# ON HOCHSCHILD COHOMOLOGY OF A SELF-INJECTIVE SPECIAL BISERIAL ALGEBRA OBTAINED BY A CIRCULAR QUIVER WITH DOUBLE ARROWS 

AYAKO ITABA

#### Abstract

We calculate the dimensions of the Hochschild cohomology groups of a selfinjective special biserial algebra $\Lambda_{s}$ obtained by a circular quiver with double arrows. Moreover, we give a presentation of the Hochschild cohomology ring modulo nilpotence of $\Lambda_{s}$ by generators and relations. This result shows that the Hochschild cohomology ring modulo nilpotence of $\Lambda_{s}$ is finitely generated as an algebra.

## 1. Introduction

Let $K$ be an algebraically closed field. For a positive integer $s$, let $\Gamma_{s}$ be the following circular quiver with double arrows:

Denote the trivial path at the vertex $i$ by $e_{i}$. We set the elements $x=\sum_{i=0}^{s-1} a_{i}$ and $y=$ $\sum_{i=0}^{s-1} b_{i}$ in the path algebra $K \Gamma_{s}$. Then $e_{i} x^{n}=x^{n} e_{i+n}=e_{i} x^{n} e_{i+n}$ and $e_{i} y^{n}=y^{n} e_{i+n}=$ $e_{i} y^{n} e_{i+n}$ hold for $0 \leq i \leq s-1$ and $n \geq 0$, where the subscript $i+n$ of $e_{i+n}$ is regarded as modulo $s$. We denote by $I$ the ideal generated by $x^{2}, x y+y x$ and $y^{2}$, that is, $I=$ $\left\langle x^{2}, x y+y x, y^{2}\right\rangle=\left\langle e_{i} x^{2}, e_{i}(x y+y x), e_{i} y^{2} \mid 0 \leq i \leq s-1\right\rangle$. Then we define the bound quiver algebra $\Lambda_{s}=K \Gamma_{s} / I$ over $K$. This algebra $\Lambda_{s}$ is a Koszul self-injective special biserial algebra for $s \geq 1$ (see Proposition 2.2), but is not a weakly symmetric algebra for $s \geq 3$. Our purpose in this paper is to study the Hochschild cohomology of $\Lambda_{s}$ for $s \geq 3$.

We immediately see that $\Lambda_{1}$ is the exterior algebra in two variables $K[x, y] /\left\langle x^{2}, x y+\right.$ $\left.y x, y^{2}\right\rangle$, and Xu and Han have studied the Hochschild cohomology groups and rings of the exterior algebras in arbitrary variables in [XH]. Also, in [ST] and [F], the Hochschild cohomology groups and rings for classes of some self-injective special biserial algebras have been studied. We notice that these classes contain algebras isomorphic to $\Lambda_{2}$ and $\Lambda_{4}$.

[^0]In GHMS, Green, Hartmann, Marcos and Solberg constructed a minimal projective bimodule resolution for any Koszul algebra by using sets $\mathcal{G}^{n}(n \geq 0)$ introduced by Green, Solberg and Zacharia in GSZ]. Moreover, by using this method, minimal projective bimodule resolutions of several weakly symmetric algebras are constructed in [FO], [ST] and [ ScSn ]. In this paper, by the same method, we give a minimal projective bimodule resolution of $\Lambda_{s}$ for $s \geq 1$ and compute the Hochschild cohomology group $\operatorname{HH}^{n}\left(\Lambda_{s}\right)$ of $\Lambda_{s}$ for $n \geq 0$ in the case where $s \geq 3$.

In [SnSo, Snashall and Solberg have defined the support varieties of finitely generated modules over a finite-dimensional algebra by using the Hochschild cohomology ring modulo nilpotence, which are analogous to the support varieties for group algebras of finite groups. Furthermore, in SnSo , Snashall and Solberg have conjectured that the Hochschild cohomology ring modulo nilpotence is finitely generated as an algebra. So far, it has been proved that the Hochschild cohomology rings modulo nilpotence of the following classes of finitedimensional algebras are finitely generated as algebras: group algebras of finite groups ([E]); self-injective algebras of finite representation type ([GSS1]); monomial algebras ([GSS2]); several self-injective special biserial algebras ([ES], [F], [ScSn, [ST]). However, in [X], Xu has found a counterexample to this conjecture (see also [S], XZ]). In this paper, we give generators and relations of the Hochschild cohomology ring modulo nilpotence $\mathrm{HH}^{*}\left(\Lambda_{s}\right) / \mathcal{N}_{\Lambda_{s}}$ of $\Lambda_{s}$ for all $s \geq 3$, and show that $\mathrm{HH}^{*}\left(\Lambda_{s}\right) / \mathcal{N}_{\Lambda_{s}}$ is finitely generated as an algebra.

This paper is organized as follows: In Section 2, we give sets $\mathcal{G}^{n}(n \geq 0)$ for the right $\Lambda_{s^{-}}$ module $\Lambda_{s} / \operatorname{rad} \Lambda_{s}$. Moreover, by using $\mathcal{G}^{n}$, we construct a minimal projective resolution of $\Lambda_{s}$ as a $\Lambda_{s}-\Lambda_{s}$-bimodule (see Theorem 2.6). In Section 3, we find a $K$-basis of the Hochschild cohomology group $\mathrm{HH}^{n}\left(\Lambda_{s}\right)$ (see Proposition 3.8) and describe the dimension of $\mathrm{HH}^{n}\left(\Lambda_{s}\right)$ for $n \geq 0$ and $s \geq 3$ (see Theorem 3.9). In Section 4, we investigate the Hochschild cohomology ring modulo nilpotence $\operatorname{HH}^{*}\left(\Lambda_{s}\right) / \mathcal{N}_{\Lambda_{s}}$ for $s \geq 3$. In particular, it is shown that $\mathrm{HH}^{*}\left(\Lambda_{s}\right) / \mathcal{N}_{\Lambda_{s}}$ is finitely generated as an algebra for $s \geq 3$ (see Theorem 4.1).

Throughout this paper, for all arrows $a$ of $\Gamma_{s}$, we denote the origin of $a$ by $o(a)$ and the terminus of $a$ by $t(a)$. Also, we denote the enveloping algebra $\Lambda_{s}^{\mathrm{op}} \otimes_{K} \Lambda_{s}$ of $\Lambda_{s}$ by $\Lambda_{s}^{e}$. Note that there is a natural one to one correspondence between the family of $\Lambda_{s}-\Lambda_{s}$-bimodules and that of right $\Lambda_{s}^{e}$-modules. For the general notation, we refer to [ASS].
2. $\operatorname{Sets} \mathcal{G}^{n}$ FOR $\Lambda_{s} / \operatorname{rad} \Lambda_{s}$, and A Projective bimodule resolution ( $Q^{\bullet}, \partial^{\bullet}$ ) of $\Lambda_{s}$

Let $A=K Q / I$ be a finite-dimensional $K$-algebra, where $Q$ is a finite quiver and $I$ is an admissible ideal of $K Q$. We start by recalling the construction of sets $\mathcal{G}^{n}(n \geq 0)$ in [GSZ]. Let $\mathcal{G}^{0}$ be the set of vertices of $Q, \mathcal{G}^{1}$ the set of arrows of $Q$, and $\mathcal{G}^{2}$ a minimal set of uniform generators of $I$. In GSZ], Green, Solberg and Zacharia proved that, for each $n \geq 3$, we have a set $\mathcal{G}^{n}$ consisting of uniform elements in $K Q$ such that there is a minimal projective resolution $\left(P^{\bullet}, d^{\bullet}\right)$ of the right $A$-module $A / \operatorname{rad} A$ satisfying the following conditions (a), (b) and (c):
(a) For each $n \geq 0, P^{n}=\bigoplus_{g \in \mathcal{G}^{n}} t(x) A$.
(b) For each $g \in \mathcal{G}^{n}$, we have unique elements $r_{h}, s_{k} \in K Q$, where $h \in \mathcal{G}^{n-1}$ and $k \in \mathcal{G}^{n-2}$, satisfying $g=\sum_{h \in \mathcal{G}^{n-1}} h r_{h}=\sum_{k \in \mathcal{G}^{n-2}} k s_{k}$.
(c) For each $n \geq 1, d^{n}: P^{n} \rightarrow P^{n-1}$ is determined by $d^{n}(t(g) \lambda)=\sum_{h \in \mathcal{G}^{n-1}} r_{h} t(g) \lambda$ for $g \in \mathcal{G}^{n}$ and $\lambda \in A$, where $r_{h}$ denotes the element in (b).
In [GHMS], a minimal projective bimodule resolution of any Koszul algebra is given by using the above sets $\mathcal{G}^{n}(n \geq 0)$. In this section, we construct sets $\mathcal{G}^{n}(n \geq 0)$ for the right
$\Lambda_{s}$-modules $\Lambda_{s} / \operatorname{rad} \Lambda_{s}$, and then we give a minimal projective bimodule resolution $\left(Q^{\bullet}, \partial^{\bullet}\right)$ of $\Lambda_{s}$ by following [GHMS].
2.1. Sets $\mathcal{G}^{n}$ for $\Lambda_{s} / \operatorname{rad} \Lambda_{s}$. In order to construct sets $\mathcal{G}^{n}$ for $\Lambda_{s} / \operatorname{rad} \Lambda_{s}$, we define the following elements $g_{i, j}^{n}$ in $K \Gamma_{s}$ :

Definition 2.1. For $0 \leq i \leq s-1$, we put $g_{i, 0}^{0}:=e_{i}$, and, for $n \geq 1$, we inductively define the elements $g_{i, j}^{n} \in K \Gamma_{s}$ as follows:

- $g_{i, 0}^{n}:=g_{i, 0}^{n-1} y$ for $0 \leq i \leq s-1$,
- $g_{i, j}^{n}:=g_{i, j-1}^{n-1} x+g_{i, j}^{n-1} y$ for $0 \leq i \leq s-1$ and $1 \leq j \leq n-1$,
- $g_{i, n}^{n}:=g_{i, n-1}^{n-1} x$ for $0 \leq i \leq s-1$,

Throughout this paper, we regard the subscript $i$ of $g_{i, \bullet}^{\bullet}$ as modulo $s$. Then we see that these elements $g_{i, j}^{n}$ are uniform, and that $o\left(g_{i, j}^{n}\right)=e_{i}$ and $t\left(g_{i, j}^{n}\right)=e_{i+n}$ hold for all $n \geq 0$, $i \in \mathbb{Z}$, and $0 \leq j \leq n$.

We put the set

$$
\mathcal{G}^{n}=\left\{g_{i, j}^{n} \mid 0 \leq i \leq s-1,0 \leq j \leq n\right\}
$$

for all $n \geq 0$. It is easy to check that these sets satisfy the conditions (a), (b) and (c) in the beginning of this section.

Now, we have the following proposition.
Proposition 2.2. For $s \geq 1$, the algebra $\Lambda_{s}$ is a Koszul self-injective special biserial algebra.
Proof. By calculating directly the presentations of all indecomposable projective and injective $\Lambda_{s}$-modules, we easily see that $\Lambda_{s}$ is self-injective. Moreover, let $d^{0}: P^{0}:=\bigoplus_{x \in \mathcal{G}^{0}} t(x) \Lambda_{s} \rightarrow$ $\Lambda_{s} / \operatorname{rad} \Lambda_{s}$ be the natural map. Then the projective resolution $\left(P^{\bullet}, d^{\bullet}\right)$ given by (a), (b) and (c) is a linear resolution of $\Lambda_{s} / \operatorname{rad} \Lambda_{s}$. Therefore, $\Lambda_{s}$ is a Koszul algebra.

In order to obtain a minimal projective resolution $\left(Q^{\bullet}, \partial^{\bullet}\right)$ of $\Lambda_{s}$ as a $\Lambda_{s}^{e}$-module, we need the following lemma.

Lemma 2.3. For $n \geq 1$, the following equations hold:

- $g_{i, 0}^{n}=y g_{i+1,0}^{n-1} \quad$ for $0 \leq i \leq s-1$,
- $g_{i, j}^{n}=y g_{i+1, j}^{n-1}+x g_{i+1, j-1}^{n-1} \quad$ for $0 \leq i \leq s-1$ and $1 \leq j \leq n-1$,
- $g_{i, n}^{n}=x g_{i+1, n-1}^{n-1} \quad$ for $0 \leq i \leq s-1$.

The proof is easily done by induction on $n$.
2.2. A minimal projective resolution of $\Lambda_{s}$ as a right $\Lambda_{s}^{e}$-module. In this subsection, by using the sets $\mathcal{G}^{n}(n \geq 0)$ of Section 2.1, we give a minimal projective resolution $\left(Q^{\bullet}, \partial^{\bullet}\right)$ of $\Lambda_{s}$ as a right $\Lambda_{s}^{e}$-module.

First, we start with the definition of the projective $\Lambda_{s}^{e}$-module $Q^{n}$ for $n \geq 0$. For simplicity, we denote $\otimes_{K}$ by $\otimes$ and, for $n \geq 0$, set the elements $b_{i, j}^{n}:=o\left(g_{i, j}^{n}\right) \otimes t\left(g_{i, j}^{n}\right)$ in $\Lambda_{s} o\left(g_{i, j}^{n}\right) \otimes$ $t\left(g_{i, j}^{n}\right) \Lambda_{s}$ for $0 \leq i \leq s-1$ and $0 \leq j \leq n$.
Definition 2.4. We define the projective $\Lambda_{s}^{e}$-module $Q^{n}$ by

$$
Q^{n}:=\bigoplus_{g \in \mathcal{G}^{n}} \Lambda_{s} o(g) \otimes t(g) \Lambda_{s}=\bigoplus_{i=0}^{s-1} \bigoplus_{j=0}^{n} \Lambda_{s} b_{i, j}^{n} \Lambda_{s} \quad \text { for } n \geq 0
$$

Next, we define the map $\partial^{n}: Q^{n} \rightarrow Q^{n-1}$ as follows:

Definition 2.5. We define $\partial^{0}: Q^{0} \rightarrow \Lambda_{s}$ to be the multiplication map, and, for $n \geq 1$, $\partial^{n}: Q^{n} \rightarrow Q^{n-1}$ to be the $\Lambda_{s}^{e}$-homomorphism determined by

- $b_{i, 0}^{n} \longmapsto b_{i, 0}^{n-1} y+(-1)^{n} y b_{i+1,0}^{n-1} \quad$ for $0 \leq i \leq s-1$,
- $b_{i, j}^{n} \longmapsto\left(b_{i, j-1}^{n-1} x+b_{i, j}^{n-1} y\right)+(-1)^{n}\left(y b_{i+1, j}^{n-1}+x b_{i+1, j-1}^{n-1}\right) \quad$ for $0 \leq i \leq s-1$ and $1 \leq j \leq n-1$,
- $b_{i, n}^{n} \longmapsto b_{i, n-1}^{n-1} x+(-1)^{n} x b_{i+1, n-1}^{n-1} \quad$ for $\quad 0 \leq i \leq s-1$,
where the subscript $i+1$ of $b_{i+1, \bullet}^{\bullet}$ is regarded as modulo $s$.
By direct computations, we see that the composite $\partial^{n} \partial^{n+1}$ is zero for all $n \geq 0$. Therefore, $\left(Q^{\bullet}, \partial^{\bullet}\right)$ is a complex of $\Lambda_{s}^{e}$-modules.

Now, since $\Lambda_{s}$ is a Koszul algebra by Proposition 2.2, the following theorem is immediate from [GHMS].

Theorem 2.6. For $s \geq 1$, $\left(Q^{\bullet}, \partial^{\bullet}\right)$ is a minimal projective $\Lambda_{s}^{e}$-resolution of $\Lambda_{s}$.

## 3. The Hochschild cohomology groups $\operatorname{HH}^{n}\left(\Lambda_{s}\right)$

In this section, we calculate the Hochschild cohomology group $\operatorname{HH}^{n}\left(\Lambda_{s}\right)$ for $n \geq 0$. By applying the functor $\operatorname{Hom}_{\Lambda_{s}^{e}}\left(-, \Lambda_{s}\right)$ to the resolution $\left(Q^{\bullet}, \partial^{\bullet}\right)$, we have the complex

$$
0 \longrightarrow \widehat{Q}^{0} \xrightarrow{\widehat{\partial}^{1}} \widehat{Q}^{1} \xrightarrow{\widehat{\partial}^{2}} \widehat{Q}^{2} \xrightarrow{\widehat{\partial}^{3}} \cdots \xrightarrow{\widehat{\partial}^{n-1}} \widehat{Q}^{n-1} \xrightarrow{\widehat{\partial}^{n}} \widehat{Q}^{n} \xrightarrow{\widehat{\partial}^{n+1}} \widehat{Q}^{n+1} \xrightarrow{\widehat{\partial}^{n+2}} \cdots,
$$

where $\widehat{Q}^{n}:=\operatorname{Hom}_{\Lambda_{s}^{e}}\left(Q^{n}, \Lambda_{s}\right)$ and $\widehat{\partial}^{n}:=\operatorname{Hom}_{\Lambda_{s}^{e}}\left(\partial^{n}, \Lambda_{s}\right)$. We recall that, for $n \geq 0$, the $n$-th Hochschild cohomology group $\operatorname{HH}^{n}\left(\Lambda_{s}\right)$ is defined to be the $K$-space $\operatorname{HH}^{n}\left(\Lambda_{s}\right):=$ $\operatorname{Ext}_{\Lambda_{s}^{e}}^{n}\left(\Lambda_{s}, \Lambda_{s}\right)=\operatorname{Ker} \widehat{\partial}^{n+1} / \operatorname{Im} \widehat{\partial^{n}}$.
3.1. A basis of $\widehat{Q}^{n}$. We start with the following easy lemma.

Lemma 3.1. For integers $n \geq 0,0 \leq i \leq s-1$ and $0 \leq j \leq n$, the $K$-space o $\left(g_{i, j}^{n}\right) \Lambda_{s} t\left(g_{i, j}^{n}\right)=$ $e_{i} \Lambda_{s} e_{i+n}$ has the following basis:

$$
\begin{cases}1, x, y, x y & \text { if } s=1, \\ e_{i}, e_{i} x y & \text { if } s=2 \text { and } n \equiv 0 \quad(\bmod 2), \\ e_{i} x, e_{i} y & \text { if } s=2 \text { and } n \equiv 1 \quad(\bmod 2), \\ e_{i} & \text { if } s \geq 3 \text { and } n \equiv 0 \quad(\bmod s), \\ e_{i} x, e_{i} y & \text { if } s \geq 3 \text { and } n \equiv 1 \quad(\bmod s), \\ e_{i} x y & \text { if } s \geq 3 \text { and } n \equiv 2 \quad(\bmod s) .\end{cases}
$$

Also, if $s \geq 4$ and $n \not \equiv 0,1,2(\bmod s)$, then $o\left(g_{i, j}^{n}\right) \Lambda_{s} t\left(g_{i, j}^{n}\right)=0$.
Let $n \geq 0$ be an integer. For $0 \leq i \leq s-1$ and $0 \leq j \leq n$, we define right $\Lambda_{s}^{e}$-module homomorphisms $\alpha_{i, j}^{n}, \beta_{i, j}^{n}, \gamma_{i, j}^{n}, \delta_{i, j}^{n}$ by the following equations: For $0 \leq k \leq s-1$ and $0 \leq l \leq n$,
(i) If $s=1$, we define $\alpha_{0, j}^{n}, \beta_{0, j}^{n}, \gamma_{0, j}^{n}, \delta_{0, j}^{n}: Q^{n} \rightarrow \Lambda_{1}$ by

$$
\begin{aligned}
& \alpha_{0, j}^{n}\left(b_{0, l}^{n}\right)= \begin{cases}e_{0} & \text { if } l=j, \\
0 & \text { otherwise },\end{cases}
\end{aligned} \beta_{0, j}^{n}\left(b_{0, l}^{n}\right)=\left\{\begin{array}{ll}
e_{0} x & \text { if } l=j, \\
0 & \text { otherwise },
\end{array}, ~ \begin{array}{ll}
\gamma_{0, j}^{n} & \text { if } l=j, \\
0 & \text { otherwise, }
\end{array}, \delta_{0, l}^{n}\left(b_{0, l}^{n}\right)=\left\{\begin{array}{ll}
e_{0} x y & \text { if } l=j, \\
0 & \text { otherwise }
\end{array} .\right.\right.
$$

(ii) If $s=2$, then

- If $n \equiv 0(\bmod 2)$, we define $\alpha_{i, j}^{n}, \delta_{i, j}^{n}: Q^{n} \rightarrow \Lambda_{2}$ by

$$
\alpha_{i, j}^{n}\left(b_{k, l}^{n}\right)= \begin{cases}e_{i} & \text { if }(k, l)=(i, j), \quad \delta_{i, j}^{n}\left(b_{k, l}^{n}\right)= \begin{cases}e_{i} x y & \text { if }(k, l)=(i, j) \\ 0 & \text { otherwise },\end{cases} \\ 0 & \text { otherwise }\end{cases}
$$

- If $n \equiv 1(\bmod 2)$, we define $\beta_{i, j}^{n}, \gamma_{i, j}^{n}: Q^{n} \rightarrow \Lambda_{2}$ by

$$
\beta_{i, j}^{n}\left(b_{k, l}^{n}\right)=\left\{\begin{array}{ll}
e_{i} x & \text { if }(k, l)=(i, j), \\
0 & \text { otherwise },
\end{array} \quad \gamma_{i, j}^{n}\left(b_{k, l}^{n}\right)= \begin{cases}e_{i} y & \text { if }(k, l)=(i, j) \\
0 & \text { otherwise }\end{cases}\right.
$$

(iii) If $s \geq 3$, then

- If $n \equiv 0(\bmod s)$, we define $\alpha_{i, j}^{n}: Q^{n} \rightarrow \Lambda_{s}$ by

$$
\alpha_{i, j}^{n}\left(b_{k, l}^{n}\right)= \begin{cases}e_{i} & \text { if }(k, l)=(i, j) \\ 0 & \text { otherwise }\end{cases}
$$

- If $n \equiv 1(\bmod s)$, we define $\beta_{i, j}^{n}, \gamma_{i, j}^{n}: Q^{n} \rightarrow \Lambda_{s}$ by

$$
\beta_{i, j}^{n}\left(b_{k, l}^{n}\right)=\left\{\begin{array}{ll}
e_{i} x & \text { if }(k, l)=(i, j), \\
0 & \text { otherwise },
\end{array} \quad \gamma_{i, j}^{n}\left(b_{k, l}^{n}\right)= \begin{cases}e_{i} y & \text { if }(k, l)=(i, j) \\
0 & \text { otherwise }\end{cases}\right.
$$

- If $n \equiv 2(\bmod s)$, we define $\delta_{i, j}^{n}: Q^{n} \rightarrow \Lambda_{s}$ by

$$
\delta_{i, j}^{n}\left(b_{k, l}^{n}\right)= \begin{cases}e_{i} x y & \text { if }(k, l)=(i, j) \\ 0 & \text { otherwise }\end{cases}
$$

Throughout this paper, we regard the subscripts $i$ of $\alpha_{i, \bullet}^{\bullet}, \beta_{i, \bullet}^{\bullet}, \gamma_{i, \bullet}^{\bullet}$ and $\delta_{i, \bullet}^{\bullet}$ as modulo $s$.
For $n \geq 0$, we have an isomorphism of $K$-spaces $F_{n}: \bigoplus_{g \in \mathcal{G}^{n}} o(g) \Lambda_{s} t(g) \xrightarrow{\sim} \operatorname{Hom}_{\Lambda_{s}^{e}}\left(Q^{n}, \Lambda_{s}\right)$ given by $F_{n}\left(\sum_{g \in \mathcal{G}^{n}} z_{g}\right)\left(b_{i, j}^{n}\right)=z_{g_{i, j}^{n}}$, where $z_{g} \in o(g) \Lambda_{s} t(g)$ for $g \in \mathcal{G}^{n}, 0 \leq i \leq s-1$ and $0 \leq j \leq n$ (cf. [F]).

Therefore, by the above isomorphism and Lemma 3.1, we have the following lemma:
Lemma 3.2. Let $n \geq 0$ be an integer. Then the $K$-space $\widehat{Q}^{n}=\operatorname{Hom}_{\Lambda_{s}^{e}}\left(Q^{n}, \Lambda_{s}\right)$ has the following basis:

$$
\begin{cases}\alpha_{0, l}^{n}, \beta_{0, l}^{n}, \gamma_{0, l}^{n}, \delta_{0, l}^{n}(0 \leq l \leq n) & \text { if } s=1, \\ \alpha_{k, l}^{n}, \delta_{k, l}^{n=0,1 ; 0 \leq l \leq n)} & \text { if } s=2 \text { and } n \equiv 0(\bmod 2), \\ \beta_{k, l}^{n}, \gamma_{k, l}^{n}(k=0,1 ; 0 \leq l \leq n) & \text { if } s=2 \text { and } n \equiv 1 \quad(\bmod 2), \\ \alpha_{k, l}^{n}(0 \leq k \leq s-1 ; 0 \leq l \leq n) & \text { if } s \geq 3 \text { and } n \equiv 0(\bmod s), \\ \beta_{k, l}^{n}, \gamma_{k, l}^{n}(0 \leq k \leq s-1 ; 0 \leq l \leq n) & \text { if } s \geq 3 \text { and } n \equiv 1 \quad(\bmod s), \\ \delta_{k, l}^{n}(0 \leq k \leq s-1 ; 0 \leq l \leq n) & \text { if } s \geq 3 \text { and } n \equiv 2(\bmod s) .\end{cases}
$$

Also, if $s \geq 4$ and $n \not \equiv 0,1,2(\bmod s)$, then $\widehat{Q}^{n}=0$.
3.2. Maps $\widehat{\partial}^{n+1}$. In the rest of this paper, we assume $s \geq 3$. By direct computations, we have the images of the basis elements in Lemma 3.2 under the map $\widehat{\partial}^{n+1}=\operatorname{Hom}_{\Lambda_{s}^{e}}\left(\partial^{n+1}, \Lambda_{s}\right)$ for $n \geq 0$ :

Lemma 3.3. For $0 \leq i \leq s-1$ and $0 \leq j \leq n$, we have the following equations:
(i) If $n \equiv 0(\bmod s)$, then

$$
\begin{aligned}
\widehat{\partial}^{n+1}\left(\alpha_{i, j}^{n}\right) & =\alpha_{i, j}^{n} \partial^{n+1} \\
& =\beta_{i, j+1}^{n+1}+\gamma_{i, j}^{n+1}+(-1)^{n+1}\left(\beta_{i-1, j+1}^{n+1}+\gamma_{i-1, j}^{n+1}\right) .
\end{aligned}
$$

(ii) If $n \equiv 1(\bmod s)$, then

$$
\left\{\begin{array}{l}
\widehat{\partial}^{n+1}\left(\beta_{i, j}^{n}\right)=\beta_{i, j}^{n} \partial^{n+1}=\delta_{i, j}^{n+1}+(-1)^{n} \delta_{i-1, j}^{n+1}, \\
\widehat{\partial}^{n+1}\left(\gamma_{i, j}^{n}\right)=\gamma_{i, j}^{n} \partial^{n+1}=-\delta_{i, j+1}^{n+1}+(-1)^{n+1} \delta_{i-1, j+1}^{n+1} .
\end{array}\right.
$$

(iii) If $n \equiv 2(\bmod s)$, then

$$
\widehat{\partial}^{n+1}\left(\delta_{i, j}^{n}\right)=\delta_{i, j}^{n} \partial^{n+1}=0 .
$$

Moreover, if $n \not \equiv 0,1,2(\bmod s)$, then we have $\widehat{\partial}^{n+1}=0$.
3.3. A basis of $\operatorname{Im} \widehat{\partial}^{n+1}$. Now, by Lemma 3.3, we have the following lemma.

Lemma 3.4. Let $n \geq 0$ be any integer. If we write $n=m s+r$ for integers $m$ and $0 \leq r \leq s-1$, then the following elements give a K-basis of the subspace $\operatorname{Im} \widehat{\partial}^{n+1}$ of $\widehat{Q}^{n+1}$ :
(a) $\beta_{i, j+1}^{m s+1}+\gamma_{i, j}^{m s+1}-\beta_{i-1, j+1}^{m s+1}-\gamma_{i-1, j}^{m s+1}(0 \leq i \leq s-1,0 \leq j \leq m s)$ is a $K$-basis of $\operatorname{Im} \widehat{\partial}^{m s+1}$ for $m$ odd, $s$ odd, and char $K \neq 2$.
(b) $\beta_{i, j+1}^{m s+1}+\gamma_{i, j}^{m s+1}-\beta_{i-1, j+1}^{m s+1}-\gamma_{i-1, j}^{m s+1}(0 \leq i \leq s-2,0 \leq j \leq m s)$ is a $K$-basis of $\operatorname{Im} \widehat{\partial}^{m s+1}$ for $m$ even, $s$ even, or char $K=2$.
(c) $\delta_{i, j}^{m s+2}+\delta_{i-1, j}^{m s+2}(0 \leq i \leq s-1,0 \leq j \leq m s+2)$ is a $K$-basis of $\operatorname{Im} \widehat{\partial}^{m s+2}$ for $m$ odd, $s$ odd, and char $K \neq 2$.
(d) $\delta_{i, j}^{m s+2}+\delta_{i-1, j}^{m s+2}(0 \leq i \leq s-2,0 \leq j \leq m s+2)$ is a $K$-basis of $\operatorname{Im} \widehat{\partial}^{m s+2}$ for $m$ even, $s$ even, or char $K=2$.
(e) $\operatorname{Im} \widehat{\partial}^{m s+r+1}=0$ for $r \neq 0,1$.

As an immediate consequence of the above lemma, we get the dimension of $\operatorname{Im} \widehat{\partial}^{n+1}$ for $n \geq 0$ :
Corollary 3.5. Let $n=m s+r$ for integers $m \geq$ and $0 \leq r \leq s-1$. Then the dimension of $\operatorname{Im} \widehat{\partial}^{n+1}$ is as follows:

$$
\begin{aligned}
& \operatorname{dim}_{K} \operatorname{Im} \widehat{\partial}^{m s+r+1} \\
& = \begin{cases}s(m s+1) & \text { if } s \text { odd, } m \text { odd, char } K \neq 2 \text { and } r=0, \\
(s-1)(m s+1) & \text { if } s \text { even and } r=0, \text { if } m \text { even and } r=0, \text { or } \\
\quad \text { if char } K=2 \text { and } r=0, \\
s(m s+3) & \text { if } s \text { odd, } m \text { odd, char } K \neq 2 \text { and } r=1, \\
(s-1)(m s+3) & \text { if } s \text { even and } r=1, \text { if } m \text { even and } r=1, \text { or } \\
\quad \text { if char } K=2 \text { and } r=1, \\
0 & \text { otherwise. }\end{cases}
\end{aligned}
$$

3.4. A basis of $\operatorname{Ker} \widehat{\partial}^{n+1}$. Now, by using Lemma 3.4, we have the following lemma. The proof follows from easy computations.

Lemma 3.6. Let $n=m s+r$ for integers $m \geq 0$ and $0 \leq r \leq s-1$. The following elements give a $K$-basis of the subspace $\operatorname{Ker} \widehat{\partial}^{n+1}$ of $\widehat{Q}^{n}$ :
(a) Ker $\widehat{\partial}^{m s+1}=0$ for $m$ odd, $s$ odd, and char $K \neq 2$.
(b) $\sum_{i=0}^{s-1} \alpha_{i, j}^{m s}(0 \leq j \leq m s)$ is a K-basis of Ker $\widehat{\partial}^{m s+1}$ for $m$ even, $s$ even, or char $K=2$.
(c) $\beta_{i, j+1}^{m s+1}+\gamma_{i, j}^{m s+1}(0 \leq i \leq s-1,0 \leq j \leq m s)$ is a $K$-basis of Ker $\widehat{\partial}^{m s+2}$ for $m$ odd, $s$ odd, and char $K \neq 2$.
(d) $\left.\sum_{i=0}^{s-1} \beta_{i, j}^{m s+1}(0 \leq j \leq m s+1), \beta_{i, j+1}^{m s+1}+\gamma_{i, j}^{m s+1} 0 \leq i \leq s-2,0 \leq j \leq m s\right), \sum_{i=0}^{s-1} \gamma_{i, j}^{m s+1}$ $(0 \leq j \leq m s+1)$ is a $K$-basis of Ker $\widehat{\partial}^{m s+2}$ for $m$ even, $s$ even, or char $K=2$.
(e) Ker $\widehat{\partial}^{m s+3}=\widehat{Q}^{m s+2}$.
(f) Ker $\widehat{\partial}^{m s+r+1}=0$ for $r \neq 0,1,2$.

As an immediate consequence, we get the dimension of $\operatorname{Ker} \widehat{\partial}^{n+1}$ for $n \geq 1$ :
Corollary 3.7. Let $n=m s+r$ for integers $m \geq 0$ and $0 \leq r \leq s-1$. Then the dimension of $\operatorname{Ker} \widehat{\partial}^{n+1}$ is as follows:

$$
\begin{aligned}
& \operatorname{dim}_{K} \operatorname{Ker} \widehat{\partial}^{m s+r+1} \\
& = \begin{cases}0 & \text { if } s \text { odd, } m \text { odd, char } K \neq 2 \text { and } r=0, \\
m s+1 & \text { if } s \text { even and } r=0 \text {, if } m \text { even and } r=0, \text { or } \\
\quad \text { if char } K=2 \text { and } r=0, \\
s(m s+1) & \text { if } s \text { odd, } m \text { odd, char } K \neq 2 \text { and } r=1, \\
(s+1)(m s+1)+2 & \text { if } s \text { even and } r=1, \text { if } m \text { even and } r=1, \text { or } \\
\text { if char } K=2 \text { and } r=1, \\
s(m s+3) & \text { if } r=2, \\
0 & \text { otherwise. }\end{cases}
\end{aligned}
$$

3.5. Calculation of the Hochschild cohomology groups $\operatorname{HH}^{n}\left(\Lambda_{s}\right)$. Now, by Lemmas 3.4 and 3.6, we have a $K$-basis of the Hochschild cohomology group $\mathrm{HH}^{n}\left(\Lambda_{s}\right)$ for $n \geq 0$.

Proposition 3.8. Let $n=m s+r$ for integers $m \geq 0$ and $0 \leq r \leq s-1$. Then the following elements give a $K$-basis of $\operatorname{HH}^{n}\left(\Lambda_{s}\right)$ of $\Lambda_{s}$ :
(a) $\operatorname{HH}^{m s}\left(\Lambda_{s}\right)=0$ for $s$ odd, $m$ odd, and char $K \neq 2$.
(b) $\sum_{i=0}^{s-1} \alpha_{i, j}^{m s}(0 \leq j \leq m s)$ is a $K$-basis of $\operatorname{HH}^{m s}\left(\Lambda_{s}\right)$ for $s$ even, $m$ even, or char $K=2$.
(c) $\operatorname{HH}^{m s+1}\left(\Lambda_{s}\right)=0$ for $s$ odd, $m$ odd, and char $K \neq 2$.
(d) $\sum_{i=0}^{s-1} \beta_{i, 0}^{m s+1}, \sum_{i=0}^{s-1} \gamma_{i, j}^{m s+1}(0 \leq j \leq m s+1), \beta_{s-1, j+1}^{m s+1}+\gamma_{s-1, j}^{m s+1}(0 \leq j \leq m s)$ is a K-basis of $\operatorname{HH}^{m s+1}\left(\Lambda_{s}\right)$ for $s$ even, $m$ even, or char $K=2$.
(e) $\operatorname{HH}^{m s+2}\left(\Lambda_{s}\right)=0$ for $s$ odd, $m$ odd and char $K \neq 2$.
(f) $\delta_{s-1, j}^{m s+2}(0 \leq j \leq m s+2)$ is a $K$-basis of $\mathrm{HH}^{m s+2}\left(\Lambda_{s}\right)$ for $s$ even, $m$ even, or char $K=2$,
(g) $\operatorname{HH}^{m s+r}\left(\Lambda_{s}\right)=0$ for $r \neq 0,1,2$.

By Proposition 3.8, we have the following theorem.
Theorem 3.9. Let $n=m s+r$ for integers $m \geq 0$ and $0 \leq r \leq s-1$. Then, for $s \geq 3$, we have the dimension formula for $\mathrm{HH}^{n}\left(\Lambda_{s}\right)$ :

$$
\begin{aligned}
& \operatorname{dim}_{K} \operatorname{HH}^{m s+r}\left(\Lambda_{s}\right) \\
& = \begin{cases}m s+1 & \text { if } s \text { even and } r=0 \text {, if } m \text { even and } r=0, \text { or } \\
\text { if char } K=2 \text { and } r=0, \\
2 m s+4 & \text { if } s \text { even and } r=1 \text {, if } m \text { even and } r=1 \text {, or } \\
m s+3 & \text { if char } K=2 \text { and } r=1, \\
\text { if } s \text { even and } r=2 \text {, if } m \text { even and } r=2, \text { or } \\
0 & \text { if char } K=2 \text { and } r=2,\end{cases} \\
& \text { otherwise. }
\end{aligned}
$$

## 4. The Hochschild cohomology ring modulo nilpotence $\operatorname{HH}^{*}\left(\Lambda_{s}\right) / \mathcal{N}_{s}$

Throughout this section, we keep the notation from Sections 2 and 3. Recall that the Hochschild cohomology ring of the algebra $\Lambda_{s}$ is defined to be the graded ring

$$
\operatorname{HH}^{*}\left(\Lambda_{s}\right):=\operatorname{Ext}_{\Lambda_{s}^{e}}^{*}\left(\Lambda_{s}, \Lambda_{s}\right)=\bigoplus_{t \geq 0} \operatorname{Ext}_{\Lambda_{s}^{e}}^{t}\left(\Lambda_{s}, \Lambda_{s}\right)
$$

with the Yoneda product. Denote $\mathcal{N}_{\Lambda_{s}}$ by the ideal generated by all homogeneous nilpotent elements in $\operatorname{HH}^{*}\left(\Lambda_{s}\right)$. Then the quotient algebra $\mathrm{HH}^{*}\left(\Lambda_{s}\right) / \mathcal{N}_{\Lambda_{s}}$ is called the Hochschild cohomology ring modulo nilpotence of $\Lambda_{s}$. Note that $\operatorname{HH}^{*}\left(\Lambda_{s}\right) / \mathcal{N}_{\Lambda_{s}}$ is a commutative graded algebra (see SnSo ). Our purpose of this section is to find generators and relations of $\operatorname{HH}^{*}\left(\Lambda_{s}\right) / \mathcal{N}_{\Lambda_{s}}$ for $s \geq 3$. For simplicity, we denote the graded subalgebras $\bigoplus_{t \geq 0} \operatorname{HH}^{s t}\left(\Lambda_{s}\right)$ of $\operatorname{HH}^{*}\left(\Lambda_{s}\right)$ by $\mathrm{HH}^{s *}\left(\Lambda_{s}\right)$ and $\bigoplus_{t \geq 0} \operatorname{HH}^{2 s t}\left(\Lambda_{s}\right)$ by $\mathrm{HH}^{2 s *}\left(\Lambda_{s}\right)$. Also, we denote the Yoneda product in $\operatorname{HH}^{*}\left(\Lambda_{s}\right)$ by $\times$. Note that, by Lemma $3.3, \operatorname{Im} \widehat{\partial}^{s t}=0$ and so $H^{s t}\left(\Lambda_{s}\right)=\operatorname{Ker} \widehat{\partial}^{s t+1}$ for $s \geq 3$ and $t \geq 0$.

Theorem 4.1. For $s \geq 3$, there are the following isomorphisms of commutative graded algebras:
(i) If $s$ is odd and char $K \neq 2$, then

$$
\begin{aligned}
& \operatorname{HH}^{*}\left(\Lambda_{s}\right) / \mathcal{N}_{\Lambda_{s}} \cong \operatorname{HH}^{2 s *}\left(\Lambda_{s}\right) \\
& \cong K\left[z_{0}, \ldots, z_{2 s}\right] /\left\langle z_{k} z_{l}-z_{q} z_{r} \mid k+l=q+r, 0 \leq k, l, q, r \leq 2 s\right\rangle,
\end{aligned}
$$

where $z_{0}, \ldots, z_{2 s}$ are in degree $2 s$.
(ii) If $s$ is even or char $K=2$, then

$$
\begin{aligned}
& \operatorname{HH}^{*}\left(\Lambda_{s}\right) / \mathcal{N}_{\Lambda_{s}} \cong \operatorname{HH}^{s *}\left(\Lambda_{s}\right) \\
& \cong K\left[z_{0}, \ldots, z_{s}\right] /\left\langle z_{k} z_{l}-z_{q} z_{r} \mid k+l=q+r, 0 \leq k, l, q, r \leq s\right\rangle,
\end{aligned}
$$

where $z_{0}, \ldots, z_{s}$ are in degree $s$.
Therefore, $\mathrm{HH}^{*}\left(\Lambda_{s}\right) / \mathcal{N}_{\Lambda_{s}}$ is finitely generated as an algebra.
Proof. We prove (i) only. The proof of (ii) is similar. First, we construct the second isomorphism in the statement. For $0 \leq u \leq 2 s$, we set $z_{u}:=\sum_{i=0}^{s-1} \alpha_{i, u}^{2 s}: Q^{2 s} \rightarrow \Lambda_{s}$, where $\alpha_{i, u}^{2 s}$ is the map defined in Section 3.1. For $0 \leq u \leq 2 s$ and $v \geq 0$, we define a $\Lambda_{s}^{e}$-module homomorphism $\theta_{u}^{v}: Q^{2 s+v} \rightarrow Q^{v}$ by

$$
b_{k, l}^{2 s+v} \longmapsto \begin{cases}b_{k, w}^{v} & \text { if } l=u+w \text { for some integer } w \text { with } 0 \leq w \leq v \\ 0 & \text { otherwise }\end{cases}
$$

for $0 \leq k \leq s-1$ and $0 \leq l \leq 2 s+v$. Then $z_{u}=\partial^{0} \theta_{u}^{0}$ and $\theta_{u}^{v} \partial^{2 s+v+1}=\partial^{v+1} \theta_{u}^{v+1}$ hold for $0 \leq u \leq 2 s$ and $v \geq 0$, and so $\theta_{u}^{v}$ is a lifting of $z_{u}(0 \leq u \leq 2 s)$. Also, it follows that, for any integers $0 \leq u_{1}, u_{2} \leq 2 s$, the composite $z_{u_{2}} \theta_{u_{1}}^{2 s}: Q^{4 s} \rightarrow \Lambda_{s}$ is given by

$$
b_{k, l}^{4 s} \longmapsto \begin{cases}e_{k} & \text { if } l=u_{1}+u_{2} \\ 0 & \text { otherwise }\end{cases}
$$

for $0 \leq k \leq s-1$ and $0 \leq l \leq 4 s$. Hence we have $z_{u_{2}} \theta_{u_{1}}^{2 s}=\sum_{i=0}^{s-1} \alpha_{i, u_{1}+u_{2}}^{4 s}$, and this equals the Yoneda product $z_{u_{1}} \times z_{u_{2}} \in \operatorname{HH}^{4 s}\left(\Lambda_{s}\right)$.

Now, let $t \geq 2$ be a positive integer, and let $u_{1}, \ldots, u_{t}$ be integers with $0 \leq u_{1}, \ldots, u_{t} \leq 2 s$. Then it is proved by induction on $t$ that the product $z_{u_{1}} \times \cdots \times z_{u_{t}}$ equals the map

$$
Q^{2 s t} \rightarrow \Lambda_{s} ; b_{k, l}^{2 s t} \longmapsto \begin{cases}e_{k} & \text { if } l=\sum_{p=1}^{t} u_{p} \\ 0 & \text { otherwise }\end{cases}
$$

for $0 \leq k \leq s-1$ and $0 \leq l \leq 2 s t$, which equals the map $\sum_{i=0}^{s-1} \alpha_{i, \sum_{p=1}^{t} u_{p}}^{2 s t}$. Therefore, by Proposition $3.8(\mathrm{~b})$, we see that $\operatorname{HH}^{2 s *}\left(\Lambda_{s}\right)$ is generated by $z_{0}, \ldots, z_{2 s} \in \operatorname{HH}^{2 s}\left(\Lambda_{s}\right)$.

Let $t \geq 2$ be an integer, and let $z_{u_{1}} \times \cdots \times z_{u_{t}}$ and $z_{u_{1}^{\prime}} \times \cdots \times z_{u_{t}^{\prime}}$ be any products in $\operatorname{HH}^{2 s t}\left(\Lambda_{s}\right)$ for $0 \leq u_{p}, u_{p}^{\prime} \leq 2 s(1 \leq p \leq t)$. Then, since $z_{u_{1}} \times \cdots \times z_{u_{t}}=\sum_{i=0}^{s-1} \alpha_{i, \sum_{p=1}^{t} u_{p}}^{2 s t}$ and $z_{u_{1}^{\prime}} \times \cdots \times z_{u_{t}^{\prime}}=\sum_{i=0}^{s-1} \alpha_{i, \sum_{p=1}^{t} u_{p}^{\prime}}^{2 s t}$, it follows that $z_{u_{1}} \times \cdots \times z_{u_{t}}=z_{u_{1}^{\prime}} \times \cdots \times z_{u_{t}^{\prime}}$ if and only if $\sum_{p=1}^{t} u_{p}=\sum_{p=1}^{t} u_{p}^{\prime}$. This means that the relations $z_{k} z_{l}-z_{q} z_{r}=0$ for every $0 \leq k, l, q, r \leq 2 s$ with $k+l=q+r$ are enough to give the second isomorphism.

Now, using the second isomorphism, we easily see that all elements in $\operatorname{HH}^{2 s *}\left(\Lambda_{s}\right)$ are not nilpotent. Furthermore, for $t \geq 0$ and $r=1, \ldots, s-1$, the image of all basis elements of $\mathrm{HH}^{2 s t+r}\left(\Lambda_{s}\right)$ described in Proposition 3.8 are in $\mathrm{rad} \Lambda_{s}$, so that by [SnSo, Proposition 4.4], $\mathrm{HH}^{2 s t+r}\left(\Lambda_{s}\right)$ is contained in $\mathcal{N}_{\Lambda_{s}}$. Hence we have the first isomorphism.

We conclude this paper with the following remarks.
Remark 4.2. Let $E\left(\Lambda_{s}\right)=\bigoplus_{i \geq 0} \operatorname{Ext}_{\Lambda_{s}}^{i}\left(\Lambda_{s} / \operatorname{rad} \Lambda_{s}, \Lambda_{s} / \operatorname{rad} \Lambda_{s}\right)$ be the Ext algebra of $\Lambda_{s}$, and let $Z_{g r}\left(E\left(\Lambda_{s}\right)\right)$ be the graded center of $E\left(\Lambda_{s}\right)$ (see [BGSS], for example). Denote by $\mathcal{N}_{\Lambda_{s}}^{\prime}$ the ideal of $Z_{g r}\left(E\left(\Lambda_{s}\right)\right)$ generated by all homogeneous nilpotent elements. Since $\Lambda_{s}$ is a Koszul algebra by Proposition 2.2, it follows by [BGSS] that $Z_{g r}\left(E\left(\Lambda_{s}\right)\right) / \mathcal{N}_{\Lambda_{s}}^{\prime} \cong \mathrm{HH}^{*}\left(\Lambda_{s}\right) / \mathcal{N}_{\Lambda_{s}}$ as graded rings. Therefore, we have the same presentation of $Z_{g r}\left(E\left(\Lambda_{s}\right)\right) / \mathcal{N}_{\Lambda_{s}}^{\prime}$ by generators and relations as that in Theorem 4.1.

Remark 4.3. In [F], Furuya has discussed the Hochschild cohomology of some self-injective special biserial algebra $A_{T}$ for $T \geq 0$, and in particular he has given a presentation of $\mathrm{HH}^{*}\left(A_{T}\right) / \mathcal{N}_{A_{T}}$ by generators and relations in the case $T=0$. We easily see that the algebra $\Lambda_{4}$ is isomorphic to $A_{0}$. By setting $s=4$ in Theorem 4.1, our presentation actually coincides with that in [ $\mathbf{F}$, Theorem 4.1].

## Acknowledgments

The author is grateful to Professor Katsunori Sanada and Professor Takahiko Furuya for many helpful comments and suggestions on improving the clarity of the paper.
