38). Consequently,

$$
J_{0}(x ; \bar{u}(\cdot))+\operatorname{var}[\bar{X}(T)]=\widehat{J}_{0}(x ; \bar{u}(\cdot))=\pi(0) x^{2} \leq p(0) x^{2} \leq \frac{g_{0}+g}{g_{0}} p_{0}(0) x^{2}=\frac{g_{0}+g}{g_{0}} J\left(x ; \bar{u}_{0}(\cdot)\right)
$$

Therefore,

$$
0 \leq J_{0}(x ; \bar{u}(\cdot))-J_{0}\left(x ; \bar{u}_{0}(\cdot)\right)+g \operatorname{var}[\bar{X}(T)] \leq \frac{g}{g_{0}} J\left(x ; \bar{u}_{0}(\cdot)\right)
$$

The above gives an upper bound for the cost increase in order to have a smaller var $[X(T)]$. Taking into account of (5.37), we see that it is a very good trade-off to consider the modified LQ problem if one wishes to have a smaller var $[X(T)]$. It is possible to more carefully calculate the price difference $J_{0}(x ; u(\cdot))-$ $J_{0}\left(x ; \bar{u}_{0}(\cdot)\right)$. We omit the details here.

Also, it is possible to calculate the situation of including var $[u(s)]$ and/or var $[X(s)]$ in the integrand of the modified cost functional. The details are omitted here as well.

To conclude this paper, let us make some remarks. First of all, we have presented some results on the LQ problem for MF-SDEs with deterministic coefficients. Optimal control is represented by a state feedback form involving both $X(\cdot)$ and $\mathbb{E}[X(\cdot)]$, via the solutions of two Riccati equations. Apparently, there are many problems left unsolved (and some of them might be challenging). To mention a few, one may consider the case of infinite-horizon problem, following the idea of [31], and more interestingly, the case of random coefficients (for which one might have to introduce some other techniques since the approach used in this paper will not work). We will continue our study and report new results in our future publications.
