The elliptic modular function, \( j \), invariant under \( \text{PSL}(2, \mathbb{Z}) \), has Fourier expansion
\[
j(q) = \frac{E_4(q)^3}{\Delta(q)} = \sum_{m=-1}^{\infty} c_m q^m = \frac{1}{q} + 744 + 196884q + 21493760q^2 + \ldots ,
\]
as \( z \to i\infty \), where \( q = e^{2\pi i z} \) is the nome for \( z \). \( E_4(z) = 1 + 240 \sum_{n=1}^{\infty} \sigma_3(n)q^n \) is the theta series for the \( E_8 \) lattice, \( \sigma_3(n) = \sum_{d|n} d^3 \) and
\[
\Delta(q) = q \prod_{n=1}^{\infty} (1 - q^n)^{24} = \sum_{m=1}^{\infty} \tau_m q^m = q - 24q^2 + 252q^3 - 1472q^4 + 4830q^5 + \ldots
\]
is the modular discriminant \( \mathcal{S} \). There are two new congruences

**OBSERVATIONS:**
1. \( \text{[JM]} \left( \sum_{m=1}^{24} c_m^2 \right) \mod 70 \equiv 42 \) ;
2. \( \text{[YHH]} \left( \sum_{m=1}^{24} \tau_m^2 \right) \mod 70 \equiv 42 \)

The vector \( \omega = (0, 1, 2, \ldots, 24 : 70) \) lives in the Lorentzian lattice \( II_{25,1} \) in 26 dimensions as an isotropic Weyl vector \( [C] \), allowing us to construct the Leech lattice as \( \omega^\perp/\omega \). Watson’s \( [L, W] \) unique non-trivial solution to \( \sum_{i=1}^{n} i^2 = m^2 \) is \( (n, m) = (24, 70) \).

Indeed, the second author’s observation 35 years ago that
\[
196884 = 196883 + 1
\]
sparked the field of “Monstrous Moonshine” \( [B, CN] \), underlying so much mathematics and physics, relating, inter alia, modular functions, finite groups, lattices, conformal field theory, string theory and gravity (see \( [G] \) for a review of some of the vast subjects encompassed) in which the \( j \)-invariant and the Leech lattice are central. As we ponder the meaning of life, we should be aware of the prescient remarks of the author \( [A] \), Douglas Adams:

“The Answer to the Great Question . . . is . . . Forty-two,” said Deep Thought, with infinite majesty and calm.
