# Multi-scale Modeling for Piezoelectric Composite Materials 

Qian Zhang ${ }^{\text {a }}$, Xingye Yue ${ }^{\text {b,* }}$<br>${ }^{a}$ Department of Mathematics, The Hong Kong University of Science and Technology Clear Water Bay, Kowloon, Hong Kong, China<br>${ }^{b}$ Department of Mathematics, Soochow University, Suzhou, China

#### Abstract

In this paper, we focus on multi-scale modeling and simulation of piezoelectric composite materials. A multi-scale model for piezoelectric composite materials under the framework of Heterogeneous Multi-scale Method(HMM) is proposed. For materials with periodic microstructure, macroscopic model is derived from microscopic model of piezoelectric composite material by asymptotic expansion. Convergence analysis under the framework of homogenization theory is carried out. Moreover, error estimate between HMM solutions and homogenization solutions is derived. A 3-D numerical example of 1-3 type piezoelectric composite materials is employed to verify the error estimate.

Keywords: Piezoelectric composite materials, Multi-scale modeling, Homogenization theory, Asymptotic expansion, Heterogeneous multi-scale method

## 1. Introduction

Piezoelectricity is the ability of some materials to generate an electric field or electric potential in response to mechanical strain applied. The piezoelectric effect is reversible in that materials exhibiting the direct piezoelectric effect (the production of an electric potential when stress is applied) also exhibit the reverse piezoelectric effect (the production of stress and/or strain when an electric field is applied). The effect is found useful in applications such as the production and detection of sound, generation of high voltages,

[^0]electronic frequency generation, microbalances, and ultra fine focusing of optical assemblies. It is also the basis of a number of scientific instrumental techniques with atomic resolution, the scanning probe microscopies such as STM, AFM, MTA, SNOM, etc., and everyday uses such as acting as the ignition source for cigarette lighters and push-start propane barbecues. Moreover, the piezoelectric effect and the reverse piezoelectric effect can be reflected by the following two constitutive relationships respectively
\[

$$
\begin{equation*}
D_{m}=\epsilon_{m n} E_{n}+d_{m k l} \sigma_{k l} \quad S_{i j}=s_{i j k l} \sigma_{k l}+d_{m i j} E_{m} \tag{1}
\end{equation*}
$$

\]

where $\mathbf{D}$ is electric displacement, $\epsilon_{m n}$ is permittivity, $\mathbf{E}$ is electric field strength, $S_{i j}$ is strain, $s_{i j k l}$ is compliance and $\sigma_{k l}$ is stress, $d_{m k l}$ is piezoelectric constant.

It is apparent that some composite materials could be designed so as to attain properties desired in industry. In this way, the best properties from each constituent phase within the composite may be utilized to create an improved material. In general, by replacing a portion of a piezoceramic with a lightweight, flexible, polymer, the resulting density, acoustic impedance, mechanical quality factor and dielectric constant can be decreased. If the phases can be arranged so the piezoelectric charge coefficients of the composite are maintained at reasonable levels, its voltage coefficients can be substantially improved. As a result, the merit of the piezocomposites can actually surpass those of single phase materials.

Therefore, according to aspects mentioned above, multi-scale modeling is necessary to describe the behavior of piezoelectric composites for the following two reasons. On one hand, in engineering, we are interested in relationship between micro-structure of the composite materials and macro-properties of the composite materials because in this way we can make the composite materials with desired macro-properties by controlling its micro-structure. On the other hand, in numerical computation, the computation of the parameters describing a micro-nonhomogeneous medium is an extremely difficult task, since the coefficients of the corresponding differential equations are given by rapidly oscillating functions. Many methods has been raised to get the multi-scale model, such as MsFEM, RVE, HMM and etc.

A number of work have been done in this field by former researchers. Most of them focus on the piezoelectric composite materials with some special microstructures. The modeling of the piezoelectric composites with shell, perforated, periodic micro-structure
with theoretical analysis has been held by Marius et al. [5] and Bernadette et al. 11. The modeling of $1-3$ type piezoelectric composite without theoretical analysis has been held by Harald et al. [4] using RVE.

In this paper, a multi-scale model under the framework of HMM is designed. Corresponding theoretical analysis is derived. Differing from the elliptic equations whose solution is a minimum point of its energy functional, the solution of piezoelectric equations is a saddle point of its energy functional, which is caused by the coupling of mechanical field and electrical field. This difference brought main obstacle for theoretical analysis. We also deduced the macroscopic model from the microscopic model of piezoelectric composite material for materials with periodic microstructure and carried out the corresponding convergence analysis under the framework of homogenization. For the analysis of convergence, noticing that the regularity of the solutions of cell problems in the model cannot reach $W^{1, \infty}$, which makes the traditional treatment to this kind of problem not work on our problem. To solve this problem, we employ two useful lemmas, whose original idea is from Tatyana et al. [8] under the assumption that the regularity of solutions of cell problems in the model can reach $L^{\infty}$. Moreover, error estimate between HMM solutions and homogenization solutions is derived. A 3-D numerical example was given out to verify the error estimate.

The rest of the paper is organized as follows. In Section 2, we introduction the multi-scale problem of piezoelectric composite material briefly. In Section 3, a multiscale model under the framework of HMM is designed. The macroscopic model from the microscopic model of piezoelectric composite material for materials with periodic microstructure is derived by asymptotic expansion in Section 4. We also give out the corresponding convergence analysis for the model we derived under the framework of homogenization in Section 4. In Section 5, both error estimate between HMM solutions and homogenization solutions and error estimate of the effective coefficients is derived. Numerical examples are employed to verify the error estimate in Section 6. The paper concludes in Section 7.

## 2. Piezoelectric Equations

Under the action of applied volume loading $\mathbf{f} \in L^{2}(\Omega)$ and without electric charges, the electroelastic state of piezoelectric medium is governed by the following system of equations.

- Equations of motion:

$$
\begin{equation*}
-\frac{\partial \sigma_{i j}}{\partial x_{j}}=f_{i} \quad \text { in } \quad \Omega \tag{2}
\end{equation*}
$$

- Maxwell's equations (in the quasistatic approximation):

$$
\begin{equation*}
\frac{\partial D_{i}}{\partial x_{i}}=0 \quad E_{i}=-\frac{\partial \varphi}{\partial x_{i}} \quad \text { in } \quad \Omega \tag{3}
\end{equation*}
$$

- Constitutive relations:

$$
\begin{align*}
\sigma_{i j} & =c_{i j k n} \frac{\partial u_{k}}{\partial x_{n}}-e_{k i j} E_{k}  \tag{4}\\
D_{i} & =e_{i k n} \frac{\partial u_{k}}{\partial x_{n}}+\epsilon_{i j} E_{j} \tag{5}
\end{align*}
$$

Without lose of generalization, we just take the Dirichlet Boundary condition as follows.

$$
\begin{equation*}
u_{i}=0, \quad \varphi=0 \quad \text { on } \quad \partial \Omega \tag{6}
\end{equation*}
$$

where $\sigma_{i j}$ is stress tensor, $\mathbf{u}$ is elastic displacement field, $\mathbf{D}$ is electrical displacement, $\mathbf{E}$ is electric field, $\varphi$ is potential field.

Hence, characteristics of the piezoelectric material are given by elastic tensor ( $c_{i j k n}$ ), dielectric tensor $\left(\epsilon_{i j}\right)$ and piezoelectric tensor $\left(e_{k i j}\right)$. These three tensors have the following properties:

- The elastic tensor $\left(c_{i j k n}\right)$ is symmetric and positive defined, that is,

$$
c_{i j k l}=c_{j i k l}=c_{k l i j}
$$

and there exists $\alpha>0$, such that $c_{i j k l} X_{i j} X_{k l} \geq \alpha X_{i j} X_{k l}, \forall X_{i j}=X_{j i} \in R$

- The dielectric tensor $\left(\epsilon_{i j}\right)$ is symmetric and positive defined, that is,

$$
\epsilon_{i j}=\epsilon_{i j}
$$

and there exists $\beta>0$, such that $\epsilon_{i j} X_{i} X_{j} \geq \beta X_{i} X_{j}, \forall X_{i} \in R$

- The piezoelectric tensor $\left(e_{k i j}\right)$ is symmetric in the sense that $e_{k i j}=e_{k j i}$
- $c_{i j k l} \in L^{\infty}(\Omega), d_{i j} \in L^{\infty}(\Omega), e_{i j k} \in L^{\infty}(\Omega)$

Thus, in the rest parts of this paper, we consider the following equation system,

$$
\begin{cases}-\frac{\partial \sigma_{i j}^{(\varepsilon)}}{\partial x_{j}}=f_{i} & x \in \Omega \subset R^{d}  \tag{7}\\ \frac{\partial D_{i}^{(\varepsilon)}}{\partial x_{i}}=0 & x \in \Omega \subset R^{d} \\ \sigma_{i j}^{(\varepsilon)}=c_{i j k n}^{(\varepsilon)} \frac{\partial u_{k}^{(\varepsilon)}}{\partial x_{n}}+e_{k i j}^{(\varepsilon)} \frac{\partial \varphi^{(\varepsilon)}}{\partial x_{k}} & \\ D_{i}^{(\varepsilon)}=e_{i k n}^{(\varepsilon)} \frac{\partial u_{k}^{(\varepsilon)}}{\partial x_{n}}-\epsilon_{i j}^{(\varepsilon)} \frac{\partial \varphi^{(\varepsilon)}}{\partial x_{j}} & \\ u_{i}^{(\varepsilon)}=0 \quad \varphi^{(\varepsilon)}=0 & x \in \partial \Omega\end{cases}
$$

where $\varepsilon \ll 1$ is the characteristic non-homogeneity dimension.
Moreover, through this paper, Latin indices and exponents take their values in the set $\{1,2,3\}$, if there is no special illustration. The average symbol $\langle\cdot\rangle_{\square}$ is defined as

$$
\langle\cdot\rangle_{\square}=\frac{1}{|\square|} \int_{\square} \cdot d y
$$

where $|\square|$ is the volume of $\square$. Let $\Omega$ be a polyhedral domain in $R^{d}$ with a Lipschitz boundary $\partial \Omega$ whose unit outer normal is denoted by $\mathbf{n}$. In the derivations below, we use $L^{2}(\Omega)$ based Sobolev spaces $H^{k}(\Omega)$ equipped with norms and seminorms

$$
\|u\|_{k, \Omega}=\left(\int_{\Omega} \sum_{|\alpha| \leq k}\left|D^{\alpha} u\right|^{2}\right)^{1 / 2}, \quad|u|_{k, \Omega}=\left(\int_{\Omega} \sum_{|\alpha|=k}\left|D^{\alpha} u\right|^{2}\right)^{1 / 2}
$$

## 3. HMM modeling of piezoelectric composite materials

HMM (Heterogeneous multiscale method) by W. E et al. 11] is a general methodology for designing sublinear algorithms by exploiting scale separation and other special features of the problem. It consists of two components: selection of a macroscopic solver and estimating the missing macroscale data by solving locally the fine scale problem.

For (7), the macroscopic solver can be chosen as standard piecewise linear finite element method on a triangulation $\mathscr{T}_{H}$ of element size H which should resolve the macroscale features of $c_{i j k n}^{(\varepsilon)}, e_{k i j}^{(\varepsilon)}$ and $\epsilon_{i j}^{(\varepsilon)}$. The missing data are the effective stiffness matrices
at this scale. Assuming that the effective coefficients at this scale are $c_{i j k n}^{H}, e_{i j k}^{H}$ and $\epsilon_{i j}^{H}$, if we know $c_{i j k n}^{H}, e_{i j k}^{H}$ and $\epsilon_{i j}^{H}$ explicitly, macroscopic piezoelectric equation system could be solved by FEM in the following variational form.

Find $\mathbf{u} \in X_{H} \times X_{H} \times X_{H}, \varphi \in X_{H}$ s.t.

$$
\left\{\begin{array}{lll}
c_{H}(\mathbf{u}, \mathbf{v})+e_{H}(\mathbf{v}, \varphi)=(\mathbf{f}, \mathbf{v}), & \forall & \mathbf{v} \in X_{H} \times X_{H} \times X_{H}  \tag{8}\\
-e_{H}(\mathbf{u}, \psi)+d_{H}(\varphi, \psi)=0, & \forall & \psi \in X_{H}
\end{array}\right.
$$

where

$$
\begin{align*}
& c_{H}(\mathbf{u}, \mathbf{v})=\int_{\Omega} c_{i j k l}^{H} s_{i j}(\mathbf{u}) s_{k l}(\mathbf{v}) d x \simeq \sum_{K \in \mathscr{T}_{H}}|K| \sum_{x_{\alpha} \in K} w_{\alpha}\left(c_{i j k l}^{H} s_{i j}(\mathbf{u}) s_{k l}(\mathbf{v})\right)\left(x_{\alpha}\right) \\
& e_{H}(\mathbf{v}, \varphi)=\int_{\Omega} e_{i j k}^{H} s_{i j}(\mathbf{v}) \partial_{k} \varphi d x \simeq \sum_{K \in \mathscr{T}_{H}}|K| \sum_{x_{\alpha} \in K} w_{\alpha}\left(e_{i j k}^{H} s_{i j}(\mathbf{v}) \partial_{k} \varphi\right)\left(x_{\alpha}\right)  \tag{9}\\
& d_{H}(\varphi, \psi)=\int_{\Omega} \epsilon_{i j}^{H} \partial_{i} \varphi \partial_{j} \psi d x \simeq \sum_{K \in \mathscr{T}_{H}}|K| \sum_{x_{\alpha} \in K} w_{\alpha}\left(\epsilon_{i j}^{H} \partial_{i} \varphi \partial_{j} \psi\right)\left(x_{\alpha}\right)
\end{align*}
$$

where $x_{\alpha}$ and $w_{\alpha}$ are the quadrature points and weights in $\mathrm{K},|K|$ is the volume of K .
However, we can not get $c_{i j k n}^{H}, e_{i j k}^{H}$ and $\epsilon_{i j}^{H}$ explicitly in most cases. In the absence of explicit knowledge of $c_{i j k n}^{H}, e_{i j k}^{H}$ and $\epsilon_{i j}^{H}$, we approximation $c_{H}(\mathbf{u}, \mathbf{v}), e_{H}(\mathbf{v}, \varphi)$ and $d_{H}(\varphi, \psi)$ by solving two microscopic problems as follows on the samples we have chosen.

$$
\begin{cases}-\frac{\partial \sigma_{i j}^{(\varepsilon)}}{\partial x_{j}}=0 & x \in I_{\delta}\left(x_{\alpha}\right)  \tag{10}\\ \frac{\partial D_{i}^{(\varepsilon)}}{\partial x_{i}}=0 & x \in I_{\delta}\left(x_{\alpha}\right) \\ \sigma_{i j}^{(\varepsilon)}=c_{i j k n}^{(\varepsilon)} \frac{\partial\left(v_{\alpha}\right)_{k}^{(\varepsilon)}}{\partial x_{n}}+e_{k i j}^{(\varepsilon)} \frac{\partial \varphi_{\alpha v}^{(\varepsilon)}}{\partial x_{k}} & \\ D_{i}^{(\varepsilon)}=e_{i k n}^{(\varepsilon)} \frac{\partial\left(v_{\alpha}\right)_{k}^{(\varepsilon)}}{\partial x_{n}}-\epsilon_{i j}^{(\varepsilon)} \frac{\partial \varphi_{\alpha v}^{(\varepsilon)}}{\partial x_{j}} & \\ \mathbf{v}_{\alpha}^{(\varepsilon)}=\mathbf{V}_{\alpha}(x) \quad \varphi_{\alpha v}^{(\varepsilon)}=0 & x \in \partial I_{\delta}\left(x_{\alpha}\right)\end{cases}
$$

and

$$
\begin{cases}-\frac{\partial \sigma_{j j}^{(\varepsilon)}}{\partial x_{j}}=0 & x \in I_{\delta}\left(x_{\alpha}\right)  \tag{11}\\ \frac{\partial D_{i}^{(\varepsilon)}}{\partial x_{i}}=0 & x \in I_{\delta}\left(x_{\alpha}\right) \\ \sigma_{i j}^{(\varepsilon)}=c_{i j k n}^{(\varepsilon)} \frac{\partial\left(v_{\alpha \alpha}\right)_{k}^{(\varepsilon)}}{\partial x_{n}}+e_{k i j}^{(\varepsilon)} \frac{\partial \varphi_{\alpha}^{(\varepsilon)}}{\partial x_{k}} & \\ D_{i}^{(\varepsilon)}=e_{i k n}^{(\varepsilon)} \frac{\partial\left(v_{\alpha \varphi}\right)_{k}^{(\varepsilon)}}{\partial x_{n}}-\epsilon_{i j}^{(\varepsilon)} \frac{\partial \varphi_{\alpha}^{(\varepsilon)}}{\partial x_{j}} & \\ \mathbf{v}_{\alpha \varphi}^{(\varepsilon)}=0 & \varphi_{\alpha}^{(\varepsilon)}=\varphi_{\alpha}(x)\end{cases}
$$

where $I_{\delta}\left(x_{\alpha}\right)=x_{\alpha}+\left[-\frac{\delta}{2}, \frac{\delta}{2}\right]^{d}$ is a cubic of size $\delta$ centered at $x_{\alpha}$ and $\mathbf{V}_{\alpha}$ is the linear approximation of $\mathbf{v}$ at $I_{\delta}\left(x_{\alpha}\right)$. For the macroscopic finite element space $X_{H}$ we have chosen, $\mathbf{V}_{\alpha}$ is $\mathbf{v}$. Similarly, $\varphi_{\alpha}(x)$ is the linear approximation of $\varphi$ at $I_{\delta}\left(x_{\alpha}\right)$.

Figure 1. Illustration of HMM for solving (7). The dots are the quadrature points in (9). we define the corresponding bilinear forms as follows.
For any $\mathbf{u} \in X_{H} \times X_{H} \times X_{H}, \mathbf{v} \in X_{H} \times X_{H} \times X_{H}, \varphi \in X_{H}, \psi \in X_{H}$

$$
\begin{aligned}
& c_{H}(\mathbf{u}, \mathbf{v})=\sum_{K \in \mathscr{T}_{H}}|K| \sum_{x_{\alpha} \in K} w_{\alpha} \frac{1}{\left|I_{\delta}\left(x_{\alpha}\right)\right|} \int_{I_{\delta}\left(x_{\alpha}\right)}\left(c_{i j k l}^{(\varepsilon)} s_{i j}\left(\mathbf{u}_{\alpha}^{(\varepsilon)}\right) s_{k l}\left(\mathbf{v}_{\alpha}^{(\varepsilon)}\right)+e_{i j k}^{(\varepsilon)} s_{i j}\left(\mathbf{u}_{\alpha}^{(\varepsilon)}\right) \partial_{k} \varphi_{\alpha v}^{(\varepsilon)}\right) d x \\
& e_{H}(\mathbf{v}, \varphi)=\sum_{K \in \mathscr{S}_{H}}|K| \sum_{x_{\alpha} \in K} w_{\alpha} \frac{1}{\left|I_{\delta}\left(x_{\alpha}\right)\right|} \int_{I_{\delta}\left(x_{\alpha}\right)}\left(e_{i j k}^{(\varepsilon)} s_{i j}\left(\mathbf{v}_{\alpha}^{(\varepsilon)}\right) \partial_{k} \varphi_{\alpha}^{(\varepsilon)}-\epsilon_{i j}^{(\varepsilon)} \partial_{i} \varphi_{\alpha v}^{(\varepsilon)} \partial_{j} \varphi_{\alpha}^{(\varepsilon)}\right) d x \\
& e_{H}(\mathbf{v}, \varphi)=\sum_{K \in \mathscr{F}_{H}}|K| \sum_{x_{\alpha} \in K} w_{\alpha} \frac{1}{\left|I_{\delta}\left(x_{\alpha}\right)\right|} \int_{I_{\delta}\left(x_{\alpha}\right)}\left(c_{i j k l}^{(\varepsilon)} s_{i j}\left(\mathbf{v}_{\alpha}^{(\varepsilon)}\right) s_{k l}\left(\mathbf{v}_{\alpha \varphi}^{(\varepsilon)}\right)+e_{i j k}^{(\varepsilon)} s_{i j}\left(\mathbf{v}_{\alpha}^{(\varepsilon)}\right) \partial_{k} \varphi_{\alpha}^{(\varepsilon)}\right) d x \\
& d_{H}(\varphi, \psi)=-\sum_{K \in \mathscr{T}_{H}}|K| \sum_{x_{\alpha} \in K} w_{\alpha} \frac{1}{\left|I_{\delta}\left(x_{\alpha}\right)\right|} \int_{I_{\delta}\left(x_{\alpha}\right)}\left(e_{i j k}^{(\varepsilon)} s_{i j}\left(\mathbf{v}_{\alpha \varphi}^{(\varepsilon)}\right) \partial_{k} \psi_{\alpha}^{(\varepsilon)}-\epsilon_{i j}^{(\varepsilon)} \partial_{i} \varphi_{\alpha}^{(\varepsilon)} \partial_{j} \psi_{\alpha}^{(\varepsilon)}\right) d x
\end{aligned}
$$

Moreover, cell problems of HMM held above are equal to the following cell problems. Estimation of the macroscopic effective coefficients could be given directly by solving the
microscopic equation systems as follows.

$$
\begin{cases}-\frac{\partial}{\partial x_{j}}\left(c_{i j n h}^{(\varepsilon)} \frac{\partial P_{n}^{k l}}{\partial x_{h}}+e_{h i j}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}}\right)=0 & x \in I_{\delta}\left(x_{\alpha}\right)  \tag{12}\\ \frac{\partial}{\partial x_{i}}\left(e_{i n h}^{(\varepsilon)} \frac{\partial P_{n}^{k l}}{\partial x_{h}}-\epsilon_{i h}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}}\right)=0 & x \in I_{\delta}\left(x_{\alpha}\right) \\ P_{k}^{k l}=x_{l} \quad P_{n}^{k l}=0(n \neq k) & x \in \partial I_{\delta}\left(x_{\alpha}\right) \\ \Phi_{k l}=0 & x \in \partial I_{\delta}\left(x_{\alpha}\right)\end{cases}
$$

Estimation of $c_{i j k l}^{H}$ and $e_{i k l}^{H}$ are given by

$$
\begin{align*}
c_{i j k l}^{H}\left(x_{\alpha}\right) & =c_{i j n h}^{H}\left(x_{\alpha}\right)\left\langle\frac{\partial P_{n}^{k l}}{\partial x_{h}}\right\rangle_{I_{\delta}\left(x_{\alpha}\right)}=\left\langle c_{i j n h}^{(\varepsilon)} \frac{\partial P_{n}^{k l}}{\partial x_{h}}+e_{h i j}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}}\right\rangle_{I_{\delta}\left(x_{\alpha}\right)}  \tag{13}\\
e_{i k l}^{H}\left(x_{\alpha}\right) & =e_{i n h}^{H}\left(x_{\alpha}\right)\left\langle\frac{\partial P_{n}^{k l}}{\partial x_{h}}\right\rangle_{I_{\delta}\left(x_{\alpha}\right)}=\left\langle e_{i n h}^{(\varepsilon)} \frac{\partial P_{n}^{k l}}{\partial x_{h}}-\epsilon_{i h}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}}\right\rangle_{I_{\delta}\left(x_{\alpha}\right)} \tag{14}
\end{align*}
$$

and

$$
\begin{cases}-\frac{\partial}{\partial x_{j}}\left(c_{i j n h}^{(\varepsilon)} \frac{\partial Q_{n}^{l}}{\partial x_{h}}+e_{h i j}^{(\varepsilon)} \frac{\partial \Psi_{l}}{\partial x_{h}}\right)=0 & x \in I_{\delta}\left(x_{\alpha}\right)  \tag{15}\\ \frac{\partial}{\partial x_{i}}\left(e_{i n h}^{(\varepsilon)} \frac{\partial Q_{n}^{l}}{\partial x_{h}}-\epsilon_{i h}^{(\varepsilon)} \frac{\partial \Psi_{l}}{\partial x_{h}}\right)=0 & x \in I_{\delta}\left(x_{\alpha}\right) \\ Q_{n}^{l}=0 & x \in \partial I_{\delta}\left(x_{\alpha}\right) \\ \Psi_{l}=x_{l} & x \in \partial I_{\delta}\left(x_{\alpha}\right)\end{cases}
$$

Estimation of $\epsilon_{i j}$ and $e_{i k l}$ are given by

$$
\begin{align*}
\epsilon_{i l}^{H}\left(x_{\alpha}\right) & =\epsilon_{i j}^{H}\left(x_{\alpha}\right)\left\langle\frac{\partial \Psi_{l}}{\partial x_{j}}\right\rangle_{I_{\delta}\left(x_{\alpha}\right)}=-\left\langle e_{i n h}^{(\varepsilon)} \frac{\partial Q_{n}^{l}}{\partial x_{h}}-\epsilon_{i h}^{(\varepsilon)} \frac{\partial \Psi_{l}}{\partial x_{h}}\right\rangle_{I_{\delta}\left(x_{\alpha}\right)}  \tag{16}\\
e_{i k l}^{H}\left(x_{\alpha}\right) & =e_{h k l}^{H}\left(x_{\alpha}\right)\left\langle\frac{\partial \Psi_{i}}{\partial x_{h}}\right\rangle_{I_{\delta}\left(x_{\alpha}\right)}=\left\langle c_{k l n h}^{(\varepsilon)} \frac{\partial Q_{n}^{i}}{\partial x_{h}}+e_{h k l}^{(\varepsilon)} \frac{\partial \Psi_{i}}{\partial x_{h}}\right\rangle_{I_{\delta}\left(x_{\alpha}\right)} \tag{17}
\end{align*}
$$

The following results assert that estimate of the effective coefficients $c_{i j k l}^{H}(x), \epsilon_{i l}^{H}(x)$ and $e_{i k l}^{H}(x)$ given above share the same symmetric property and elliptic property with $c_{i j k n}^{(\varepsilon)}(x), \epsilon_{i j}^{(\varepsilon)}(x)$ and $e_{i j k}^{(\varepsilon)}(x)$ as follows.

Lemma 3.1. If $\mathbf{P}, \mathbf{Q}, \mathbf{\Phi}, \boldsymbol{\Psi}$ are solutions of 12) and 15, $e_{i k l}^{H}, c_{i j k l}^{H}$ and $\epsilon_{i j}^{H}$ defined by (13) and (16) have the following properties,
(I)

$$
e_{i k l}^{H}=\left\langle e_{i n h}^{(\varepsilon)} \frac{\partial P_{n}^{k l}}{\partial x_{h}}-\epsilon_{i h}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}}\right\rangle_{I_{\delta}}=\left\langle c_{k l n h}^{(\varepsilon)} \frac{\partial Q_{n}^{i}}{\partial x_{h}}+e_{h k l}^{(\varepsilon)} \frac{\partial \Psi_{i}}{\partial x_{h}}\right\rangle_{I_{\delta}}
$$

(II)

$$
c_{i j k l}^{H}=c_{j i k l}^{H}=c_{k l i j}^{H}, \quad e_{k i j}^{H}=e_{k j i}^{H}, \quad \epsilon_{i j}^{H}=\epsilon_{i j}^{H}
$$

(III)

$$
\exists \alpha_{H}>0, \text { s.t.c } c_{i j k l}^{H} X_{i j} X_{k l} \geq \alpha_{H} X_{i j} X_{k l} \quad \text { and } \quad \exists \beta_{H}>0, \text { s.t. } \epsilon_{i j}^{H} X_{i} X_{j} \geq \beta_{H} X_{i} X_{j}
$$

Proof. The main idea for proving (I) and (II) is to take proper test functions in the variation forms of (12) and 15). The main idea for proving (III) is to make full use of property of energy functional of piezoelectric equation system, which is caused by the coupling of mechanical field and electric field.
In (12), taking

$$
N_{n}^{k l}=P_{n}^{k l} \quad \text { for } \quad n \neq k \quad \text { and } \quad N_{k}^{k l}=P_{k}^{k l}-x_{l}
$$

we have,

$$
\begin{cases}-\frac{\partial}{\partial x_{j}}\left(c_{i j n h}^{(\varepsilon)} \frac{\partial N_{n}^{k l}}{\partial x_{h}}+e_{h i j}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}}\right)=-\frac{\partial c_{i j k l}^{(\varepsilon)}}{\partial x_{j}} & x \in I_{\delta}\left(x_{\alpha}\right)  \tag{18}\\ \frac{\partial}{\partial x_{i}}\left(e_{i n h}^{(\varepsilon)} \frac{\partial N_{n}^{k l}}{\partial x_{h}}-\epsilon_{i h}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}}\right)=-\frac{\partial e_{i k l}^{(\varepsilon)}}{\partial x_{i}} & x \in I_{\delta}\left(x_{\alpha}\right) \\ N_{n}^{k l}=0 \quad \Phi_{k l}=0 & x \in \partial I_{\delta}\left(x_{\alpha}\right)\end{cases}
$$

The variational form of 18 is,

$$
\left\{\begin{array}{l}
\int_{I_{\delta}\left(x_{\alpha}\right)}\left(c_{i j n h}^{(\varepsilon)} \frac{\partial N_{n}^{k l}}{\partial x_{h}} \frac{\partial G_{i}}{\partial x_{j}}+e_{h i j}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}} \frac{\partial G_{i}}{\partial x_{j}}\right) d x=\int_{I_{\delta}\left(x_{\alpha}\right)} c_{i j k l}^{(\varepsilon)} \frac{\partial G_{i}}{\partial x_{j}} d x  \tag{19}\\
-\int_{I_{\delta}\left(x_{\alpha}\right)}\left(e_{i n h}^{(\varepsilon)} \frac{\partial N_{n}^{k l}}{\partial x_{h}} \frac{\partial \zeta}{\partial x_{i}}-\epsilon_{i h}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}} \frac{\partial \zeta}{\partial x_{i}}\right) d x=\int_{I_{\delta}\left(x_{\alpha}\right)} e_{i k l}^{(\varepsilon)} \frac{\partial \zeta}{\partial x_{i}} d x
\end{array}\right.
$$

for any $\mathbf{G} \in H_{0}^{1}\left(I_{\delta}\right) \times H_{0}^{1}\left(I_{\delta}\right) \times H_{0}^{1}\left(I_{\delta}\right)$ and $\zeta \in H_{0}^{1}\left(I_{\delta}\right)$.
In 15), taking $\psi_{l}=\Psi_{l}-x_{l}$, we have,

$$
\begin{cases}-\frac{\partial}{\partial x_{j}}\left(c_{i j n h}^{(\varepsilon)} \frac{\partial Q_{n}^{l}}{\partial x_{h}}+e_{h i j}^{(\varepsilon)} \frac{\partial \psi_{l}}{\partial x_{h}}\right)=-\frac{\partial e_{l i j}^{(\varepsilon)}}{\partial x_{j}} & x \in I_{\delta}\left(x_{\alpha}\right)  \tag{20}\\ \frac{\partial}{\partial x_{i}}\left(e_{i n h}^{(\varepsilon)} \frac{\partial Q_{n}^{l}}{\partial x_{h}}-\epsilon_{i h}^{(\varepsilon)} \frac{\partial \psi_{l}}{\partial x_{h}}\right)=\frac{\partial \epsilon_{i l}^{(\varepsilon)}}{\partial x_{i}} & x \in I_{\delta}\left(x_{\alpha}\right) \\ Q_{n}^{l}=0 \quad \psi_{l}=0 & x \in \partial I_{\delta}\left(x_{\alpha}\right)\end{cases}
$$

The variational form of 20 is,

$$
\left\{\begin{array}{l}
\int_{I_{\delta}\left(x_{\alpha}\right)}\left(c_{i j n h}^{(\varepsilon)} \frac{\partial Q_{n}^{l}}{\partial x_{h}} \frac{\partial F_{i}}{\partial x_{j}}+e_{h i j}^{(\varepsilon)} \frac{\partial \psi_{l}}{\partial x_{h}} \frac{\partial F_{i}}{\partial x_{j}}\right) d x=\int_{I_{\delta}\left(x_{\alpha}\right)} e_{l i j}^{(\varepsilon)} \frac{\partial F_{i}}{\partial x_{j}} d x  \tag{21}\\
\int_{I_{\delta}\left(x_{\alpha}\right)}\left(e_{i n h}^{(\varepsilon)} \frac{\partial Q_{n}^{l}}{\partial x_{h}} \frac{\partial \xi}{\partial x_{i}}-\epsilon_{i h}^{(\varepsilon)} \frac{\partial \psi_{l}}{\partial x_{h}} \frac{\partial \xi}{\partial x_{i}}\right) d x=\int_{I_{\delta}\left(x_{\alpha}\right)} \epsilon_{i l}^{(\varepsilon)} \frac{\partial \xi}{\partial x_{i}}
\end{array}\right.
$$

for any $\mathbf{F} \in H_{0}^{1}\left(I_{\delta}\left(x_{\alpha}\right)\right) \times H_{0}^{1}\left(I_{\delta}\left(x_{\alpha}\right)\right) \times H_{0}^{1}\left(I_{\delta}\left(x_{\alpha}\right)\right)$ and $\xi \in H_{0}^{1}\left(I_{\delta}\left(x_{\alpha}\right)\right)$
(I) Taking $(\mathbf{G}, \zeta)=\left(\mathbf{Q}^{i}, \psi_{i}\right)$ in 19), we have

$$
\left\{\begin{array}{l}
\int_{I_{\delta}\left(x_{\alpha}\right)}\left(c_{n h s m}^{(\varepsilon)} \frac{\partial N_{s}^{k l}}{\partial x_{m}} \frac{\partial Q_{n}^{i}}{\partial x_{h}}+e_{m n h}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{m}} \frac{\partial Q_{n}^{i}}{\partial x_{h}}\right) d x=\int_{I_{\delta}\left(x_{\alpha}\right)} c_{n h k l}^{(\varepsilon)} \frac{\partial Q_{n}^{i}}{\partial x_{h}} d x  \tag{22}\\
-\int_{I_{\delta}\left(x_{\alpha}\right)}\left(e_{h n m}^{(\varepsilon)} \frac{\partial N_{n}^{k l}}{\partial x_{m}} \frac{\partial \psi_{i}}{\partial x_{h}}-\epsilon_{h m}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{m}} \frac{\partial \psi_{i}}{\partial x_{h}}\right) d x=\int_{I_{\delta}\left(x_{\alpha}\right)} e_{i k l}^{(\varepsilon)} \frac{\partial \psi_{i}}{\partial x_{i}} d x
\end{array}\right.
$$

Taking $(\mathbf{F}, \xi)=\left(\mathbf{N}^{k l}, \Phi_{k l}\right)$ in 21 , we obtain

$$
\left\{\begin{array}{l}
\int_{I_{\delta}\left(x_{\alpha}\right)}\left(c_{n h s m}^{(\varepsilon)} \frac{\partial Q_{s}^{i}}{\partial x_{m}} \frac{\partial N_{n}^{k l}}{\partial x_{h}}+e_{m n h}^{(\varepsilon)} \frac{\partial \psi_{i}}{\partial x_{m}} \frac{\partial N_{n}^{k l}}{\partial x_{h}}\right) d x=\int_{I_{\delta}\left(x_{\alpha}\right)} e_{i n h}^{(\varepsilon)} \frac{\partial N_{n}^{k l}}{\partial x_{h}} d x  \tag{23}\\
\int_{I_{\delta}\left(x_{\alpha}\right)}\left(e_{h s m}^{(\varepsilon)} \frac{\partial Q_{s}^{i}}{\partial x_{m}} \frac{\partial \Phi_{k l}}{\partial x_{h}}-\epsilon_{h m}^{(\varepsilon)} \frac{\partial \psi_{i}}{\partial x_{m}} \frac{\partial \Phi_{k l}}{\partial x_{h}}\right) d x=\int_{I_{\delta}\left(x_{\alpha}\right)} \epsilon_{i h}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}} d x
\end{array}\right.
$$

Since

$$
\begin{align*}
\left\langle e_{i n h}^{(\varepsilon)} \frac{\partial P_{n}^{k l}}{\partial x_{h}}-\epsilon_{i h}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}}\right\rangle_{I_{\delta}\left(x_{\alpha}\right)} & =\left\langle e_{i k l}^{(\varepsilon)}+e_{i n h}^{(\varepsilon)} \frac{\partial N_{n}^{k l}}{\partial x_{h}}-\epsilon_{i h}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}}\right\rangle_{I_{\delta}\left(x_{\alpha}\right)}  \tag{24}\\
\left\langle c_{k l n h}^{(\varepsilon)} \frac{\partial Q_{n}^{i}}{\partial x_{h}}+e_{h k l}^{(\varepsilon)} \frac{\partial \Psi_{i}}{\partial x_{h}}\right\rangle_{I_{\delta}\left(x_{\alpha}\right)} & =\left\langle e_{i k l}^{(\varepsilon)}+c_{k l n h}^{(\varepsilon)} \frac{\partial Q_{n}^{i}}{\partial x_{h}}+e_{h k l}^{(\varepsilon)} \frac{\partial \psi_{i}}{\partial x_{h}}\right\rangle_{I_{\delta}\left(x_{\alpha}\right)}, \tag{25}
\end{align*}
$$

we get

$$
\begin{equation*}
e_{i k l}^{H}=\left\langle e_{i n h}^{(\varepsilon)} \frac{\partial P_{n}^{k l}}{\partial x_{h}}-\epsilon_{i h}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}}\right\rangle_{I_{\delta}}=\left\langle c_{k l n h}^{(\varepsilon)} \frac{\partial Q_{n}^{i}}{\partial x_{h}}+e_{h k l}^{(\varepsilon)} \frac{\partial \Psi_{i}}{\partial x_{h}}\right\rangle_{I_{\delta}} \tag{26}
\end{equation*}
$$

by the symmetric property of $c_{i j k n}^{(\varepsilon)}(x), \epsilon_{i j}^{(\varepsilon)}(x), e_{i j k}^{(\varepsilon)}(x)$ and subtracting of 22 and 23 . respectively.
(II) Taking $(\mathbf{G}, \zeta)=\left(\mathbf{N}^{i j}, \Phi_{i j}\right)$ in we obtain

$$
\begin{align*}
c_{i j k l}^{H} & =<c_{s m n h}^{(\varepsilon)} \frac{\partial P_{n}^{k l}}{\partial x_{h}} \frac{\partial P_{s}^{i j}}{\partial x_{m}}+e_{h s m}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}} \frac{\partial P_{s}^{i j}}{\partial x_{m}}>_{I_{\delta}\left(x_{\alpha}\right)}  \tag{27}\\
& =<c_{s m n h}^{(\varepsilon)} \frac{\partial P_{n}^{k l}}{\partial x_{h}} \frac{\partial P_{s}^{i j}}{\partial x_{m}}+\epsilon_{h m}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}} \frac{\partial \Phi_{i j}}{\partial x_{m}}>_{I_{\delta}\left(x_{\alpha}\right)} \tag{28}
\end{align*}
$$

Therefore, $c_{i j k l}^{H}=c_{k l i j}^{H}$
Since

$$
\begin{equation*}
c_{i j k l}^{H}=\left\langle c_{i j n h}^{(\varepsilon)} \frac{\partial P_{n}^{k l}}{\partial x_{h}}+e_{h i j}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}}\right\rangle_{I_{\delta}\left(x_{\alpha}\right)}=\left\langle c_{i j k l}^{(\varepsilon)}+c_{i j n h}^{(\varepsilon)} \frac{\partial N_{n}^{k l}}{\partial x_{h}}+e_{h i j}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}}\right\rangle_{I_{\delta}\left(x_{\alpha}\right)} \tag{29}
\end{equation*}
$$

we have $c_{i j k l}^{H}=c_{j i k l}^{H}=c_{i j l k}^{H}$ by the symmetric property of $c_{i j k n}^{(\varepsilon)}(x), \epsilon_{i j}^{(\varepsilon)}(x), e_{i j k}^{(\varepsilon)}(x)$ in 18 .
Similarly, it is easy to prove that $e_{k i j}^{H}=e_{k j i}^{H}, \epsilon_{i j}^{H}=\epsilon_{i j}^{H}$
(III) By 29), for any $\mathbf{X}=\left(X_{i j}\right) \neq \mathbf{0}$, we have

$$
c_{i j k l}^{H} X_{i j} X_{k l}=<c_{i j k l}^{(\varepsilon)} X_{i j} X_{k l}+c_{i j n h}^{(\varepsilon)} \frac{\partial N_{n}^{k l}}{\partial x_{h}} X_{i j} X_{k l}+e_{h i j}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}} X_{i j} X_{k l}>_{I_{\delta}\left(x_{\alpha}\right)}
$$

Setting $(\mathbf{N}, \Phi)=\left(N_{n}^{k l} X_{k l}, \Phi_{k l} X_{k l}\right)$ in 19, we obtain

$$
\left\{\begin{array}{l}
\int_{I_{\delta}\left(x_{\alpha}\right)}\left(c_{i j n h}^{(\varepsilon)} \frac{\partial N_{n}}{\partial x_{h}}+e_{h i j}^{(\varepsilon)} \frac{\partial \Phi}{\partial x_{h}}\right) \frac{\partial G_{i}}{\partial x_{j}}=-\int_{I_{\delta}\left(x_{\alpha}\right)} c_{i j k l}^{(\varepsilon)} \frac{\partial G_{i}}{\partial x_{j}} X_{k l}  \tag{30}\\
\int_{I_{\delta}\left(x_{\alpha}\right)}\left(e_{i n h}^{(\varepsilon)} \frac{\partial N_{n}}{\partial x_{h}}-\epsilon_{i h}^{(\varepsilon)} \frac{\partial \Phi}{\partial x_{h}}\right) \frac{\partial \zeta}{\partial x_{i}}=-\int_{I_{\delta}\left(x_{\alpha}\right)} e_{i k l}^{(\varepsilon)} \frac{\partial \zeta}{\partial x_{i}} X_{k l}
\end{array}\right.
$$

Since $(\mathbf{N}, \Phi)$ is the saddle point associated to the energy functional defined by

$$
\begin{align*}
I[\mathbf{V}, \Psi]= & \frac{1}{2} \int_{I_{\delta}\left(x_{\alpha}\right)} c_{i j n h}^{(\varepsilon)}\left(\frac{\partial V_{n}}{\partial x_{h}}+X_{n h}\right)\left(\frac{\partial V_{i}}{\partial x_{j}}+X_{i j}\right) d x-\frac{1}{2} \int_{I_{\delta}\left(x_{\alpha}\right)} \epsilon_{i h}^{(\varepsilon)} \frac{\partial \Psi}{\partial x_{i}} \frac{\partial \Psi}{\partial x_{h}} \\
& +\int_{I_{\delta}\left(x_{\alpha}\right)} e_{i n h}^{(\varepsilon)} \frac{\partial \Psi}{\partial x_{i}}\left(\frac{\partial V_{n}}{\partial x_{h}}+X_{n h}\right) \tag{31}
\end{align*}
$$

Thus, we obtain

$$
\begin{equation*}
I[\mathbf{N}, \Psi] \leq I[\mathbf{N}, \Phi] \leq I[\mathbf{V}, \Phi], \forall \mathbf{V} \underset{11}{ } \in\left(H_{0}^{1}\left(I_{\delta}\right)\right)^{3}, \Psi \in H_{0}^{1}\left(I_{\delta}\right) \tag{32}
\end{equation*}
$$

which implies $I[\mathbf{N}, \Phi] \geq I[\mathbf{N}, 0]>0$
Taking $(\mathbf{G}, \zeta)=(\mathbf{N}, \Phi)$ in (30), we get

$$
\begin{equation*}
c_{i j k l}^{H} X_{i j} X_{k l}=2 I[\mathbf{N}, \Phi]>0 \tag{33}
\end{equation*}
$$

$\mathbb{B}=\left\{X=\left(X_{i j}\right): X\right.$ is symmetric and $\left.X_{i j} X_{i j}=1\right\}$ and consider $\Psi: \mathbb{B} \mapsto R$ defined by $\Psi\left(X_{i j}\right)=c_{i j k l}^{H} X_{i j} X_{k l}$, it is easy to see $\Psi$ is continuous on $\mathbb{B}$ and $\Psi>0$, which implies there exists $\alpha_{H}>0$ such that

$$
\begin{equation*}
\Psi\left(\frac{X_{i j}}{\|X\|}\right) \geq \alpha_{H}, \text { for any } \mathbf{X}=\left(X_{i j}\right) \neq \mathbf{0} \tag{34}
\end{equation*}
$$

Therefore, there exists $\alpha_{H}>0$ such that $c_{i j k l}^{H} X_{i j} X_{k l} \geq \alpha_{H} X_{i j} X_{k l}$
Similarly, it is easy to prove that there exists $\beta_{H}>0$ such that $\epsilon_{i j}^{H} X_{i} X_{j} \geq \beta_{H} X_{i} X_{j}$. This completes the proof of Lemma 3.1.

In Section 5, we will give out both error estimate between the HMM solutions and the homogenization solutions and error estimate of the effective coefficients for piezoelectric composite materials with periodic microstructure.

## 4. Homogenization theory

For those piezoelectric composite materials with periodic microstructure we consider the following equation system,

$$
\begin{cases}-\frac{\partial \sigma_{i j}^{(\varepsilon)}}{\partial x_{j}}=f_{i} & x \in \Omega \subset R^{d}  \tag{35}\\ \frac{\partial D_{i}^{(\varepsilon)}}{\partial x_{i}}=0 & x \in \Omega \subset R^{d} \\ \sigma_{i j}^{(\varepsilon)}=c_{i j k n}^{(\varepsilon)} \frac{\partial u_{k}^{(\varepsilon)}}{\partial x_{n}}+e_{k i j}^{(\varepsilon)} \frac{\partial \varphi^{(\varepsilon)}}{\partial x_{k}} & \\ D_{i}^{(\varepsilon)}=e_{i k n}^{(\varepsilon)} \frac{\partial u_{k}^{(\varepsilon)}}{\partial x_{n}}-\epsilon_{i j}^{(\varepsilon)} \frac{\partial \varphi^{(\varepsilon)}}{\partial x_{j}} & \\ u_{i}^{(\varepsilon)}=0 \quad \varphi^{(\varepsilon)}=0 & x \in \partial \Omega\end{cases}
$$

where $c_{i j k n}^{(\varepsilon)}(x)=c_{i j k n}(x, y), e_{i j k}^{(\varepsilon)}(x)=e_{i j k}(x, y), \epsilon_{i j}^{(\varepsilon)}(x)=\epsilon_{i j}(x, y)$ are periodic in $y=\frac{x}{\varepsilon}$ with reference cell $Y=[0,1]^{d}$ as their periodic. For understanding easily, we assume that the coefficients are periodic globally, i.e.

$$
\begin{equation*}
c_{i j k n}^{(\varepsilon)}(x)=c_{i j k n}\left(\frac{x}{\varepsilon}\right) \quad e_{i j k}^{(\varepsilon)}(x)=e_{i j k}\left(\frac{x}{\varepsilon}\right) \quad \epsilon_{i j}^{(\varepsilon)}(x)=\epsilon_{i j}\left(\frac{x}{\varepsilon}\right) \tag{36}
\end{equation*}
$$

Following the step in homogenization theory by Jikov et al. [10], we get the homogenized equation system of $\sqrt{35}$ as follows,

$$
\begin{cases}-\frac{\partial \sigma_{i j}^{(0)}}{\partial x_{j}}=f_{i} & x \in \Omega  \tag{37}\\ \frac{\partial D_{i}^{(0)}}{\partial x_{i}}=0 & x \in \Omega \\ \sigma_{i j}^{(0)}=c_{i j k n}^{(0)} \frac{\partial u_{k}^{(0)}}{\partial x_{n}}+e_{k i j}^{(0)} \frac{\partial \varphi^{(0)}}{\partial x_{k}} & \\ D_{i}^{(0)}=e_{i k n}^{(0)} \frac{\partial u_{k}^{(0)}}{\partial x_{n}}-\epsilon_{i j}^{(0)} \frac{\partial \varphi^{(0)}}{\partial x_{j}} & \\ u_{i}^{(0)}=0 \quad \varphi^{(0)}=0 & x \in \partial \Omega\end{cases}
$$

where $c_{i j k l}^{(0)}, e_{l i j}^{(0)}$ and $\epsilon_{i j}^{(0)}$ are the homogenized effective coefficients given by,

$$
\begin{align*}
c_{i j k l}^{(0)} & =\left\langle c_{i j k l}(y)+\tau_{i j}^{k l}(y)\right\rangle_{Y}  \tag{38}\\
e_{l i j}^{(0)} & =\left\langle e_{l i j}(y)+\xi_{i j}^{l}(y)\right\rangle_{Y} \\
& =\left\langle e_{l i j}(y)+d_{l}^{i j}(y)\right\rangle_{Y}  \tag{39}\\
\epsilon_{i j}^{(0)} & =\left\langle\epsilon_{i j}(y)-g_{i j}(y)\right\rangle_{Y} \tag{40}
\end{align*}
$$

where $\tau_{i j}^{k l}(y), \xi_{i j}^{l}(y), d_{l}^{i j}(y), g_{i j}(y)$ can be got by solving the following two cell probelms,

$$
\begin{cases}\frac{\partial \tau_{i j}^{k l}}{\partial y_{j}}=-\frac{\partial c_{i j k l}(y)}{\partial y_{j}} & y \in Y  \tag{41}\\ \frac{\partial d_{i}^{k l}}{\partial y_{i}}=-\frac{\partial e_{i k l}(y)}{\partial y_{i}} & y \in Y \\ \tau_{i j}^{k l}=c_{i j n h}(y) \frac{\partial N_{n}^{k l}(y)}{\partial y_{h}}+e_{h i j}(y) \frac{\partial \phi_{k l}(y)}{\partial y_{h}} & \\ d_{i}^{k l}=e_{i n h}(y) \frac{\partial N_{n}^{k l}(y)}{\partial y_{h}}-\epsilon_{i h}(y) \frac{\partial \phi_{k l}(y)}{\partial y_{h}} & \\ N_{n}^{k l}(y) \text { is periodic on } R^{d} \text { and } \int_{Y} N_{n}^{k l}(y) d y=0 & \\ \phi_{k l}(y) \text { is periodic on } R^{d} \text { and } \int_{Y}^{\phi_{k l}(y) d y=0} & \end{cases}
$$

$$
\begin{cases}\frac{\partial \xi_{i j}^{l}}{\partial y_{j}}=-\frac{\partial e_{l i j}(y)}{\partial y_{j}} & y \in Y  \tag{42}\\ \frac{\partial g_{i}^{l}}{\partial y_{i}}=\frac{\partial \epsilon_{i l}(y)}{\partial y_{i}} & y \in Y \\ \xi_{i j}^{l}=c_{i j k h}(y) \frac{\partial W_{k}^{l}(y)}{\partial y_{h}}+e_{h i j}(y) \frac{\partial \psi_{l}(y)}{\partial y_{h}} & \\ g_{i l}=e_{i k h}(y) \frac{\partial W_{k}^{l}(y)}{\partial y_{h}}-\epsilon_{i h}(y) \frac{\partial \psi_{l}(y)}{\partial y_{h}} & \\ W_{k}^{l}(y) \text { is periodic on } R^{d} \text { and } \int_{Y} W_{k}^{l}(y) d y=0 \\ \psi_{l}(y) \text { is periodic on } R^{d} \text { and } \int_{Y} \psi_{l}(y) d y=0 & \end{cases}
$$

Remark 4.1. we may deduce that $\left\langle e_{l i j}(y)+\xi_{i j}^{l}(y)\right\rangle_{Y}=\left\langle e_{l i j}(y)+d_{l}^{i j}(y)\right\rangle_{Y}$ and $c_{i j k l}^{(0)}=$ $c_{j i k l}^{(0)}=c_{k l i j}^{(0)}, e_{k i j}^{(0)}=e_{k j i}^{(0)}, \epsilon_{i j}^{(0)}=\epsilon_{i j}^{(0)}$ by the techniques we use in the proof of Lemma 3.1

So far we have derived the homogenization equations of piezoelectric composite materials with periodic microstructure in formal by asymptotic expansion. The following Lemmas and Theorems asserts the convergence of asymptotic expansion. The difficulty for the theoretical analysis of this part lays on the point that the regularity of the solutions of cell problems 41) and 42 cannot reach $W^{1, \infty}\left(R^{d}\right)$, which implies traditional treatment in second order elliptic equations in Jikov et al. 10 does not work.

The following two lemmas play an important role in getting the convergence conclusion of asymptotic expansion. The original idea of them is from Tatyana et al. [8]. Our result is the promotion of Corollary 8.3 in Tatyana et al. 8 in piezoelectric equation system.

Lemma 4.1. If $N_{n}^{k l} \in H_{p e r}^{1}(Y) \cap L^{\infty}\left(R^{d}\right)$ and $\phi_{k l} \in H_{p e r}^{1}(Y) \cap L^{\infty}\left(R^{d}\right)$, the operator $\left[\nabla \mathbf{N}^{k l}\right]$ of multiplication by the matrix $\left[\nabla \mathbf{N}^{k l}\right]$ and the operator $\left[\nabla \phi_{k l}\right]$ of multiplication by the column $\left[\nabla \mathbf{N}^{\mathbf{k l}}\right]$ are continuous from $H^{1}\left(R^{d}\right)$ to $\Re=L_{2}\left(R^{d} ; C^{d}\right)$ and

$$
\left\|\left[\nabla \mathbf{N}^{k l}\right]\right\|_{H^{1}\left(R^{d}\right) \rightarrow \Re}+\left\|\left[\nabla \phi_{k l}\right]\right\|_{H^{1}\left(R^{d}\right) \rightarrow \Re} \leq C_{1}
$$

where $C_{1}$ depends on the coefficient of the material only.
Lemma 4.2. If $W_{k}^{l} \in H_{p e r}^{1}(Y) \cap L^{\infty}\left(R^{d}\right)$ and $\psi_{l} \in H_{p e r}^{1}(Y) \cap L^{\infty}\left(R^{d}\right)$, the operator $\left[\nabla \mathbf{W}^{l}\right]$ of multiplication by the matrix $\left[\nabla \mathbf{W}^{l}\right]$ and the operator $\left[\nabla \Psi_{l}\right]$ of multiplication
by the column $\left[\nabla \psi_{l}\right]$ are continuous from $H^{1}\left(R^{d}\right)$ to $\Re=L_{2}\left(R^{d} ; C^{d}\right)$ and

$$
\left\|\left[\nabla \mathbf{W}^{l}\right]\right\|_{H^{1}\left(R^{3}\right) \rightarrow \Re}+\left\|\left[\nabla \psi_{l}\right]\right\|_{H^{1}\left(R^{3}\right) \rightarrow \Re} \leq C_{2}
$$

where $C_{2}$ depends on the coefficient of the material only.

The following Lemma is the main result that leads the convergence conclusion of asymptotic expansion. For expression convenience, we introduce

$$
\begin{gather*}
u_{k(1)}^{(\varepsilon)}=u_{k}^{(0)}(x)+\varepsilon\left(N_{n}^{k l}(y) \frac{\partial u_{k}^{(0)}(x)}{\partial x_{l}}+W_{n}^{l}(y) \frac{\partial \varphi^{(0)}(x)}{\partial x_{l}}\right)  \tag{43}\\
\varphi_{(1)}^{(\varepsilon)}=\varphi^{(0)}(x)+\varepsilon\left(\phi_{k l}(y) \frac{\partial u_{k}^{(0)}(x)}{\partial x_{l}}+\psi_{l}(y) \frac{\partial \varphi^{(0)}(x)}{\partial x_{l}}\right) \tag{44}
\end{gather*}
$$

Lemma 4.3. If $u_{i}^{(0)} \in C^{2}(\Omega), \varphi^{(0)} \in C^{2}(\Omega), N_{n}^{k l} \in H_{p e r}^{1}(Y) \cap L^{\infty}\left(R^{d}\right), W_{n}^{l} \in H_{p e r}^{1}(Y) \cap$ $L^{\infty}\left(R^{d}\right), \varphi_{k l} \in H_{p e r}^{1}(Y) \cap L^{\infty}\left(R^{d}\right), \psi_{l} \in H_{p e r}^{1}(Y) \cap L^{\infty}\left(R^{d}\right)$, we have

$$
\left\|u_{i(1)}^{(\varepsilon)}-u_{i}^{(\varepsilon)}\right\|_{H^{1}(\Omega)}+\left\|\varphi_{(1)}^{(\varepsilon)}-\varphi^{(\varepsilon)}\right\|_{H^{1}(\Omega)} \leq C \varepsilon^{\frac{1}{2}}
$$

Proof. Take a truncation function $\tau^{\varepsilon}(x)$ satisfying,

1. $\quad \tau^{\varepsilon}(x) \in C_{0}^{\infty}(\Omega), \quad 0 \leq \tau^{\varepsilon}(x) \leq 1 \quad$ and $\quad \tau^{\varepsilon}(x)=1, \quad$ if $\quad \rho(x, \partial \Omega)>\varepsilon$
2. $\quad \varepsilon\left|\nabla \tau^{\varepsilon}(x)\right| \leq C, \quad$ in $\quad \Omega$

Set

$$
\begin{aligned}
W_{k(1)}^{(\varepsilon)} & =u_{k(1)}^{(\varepsilon)}-\varepsilon\left(1-\tau^{\varepsilon}(x)\right)\left(N_{n}^{k l} \frac{\partial u_{n}^{(0)}}{\partial x_{l}}+W_{k}^{l} \frac{\partial \varphi^{(0)}}{\partial x_{l}}\right) \\
W_{(1)}^{(\varepsilon)} & =\varphi_{(1)}^{(\varepsilon)}-\varepsilon\left(1-\tau^{\varepsilon}(x)\right)\left(\phi_{k l} \frac{\partial u_{n}^{(0)}}{\partial x_{l}}+\psi_{l} \frac{\partial \varphi^{(0)}}{\partial x_{l}}\right)
\end{aligned}
$$

To get the conclusion, we separate the proof into two steps,

$$
\begin{array}{ll}
\text { Step } 1 . & \text { Prove }
\end{array}\left\|u_{k(1)}^{(\varepsilon)}-W_{k(1)}^{(\varepsilon)}\right\|_{H^{1}(\Omega)} \leq C \varepsilon^{\frac{1}{2}}, \quad\left\|\varphi_{(1)}^{(\varepsilon)}-W_{(1)}^{(\varepsilon)}\right\|_{H^{1}(\Omega)} \leq C \varepsilon^{\frac{1}{2}}, ~\left\|u_{k}^{(\varepsilon)}-W_{k(1)}^{(\varepsilon)}\right\|_{H^{1}(\Omega)} \leq C \varepsilon^{\frac{1}{2}}, \quad\left\|\varphi^{(\varepsilon)}-W_{(1)}^{(\varepsilon)}\right\|_{H^{1}(\Omega)} \leq C \varepsilon^{\frac{1}{2}}
$$

For step 1,

$$
\begin{aligned}
& \left\|u_{k(1)}^{(\varepsilon)}-W_{k(1)}^{(\varepsilon)}\right\|_{H^{1}(\Omega)}^{2} \\
= & \int_{\Omega}\left[\varepsilon\left(1-\tau^{\varepsilon}(x)\right)\left(N_{n}^{k l} \frac{\partial u_{n}^{(0)}}{\partial x_{l}}+W_{k}^{l} \frac{\partial \varphi^{(0)}}{\partial x_{l}}\right)\right]^{2} d x \\
& +\sum_{j} \int_{\Omega}\left[\varepsilon \frac{\partial \tau^{\varepsilon}(x)}{\partial x_{j}}\left(N_{n}^{k l} \frac{\partial u_{n}^{(0)}}{\partial x_{l}}+W_{k}^{l} \frac{\partial \varphi^{(0)}}{\partial x_{l}}\right)\right]^{2} d x \\
& +\sum_{j} \int_{\Omega}\left[\left(1-\tau^{\varepsilon}(x)\right)\left(\frac{\partial N_{k}^{m l}}{\partial y_{j}} \frac{\partial u_{m}^{(0)}}{\partial x_{l}}+\frac{\partial W_{k}^{l}}{\partial y_{j}} \frac{\partial \varphi^{(0)}}{\partial x_{l}}\right)\right]^{2} d x \\
& +\sum_{j} \int_{\Omega}\left[\varepsilon\left(1-\tau^{\varepsilon}(x)\right)\left(N_{k}^{m l} \frac{\partial^{2} u_{m}^{(0)}}{\partial x_{j} \partial x_{l}}+W_{k}^{l} \frac{\partial^{2} \varphi^{(0)}}{\partial x_{j} \partial x_{l}}\right)\right]^{2} d x \\
= & (I)+(I I)+(I I I)+(I V)
\end{aligned}
$$

For (I), (II), (IV), there is no essential difference from the analysis of corresponding parts in second order elliptic equations in Jikov et al. [10]. So it is easy to get

$$
(I)+(I I)+(I V) \leq C_{1}\left(\varepsilon^{2}+\varepsilon \rho^{d-1}\right)\left(\left\|u_{i}^{(0)}\right\|_{H^{2}(\Omega)}^{2}+\left\|\varphi^{(0)}\right\|_{H^{2}(\Omega)}^{2}\right)
$$

For (III), we notice that the regularity of the solutions of cell problems 41) and 42) cannot reach $W^{1, \infty}\left(R^{d}\right)$, which makes the traditional treatment in second order elliptic equations in Jikov et al. [10] not work. In this case, we lent help from Lemma 4.1 and Lemma 4.2. We take the first term of (III) as example to give out proof in details. The proof of other terms are similar.
By lemma 4.1, we have

$$
\begin{equation*}
\int_{R^{d}}\left[\frac{\partial N_{n}^{k l}}{\partial y_{j}} \frac{\partial N_{n}^{k l}}{\partial y_{j}}\right]|v(y)|^{2} d y \leq C\left(\int_{R^{d}}|v|^{2} d y+\int_{R^{d}}|\nabla v|^{2} d y\right) \quad \forall v \in H^{1}(\Omega) \tag{45}
\end{equation*}
$$

which implies

$$
\begin{aligned}
& \int_{R^{d}}\left[\frac{\partial N_{n}^{k l}}{\partial y_{j}} \frac{\partial N_{n}^{k l}}{\partial y_{j}}\right]|w(x)|^{2} d x \\
= & \varepsilon^{d} \int_{R^{d}}\left[\frac{\partial N_{n}^{k l}}{\partial x_{j}} \frac{\partial N_{n}^{k l}}{\partial x_{j}}\right]|w(\varepsilon x)|^{2} d x \\
\leq & \int_{R^{d}}|w(\varepsilon x)|^{2} d x+\int_{R^{d}}\left|\nabla_{x} w(\varepsilon x)\right|^{2} d x \\
= & \int_{R^{d}}|w(x)|^{2}+\varepsilon^{2} \int_{R^{d}}\left|\nabla_{x} w(x)\right|^{2} d x
\end{aligned}
$$

Taking $w(x)=\left(1-\tau^{\varepsilon}(x)\right) \frac{\partial u_{k}^{(0)}}{\partial x_{l}}$, we obtain

$$
\begin{aligned}
& \int_{\Omega}\left[\left(1-\tau^{\varepsilon}(x)\right)\left(\frac{\partial N_{n}^{k l}}{\partial y_{j}} \frac{\partial u_{k}^{(0)}}{\partial x_{l}}\right)\right]^{2} d x \\
\leq & \int_{R^{3}}\left[\left(1-\tau^{\varepsilon}(x)\right)\left(\frac{\partial N_{n}^{k l}}{\partial y_{j}} \frac{\partial u_{k}^{(0)}}{\partial x_{l}}\right)\right]^{2} d x \\
\leq & \int_{R^{3}}\left|\left(1-\tau^{\varepsilon}(x)\right) \frac{\partial u_{k}^{0}}{\partial x_{l}}\right|^{2} d x+\varepsilon^{2} \int_{R^{3}}\left|\nabla\left(\left(1-\tau^{\varepsilon}(x)\right) \frac{\partial u_{k}^{0}}{\partial x_{l}}\right)\right|^{2} d x \\
= & \int_{Q^{\varepsilon}}\left|\left(1-\tau^{\varepsilon}(x)\right) \frac{\partial u_{k}^{0}}{\partial x_{l}}\right|^{2} d x+\varepsilon^{2} \int_{Q^{\varepsilon}}\left|\nabla\left(\left(1-\tau^{\varepsilon}(x)\right) \frac{\partial u_{k}^{0}}{\partial x_{l}}\right)\right|^{2} d x \\
\leq & C \varepsilon \rho^{d-1}
\end{aligned}
$$

Therefore,

$$
(I)+(I I)+(I I I)+(I V) \leq C_{1}\left(\varepsilon^{2}+\varepsilon \rho^{d-1}\right)\left(\left\|u_{i}^{(0)}\right\|_{H^{2}(\Omega)}^{2}+\left\|\varphi^{(0)}\right\|_{H^{2}(\Omega)}^{2}\right)
$$

Similarly, we can get $\left\|\varphi_{(1)}^{(\varepsilon)}-W_{(1)}^{(\varepsilon)}\right\|_{H^{1}(\Omega)} \leq C \varepsilon^{\frac{1}{2}}$
This completes the proof of Step 1.
For Step 2, there is no essential difference from the analysis of corresponding parts in second order elliptic equations in Jikov et al. 10. Therefore, we omit the proof of this part. Thus, it is a direct corollary from Step 1 and Step 2 that

$$
\left\|u_{i(1)}^{(\varepsilon)}-u_{i}^{(\varepsilon)}\right\|_{H^{1}(\Omega)}+\left\|\varphi_{(1)}^{(\varepsilon)}-\varphi^{(\varepsilon)}\right\|_{H^{1}(\Omega)} \leq C \varepsilon^{\frac{1}{2}}
$$

This completes the proof of Lemma 4.3 .

Thus, the convergence conclusion of asymptotic expansion is got in the sense of H convergence as follows.

Theorem 4.1. If $u_{i}^{(0)} \in C^{2}(\Omega), \varphi^{(0)} \in C^{2}(\Omega), N_{n}^{k l} \in H_{p e r}^{1}(Y) \cap L^{\infty}\left(R^{d}\right), W_{n}^{l} \in$ $H_{p e r}^{1}(Y) \cap L^{\infty}\left(R^{d}\right), \varphi_{k l} \in H_{p e r}^{1}(Y) \cap L^{\infty}\left(R^{d}\right), \psi_{l} \in H_{p e r}^{1}(Y) \cap L^{\infty}\left(R^{d}\right)$, we have

$$
\begin{array}{rlllll}
u_{i}^{(\varepsilon)} \rightharpoonup u_{i}^{(0)}, & \varphi^{(\varepsilon)} \rightharpoonup \varphi^{(0)} & \text { in } & H_{0}^{1}(\Omega) & \text { as } & \varepsilon \rightarrow 0 \\
\sigma_{i j}^{(\varepsilon)} \rightharpoonup \sigma_{i j}^{(0)}, & D_{i}^{(\varepsilon)} \rightharpoonup D_{i}^{(0)} & \text { in } & L^{2}(\Omega) & \text { as } & \varepsilon \rightarrow 0
\end{array}
$$

Proof. The property of the mean value yields

$$
\begin{array}{llllll}
u_{i(1)}^{(\varepsilon)} \rightharpoonup u_{i}^{(0)}, & \varphi_{(1)}^{(\varepsilon)} \rightharpoonup \varphi^{(0)} \quad \text { in } \quad H^{1}(\Omega) & \text { as } & \varepsilon \rightarrow 0 \\
\sigma_{i j}^{(\varepsilon)} \rightharpoonup \sigma_{i j}^{(0)}, & D_{i}^{(\varepsilon)} \rightharpoonup D_{i}^{(0)} \quad \text { in } & L^{2}(\Omega) & \text { as } & \varepsilon \rightarrow 0 \tag{47}
\end{array}
$$

following the steps in Jikov et al. [10].
Then, by the conclusions in Lemma 4.3, we have

$$
\begin{equation*}
u_{i(1)}^{(\varepsilon)} \rightarrow u_{i}^{(\varepsilon)}, \quad \varphi_{(1)}^{(\varepsilon)} \rightarrow \varphi^{(\varepsilon)} \quad \text { in } \quad H^{1}(\Omega) \quad \text { as } \quad \varepsilon \rightarrow 0 \tag{48}
\end{equation*}
$$

Thus, it is obviously that

$$
\begin{gathered}
u_{i}^{(\varepsilon)} \rightharpoonup u_{i}^{(0)}, \varphi^{(\varepsilon)} \rightharpoonup \varphi^{(0)} \quad \text { in } \quad H_{0}^{1}(\Omega) \quad \text { as } \quad \varepsilon \rightarrow 0 \\
\sigma_{i j}^{(\varepsilon)} \rightharpoonup \sigma_{i j}^{(0)}, D_{i}^{(\varepsilon)} \rightharpoonup D_{i}^{(0)} \quad \text { in } \quad L^{2}(\Omega) \quad \text { as } \quad \varepsilon \rightarrow 0
\end{gathered}
$$

by (46) and 48. This completes the proof of Theorem 4.1.
Remark 4.2. It is not necessary to assume the solutions of the cell problems 41) and (42) belong to $L^{\infty}\left(R^{d}\right)$ to certify the convergence of asymptotic expansion. However, to get the order of $\varepsilon$ in Lemma 4.3, the conditions $N_{n}^{k l} \in H_{p e r}^{1}(Y) \cap L^{\infty}\left(R^{d}\right), W_{n}^{l} \in$ $H_{p e r}^{1}(Y) \cap L^{\infty}\left(R^{d}\right), \varphi_{k l} \in H_{p e r}^{1}(Y) \cap L^{\infty}\left(R^{d}\right), \psi_{l} \in H_{p e r}^{1}(Y) \cap L^{\infty}\left(R^{d}\right)$ should be involved.

So far, for those materials with periodic microstructure, the homogenized equation have been deduced from the microscopic model of piezoelectric composite material under the frame of homogenization theory and the corresponding convergence analysis is complected.

## 5. Error estimate of multi-scale modeling for piezoelectric composite materials

In Section 3, we have designed multi-scale model for piezoelectric composite materials under the framework of HMM. However, HMM is an algorithm estimating the missing macro-scale data by solving the fine scale problem locally. Therefore, both error estimate between HMM solutions and homogenization solutions and error estimate of the effective coefficients will be held in the following part. We restrict our discussion for these analysis to the periodic case, i.e., we assume that holds.

Theorem 5.1. Denote the solution of (37) and the HMM solution by $\left(\mathbf{u}^{(0)}, \varphi^{(0)}\right)$ and
$\left(\mathbf{u}^{H}, \varphi^{H}\right)$, respectively. Let

$$
\begin{aligned}
& e_{c}(H M M)=\max _{x_{l} \in K, K \in \mathscr{T}_{H}}\left\|c_{i j k l}^{(0)}-c_{i j k l}^{H}\right\| \\
& e_{e}(H M M)=\max _{x_{l} \in K, K \in \mathscr{T}_{H}}\left\|e_{i j k}^{(0)}-e_{i j k}^{H}\right\| \\
& e_{d}(H M M)=\max _{x_{l} \in K, K \in \mathscr{T}_{H}}\left\|\epsilon_{i j}^{(0)}-e_{i j k}^{H}\right\|
\end{aligned}
$$

where $\|\cdot\|$ is the Euclidean norm. If $\left(\mathbf{u}^{(0)}, \varphi^{(0)}\right)$ are sufficiently smooth, then there exists a constant $C$ independent of $\varepsilon, \delta, H$, such that

$$
\left\|u_{i}^{(0)}-u_{i}^{H}\right\|_{1}+\left\|\varphi^{(0)}-\varphi^{H}\right\|_{1} \leq C\left(H+e_{c}(H M M)+e_{e}(H M M)+e_{d}(H M M)\right)
$$

Proof. It is obviously that

$$
\begin{align*}
\left\|u_{i}^{(0)}-u_{i}^{H}\right\|_{H^{1}(\Omega)} & \leq\left\|u_{i}^{(0)}-\Pi u_{i}^{(0)}\right\|_{H^{1}(\Omega)}+\left\|\Pi u_{i}^{(0)}-u_{i}^{H}\right\|_{H^{1}(\Omega)}  \tag{49}\\
\left\|\varphi^{(0)}-\varphi^{H}\right\|_{H^{1}(\Omega)} & \leq\left\|\varphi-\Pi \varphi^{(0)}\right\|_{H^{1}(\Omega)}+\left\|\Pi \varphi^{(0)}-\varphi^{H}\right\|_{H^{1}(\Omega)} \tag{50}
\end{align*}
$$

where $\Pi$ is 1st-order Lagrange interpolate operator.
Using interpolation error estimate in Susanne et al. 77, we have

$$
\begin{align*}
\left\|u_{i}^{(0)}-\Pi u_{i}^{(0)}\right\|_{H^{1}(\Omega)} & \leq C H\left|u_{i}^{(0)}\right|_{2}  \tag{51}\\
\left\|\varphi^{(0)}-\Pi \varphi^{(0)}\right\|_{H^{1}(\Omega)} & \leq C H\left|\varphi^{(0)}\right|_{2} \tag{52}
\end{align*}
$$

Then, it remains analysis of $\left\|\Pi u_{i}^{(0)}-u_{i}^{H}\right\|_{H^{1}(\Omega)}$ and $\left\|\varphi^{H}-\Pi \varphi^{(0)}\right\|_{H^{1}(\Omega)}$
By adding, (8) yields

$$
\begin{equation*}
c_{H}\left(\mathbf{u}^{H}, \mathbf{v}^{H}\right)+e_{H}\left(\mathbf{v}^{H}, \varphi^{H}\right)-e_{H}\left(\mathbf{u}^{H}, \psi^{H}\right)+d_{H}\left(\varphi^{H}, \psi^{H}\right)=\left(\mathbf{f}, \mathbf{v}^{H}\right) \tag{53}
\end{equation*}
$$

For homogenized equations (37), the variational form is

$$
\begin{cases}c\left(\mathbf{u}^{(0)}, \mathbf{v}^{(0)}\right)+e\left(\mathbf{v}^{(0)}, \varphi^{(0)}\right)=\left(\mathbf{f}, \mathbf{v}^{(0)}\right) & \forall \mathbf{v}^{(0)} \in H_{0}^{1} \times H_{0}^{1} \times H_{0}^{1}  \tag{54}\\ -e\left(\mathbf{u}^{(0)}, \psi^{(0)}\right)+d\left(\varphi^{(0)}, \psi^{(0)}\right)=0 & \forall \psi^{(0)} \in H_{0}^{1}\end{cases}
$$

where

$$
\begin{aligned}
c\left(\mathbf{u}^{(0)}, \mathbf{v}^{(0)}\right) & =\int_{\Omega} c_{i j k l}^{(0)} s_{i j}\left(\mathbf{u}^{(0)}\right) s_{k l}\left(\mathbf{v}^{(0)}\right) d x \\
e\left(\mathbf{v}^{(0)}, \varphi^{(0)}\right) & =\int_{\Omega} e_{i j k}^{(0)} s_{i j}\left(\mathbf{v}^{(0)}\right) \partial_{k} \varphi^{(0)} d x \\
d\left(\varphi^{(0)}, \psi^{(0)}\right) & =\int_{\Omega} \epsilon_{i j}^{(0)} \partial_{i} \varphi^{(0)} \partial_{j} \psi^{(0)} d x
\end{aligned}
$$

By adding and $X_{H} \subset H_{0}^{1}$, 54 yields

$$
\begin{equation*}
c\left(\mathbf{u}^{(0)}, \mathbf{v}^{H}\right)+e\left(\mathbf{v}^{H}, \varphi^{(0)}\right)-e\left(\mathbf{u}^{(0)}, \psi^{H}\right)+d\left(\varphi^{(0)}, \psi^{H}\right)=\left(\mathbf{f}, \mathbf{v}^{H}\right) \tag{55}
\end{equation*}
$$

for any $\mathbf{v}^{H} \in X_{H} \times X_{H} \times X_{H}$ and $\psi^{H} \in X_{H}$-55 - 53), we have,

$$
\begin{align*}
& \left(c\left(\mathbf{u}^{(0)}, \mathbf{v}^{H}\right)-c_{H}\left(\mathbf{u}^{H}, \mathbf{v}^{H}\right)\right)+\left(d\left(\varphi^{(0)}, \psi^{H}\right)-d_{H}\left(\varphi^{H}, \psi^{H}\right)\right) \\
+ & \left(e\left(\mathbf{v}^{H}, \varphi^{(0)}\right)-e_{H}\left(\mathbf{v}^{H}, \varphi^{H}\right)\right)-\left(e\left(\mathbf{u}^{(0)}, \psi^{H}\right)-e_{H}\left(\mathbf{u}^{H}, \psi^{H}\right)\right)=0 \tag{56}
\end{align*}
$$

By (56), it is obviously that

$$
\begin{align*}
& \left(c\left(\mathbf{u}^{(0)}, \mathbf{v}^{H}\right)-c_{H}\left(\mathbf{u}^{(0)}, \mathbf{v}^{H}\right)\right)+c_{H}\left(\mathbf{u}^{(0)}-\Pi \mathbf{u}^{(0)}, \mathbf{v}^{H}\right) \\
+ & \left.\left(d\left(\varphi^{(0)}, \psi^{H}\right)-d_{H}\left(\varphi^{(0)}, \psi^{H}\right)\right)+d_{H}\left(\varphi^{(0)}-\Pi \varphi^{(0)}, \psi^{H}\right)\right) \\
+ & \left.\left(e\left(\mathbf{v}^{H}, \varphi^{(0)}\right)-e_{H}\left(\mathbf{v}^{H}, \varphi^{(0)}\right)\right)+e_{H}\left(\mathbf{v}^{H}, \varphi^{(0)}-\Pi \varphi^{(0)}\right)\right) \\
- & \left(e\left(\mathbf{u}^{(0)}, \psi^{H}\right)-e_{H}\left(\mathbf{u}^{(0)}, \psi^{H}\right)\right)-e_{H}\left(\mathbf{u}^{(0)}-\Pi \mathbf{u}^{(0)}, \psi^{H}\right) \\
= & \left.\left.c_{H}\left(\mathbf{u}^{H}-\Pi \mathbf{u}^{(0)}, \mathbf{v}^{H}\right)+d_{H}\left(\varphi^{H}-\Pi \varphi^{(0)}, \psi^{H}\right)\right)+e_{H}\left(\mathbf{v}^{H}, \varphi^{H}-\Pi \varphi^{(0)}\right)\right)-e_{H}\left(\mathbf{u}^{H}-\Pi \mathbf{u}^{(0)}, \psi^{H}\right) \tag{57}
\end{align*}
$$

Setting $\mathbf{v}^{H}=\mathbf{u}^{H}-\Pi \mathbf{u}^{(0)}, \psi^{H}=\varphi^{H}-\Pi \varphi^{(0)}$ in 57, we have
The right hand side of $57 \geq \alpha\left\|\mathbf{u}^{H}-\Pi \mathbf{u}^{(0)}\right\|_{1}^{2}+\beta\left\|\varphi^{H}-\Pi \varphi^{(0)}\right\|_{1}^{2}$
by Fridriches's inequality and Lemma 3.1.
Using Hölder inequality, we obtain

The left hand side of 57

$$
\begin{aligned}
& \leq e_{c}(H M M)\left|\mathbf{u}^{(0)}\right|_{1}\left|\mathbf{u}^{H}-\Pi \mathbf{u}^{(0)}\right|_{1}+C_{1}\left|\mathbf{u}^{H}-\Pi \mathbf{u}^{(0)}\right|_{1}\left|\mathbf{u}^{(0)}-\Pi \mathbf{u}^{(0)}\right|_{1} \\
& +e_{d}(H M M)\left|\varphi^{(0)}\right|_{1}\left|\varphi^{H}-\Pi \varphi^{(0)}\right|_{1}+C_{2}\left|\varphi^{(0)}-\Pi \varphi^{(0)}\right|_{1}\left|\varphi^{H}-\Pi \varphi^{(0)}\right|_{1} \\
& +e_{e}(H M M)\left|\varphi^{(0)}\right|_{1}\left|\mathbf{u}^{H}-\Pi \mathbf{u}^{(0)}\right|_{1}+C_{3}\left|\varphi^{(0)}-\Pi \varphi^{(0)}\right|_{1}\left|\mathbf{u}^{H}-\Pi \mathbf{u}^{(0)}\right|_{1} \\
& +e_{e}(H M M)\left|\mathbf{u}^{(0)}\right|_{1}\left|\varphi^{H}-\Pi \varphi^{(0)}\right|_{1}+C_{4}\left|\varphi^{H}-\Pi \varphi^{(0)}\right|_{1}\left|\mathbf{u}^{(0)}-\Pi \mathbf{u}^{(0)}\right|_{1}
\end{aligned}
$$

Then, by Cauchy inequality and interpolation error estimate in Susanne et al. [7, we have
$\left\|\Pi u_{i}^{(0)}-u_{i}^{H}\right\|_{H^{1}(\Omega)}+\left\|\varphi^{H}-\Pi \varphi^{(0)}\right\|_{H^{1}(\Omega)} \leq C\left(H+e_{c}(H M M)+e_{d}(H M M)+e_{e}(H M M)\right)$
This completes the proof of Theorem 5.1

Remark 5.1. At this stage, no assumption on the form of $c_{i j k l}^{(\varepsilon)}, e_{i j k}^{(\varepsilon)}$ and $\epsilon_{i j}^{(\varepsilon)}$ is needed. $\left(\mathbf{u}^{(0)}, \varphi^{(0)}\right)$ can be the solution of an arbitrary macroscopic equation system with the same right-hand side as in (7)

Theorem 5.2. For those piezoelectric composite materials with periodic microstructure, if $N_{n}^{k l} \in H_{p e r}^{1}(Y) \cap L^{\infty}\left(R^{d}\right)$ and $\phi_{k l} \in H_{p e r}^{1}(Y) \cap L^{\infty}\left(R^{d}\right)$, we have the following estimate

$$
\begin{aligned}
& e_{c}(H M M) \leq C_{c} \frac{\varepsilon}{\delta} \\
& e_{e}(H M M) \leq C_{e} \frac{\frac{\varepsilon}{\delta}}{e_{d}} \\
& e_{d}(H M M) \leq C_{d} \frac{\varepsilon}{\delta}
\end{aligned}
$$

where $C_{c}, C_{e}, C_{d}$ are constants independent of $\varepsilon$ and $\delta$.
Proof. By (12) and 13), we obtain

$$
\begin{align*}
c_{i j k l}^{H} & =\left\langle c_{s m n h}^{(\varepsilon)} \frac{\partial P_{n}^{k l}}{\partial x_{h}} \frac{\partial P_{s}^{i j}}{\partial x_{m}}+e_{h s m}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}} \frac{\partial P_{s}^{i j}}{\partial x_{m}}\right\rangle_{I_{\delta}}  \tag{58}\\
& =\left\langle c_{s m n h}^{(\varepsilon)} \frac{\partial P_{n}^{k l}}{\partial x_{h}} \frac{\partial P_{s}^{i j}}{\partial x_{m}}+\epsilon_{h m}^{(\varepsilon)} \frac{\partial \Phi_{k l}}{\partial x_{h}} \frac{\partial \Phi_{i j}}{\partial x_{m}}\right\rangle_{I_{\delta}} \tag{59}
\end{align*}
$$

Similarly, by (41) and (38), we have

$$
\begin{align*}
c_{i j k l}^{(0)} & =\left\langle c_{s m n h}(y)\left(\frac{\partial N_{s}^{i j}}{\partial y_{m}}+\delta_{i s} \delta_{j m}\right)\left(\frac{\partial N_{n}^{k l}}{\partial y_{h}}+\delta_{k n} \delta_{h l}\right)+e_{h s m} \frac{\partial \phi_{k l}}{\partial y_{h}}\left(\frac{\partial N_{s}^{i j}}{\partial y_{m}}+\delta_{i s} \delta_{j m}\right)\right\rangle_{Y}  \tag{60}\\
& =\left\langle c_{s m n h}(y)\left(\frac{\partial N_{s}^{i j}}{\partial y_{m}}+\delta_{i s} \delta_{j m}\right)\left(\frac{\partial N_{n}^{k l}}{\partial y_{h}}+\delta_{k n} \delta_{h l}\right)+\epsilon_{h m} \frac{\partial \phi_{k l}}{\partial y_{h}} \frac{\partial \phi_{i j}}{\partial y_{m}}\right\rangle_{Y} \tag{61}
\end{align*}
$$

The solution of $12,\left(\mathbf{P}^{k l}, \Phi_{k l}\right)$ has the following expansion,

$$
\begin{align*}
& P_{n}^{k l}=P_{n}^{k l(0)}+\varepsilon\left(N_{n}^{k j}(y) \frac{\partial P_{n}^{k l(0)}(x)}{\partial x_{j}}+W_{n}^{j}(y) \frac{\partial \Phi_{k l}^{(0)}(x)}{\partial x_{j}}\right)+\varepsilon \theta_{n}^{k l}  \tag{62}\\
& \Phi_{k l}=\Phi_{k l}^{(0)}+\varepsilon\left(\phi_{n j}(y) \frac{\partial P_{n}^{k l}(0)(x)}{\partial x_{j}}+\psi_{j}(y) \frac{\partial \Phi_{k l}^{(0)}(x)}{\partial x_{j}}\right)+\varepsilon \Theta_{k l} \tag{63}
\end{align*}
$$

where $\left(\mathbf{P}^{k l(0)}, \Phi_{k l}^{(0)}\right)$ is the solution of the following equation system

$$
\begin{cases}-\frac{\partial}{\partial x_{j}}\left(c_{i j n h}^{(0)} \frac{\partial P_{n}^{k l(0)}}{\partial x_{h}}+e_{h i j}^{(0)} \frac{\partial \Phi_{k l}^{(0)}}{\partial x_{h}}\right)=0 & x \in I_{\delta}\left(x_{\alpha}\right)  \tag{64}\\ \frac{\partial}{\partial x_{i}}\left(e_{i n h}^{(0)} \frac{\partial P_{n}^{k l}(0)}{\partial x_{h}}-\epsilon_{i h}^{(0)} \frac{\partial \Phi_{k l}{ }^{(0)}}{\partial x_{h}}\right)=0 & x \in I_{\delta}\left(x_{\alpha}\right) \\ P_{k}^{k l(0)}=x_{l} \quad P_{n}^{k l(0)}=0(n \neq k) & x \in \partial I_{\delta}\left(x_{\alpha}\right) \\ \Phi_{k l}{ }^{(0)}=0 & x \in \partial I_{\delta}\left(x_{\alpha}\right)\end{cases}
$$

We know that $c_{i j n h}^{(0)}, e_{i n h}^{(0)}, \epsilon_{i h}^{(0)}$ are constants under the assumption 36 . Thus, we can write out the solution of (64) explicitly as follows by the existent and unique property of the solution of (64).

$$
\begin{equation*}
P_{k}^{k l}{ }^{(0)}=x_{l} \quad P_{n}^{k l(0)}=0(n \neq k) \quad \Phi_{k l}^{(0)}=0 \quad \text { on } I_{\delta}\left(x_{\alpha}\right) \tag{65}
\end{equation*}
$$

Then,

$$
\begin{align*}
\nabla P_{k}^{k l} & =e_{l}+\nabla_{y} N_{k}^{k l}(y)+\nabla\left(\varepsilon \theta_{k}^{k l}\right)=\mathbf{W}_{\mathbf{k}}^{\mathbf{k l}}+\nabla\left(\varepsilon \theta_{k}^{k l}\right)  \tag{66}\\
\nabla P_{n}^{k l} & =0+\nabla_{y} N_{n}^{k l}(y)+\nabla\left(\varepsilon \theta_{n}^{k l}\right)=\mathbf{W}_{\mathbf{n}}^{\mathbf{k l}}+\nabla\left(\varepsilon \theta_{n}^{k l}\right)  \tag{67}\\
\nabla \Phi_{k l} & =0+\nabla_{y} \phi_{k l}(y)+\nabla\left(\varepsilon \Theta_{k l}\right)=\mathbf{M}_{\mathbf{k} \mathbf{l}}+\nabla\left(\varepsilon \Theta_{k l}\right) \tag{68}
\end{align*}
$$

where $\left(\theta^{k l}, \Theta_{k l}\right)$ satisfies the following equation system

$$
\begin{cases}-\frac{\partial}{\partial x_{j}}\left(c_{i j n h}^{(\varepsilon)} \frac{\partial \theta_{n}^{k l}}{\partial x_{h}}+e_{h i j}^{(\varepsilon)} \frac{\partial \Theta_{k l}}{\partial x_{h}}\right)=0 & x \in I_{\delta}\left(x_{\alpha}\right)  \tag{69}\\ \frac{\partial}{\partial x_{i}}\left(e_{i n h}^{(\varepsilon)} \frac{\partial \theta_{n}^{k l}}{\partial x_{h}}-\epsilon_{i h}^{(\varepsilon)} \frac{\partial \Theta_{k l}}{\partial x_{h}}\right)=0 & x \in I_{\delta}\left(x_{\alpha}\right) \\ \theta_{n}^{k l}=-N_{n}^{k l} & x \in \partial I_{\delta}\left(x_{\alpha}\right) \\ \Theta_{k l}=-\phi_{k l} & x \in \partial I_{\delta}\left(x_{\alpha}\right)\end{cases}
$$

(60)-58), we have

$$
\begin{align*}
& c_{i j k l}^{H}-c_{i j k l}^{(0)} \\
= & \left.\left\langle c_{s m n h}^{(\varepsilon)}\left(\left(W_{n}^{k l}\right)_{h}+\varepsilon \frac{\partial \theta_{n}^{k l}}{\partial x_{h}}\right)\right)\left(\left(W_{s}^{i j}\right)_{m}+\varepsilon \frac{\partial \theta_{s}^{i j}}{\partial x_{m}}\right)\right) \\
& \left.\left.+e_{s m h}\left(\left(M_{k l}\right)_{h}+\varepsilon \frac{\partial \Theta_{k l}}{\partial x_{h}}\right)\left(\left(W_{s}^{i j}\right)_{m}+\varepsilon \frac{\partial \theta_{s}^{i j}}{\partial x_{m}}\right)\right)\right\rangle_{I_{\delta}} \\
& -\left\langle c_{s m n h}(y)\left(W_{n}^{k l}\right)_{h}\left(W_{s}^{i j}\right)_{m}+e_{s m h}(y)\left(M_{k l}\right)_{h}\left(W_{s}^{i j}\right)_{m}\right\rangle_{Y}  \tag{70}\\
= & \left\langle c_{s m n h}^{(\varepsilon)}(y)\left(W_{n}^{k l}\right)_{h}\left(W_{s}^{i j}\right)_{m}+e_{s m h}^{(\varepsilon)}(y)\left(M_{k l}\right)_{h}\left(W_{s}^{i j}\right)_{m}\right\rangle_{I_{\delta}} \\
& -\left\langle c_{s m n h}(y)\left(W_{n}^{k l}\right)_{h}\left(W_{s}^{i j}\right)_{m}+e_{s m h}(y)\left(M_{k l}\right)_{h}\left(W_{s}^{i j}\right)_{m}\right\rangle_{Y} \\
& +\varepsilon\left\langle\left(c_{s m n h}^{(\varepsilon)}\left(W_{n}^{k l}\right)_{h}+e_{s m h}^{(\varepsilon)}\left(M_{k l}\right)_{h}\right) \frac{\partial \theta_{s}^{i j}}{\partial x_{m}}\right\rangle_{I_{\delta}} \\
& +\varepsilon\left\langle c_{s m n h}^{(\varepsilon)} \frac{\partial \theta_{n}^{k l}}{\partial x_{h}}\left(W_{s}^{i j}\right)_{m}+e_{s m h}^{(\varepsilon)} \frac{\partial \Theta_{k l}}{\partial x_{h}}\left(W_{s}^{i j}\right)_{m}\right\rangle_{I_{\delta}} \\
& +\varepsilon^{2}\left\langle c_{s m n h}^{(\varepsilon)} \frac{\partial \theta_{n}^{k l}}{\partial x_{h}} \frac{\partial \theta_{s}^{i j}}{\partial x_{m}}+e_{s m h}^{(\varepsilon)} \frac{\partial \Theta_{k l}}{\partial x_{h}} \frac{\partial \theta_{s}^{i j}}{\partial x_{m}}\right\rangle_{I_{\delta}} \tag{71}
\end{align*}
$$

(61)-(59), we obtain

$$
\begin{align*}
& c_{i j k l}^{H}-c_{i j k l}^{(0)} \\
= & \left\langle c_{s m n h}^{(\varepsilon)}\left(\left(W_{n}^{k l}\right)_{h}+\varepsilon \frac{\partial \theta_{n}^{k l}}{\partial x_{h}}\right)\left(\left(W_{s}^{i j}\right)_{m}+\varepsilon \frac{\partial \theta_{s}^{i j}}{\partial x_{m}}\right)\right) \\
& \left.+\epsilon_{h m}^{(\varepsilon)}\left(\left(M_{i j}\right)_{m}+\varepsilon \frac{\partial \Theta_{i j}}{\partial x_{m}}\right)\left(\left(M_{k l}\right)_{h}+\varepsilon \frac{\partial \Theta_{k l}}{\partial x_{h}}\right)\right\rangle_{I_{\delta}} \\
& -\left\langle c_{s m n h}(y)\left(W_{n}^{k l}\right)_{h}\left(W_{s}^{i j}\right)_{m}+\epsilon_{h m}(y)\left(M_{i j}\right)_{m}\left(M_{k l}\right)_{h}\right\rangle_{Y}  \tag{72}\\
= & \left\langle c_{s m n h}^{(\varepsilon)}\left(W_{n}^{k l}\right)_{h}\left(W_{s}^{i j}\right)_{m}+\epsilon_{h m}^{(\varepsilon)}\left(M_{i j}\right)_{m}\left(M_{k l}\right)_{h}\right\rangle_{I_{\delta}} \\
& -\left\langle c_{s m n h}(y)\left(W_{n}^{k l}\right)_{h}\left(W_{s}^{i j}\right)_{m}+\epsilon_{h m}(y)\left(M_{i j}\right)_{m}\left(M_{k l}\right)_{h}\right\rangle_{Y} \\
& +2 \varepsilon\left\langle c_{s m n h}^{(\varepsilon)} \frac{\partial \theta_{n}^{k l}}{\partial x_{h}}\left(W_{s}^{i j}\right)_{m}+\epsilon_{h m}^{(\varepsilon)}\left(M_{i j}\right)_{m} \frac{\partial \Theta_{k l}}{\partial x_{h}}\right\rangle_{I_{\delta}} \\
& +\varepsilon^{2}\left\langle c_{s m n h}^{(\varepsilon)} \frac{\partial \theta_{n}^{k l}}{\partial x_{h}} \frac{\partial \theta_{s}^{i j}}{\partial x_{m}}+\epsilon_{h m}^{(\varepsilon)} \frac{\partial \Theta_{i j}}{\partial x_{m}} \frac{\partial \Theta_{k l}}{\partial x_{h}}\right\rangle_{I_{\delta}} \tag{73}
\end{align*}
$$

$2 \times(71)-73$, we have

$$
\begin{align*}
& c_{i j k l}^{H}-c_{i j k l}^{(0)} \\
= & \left\langle c_{s m n h}^{(\varepsilon)}(y)\left(W_{n}^{k l}\right)_{h}\left(W_{s}^{i j}\right)_{m}+e_{s m h}^{(\varepsilon)}(y)\left(M_{k l}\right)_{h}\left(W_{s}^{i j}\right)_{m}\right\rangle_{I_{\delta}} \\
- & \left\langle c_{s m n h}(y)\left(W_{n}^{k l}\right)_{h}\left(W_{s}^{i j}\right)_{m}+e_{s m h}(y)\left(M_{k l}\right)_{h}\left(W_{s}^{i j}\right)_{m}\right\rangle_{Y} \\
+ & \varepsilon^{2}\left(2\left\langle c_{s m n h}^{(\varepsilon)} \frac{\partial \theta_{n}^{k l}}{\partial x_{h}} \frac{\partial \theta_{s}^{i j}}{\partial x_{m}}+e_{s m h}^{(\varepsilon)} \frac{\partial \Theta_{k l}}{\partial x_{h}} \frac{\partial \theta_{s}^{i j}}{\partial x_{m}}\right\rangle_{I_{\delta}}-\left\langle c_{s m n h}^{(\varepsilon)} \frac{\partial \theta_{n}^{k l}}{\partial x_{h}} \frac{\partial \theta_{s}^{i j}}{\partial x_{m}}+\epsilon_{h m}^{(\varepsilon)} \frac{\partial \Theta_{i j}}{\partial x_{m}} \frac{\partial \Theta_{k l}}{\partial x_{h}}\right\rangle_{I_{\delta}}\right) \\
+ & 2 \varepsilon\left(\left\langle\left(e_{s m h}^{(\varepsilon)}\left(W_{s}^{i j}\right)_{m}-\epsilon_{m h}^{(\varepsilon)}\left(M_{i j}\right)_{m}\right) \frac{\partial \Theta_{k l}}{\partial x_{h}}\right\rangle_{I_{\delta}}+\left\langle\left(c_{s m n h}^{(\varepsilon)}\left(W_{n}^{k l}\right)_{h}+e_{s m h}^{(\varepsilon)}\left(M_{k l}\right)_{h}\right) \frac{\partial \theta_{s}^{i j}}{\partial x_{m}}\right\rangle_{I_{\delta}}\right) \tag{74}
\end{align*}
$$

Setting

$$
\begin{align*}
I_{0}\left(\varepsilon^{0}\right) & =\left\langle c_{s m n h}^{(\varepsilon)}(y)\left(W_{n}^{k l}\right)_{h}\left(W_{s}^{i j}\right)_{m}+e_{s m h}^{(\varepsilon)}(y)\left(M_{k l}\right)_{h}\left(W_{s}^{i j}\right)_{m}\right\rangle_{I_{\delta}} \\
& -\left\langle c_{s m n h}(y)\left(W_{n}^{k l}\right)_{h}\left(W_{s}^{i j}\right)_{m}+e_{s m h}(y)\left(M_{k l}\right)_{h}\left(W_{s}^{i j}\right)_{m}\right\rangle_{Y} \\
I_{1}\left(\varepsilon^{1}\right) & =2 \varepsilon\left\langle\left(e_{s m h}^{(\varepsilon)}\left(W_{s}^{i j}\right)_{m}-\epsilon_{m h}^{(\varepsilon)}\left(M_{i j}\right)_{m}\right) \frac{\partial \Theta_{k l}}{\partial x_{h}}\right\rangle_{I_{\delta}}+2 \varepsilon\left\langle\left(c_{s m n h}^{(\varepsilon)}\left(W_{n}^{k l}\right)_{h}+e_{s m h}^{(\varepsilon)}\left(M_{k l}\right)_{h}\right) \frac{\partial \theta_{s}^{i j}}{\partial x_{m}}\right\rangle_{I_{\delta}} \\
I_{2}\left(\varepsilon^{2}\right) & =2 \varepsilon^{2}\left\langle c_{s m n h}^{(\varepsilon)} \frac{\partial \theta_{n}^{k l}}{\partial x_{h}} \frac{\partial \theta_{s}^{i j}}{\partial x_{m}}+e_{s m h}^{(\varepsilon)} \frac{\partial \Theta_{k l}}{\partial x_{h}} \frac{\partial \theta_{s}^{i j}}{\partial x_{m}}\right\rangle_{I_{\delta}}-\varepsilon^{2}\left\langle c_{s m n h}^{(\varepsilon)} \frac{\partial \theta_{n}^{k l}}{\partial x_{h}} \frac{\partial \theta_{s}^{i j}}{\partial x_{m}}+\epsilon_{h m}^{(\varepsilon)} \frac{\partial \Theta_{i j}}{\partial x_{m}} \frac{\partial \Theta_{k l}}{\partial x_{h}}\right\rangle_{I_{\delta}} \tag{75}
\end{align*}
$$

For $I_{0}\left(\varepsilon^{0}\right)$, referring to the ideas of Lemma 4.1, Lemma 4.2 and X.H et al. [13], we get

$$
\begin{equation*}
\left|I_{0}\left(\varepsilon^{0}\right)\right| \leq C_{0} \frac{\varepsilon}{\delta} \tag{76}
\end{equation*}
$$

For $I_{1}\left(\varepsilon^{1}\right)$, we denote the first term and the second term of $I_{1}\left(\varepsilon^{1}\right)$ as $I_{1}(1)$ and $I_{1}(2)$ respectively.

By Green Formula, we have

$$
\begin{aligned}
I_{1}(1)= & \frac{2 \varepsilon}{\left|I_{\delta}\right|}\left(\int_{\partial I_{\delta}} \Theta_{k l}\left(e_{s m h}^{(\varepsilon)}\left(W_{s}^{i j}\right)_{m}-\epsilon_{m h}^{(\varepsilon)}\left(M_{i j}\right)_{m}\right) \cdot \vec{n} d s\right. \\
& -\int_{I_{\delta}} \Theta_{k l} \frac{\partial}{\partial x_{h}}\left(e_{s m h}^{(\varepsilon)}\left(W_{s}^{i j}\right)_{m}-\epsilon_{m h}^{(\varepsilon)}\left(M_{i j}\right)_{m}\right) d x
\end{aligned}
$$

Due to 41) and 69, we obtain,

$$
\left|I_{1}(1)\right|=\left|\frac{2 \varepsilon}{\left|I_{\delta}\right|} \int_{\partial I_{\delta}} \phi_{k l}\left(e_{s m h}^{(\varepsilon)}\left(W_{s}^{i j}\right)_{m}-\epsilon_{m h}^{(\varepsilon)}\left(M_{i j}\right)_{m}\right) \cdot \vec{n} d s\right|
$$

Using the singularity of the solutions of 41 and Hölder inequality, we get

$$
\left|I_{1}(1)\right| \leq \frac{2 \varepsilon}{\left|I_{\delta}\right|} C_{1}\left|\partial I_{\delta}\right|^{\frac{1}{2}} \leq C_{1} \frac{\varepsilon}{\delta}
$$

Similarly, we can get

$$
\left|I_{1}(2)\right| \leq C_{2} \frac{\varepsilon}{\delta}
$$

Thus,

$$
\begin{equation*}
\left|I_{1}\left(\varepsilon^{1}\right)\right| \leq \max \left(C_{1}, C_{2}\right) \frac{\varepsilon}{\delta} \tag{77}
\end{equation*}
$$

For $I_{2}\left(\varepsilon^{2}\right)$, we may just follow the steps in the proof of Lemma 4.3 to get the following estimate,

$$
\begin{equation*}
\left|I_{2}\left(\varepsilon^{2}\right)\right| \leq C_{3} \frac{\varepsilon}{\delta} \tag{78}
\end{equation*}
$$

Therefore, we obtain

$$
e_{c}(H M M) \leq \max \left\{C_{0}, C_{1}, C_{2}, C_{3}\right\} \frac{\varepsilon}{\delta}=C_{c} \frac{\varepsilon}{\delta}
$$

Similarly, we can also get

$$
e_{d}(H M M) \leq C_{d} \frac{\varepsilon}{\delta}
$$

For the estimation of $e_{e}(H M M)$, we do not have essential difference with the estimation of $e_{c}(H M M)$ and $e_{d}(H M M)$, except some techniques on constructing suitable expressions for analytical convenience, which is not necessary to be writen out in details here. This completes the proof of Theorem 5.2

## 6. Numerical simulation

### 6.1. Numerical example

In order to illustrate the multi-scale methods mentioned above in this paper, we introduce an numerical example of 1-3 type piezoelectric composite materials made of piezoceramic(PZT) fibers embedded in a soft non-piezoelectric matrix(polymer). Since, for a transversely isotropic piezoelectric solid, the stiffness matrix, the piezoelectric matrix and the dielectric matrix simplify so that there remain 11 independent coefficients, we
take the piezoelectric composite materials aligned fibers made of a transversely isotropic piezoelectric solid (PZT), embedded in an isotropic polymer matrix. Moreover, it is easy to verify that the resulting composite is a transversely isotropic piezoelectric material too. Therefore, if we take

$$
11 \longrightarrow 1 \quad 22 \longrightarrow 2 \quad 33 \longrightarrow 3 \quad 23 \longrightarrow 4 \quad 13 \longrightarrow 5 \quad 12 \longrightarrow 6
$$

then the constitutive relations of both each component and the resulting composite have the following form.

$$
\left(\begin{array}{c}
\sigma_{11} \\
\sigma_{22} \\
\sigma_{33} \\
\sigma_{23} \\
\sigma_{31} \\
\sigma_{12} \\
D_{1} \\
D_{2} \\
D_{3}
\end{array}\right)=\left(\begin{array}{ccccccccc}
c_{11} & c_{12} & c_{13} & 0 & 0 & 0 & 0 & 0 & -e_{13} \\
c_{12} & c_{22} & c_{13} & 0 & 0 & 0 & 0 & 0 & -e_{13} \\
c_{13} & c_{13} & c_{33} & 0 & 0 & 0 & 0 & 0 & -e_{33} \\
0 & 0 & 0 & c_{44} & 0 & 0 & 0 & -e_{15} & 0 \\
0 & 0 & 0 & 0 & c_{44} & 0 & -e_{15} & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & c_{66} & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & e_{15} & 0 & \epsilon_{11} & 0 & 0 \\
0 & 0 & 0 & e_{15} & 0 & 0 & 0 & \epsilon_{11} & 0 \\
e_{13} & e_{13} & e_{33} & 0 & 0 & 0 & 0 & 0 & \epsilon_{33}
\end{array}\right)\left(\begin{array}{c}
s_{11} \\
s_{22} \\
s_{33} \\
s_{23} \\
s_{31} \\
s_{12} \\
E_{1} \\
E_{2} \\
E_{3}
\end{array}\right)
$$

In our numerical example, we take the material properties of the composite constituents fiber (PZT-5) and matrix (polymer) as Table 1.

Table 1: Material properties of the composite constituents fiber(PZT-5) and matrix(polymer)

|  | $c_{11}\left(10^{10}\right)$ | $c_{12}\left(10^{10}\right)$ | $c_{13}\left(10^{10}\right)$ | $c_{33}\left(10^{10}\right)$ | $c_{44}\left(10^{10}\right)$ | $c_{66}\left(10^{10}\right)$ | $e_{15}$ | $e_{13}$ | $e_{33}$ | $\epsilon_{11}\left(10^{-9}\right)$ | $\epsilon_{33}\left(10^{-9}\right)$ |
| ---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| PZT-5 | 12.1 | 7.54 | 7.52 | 11.1 | 2.11 | 2.28 | 12.3 | -5.4 | 15.8 | 8.11 | 7.35 |
| Polymer | 0.386 | 0.257 | 0.257 | 0.386 | 0.064 | 0.064 | - | - | - | 0.07965 | 0.07965 |

And the multi-scale structure of the composite is shown in .
We take $\Omega=[0,5] \times[0,5] \times[0,5]$ as the computation domain, and $R$ denotes the radius of the fiber in one microscopic periodic. $\varepsilon=0.015625$ is the microscopic periodic. Ignoring volume forces, we apply boundary condition as follows,

$$
u_{i}=0 \quad \varphi(5, y, z)=1000 \quad \varphi(x, y, z)=0 \quad \text { for } \quad x \neq 5, \quad \text { on } \partial \Omega
$$

The computation domain $\Omega$ is divided into $40 \times 40 \times 40$ elements, the coarse mesh. Each element contains $8 \times 8 \times 8$ microscopic periodicals, see Picture 2. The computation process for given R and $\delta$ is as follows:

1. Solving the two cell problems (41) and (42) and calculating the effective coefficients as (38).
2. Solving (37) on $\Omega$ with the effective coefficients got in Step 1 .
3. Given $\alpha$, solving the cell problems of HMM (12) and 15 on $I_{\delta}\left(x_{\alpha}\right)$. Then we give out the estimation of the effective coefficients at scale H by 13) and 16. In this numerical example, we take one sample in each Macroscopic element K.
4. Solving 8 on $\Omega$ by the estimation of the effective coefficients got in Step 3.

Picture 2. The multi-scale structure of 1-3 type piezoelectric composite materials

### 6.2. Numerical results and analysis

### 6.2.1. Order of the effective coefficients

For given $R=0.3125 \varepsilon$ and $R=0.4375 \varepsilon$, we take $\delta=4 \varepsilon, \delta=3 \varepsilon, \delta=2 \varepsilon$ respectively. We take the scale of elements on $I_{\delta}$ as $h=0.00078125$. Then, following the steps in Section 3.1, we give out the order of error estimate between the effective coefficients got in Step 1 and the estimation of the effective coefficients got in Step 3.

Table 2: Accuracy of HMM on coefficients for 1-3 type composites with $R=0.3125 \varepsilon$

| $\frac{\varepsilon}{\delta}$ | $c_{11}^{H}$ | order | $c_{12}^{H}$ | order | $c_{13}^{H}$ | order |

| $\epsilon_{i j}^{(0)}$ | $4.32 \mathrm{e}-10$ | - | $4.61 \mathrm{e}-09$ | - |

Table 3: Accuracy of HMM on coefficients for 1-3 type composites with $R=0.4375 \varepsilon$

### 6.2.2. Analysis of the results

In the numerical result, we can see that the order of error of the effective coefficients we have got in the numerical examples support the corresponding conclusions in our theoretical analysis in section 5. Therefore, we can predict that the estimation of the effective coefficients in the multi-scale model we designed under the framework of HMM can be better and better as the number of the cells taken in one sample increases larger and larger.

## 7. Conclusions

In this paper, a multi-scale model for piezoelectric composite materials under the framework of Heterogeneous Multi-scale Method(HMM) is proposed. In order to verify the capability of the multi-scale model we developed, macroscopic model is derived from microscopic model of piezoelectric composite material by asymptotic expansion for materials with periodic microstructure. Convergence rate of asymptotic expansion is proved to be $\sqrt{\epsilon}$ under the framework of homogenization theory. We then give out both error
estimate between HMM solutions and homogenization solutions and error estimate of the effective coefficients for piezoelectric composite materials with periodic microstructure. Therefore, HMM solutions is shown to convergence to homogenization solutions in the order of ( $H+\frac{\epsilon}{\delta}$ ) and the effective coefficients got by HMM modeling is shown to convergence to effective coefficients got by homogenization theory in the order of $\frac{\epsilon}{\delta}$. Moreover, our numerical simulation result support the corresponding theoretical conclusions we got above very well.
