Received April 16, 2014, in final form May 14, 2014

Explicit expression for the  $N$ -point free energy distribution function in one dimensional directed polymers in a random potential is derived in terms of the Bethe ansatz replica technique. The obtained result is equivalent to the one derived earlier by Prolhac and Spohn [J. Stat. Mech., 2011, P03020].

## **1. Introduction**

In this paper we consider the model of one-dimensional directed polymers in a quenched random potential. This model is defined in terms of an elastic string  $\phi(\tau)$  directed along the  $\tau$ -axis within an interval  $[0, t]$  which passes through a random medium described by a random potential  $V(\phi, \tau)$ . The energy of a given polymer's trajectory  $\phi(\tau)$  is

$$H[\phi(\tau), V] = \int_0^t d\tau \left\{ \frac{1}{2} [\partial_\tau \phi(\tau)]^2 + V[\phi(\tau), \tau] \right\}, \quad (1)$$

where the disorder potential  $V[\phi, \tau]$  is described by the Gaussian distribution with a zero mean  $\overline{V(\phi, \tau)} = 0$  and the  $\delta$ -correlations:  $\overline{V(\phi, \tau) V(\phi', \tau')} = u \delta(\tau - \tau') \delta(\phi - \phi')$ . The parameter  $u$  describes the strength of the disorder.

The system of this type as well as the equivalent problem of the KPZ-equation [1] describing the growth of an interface with time in the presence of noise have been the subject of intense investigations for about the last three decades (see e.g. [2–13]). Such a system exhibits numerous non-trivial features due to the interplay between elasticity and disorder. In particular, in the limit  $t \rightarrow \infty$ , the polymer mean squared displacement exhibits a universal scaling form  $\langle \phi^2 \rangle \propto t^{4/3}$  (where  $\langle \dots \rangle$  and  $\overline{\dots}$  denote the thermal and the disorder averages) while the typical value of the free energy fluctuations scales as  $t^{1/3}$ . Note that in the corresponding pure system (with  $V(\phi, \tau) \equiv 0$ )  $\langle \phi^2 \rangle \propto t$  while the free energy is proportional to  $\ln(t)$ .

A few years ago, an exact solution for the free energy probability distribution function (PDF) has been found [14–27]. It was shown that depending on the boundary conditions, this PDF is given by the Tracy-Widom (TW) distribution [28] either of the Gaussian Unitary Ensemble (GUE) or of the Gaussian Orthogonal Ensemble (GOE) or of the Gaussian Symplectic Ensemble (GSE). Besides, recently the two-point free energy distribution function which describes the joint statistics of the free energies of the directed polymers coming to two different endpoints has been derived in [29–31].

For fixed boundary conditions,  $\phi(0) = 0; \phi(t) = x$ , the partition function of the model (1) is

$$Z_t(x) = \int_{\phi(0)=0}^{\phi(t)=x} \mathcal{D}\phi(\tau) e^{-\beta H[\phi]} = \exp[-\beta F_t(x)], \quad (2)$$

where  $\beta$  is the inverse temperature and  $F_t(x)$  is the free energy. In the limit  $t \rightarrow \infty$ , the free energy scales as

$$\beta F_t(x) = \beta f_0 t + \beta x^2/2t + \lambda_t f(x), \quad (3)$$

where  $f_0$  is the selfaveraging free energy density and

$$\lambda_t = \frac{1}{2} (\beta^5 u^2 t)^{1/3} \propto t^{1/3}. \quad (4)$$

It is the statistics of rescaled free energy fluctuations  $f(x)$  which in the limit  $t \rightarrow \infty$  is expected to be described by a non-trivial universal distribution  $W(f)$ . In fact, the first two trivial terms of this free energy can be easily eliminated by simple redefinition of the partition function:

$$Z_t(x) \rightarrow \exp\{-\beta f_0 t - \beta x^2/2t\} \tilde{Z}_t(x) \quad (5)$$

so that

$$\tilde{Z}_t(x) = \exp\{-\lambda_t f(x)\}. \quad (6)$$

The aim of the present work is to study the  $N$ -point free energy probability distribution function

$$W(f_1, \dots, f_N; x_1, \dots, x_N) \equiv W(\mathbf{f}; \mathbf{x}) = \lim_{t \rightarrow \infty} \text{Prob}[f(x_1) > f_1, \dots, f(x_N) > f_N], \quad (7)$$

which describes the joint statistics of the free energies of  $N$  directed polymers coming to  $N$  different endpoints. Some time ago the result for this function has been derived in terms of the Bethe ansatz replica technique under a particular decoupling assumption [32]. Here, I am going to recompute this function using somewhat different computational tricks which do not require any supplementary assumptions and which permit to represent the final result in somewhat more explicit form.

## 2. $N$ -point distribution function

The probability distribution function, equation (7) can be defined as follows:

$$W(\mathbf{f}; \mathbf{x}) = \lim_{\lambda \rightarrow \infty} \sum_{L_1, \dots, L_N=0}^{\infty} \prod_{k=1}^N \left[ \frac{(-1)^{L_k}}{L_k!} \exp(\lambda L_k f_k) \right] \overline{\left( \prod_{k=1}^N \tilde{Z}_t(x_k) \right)}, \quad (8)$$

where  $\overline{(\dots)}$  denotes the average over random potentials. Indeed, substituting here equation (6) we get

$$W(\mathbf{f}; \mathbf{x}) = \lim_{\lambda \rightarrow \infty} \overline{\left( \prod_{k=1}^N \exp\{-\lambda_t(f_k - f(x_k))\} \right)} = \overline{\left[ \prod_{k=1}^N \theta(f(x_k) - f_k) \right]} \quad (9)$$

which coincides with the definition (7).

Performing the standard averaging over random potentials in equation (8) one obtains (for details see e.g. [20])

$$W(\mathbf{f}; \mathbf{x}) = \lim_{\lambda \rightarrow \infty} \sum_{L_1, \dots, L_N=0}^{\infty} \prod_{k=1}^N \left[ \frac{(-1)^{L_k}}{L_k!} \exp(\lambda L_k f_k) \right] \Psi(\underbrace{x_1, \dots, x_1}_{L_1}, \underbrace{x_2, \dots, x_2}_{L_2}, \dots, \underbrace{x_N, \dots, x_N}_{L_N}; t), \quad (10)$$

where the time dependent  $n$ -point wave function  $\Psi(x_1, \dots, x_n; t)$  ( $n = \sum_{k=1}^N L_k$ ) is the solution of the imaginary time Schrödinger equation

$$\beta \partial_t \Psi(\mathbf{x}; t) = \left[ \frac{1}{2} \sum_{a=1}^n \partial_{x_a}^2 + \frac{1}{2} \kappa \sum_{a \neq b}^n \delta(x_a - x_b) \right] \Psi(\mathbf{x}; t) \quad (11)$$

with  $\kappa = \beta^3 u$  and the initial condition

$$\Psi(\mathbf{x}; t=0) = \prod_{a=1}^n \delta(x_a). \quad (12)$$

A generic eigenstate of such a system is characterized by  $n$  momenta  $\{Q_a\}$  ( $a = 1, \dots, n$ ) which split into  $M$  ( $1 \leq M \leq n$ ) clusters described by continuous real momenta  $q_\alpha$  ( $\alpha = 1, \dots, M$ ) and having  $n_\alpha$  discrete imaginary parts

$$Q_a \equiv q_r^\alpha = q_\alpha - \frac{i\kappa}{2}(n_\alpha + 1 - 2r), \quad (r = 1, \dots, n_\alpha), \quad (13)$$

with the global constraint

$$\sum_{\alpha=1}^M n_\alpha = n. \quad (14)$$

The time dependent solution  $\Psi(\mathbf{x}, t)$  of the Schrödinger equation (11) with the initial conditions, equation (12), can be represented in the form of a linear combination of eigenfunctions  $\Psi_{\mathbf{Q}}^{(M)}(\mathbf{x})$ :

$$\Psi(\mathbf{x}; t) = \sum_{M=1}^N \frac{1}{M!} \prod_{\alpha=1}^M \left[ \int_{-\infty}^{+\infty} \frac{dq_\alpha}{2\pi} \sum_{n_\alpha=1}^{\infty} \right] \delta \left( \sum_{\alpha=1}^M n_\alpha, n \right) \frac{\kappa^N |C_M(\mathbf{q}, \mathbf{n})|^2}{N! \prod_{\alpha=1}^M (\kappa n_\alpha)} \Psi_{\mathbf{Q}}^{(M)}(\mathbf{x}) \Psi_{\mathbf{Q}}^{(M)*}(\mathbf{0}) \exp\{-E_M(\mathbf{q}, \mathbf{n})t\}. \quad (15)$$

Here,  $\delta(k, m)$  is the Kronecker symbol, the normalization factor

$$|C_M(\mathbf{q}, \mathbf{n})|^2 = \prod_{\alpha < \beta}^M \frac{|q_\alpha - q_\beta - \frac{i\kappa}{2}(n_\alpha - n_\beta)|^2}{|q_\alpha - q_\beta - \frac{i\kappa}{2}(n_\alpha + n_\beta)|^2} \quad (16)$$

and the eigenvalues:

$$E_M(\mathbf{q}, \mathbf{n}) = \sum_{\alpha=1}^M \left( \frac{1}{2\beta} n_\alpha q_\alpha^2 - \frac{\kappa^2}{24\beta} n_\alpha^3 \right). \quad (17)$$

For a given set of integers  $\{M; n_1, \dots, n_M\}$ , the eigenfunctions  $\Psi_{\mathbf{Q}}^{(M)}(\mathbf{x})$  can be represented as follows (for details see [33–37]):

$$\Psi_{\mathbf{Q}}^{(M)}(\mathbf{x}) = \sum_{\mathcal{P}} \prod_{a < b}^n \left[ 1 + i\kappa \frac{\text{sgn}(x_a - x_b)}{Q_{\mathcal{P}_a} - Q_{\mathcal{P}_b}} \right] \exp\left(i \sum_{a=1}^n Q_{\mathcal{P}_a} x_a\right), \quad (18)$$

where the summation goes over  $n!$  permutations  $\mathcal{P}$  of  $n$  momenta  $Q_a$ , equation (13), over  $n$  particles  $x_a$ .

Substituting equations (15)–(18) into equation (10) we get

$$\begin{aligned} W(\mathbf{f}; \mathbf{x}) = & 1 + \lim_{\lambda \rightarrow \infty} \left\{ \sum_{L_1 + \dots + L_N \geq 1}^{\infty} \prod_{k=1}^N \left[ \frac{(-1)^{L_k}}{L_k!} \exp(\lambda L_k f_k) \right] \right. \\ & \times \sum_{M=1}^{L_1 + \dots + L_N} \frac{1}{M!} \prod_{\alpha=1}^M \left[ \sum_{n_\alpha=1}^{\infty} \int_{-\infty}^{+\infty} dq_\alpha \frac{\kappa n_\alpha}{2\pi\kappa n_\alpha} \exp\left(-\frac{t}{2\beta} n_\alpha q_\alpha^2 + \frac{\kappa^2 t}{24\beta} n_\alpha^3\right) \right] \delta \left( \sum_{\alpha=1}^M n_\alpha, \sum_{k=1}^N L_k \right) |C_M(\mathbf{q}, \mathbf{n})|^2 \\ & \times \left. \sum_{\mathcal{P}^{(L_1, \dots, L_N)}} \prod_{k=1}^N \left[ \sum_{\mathcal{P}^{(L_k)}} \right] \prod_{k < l}^N \prod_{a_k=1}^{L_k} \prod_{a_l=1}^{L_l} \left( \frac{Q_{\mathcal{P}_{a_k}^{(L_k)}} - Q_{\mathcal{P}_{a_l}^{(L_l)}} - i\kappa}{Q_{\mathcal{P}_{a_k}^{(L_k)}} - Q_{\mathcal{P}_{a_l}^{(L_l)}}} \right) \exp\left(i \sum_{k=1}^N x_k \sum_{a_k=1}^{L_k} Q_{\mathcal{P}_{a_k}^{(L_k)}}\right) \right\}. \end{aligned} \quad (19)$$

In the above expression, the summation over permutations of  $n = L_1 + \dots + L_N$  momenta  $Q_a$  split into the internal permutations  $\mathcal{P}^{(L_k)}$  of  $L_k$  momenta [taken at random out of the total list  $\{Q_a\}$  ( $a = 1, \dots, n$ )] and the permutations  $\mathcal{P}^{(L_1, \dots, L_N)}$  of the momenta among the groups  $L_k$ . It is evident that due to the symmetry of the expression in equation (19), the summations over  $\mathcal{P}^{(L_k)}$  give just the factor  $L_1! \dots L_N!$ . On the other hand, the structure of the Bethe ansatz wave functions, equation (18), is such that for the positions of ordered particles in the summation over permutations, the momenta  $Q_a$  belonging to the same cluster also remain ordered (for details see e.g. [37]). Thus, in order to perform the summation over

the permutations  $\mathcal{P}^{(L_1, \dots, L_N)}$  in equation (19) it is sufficient to split the momenta of each cluster into  $N$  parts:

$$\underbrace{\{q_1^\alpha, \dots, q_{m_\alpha^1}^\alpha\}}_{m_\alpha^1}, \underbrace{\{q_{m_\alpha^1+1}^\alpha, \dots, q_{m_\alpha^1+m_\alpha^2}^\alpha\}}_{m_\alpha^2}, \dots, \underbrace{\{q_{\sum_{k=1}^{N-1} m_\alpha^k + 1}^\alpha, \dots, q_{\sum_{k=1}^N m_\alpha^k}^\alpha\}}_{m_\alpha^N}, \quad (20)$$

where the integers  $m_\alpha^k = 0, 1, \dots, n_\alpha$  are constrained by the conditions

$$\sum_{k=1}^N m_\alpha^k = n_\alpha, \quad (21)$$

$$\sum_{\alpha=1}^M m_\alpha^k = L_k, \quad (22)$$

and the momenta of every group  $\{q_{\sum_{l=1}^{k-1} m_\alpha^l + 1}^\alpha, \dots, q_{\sum_{l=1}^k m_\alpha^l}^\alpha\}$  all belong to the particles whose coordinates are all equal to  $x_k$ . Let us redefine:

$$q_{\sum_{l=1}^{k-1} m_\alpha^l + r}^\alpha \equiv q_{k,r}^\alpha = q_\alpha + \frac{i\kappa}{2} \left( n_\alpha + 1 - 2 \sum_{l=1}^{k-1} m_\alpha^l - 2r \right). \quad (23)$$

In this way, the summation over  $\mathcal{P}^{(L_1, \dots, L_N)}$  is changed by the summation over the integers  $\{m_\alpha^k\}$ . Substituting equations (20)–(23) into equation (19) after simple algebra, we find

$$\begin{aligned} W(\mathbf{f}; \mathbf{x}) = & 1 + \lim_{\lambda \rightarrow \infty} \left( \sum_{M=1}^{\infty} \frac{(-1)^M}{M!} \prod_{\alpha=1}^M \left\{ \sum_{\sum_k^N m_\alpha^k \geq 1} (-1)^{\sum_k^N m_\alpha^k - 1} \int_{-\infty}^{+\infty} \frac{dq_\alpha}{2\pi\kappa(\sum_k^N m_\alpha^k)} \right. \right. \\ & \times \exp \left[ \lambda \sum_{k=1}^N m_\alpha^k f_k + i \sum_{k=1}^N m_\alpha^k x_k q_\alpha - \frac{1}{4} \kappa \sum_{k,l=1}^N m_\alpha^k m_\alpha^l |x_k - x_l| - \frac{t}{2\beta} q_\alpha^2 \sum_{k=1}^N m_\alpha^k + \frac{\kappa^2 t}{24\beta} \left( \sum_{k=1}^N m_\alpha^k \right)^3 \right] \left. \right\} \\ & \times |C_M(\mathbf{q}; \{m_\alpha^k\})|^2 G_M(\mathbf{q}; \{m_\alpha^k\}) \Bigg), \end{aligned} \quad (24)$$

where the normalization constant  $|C_M(\mathbf{q}; \{m_\alpha^k\})|^2$  is given in equation (16) (with  $n_\alpha = \sum_{k=1}^N m_\alpha^k$ ) and

$$G_M(\mathbf{q}; \{m_\alpha^k\}) = \prod_{\alpha=1}^M \prod_{k < l} \prod_{r=1}^{m_\alpha^k} \prod_{r'=1}^{m_\alpha^l} \left( \frac{q_{k,r}^\alpha - q_{l,r'}^\alpha - i\kappa}{q_{k,r}^\alpha - q_{l,r'}^\alpha} \right) \prod_{\alpha < \beta}^M \prod_{k=1}^N \prod_{l=1}^N \prod_{r=1}^{m_\alpha^k} \prod_{r'=1}^{m_\beta^l} \left( \frac{q_{k,r}^\alpha - q_{l,r'}^\beta - i\kappa}{q_{k,r}^\alpha - q_{l,r'}^\beta} \right). \quad (25)$$

Substituting the expressions for  $q_{k,r}^\alpha$ , equation (23), one can find an explicit formula for the above factor  $G_M$  which is rather cumbersome: it contains the products of all kinds of the Gamma functions of the type  $\Gamma[1 + \frac{1}{2}(\sum_k^N (\pm) m_\alpha^k + \sum_l^N (\pm) m_\beta^l) \pm \frac{1}{\kappa}(q_\alpha - q_\beta)]$  [the example of this kind of the product is given in [38], equation (A17)]. We do not reproduce it here as it turns out to be irrelevant in the limit  $t \rightarrow \infty$  (see below).

After rescaling

$$q_\alpha \rightarrow \frac{\kappa}{2\lambda} q_\alpha, \quad (26)$$

$$x_k \rightarrow \frac{2\lambda^2}{\kappa} x_k, \quad (27)$$

with

$$\lambda = \frac{1}{2} \left( \frac{\kappa^2 t}{\beta} \right)^{1/3} = \frac{1}{2} (\beta^5 u^2 t)^{1/3} \quad (28)$$

the normalization factor  $|C_M(\mathbf{q}; \{m_\alpha^k\})|^2$ , equation (16) (with  $n_\alpha = \sum_k^N m_\alpha^k$ ), can be represented as follows:

$$\begin{aligned} |C_M(\mathbf{q}; \{m_\alpha^k\})|^2 &= \prod_{\alpha<\beta}^M \frac{|\lambda \sum_k^N m_\alpha^k - \lambda \sum_k^N m_\beta^k - iq_\alpha + iq_\beta|^2}{|\lambda \sum_k^N m_\alpha^k + \lambda \sum_k^N m_\beta^k - iq_\alpha + iq_\beta|^2} \\ &= \left[ \prod_{\alpha=1}^M \left( 2\lambda \sum_k^N m_\alpha^k \right) \right] \det \left[ \frac{1}{(\sum_k^N \lambda m_\alpha^k - iq_\alpha) + (\sum_k^N \lambda m_\beta^k + iq_\beta)} \right]_{\alpha,\beta=1,\dots,M}. \end{aligned} \quad (29)$$

Substituting equation (25)–(28) into equation (23) and using the Airy function relation

$$\exp \left[ \frac{1}{3} \lambda^3 \left( \sum_k^N m_\alpha^k \right)^3 \right] = \int_{-\infty}^{+\infty} dy \operatorname{Ai}(y) \exp \left[ \lambda \left( \sum_k^N m_\alpha^k \right) y \right] \quad (30)$$

we get

$$\begin{aligned} W(\mathbf{f}; \mathbf{x}) &= 1 + \lim_{\lambda \rightarrow \infty} \left( \sum_{M=1}^{\infty} \frac{(-1)^M}{M!} \prod_{\alpha=1}^M \left\{ \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} \frac{dq_\alpha dy_\alpha}{2\pi} \operatorname{Ai}(y_\alpha + q_\alpha^2) \right. \right. \\ &\quad \times \sum_{\sum_k^N m_\alpha^k \geq 1} (-1)^{\sum_k^N m_\alpha^k - 1} \exp \left[ \lambda \sum_{k=1}^N m_\alpha^k (y_\alpha + f_k + ix_k q_\alpha) - \frac{1}{2} \lambda^2 \sum_{k,l=1}^N m_\alpha^k m_\alpha^l \Delta_{kl} \right] \left. \right\} \\ &\quad \times \det \hat{K} \left[ \left( \sum_k^N \lambda m_\alpha^k, q_\alpha \right); \left( \sum_k^N \lambda m_\beta^k, q_\beta \right) \right]_{\alpha,\beta=1,\dots,M} G_M \left( \frac{\kappa \mathbf{q}}{2\lambda}; \{m_\alpha^k\} \right), \end{aligned} \quad (31)$$

where

$$\Delta_{kl} = |x_k - x_l| \quad (32)$$

and

$$\hat{K} \left[ \left( \sum_k^N \lambda m_\alpha^k, q_\alpha \right); \left( \sum_k^N \lambda m_\beta^k, q_\beta \right) \right] = \frac{1}{(\sum_k^N \lambda m_\alpha^k - iq_\alpha) + (\sum_k^N \lambda m_\beta^k + iq_\beta)}. \quad (33)$$

The quadratic in  $m_\alpha^k$  term in the exponential of equation (31) can be linearized as follows:

$$\begin{aligned} \exp \left\{ -\frac{1}{2} \lambda^2 \sum_{k,l=1}^N m_\alpha^k m_\alpha^l \Delta_{kl} \right\} &= \exp \left\{ -\frac{1}{4} \lambda^2 \sum_{k,l=1}^N \Delta_{kl} (m_\alpha^k + m_\alpha^l)^2 + \frac{1}{2} \lambda^2 \sum_{k=1}^N (m_\alpha^k)^2 \sum_{l=1}^N \Delta_{kl} \right\} \\ &= \prod_{k,l=1}^N \left\{ \int_{-\infty}^{+\infty} \frac{d\xi_{kl}^\alpha}{\sqrt{2\pi}} \exp \left[ -\frac{1}{2} (\xi_{kl}^\alpha)^2 \right] \right\} \prod_{k=1}^N \left\{ \int_{-\infty}^{+\infty} \frac{d\eta_k^\alpha}{\sqrt{2\pi}} \exp \left[ -\frac{1}{2} (\eta_k^\alpha)^2 \right] \right\} \\ &\quad \times \exp \left\{ \lambda \sum_k^N \left[ \frac{i}{\sqrt{2}} \sum_{l=1}^N \sqrt{\Delta_{kl}} (\xi_{kl}^\alpha + \xi_{lk}^\alpha) - \sqrt{\gamma_k} \eta_k^\alpha \right] m_\alpha^k \right\}, \end{aligned} \quad (34)$$

where

$$\gamma_k = \sum_{l=1}^N \Delta_{kl} = \sum_{l=1}^N |x_k - x_l|. \quad (35)$$

Substituting the representation (34) into equation (31) and redefining the integration parameters

$$\eta_k^\alpha \rightarrow \eta_k^\alpha + \frac{i}{\sqrt{\gamma_k}} q_\alpha x_k + i \sum_{l=1}^N \sqrt{\frac{\Delta_{kl}}{2\gamma_k}} (\xi_{kl}^\alpha + \xi_{lk}^\alpha) \quad (36)$$

we get

$$W(\mathbf{f}, \mathbf{x}) = 1 + \sum_{M=1}^{\infty} \frac{(-1)^M}{M!} \prod_{\alpha=1}^M \left( \int_{-\infty}^{+\infty} \frac{dq_\alpha dy_\alpha}{2\pi} \text{Ai}(y_\alpha + q_\alpha^2) \prod_{k,l=1}^N \left( \int_{-\infty}^{+\infty} \frac{d\xi_{kl}^\alpha}{\sqrt{2\pi}} \right) \prod_{k=1}^N \left( \int_{-\infty}^{+\infty} \frac{d\eta_k^\alpha}{\sqrt{2\pi}} \right) \right. \\ \times \exp \left\{ -\frac{1}{2} \sum_{k,l=1}^N (\xi_{kl}^\alpha)^2 - \frac{1}{2} \sum_{k=1}^N \left[ \eta_k^\alpha + \frac{i}{\sqrt{\gamma_k}} q_\alpha x_k + i \sum_{l=1}^N \sqrt{\frac{\Delta_{kl}}{2\gamma_k}} (\xi_{kl}^\alpha + \xi_{lk}^\alpha) \right]^2 \right\} \left. \mathcal{S}(\mathbf{f}, \mathbf{y}, \mathbf{q}, \{\eta_k\}) \right), \quad (37)$$

where

$$\mathcal{S}(\mathbf{f}, \mathbf{y}, \mathbf{q}, \{\eta_k\}) = \lim_{\lambda \rightarrow \infty} \prod_{\alpha=1}^M \left\{ \sum_{\sum_k m_\alpha^k \geq 1} (-1)^{\sum_k m_\alpha^k - 1} \exp \left[ \lambda \sum_{k=1}^N m_\alpha^k (y_\alpha + f_k - \sqrt{\gamma_k} \eta_k) \right] \right. \\ \times \det \hat{K} \left[ \left( \sum_k^N \lambda m_\alpha^k, q_\alpha \right); \left( \sum_k^N \lambda m_\beta^k, q_\beta \right) \right]_{\alpha, \beta=1, \dots, M} G_M \left( \frac{\kappa \mathbf{q}}{2\lambda}; \{m_\alpha^k\} \right) \left. \right\}. \quad (38)$$

The summations over  $m_\alpha^k$  in the above expression can be performed as follows:

$$\mathcal{S}(\mathbf{f}, \mathbf{y}, \mathbf{q}, \{\eta_k\}) = \lim_{\lambda \rightarrow \infty} \prod_{\alpha=1}^M \left[ \prod_{k=1}^N \left( \sum_{m_\alpha^k=0}^{\infty} \delta_{m_\alpha^k, 0} \right) - (-1)^N \prod_{k=1}^N \left\{ \sum_{m_\alpha^k=0}^{\infty} (-1)^{m_\alpha^k - 1} \exp \left[ \lambda m_\alpha^k (y_\alpha + f_k - \sqrt{\gamma_k} \eta_k) \right] \right\} \right] \\ \times \det \hat{K} \left[ \left( \sum_k^N \lambda m_\alpha^k, q_\alpha \right); \left( \sum_k^N \lambda m_\beta^k, q_\beta \right) \right]_{\alpha, \beta=1, \dots, M} \times G_M \left( \frac{\kappa \mathbf{q}}{2\lambda}; \{m_\alpha^k\} \right) \\ = \lim_{\lambda \rightarrow \infty} \prod_{\alpha=1}^M \left[ \prod_{k=1}^N \left( \int_{\mathcal{C}} dz_\alpha^k \delta(z_\alpha^k) \right) - (-1)^N \prod_{k=1}^N \left\{ \int_{\mathcal{C}} \frac{dz_\alpha^k}{2i \sin(\pi z_\alpha^k)} \exp \left[ \lambda z_\alpha^k (y_\alpha + f_k - \sqrt{\gamma_k} \eta_k) \right] \right\} \right] \\ \times \det \hat{K} \left[ \left( \sum_k^N \lambda z_\alpha^k, q_\alpha \right); \left( \sum_k^N \lambda z_\beta^k, q_\beta \right) \right]_{\alpha, \beta=1, \dots, M} G_M \left( \frac{\kappa \mathbf{q}}{2\lambda}; \{z_\alpha^k\} \right), \quad (39)$$

where the integration goes over the contour  $\mathcal{C}$  shown in figure 1. Redefining  $z_\alpha^k \rightarrow z_\alpha^k / \lambda$ , in the limit

**Figure 1.** The contours of integration in the complex plane used for summing the series equation (39).

$\lambda \rightarrow \infty$ , we get

$$\begin{aligned} \mathcal{S}(\mathbf{f}, \mathbf{y}, \mathbf{q}, \{\eta_k\}) &= \prod_{\alpha=1}^M \left[ \prod_{k=1}^N \left( \int_{\mathcal{C}} dz_\alpha^k \delta(z_\alpha^k) \right) - (-1)^N \prod_{k=1}^N \left\{ \int_{\mathcal{C}} \frac{dz_\alpha^k}{2\pi i z_\alpha^k} \exp [z_\alpha^k (y_\alpha + f_k - \sqrt{\gamma_k} \eta_k)] \right\} \right] \\ &\times \det \hat{K} \left[ \left( \sum_k^N z_\alpha^k, q_\alpha \right); \left( \sum_k^N z_\beta^k, q_\beta \right) \right]_{\alpha, \beta=1, \dots, M} \lim_{\lambda \rightarrow \infty} G_M \left( \frac{\kappa \mathbf{q}}{2\lambda}; \left\{ \frac{z_\alpha^k}{\lambda} \right\} \right). \end{aligned} \quad (40)$$

Taking into account the Gamma function property  $\lim_{|z| \rightarrow 0} \Gamma(1+z) = 1$ , one can easily demonstrate (see e.g. [38]) that

$$\lim_{\lambda \rightarrow \infty} G_M \left( \frac{\kappa \mathbf{q}}{2\lambda}; \left\{ \frac{z_\alpha^k}{\lambda} \right\} \right) = 1. \quad (41)$$

Thus, in the limit  $\lambda \rightarrow \infty$ , the expression (37) takes the form of the Fredholm determinant

$$\begin{aligned} W(\mathbf{f}; \mathbf{x}) &= 1 + \sum_{M=1}^{\infty} \frac{(-1)^M}{M!} \prod_{\alpha=1}^M \left[ \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} \frac{dq_\alpha dy_\alpha}{2\pi} \text{Ai}(y_\alpha + q_\alpha^2) \prod_{k,l=1}^N \left( \int_{-\infty}^{+\infty} \frac{d\xi_{kl}^\alpha}{\sqrt{2\pi}} \right) \prod_{k=1}^N \left( \int_{-\infty}^{+\infty} \frac{d\eta_k^\alpha}{\sqrt{2\pi}} \right) \right. \\ &\times \exp \left\{ -\frac{1}{2} \sum_{k,l=1}^N \xi_{kl}^2 - \frac{1}{2} \sum_{k=1}^N \left[ \eta_k^\alpha + \frac{i}{\sqrt{\gamma_k}} q_\alpha x_k + i \sum_{l=1}^N \sqrt{\frac{\Delta_{kl}}{2\gamma_k}} (\xi_{kl}^\alpha + \xi_{lk}^\alpha) \right]^2 \right\} \\ &\times \prod_{k=1}^N \left( \int_{\mathcal{C}} dz_\alpha^k \right) \left\{ \prod_{k=1}^N \delta(z_\alpha^k) - (-1)^N \prod_{k=1}^N \frac{1}{2\pi i z_\alpha^k} \exp [z_\alpha^k (y_\alpha + f_k - \sqrt{\gamma_k} \eta_k)] \right\} \\ &\times \det \hat{K} \left[ \left( \sum_k^N z_\alpha^k, q_\alpha \right); \left( \sum_k^N z_\beta^k, q_\beta \right) \right]_{\alpha, \beta=1, \dots, M} \end{aligned} \quad (42)$$

$$\equiv \det [\hat{1} - \hat{A}] = \exp \left\{ - \sum_{M=1}^{\infty} \frac{1}{M} \text{Tr} \hat{A}^M \right\}, \quad (43)$$

where  $\hat{A}$  is the integral operator with the kernel

$$\begin{aligned} A \left[ \left( \sum_k^N z^k, q \right); \left( \sum_k^N \tilde{z}^k, \tilde{q} \right) \right] &= \int_{-\infty}^{+\infty} \frac{dy}{2\pi} \text{Ai}(y + q^2) \prod_{k,l=1}^N \left( \int_{-\infty}^{+\infty} \frac{d\xi_{kl}}{\sqrt{2\pi}} \right) \prod_{k=1}^N \left( \int_{-\infty}^{+\infty} \frac{d\eta_k}{\sqrt{2\pi}} \right) \\ &\times \exp \left\{ -\frac{1}{2} \sum_{k,l=1}^N \xi_{kl}^2 - \frac{1}{2} \sum_{k=1}^N \left[ \eta_k + \frac{i}{\sqrt{\gamma_k}} q_\alpha x_k + i \sum_{l=1}^N \sqrt{\frac{\Delta_{kl}}{2\gamma_k}} (\xi_{kl} + \xi_{lk}) \right]^2 \right\} \\ &\times \left\{ \prod_{k=1}^N \delta(z^k) - (-1)^N \prod_{k=1}^N \frac{1}{2\pi i z^k} \exp [z^k (y + f_k - \sqrt{\gamma_k} \eta_k)] \right\} \\ &\times \frac{1}{\sum_k^N z^k - iq + \sum_k^N \tilde{z}^k + i\tilde{q}}. \end{aligned} \quad (44)$$

Correspondingly, for the trace of this operator in the  $M$ -th power [in the exponential representation of

the Fredholm determinant, equation (43)] we get

$$\begin{aligned} \text{Tr} \hat{A}^M &= \prod_{\alpha=1}^M \left[ \int_{-\infty}^{+\infty} \frac{dy dq_\alpha}{2\pi} \text{Ai}(y + q_\alpha^2) \prod_{k,l=1}^N \left( \int_{-\infty}^{+\infty} \frac{d\xi_{kl}}{\sqrt{2\pi}} \right) \prod_{k=1}^N \left( \int_{-\infty}^{+\infty} \frac{d\eta_k}{\sqrt{2\pi}} \right) \right. \\ &\quad \times \exp \left\{ -\frac{1}{2} \sum_{k,l=1}^N \xi_{kl}^2 - \frac{1}{2} \sum_{k=1}^N \left[ \eta_k + \frac{i}{\sqrt{\gamma_k}} q_\alpha x_k + i \sum_{l=1}^N \sqrt{\frac{\Delta_{kl}}{2\gamma_k}} (\xi_{kl} + \xi_{lk}) \right]^2 \right\} \\ &\quad \times \prod_{k=1}^N \left( \int_{\mathcal{C}} dz_\alpha^k \right) \left\{ \prod_{k=1}^N \delta(z_\alpha^k) - (-1)^N \prod_{k=1}^N \frac{1}{2\pi i z_\alpha^k} \exp \left[ z_\alpha^k (y + f_k - \sqrt{\gamma_k} \eta_k) \right] \right\} \\ &\quad \times \prod_{\alpha=1}^M \left( \frac{1}{\sum_k^N z_\alpha^k - iq_\alpha + \sum_k^N z_{\alpha+1}^k + iq_{\alpha+1}} \right), \end{aligned} \quad (45)$$

where, by definition,  $z_{M+1}^k \equiv z_1^k$  and  $q_{M+1} \equiv q_1$ .

Substituting

$$\frac{1}{\sum_k^N z_\alpha^k - iq_\alpha + \sum_k^N z_{\alpha+1}^k + iq_{\alpha+1}} = \int_0^\infty d\omega_\alpha \exp \left\{ -\omega_\alpha \left( \sum_k^N z_\alpha^k - iq_\alpha + \sum_k^N z_{\alpha+1}^k + iq_{\alpha+1} \right) \right\} \quad (46)$$

into equation (45) we obtain

$$\text{Tr} \hat{A}^M = \int_0^\infty \dots \int_0^\infty d\omega_1 \dots d\omega_M \prod_{\alpha=1}^M A(\omega_\alpha; \omega_{\alpha+1}), \quad (47)$$

where

$$\begin{aligned} A(\omega; \omega') &= \int_{-\infty}^{+\infty} \frac{dy dq}{2\pi} \text{Ai}(y + q^2 + \omega + \omega') \prod_{k,l=1}^N \left( \int_{-\infty}^{+\infty} \frac{d\xi_{kl}}{\sqrt{2\pi}} \right) \prod_{k=1}^N \left( \int_{-\infty}^{+\infty} \frac{d\eta_k}{\sqrt{2\pi}} \right) \\ &\quad \times \exp \left\{ -\frac{1}{2} \sum_{k,l=1}^N \xi_{kl}^2 - \frac{1}{2} \sum_{k=1}^N \left[ \eta_k + \frac{i}{\sqrt{\gamma_k}} q x_k + i \sum_{l=1}^N \sqrt{\frac{\Delta_{kl}}{2\gamma_k}} (\xi_{kl} + \xi_{lk}) \right]^2 - iq(\omega - \omega') \right\} \\ &\quad \times \left\{ 1 - (-1)^N \prod_{k=1}^N \int_{\mathcal{C}} \frac{dz^k}{2\pi i z^k} \exp \left[ z^k (y + f_k - \sqrt{\gamma_k} \eta_k) \right] \right\}. \end{aligned} \quad (48)$$

Integrating over  $z^1, \dots, z^N$ , we finally get

$$\begin{aligned} A(\omega; \omega') &= \int_{-\infty}^{+\infty} \frac{dy dq}{2\pi} \text{Ai}(y + q^2 + \omega + \omega') \prod_{k,l=1}^N \left( \int_{-\infty}^{+\infty} \frac{d\xi_{kl}}{\sqrt{2\pi}} \right) \prod_{k=1}^N \left( \int_{-\infty}^{+\infty} \frac{d\eta_k}{\sqrt{2\pi}} \right) \\ &\quad \times \exp \left\{ -\frac{1}{2} \sum_{k,l=1}^N \xi_{kl}^2 - \frac{1}{2} \sum_{k=1}^N \left[ \eta_k + \frac{i}{\sqrt{\gamma_k}} q x_k + i \sum_{l=1}^N \sqrt{\frac{\Delta_{kl}}{2\gamma_k}} (\xi_{kl} + \xi_{lk}) \right]^2 - iq(\omega - \omega') \right\} \\ &\quad \times \left[ 1 - (-1)^N \prod_{k=1}^N \theta(-y - f_k + \eta_k \sqrt{\gamma_k}) \right], \end{aligned} \quad (49)$$

where  $\Delta_{kl} = |x_k - x_l|$  and  $\gamma_k = \sum_{l=1}^N \Delta_{kl}$ .

Thus, the  $N$ -point free energy distribution function  $W(f_1, \dots, f_N; x_1, \dots, x_N)$ , equation (7), is given by the Fredholm determinant

$$W(\mathbf{f}; \mathbf{x}) = \det [\hat{1} - \hat{A}], \quad (50)$$

where  $\hat{A}$  is the integral operator with the kernel  $A(\omega; \omega')$  (with  $\omega, \omega' \geq 0$ ) represented in equation (49).

### 3. Conclusions

In this paper using the method developed in [30] we extended our result to the spatial  $N$ -point free energy distribution function in the thermodynamic limit  $t \rightarrow \infty$ . It should be noted that following the ideas of the proof [31] for the two-point function, one can easily demonstrate that the result (49)–(50) obtained in this paper is equivalent to that derived earlier by Prolhac and Spohn [32]. It should be stressed, however, that since the obtained result for the kernel  $A(\omega; \omega')$ , equation (49), has a rather complicated structure, its analytic properties are at present completely unclear and their study would require special efforts.

## ***N*-точкова функція розподілу вільної енергії в одновимірних хаотично напрямлених полімерах**

В. Доценко<sup>1,2</sup>

<sup>1</sup> Університет м. Париж VI, 75252 Париж, Франція

<sup>2</sup> Інститут теоретичної фізики ім. Л.Д. Ландау, 119334 Москва, РФ

Отримано явний вираз для  $N$ -точкової функції розподілу вільної енергії в одновимірному напрямленому полімері в термінах анзацу Бете в рамках методу реплік. Отриманий результат еквівалентний результату, раніше отриманому в роботі Пролака і Шпона [J. Stat. Mech., 2011, P03020].

**Ключові слова:** напрямлені полімери, хаотичний потенціал, репліки, флюктуації, функція розподілу
