# A PRIORI ESTIMATES FOR RELATIVISTIC LIQUID BODIES 

TODD A. OLIYNYK

#### Abstract

We demonstrate that a sufficiently smooth solution of the relativistic Euler equations that represents a dynamical compact liquid body, when expressed in Lagrangian coordinates, determines a solution to a system of non-linear wave equations with acoustic boundary conditions. Using this wave formulation, we prove that these solutions satisfy energy estimates without loss of derivatives. Importantly, our wave formulation does not require the liquid to be irrotational, and the energy estimates do not rely on divergence and curl type estimates employed in previous works.

## 1. INTRODUCTION

1.1. Relativistic Euler equations. On a 4-dimensional spacetime, the relativistic Euler equations are given by ${ }^{1}$

$$
\begin{equation*}
\nabla_{\mu} T^{\mu \nu}=0 \tag{1.1}
\end{equation*}
$$

where

$$
T^{\mu \nu}=(\rho+p) v^{\mu} v^{\nu}+p g^{\mu \nu}
$$

is the stress energy tensor,

$$
g=g_{\mu \nu} d x^{\mu} d x^{\nu}
$$

is a Lorentzian metric of signature $(-,+,+,+), \nabla_{\mu}$ is the Levi-Civita connection of $g_{\mu \nu}, v^{\mu}$ is the fluid four-velocity normalized by ${ }^{2}$

$$
g_{\mu \nu} v^{\mu} v^{\nu}=-1
$$

$\rho$ is the proper energy density of the fluid, and $p$ is the pressure. Projecting (1.1) into the subspaces parallel and orthogonal to $v^{\mu}$ yields the following well known form of the relativistic Euler equations

$$
\begin{array}{r}
v^{\mu} \nabla_{\mu} \rho+(\rho+p) \nabla_{\mu} v^{\mu}=0 \\
(\rho+p) v^{\mu} \nabla_{\mu} v^{\nu}+h^{\mu \nu} \nabla_{\mu} p=0 \tag{1.3}
\end{array}
$$

where

$$
\begin{equation*}
h_{\mu \nu}=g_{\mu \nu}+v_{\mu} v_{\nu} \tag{1.4}
\end{equation*}
$$

is the induced positive definite metric on the subspace orthogonal to $v^{\mu}$. In this article, we will be concerned with fluids with a barotropic equation of state of the form

$$
\rho=\rho(p)
$$

where $\rho$ satisfies

$$
\begin{equation*}
\rho \in C^{\infty}\left([0, \infty),\left[\rho_{0}, \rho_{1}\right]\right), \quad \rho(0)=\rho_{0} \tag{1.5}
\end{equation*}
$$

and

$$
\begin{equation*}
\rho^{\prime}(p)>0, \quad 0 \leq p<\infty \tag{1.6}
\end{equation*}
$$

for some constants $0<\rho_{0}<\rho_{1}$.
For fluid bodies with compact support, the timelike matter-vacuum boundary is defined by the vanishing of the pressure. Due to the above restrictions on the equation of state, the type of fluids considered in this article are liquids, which are characterized by having a jump discontinuity in the proper energy density at the matter-vacuum boundary. The main aim of this article is to derive a priori estimates for sufficiently smooth solutions of the relativistic Euler equations that represent dynamical compact liquid bodies. The precise form of the a priori estimates can be found in Theorem8.1 which represent the main

[^0]result of this article. The key analytic difficulties in establishing the a priori estimates are due to the presence of the matter-vacuum boundary, which is free.

Our approach to establishing a priori estimates begins with showing that sufficiently smooth solutions, which represent dynamical liquid bodies, of the relativistic Euler equations satisfy, when expressed in Lagrangian coordinates, a system of non-linear wave equations with acoustic boundary conditions; see (6.1)-(6.9) for the complete initial boundary value problem (IBVP). Although it is well known that the Euler equations can be reduced to a non-linear scalar wave equation in the special case of irrotational fluids, see [6, 31] for details, our formulation is different and able to handle the general case where rotation is present.

The starting point for the derivation of our wave equation is the relativistic continuity equation given by

$$
\begin{equation*}
\nabla_{\mu}\left(n v^{\mu}\right)=0 \tag{1.7}
\end{equation*}
$$

where $n=(\rho+p) / \zeta$ is the number density with $\zeta$ the specific enthalpy of the fluid. Introducing the one form

$$
\theta_{\mu}^{0}=-\zeta v_{\mu}
$$

we write the continuity equation (1.7) as

$$
\nabla^{\mu}\left(\frac{1}{f} \theta_{\mu}^{0}\right)=0
$$

where $f$ is a function of the specific enthalpy $\zeta$ defined below by (3.28). Applying the covariant derivative to $\nabla_{\nu}$ to this expression, we obtain, after commuting the covariant derivative $\nabla_{\nu}$ through and antisymmetrizing $\nabla_{\nu} \theta_{\mu}^{0}$, a wave equation for $\theta_{\nu}^{0}$ that includes a term at the highest order which involves the fluid vorticity 2 -form $\Lambda=-d \theta^{0}$. What makes our wave formulation useful is that we can control the vorticity term in the wave equation by using the well-known propagation equation $L_{v} \Lambda=0$ satisfied by the vorticity. It is worth noting that in all previous works on a priori estimates for the relativistic fluid bodies, the propagation equation $\mathrm{L}_{v} \Lambda=0$ is also used in an essential way.

The other essential element of our wave formulation are the boundary conditions. These boundary conditions are non-linear and of acoustic type, which means that they are Neumann boundary conditions with source terms that involves two time derivatives, in Lagrangian coordinates, along the boundary, the same order as appears in the wave equation. The orgin of this non-standard boundary condition is the geometric identity

$$
\frac{\nabla_{v} \theta_{\nu}^{0}}{\left|\nabla_{v} \theta^{0}\right|_{g}}=-n_{\nu}
$$

where $n_{\nu}$ is the unit, outward pointing co-normal to the matter-vacuum boundary, which holds along the matter-vacuum boundary for solutions of relativistic Euler equations that satisfy the liquid boundary conditions and the Taylor sign condition.

The importance of our wave formulation is that it is well suited for deriving energy estimates without derivative loss in the presence of a free matter-vacuum boundary. This is due, in part, to the wave structure of the equations, and in part, to the nature of the acoustic boundary conditions. Indeed, in Section 7, we establish a local existence and uniqueness theory for linear systems of wave equations with acoustic boundary conditions; see, in particular, Theorem 7.16. This linear theory provides the key technical result needed to establish our a priori estimates. We anticipate that the linear theory developed in Section 7 may be of independent interest as it can be applied more generally to other systems of wave equations having acoustic boundary conditions.
1.2. Comparison with existing results. The only existing work that contains a mathematical analysis of compact, relativistic liquid bodies is [30. There, the local existence and uniqueness of solutions is established using the theory of symmetric hyperbolic systems. However, the energy estimates derived from the symmetric hyperbolic theory involve a derivative loss that is repaired using a Nash-Moser iteration scheme. This leads to a rather high requirement on the regularity of the initial data in order to close the scheme. In contrast, the energy estimates established in this work do not involve derivative loss and require less regularity on the initial data.

In the non-relativistic limit, the relativistic Euler equations reduce to the compressible Euler equations. In this setting, there are more results available with the first local existence and uniqueness result for compressible liquids due to Lindblad [20]. The estimates derived in [20] also required the use of a NashMoser scheme due to derivative loss. We note that the work of Trakhinin 30 applies in the non-relativistic setting and provides an alternate approach.

More recently, a local existence and uniqueness theory without derivative loss for non-relativistic, compact, compressible liquid bodies has been developed in [7]. The regularity requirements, as measured by the amount of regularity assumed on the initial data for the map that defines the Lagrangian coordinates, for the energy estimates derived in this article are comparable with those of [7] with both needing 4.5 derivatives bounded in an $L^{2}$ sense. One key technical difference between the approach taken here compared to that taken in [7] and also [20] is the energy estimates derived in this article do not rely on the divergence and curl estimates developed in [7, 20].

It is worth noting that a priori estimates for solutions of the relativistic Euler equations that represent dynamical gaseous bodies have been established in the recent works [16, 17. There are also a number of other related results for the non-relativistic Euler equations that involve either incompressible, or gaseous fluid bodies with compact support; for example, see [9, 8, 10, 21, 22, 26] and references cited therein.
1.3. Future directions. In work that is currently in preparation, we use the techniques developed in this article to establish the local existence and uniqueness of solutions to the relativistic Euler equations that represent dynamical, compact liquid bodies. The key technical step in going from the a priori estimates presented here to existence and uniqueness is to view the relations (3.9)-(3.11) as constraints, and show that solutions of IBVP (6.1)-(6.9) that satisfy these constraints initially continue to satisfy these constraints to the future; that is, we show that the constraints propagate. Since it is relatively straightforward to establish the existence and uniqueness of solutions for (6.1)-(6.9) using the linear theory developed in Section 7 the key difficulties are reduced to showing that the IBVP satisfied by the constraints (3.9)-(3.11) has unique solutions. This uniqueness problem is solved by applying standard results from hyperbolic theory. This work will be presented in a separate article. We also are able to show that once the local existence and uniqueness problem is settled for a fixed metric, this theory can be used in conjunction with the techniques developed in [2, 3], suitably adapted, to establish the local existence of solutions to the Einstein-Euler equations. This work will be presented in a separate article.
1.4. Overview of this paper. In Section 2, we review the Frauendiener-Walton formulation of the relativistic Euler equations, which is the starting point for the derivation of our wave formulation. Here, we set out the class of solutions for which we establish a priori estimates. The derivation of our wave formulation, in the Eulerian picture, is carried out in Section 3 with the key equation being (3.34). Lagrangian coordinates adapted to our problem are introduced in Section 4 and the wave equation (3.34) is transformed into these coordinates with the resulting wave equation given by (4.39). A time differentiated version of the wave equations (4.39) is also derived in this section, see (4.60). In the follwing section, Section 5 we show that the liquid boundary condition, which corresponds to the vanishing of the pressure at the matter-vacuum interface, implies acoustic type boundary conditions for time differentiated wave equation (4.60). The complete IBVP given by (6.1)-(6.9) is then presented in Section 6, A linear existence and uniqueness theory, which includes energy estimates, for this type of IBVP is developed in Section 7. These energy estimates are then used in the final section, Section 8, to obtain the desired a priori estimates that are presented in Theorem 8.1 which represent the main result of this article. Finally, a number of useful calculus inequalities, elliptic estimates, and determinant formulas are listed in Appendices $\mathrm{A}, \mathrm{B}$ and C respectively.

## 2. The Frauendiener-Walton formulation of the relativistic Euler equations

2.1. Fraudendiner-Walton equations. The derivation of our wave formulation of the Euler equations is based on the Frauendiener-Walton formulation of the Euler equations [12, 32], which we quickly review. In the Frauendiener-Walton formulation of the Euler equations, the proper energy density $\rho$ and the normalized fluid 4 -velocity $v^{\mu}$ are combined into a single timelike vector field $w^{\mu}$ defined by

$$
\begin{equation*}
w^{\mu}=\frac{1}{\zeta} v^{\mu} \tag{2.1}
\end{equation*}
$$

where, as above,

$$
\begin{equation*}
\zeta=\frac{1}{\sqrt{w^{2}}} \quad\left(w^{2}:=-w_{\nu} w^{\nu}>0\right) \tag{2.2}
\end{equation*}
$$

is the specific enthalpy of the fluid. As shown in [12, 32, $w^{\mu}$ satisfies the symmetric hyperbolic equation

$$
\begin{equation*}
A_{\mu \nu}{ }^{\gamma} \nabla_{\gamma} w^{\nu}=0 \tag{2.3}
\end{equation*}
$$

where

$$
A_{\mu \nu}^{\gamma}=\left(3+\frac{1}{s^{2}}\right) \frac{w_{\mu} w_{\nu}}{w^{2}} w^{\gamma}+\delta_{\nu}^{\gamma} w_{\mu}+\delta_{\mu}^{\gamma} w_{\nu}+w^{\gamma} g_{\mu \nu}
$$

and the square of the sound speed $s^{2}$ is a function of $\zeta$. An explicit formula for $s^{2}=s^{2}(\zeta)$ can be calculated as follows: first, the pressure $p=p(\zeta)$ is determined by solving the initial value problem

$$
\begin{align*}
\frac{d p}{d \zeta} & =\frac{1}{\zeta}(\rho(p)+p),  \tag{2.4}\\
p\left(\zeta_{0}\right) & =p_{0} \tag{2.5}
\end{align*}
$$

for any particular choice of $\zeta_{0}>0$ and $p_{0} \geq 0$. To be definite, we set

$$
\begin{equation*}
p_{0}=0 \quad \text { and } \quad \zeta_{0}=1 \tag{2.6}
\end{equation*}
$$

Solving (2.4)-(2.5) then yields, by standard ODE theory and (1.5), a solution

$$
\begin{equation*}
p \in C^{\infty}((0, \infty)) \tag{2.7}
\end{equation*}
$$

With $p(\zeta)$ determined, $s^{2}$ is then given by the formula

$$
s^{2}=\frac{1}{\rho^{\prime}(p(\zeta))}
$$

From this formula, it is then clear from (2.7) and the assumption (1.6) on the equation of state that $s^{2}$ satisfies

$$
s^{2} \in C^{\infty}((0, \infty)) \quad \text { and } \quad s^{2}(\zeta)>0, \quad 0<\zeta<\infty
$$

It is also clear that the proper energy density of the fluid can be recovered using the formula

$$
\begin{equation*}
\rho=\rho(p(\zeta)) \tag{2.8}
\end{equation*}
$$

2.2. Equivalence of $w^{\mu}$ and $\left(\rho, v^{\mu}\right)$. The formulas (2.1), (2.2) and (2.8) define the explicit transformation that takes solutions $\left(\rho, v^{\nu}\right)$ of the Euler equations (1.2)-(1.3) to solutions $w^{\mu}$ of (2.3) and vice versa. This shows that the system (2.3) is completely equivalent to the standard formulation of the Euler equations given by (1.2)-(1.3).
2.3. Vorticity. By definition (e.g. see (6.22) and (6.25) from 15 ), the fluid vorticity is the 2-form, denote here by $\Lambda_{\mu \nu}$, constructed from the specific enthalpy $\zeta$ and four-velocity $v_{\mu}$ of the fluid as follows

$$
\Lambda_{\mu \nu}=\nabla_{\mu}\left(\zeta v_{\nu}\right)-\nabla_{\nu}\left(\zeta v_{\mu}\right)
$$

Consequently, using (2.1) and (2.2), we see that the fluid vorticity takes the form

$$
\begin{equation*}
\Lambda_{\mu \nu}=-\nabla_{\mu}\left(\frac{1}{g(w, w)} w_{\nu}\right)+\nabla_{\nu}\left(\frac{1}{g(w, w)} w_{\mu}\right) \tag{2.9}
\end{equation*}
$$

when expressed in terms of the Frauendiener-Walton vector field $w^{\mu}$.
2.4. Solution assumptions. Before proceeding, we fix the class of relativistic solutions that will be of interest to us. As noted in the introduction, our assumptions on the equation of state imply that this class of solutions represent dynamical, compact liquid bodies.

Assumptions: We assume the following:
(A.1) The $\left(x^{\mu}\right), \mu=0,1,2,3$, are (global) Cartesian coordinates on $\mathbb{R}^{4}$, and $g=g_{\mu \nu} d x^{\nu} d x^{\mu}$ is a smooth Lorentzian metric on $\mathbb{R}^{4}$.
(A.2) $U$ is an open, bounded set in $\mathbb{R}^{4}$ that is diffeomorphic to a timelike cylinder with base

$$
\Omega_{0}=\{0\} \times \Omega
$$

where $\Omega$ is a bounded, open set in $\mathbb{R}^{3}$ with smooth boundary.
(A.3) The vector field $w=w^{\mu} \partial_{\mu}$ is timelike, has components $w^{\mu} \in C^{k}(\bar{U})$ for $k \geq 8$, and satisfies the Frauendiener-Walton-Euler equations (2.3) on $U$. Here, and in the following, we employ the notation

$$
\partial_{\mu}=\frac{\partial}{\partial x^{\mu}}
$$

for partial derivatives with respect to the coordinates $\left(x^{\mu}\right)$.
(A.4) The set $U$ is invariant under the flow of $w$. Letting $\mathcal{F}_{\tau}\left(x^{\mu}\right)=\left(\mathcal{F}_{t}^{\mu}\left(x^{\mu}\right)\right)$ denote the flow map of the vector field $w$, so that $\mathcal{F}_{\tau}^{\mu}\left(x^{\nu}\right)$ is the unique solution to the initial value problem

$$
\begin{equation*}
\frac{d}{d \tau} \mathcal{F}_{\tau}^{\mu}\left(x^{\nu}\right)=w^{\mu}\left(x^{\nu}\right), \quad \mathcal{F}_{0}^{\mu}\left(x^{\nu}\right)=x^{\mu} \tag{2.10}
\end{equation*}
$$

it is clear from this assumption that there exists a $T>0$ such that

$$
U_{T}:=\bigcup_{0 \leq \tau \leq T} \mathcal{F}_{\tau}(\{0\} \times \Omega) \subset U
$$

(A.5) The vector field $w$ is tangent to the timelike boundary

$$
B_{T}:=\bigcup_{0 \leq \tau \leq T} \mathcal{F}_{\tau}(\{0\} \times \partial \Omega)
$$

of $U_{T}$, i.e.

$$
\begin{equation*}
\left.w\right|_{B_{T}} \in T B_{T} \tag{2.11}
\end{equation*}
$$

This is not actually an independent assumption since it is a consequence of the previous assumption. However, we state it here separately to emphasize the condition (2.11).
(A.6) There exists constants $0<c_{s}^{-}<c_{s}^{+}<1$ such that

$$
0<c_{s}^{-} \leq s^{2} \leq c_{s}^{+}<1 \quad \text { in } U
$$

(A.7) The pressure vanishes on the timelike boundary $B_{T}$, i.e.

$$
\begin{equation*}
\left.p\right|_{B_{T}}=0 \tag{2.12}
\end{equation*}
$$

and satisfies, for some constant $c_{p}>0$, the Taylor sign condition

$$
\begin{equation*}
0<c_{p} \leq-\nabla_{n} p \quad \text { in } B_{T} \tag{2.13}
\end{equation*}
$$

where $n=n^{\nu} \partial_{\nu}$ is the outward pointing unit normal to $B_{T}$.

## Remark 2.1.

(i) Since the vector field $w^{\mu}$ is timelike by assumption (A.3), there exists a constant $0<c_{w}$ such that

$$
0<c_{w} \leq w^{2} \quad \text { in } U
$$

(ii) Assumption (A.5) implies via (2.1) that

$$
\begin{equation*}
\left.v\right|_{B_{T}} \in T B_{T} \tag{2.14}
\end{equation*}
$$

Together, (2.12) and (2.14) make up the standard representation of the free boundary conditions for a fluid body.
(iii) Using (2.4), we have

$$
-\nabla_{n} p=\frac{\zeta^{2}}{2}(\rho(p)+p) \nabla_{n} w^{2}
$$

Evaluating this on the boundary yields

$$
-\left.\nabla_{n} p\right|_{B_{T}}=\frac{\rho_{0}}{2} \nabla_{n} w^{2}
$$

by (1.5), (2.6) and (2.12). From this it is then clear that

$$
\begin{equation*}
0<\frac{2 c_{p}}{\rho_{0}} \leq \nabla_{n} w^{2} \quad \text { in } B_{T} \tag{2.15}
\end{equation*}
$$

is equivalent to Taylor sign condition (2.13).

## 3. An Eulerian wave formulation of the Euler equations

3.1. A frame formulation of the relativistic Euler equations. The starting point for the derivation of our wave formulation is the frame formulation of the relativistic Euler equations from [24]. Following [24], we introduce a fram $3^{3}$

$$
e_{i}=e_{i}^{\mu} \partial_{\mu}
$$

where
(i)

$$
\begin{equation*}
e_{0}:=w \tag{3.1}
\end{equation*}
$$

and $w=w^{\mu} \partial_{\mu}$ is a solution of the Frauendiener-Walton-Euler equations (2.3) that satisfies the Assumptions (A.1)-(A.7) from Section 2.4,
(ii) and the remaining frame fields $\sqrt{4}^{4}\left\{e_{I}\right\}_{I=1}^{3}$ are determined by solving the Lie transport equations

$$
\begin{equation*}
\left[e_{0}, e_{I}\right]=0 \tag{3.2}
\end{equation*}
$$

Remark 3.1. Writing (3.2) as

$$
\begin{equation*}
e_{0}^{\mu} \partial_{\mu} e_{I}^{\nu}-\left(\partial_{\nu} e_{0}^{\mu}\right) e_{I}^{\nu}=0 \tag{3.3}
\end{equation*}
$$

it is clear, since $U_{T}$ is invariant under the flow of $e_{0}=w$ by assumption, that we can solve (3.3) for given initial data

$$
\begin{equation*}
\left.e_{I}^{\mu}\right|_{\Omega_{0}}=f_{I}^{\mu} \in C^{k}(\bar{\Omega}) \tag{3.4}
\end{equation*}
$$

using the method of characteristics to get a solution

$$
e_{I}^{\mu} \in C^{k-1}\left(\bar{U}_{T}\right)
$$

Next, we let

$$
\theta^{i}=\theta_{\mu}^{i} d x^{\mu} \quad\left(\left(\theta_{\mu}^{i}\right):=\left(e_{j}^{\mu}\right)^{-1}\right)
$$

denote the co-frame, and we recall that the connection coefficients $\omega_{i}{ }^{k}{ }_{j}$ are defined via the relation

$$
\nabla_{e_{i}} e_{j}=\omega_{i}{ }^{k}{ }_{j} e_{k}
$$

We define the associated connection 1-forms $\omega^{k}{ }_{j}$ in standard fashion by

$$
\omega_{j}^{k}=\omega_{i}^{k}{ }_{j} \theta^{i}
$$

and we set $5^{5}$

$$
\omega_{k j}=\gamma_{k l} \omega_{j}^{l}=\omega_{i k j} \theta^{i}
$$

where

$$
\gamma_{i j}:=g\left(e_{i}, e_{j}\right)=g_{\mu \nu} e_{i}^{\mu} e_{j}^{\nu}
$$

is the frame metric and

$$
\omega_{i k j}:=\gamma_{k l} \omega_{i}^{l}{ }_{j}=g\left(\nabla_{e_{i}} e_{j}, e_{k}\right)
$$

We also let $\gamma^{i j}$ denote the inverse frame metric, i.e.

$$
\left(\gamma^{i j}\right)^{-1}=\left(\gamma_{i j}\right)
$$

and note that

$$
w^{2}=-\gamma_{00} \quad \text { and } \quad \zeta=\left(\frac{1}{-\gamma_{00}}\right)^{\frac{1}{2}}
$$

by (2.2) and (3.1). Due to the choice (2.6), the boundary condition (2.12) is equivalent to

$$
\begin{equation*}
\left.\gamma_{00}\right|_{B_{T}}=-1 \tag{3.5}
\end{equation*}
$$

For use below, we let

$$
F \in C^{\infty}((0, \infty),(0, \infty))
$$

denote the unique solution to the initial value problem

$$
\begin{align*}
F^{\prime}(\zeta) & =-\frac{F(\zeta)}{\zeta s^{2}(\zeta)}  \tag{3.6}\\
F(1) & =1 \tag{3.7}
\end{align*}
$$

[^1]We also choose initial data (3.4) so that

$$
\begin{equation*}
\left.\gamma_{0 J}\right|_{\Omega_{0}}=0 \quad \text { and } \quad \operatorname{det}\left(\left.\gamma_{I J}\right|_{\Omega_{0}}\right)=F\left(\left(-\gamma_{00} \mid \Omega_{0}\right)^{-\frac{1}{2}}\right)^{2} \tag{3.8}
\end{equation*}
$$

As we show in Section 4.2, this is always possible.

### 3.2. Constraint propagation and vorticity. Since

(i) $e_{0}^{\mu}=w^{\mu}$, by assumption, satisfies the Frauendiener-Walton-Euler equations (2.3) on $\bar{U}_{T}$,
(ii) and the frame vectors $e_{I}^{\mu}$, by construction, satisfy the Lie transport equations (3.2) on $\bar{U}_{T}$ for initial data (3.4) satisfying the conditions (3.8),
we are in a position to apply Proposition IV. 3 of [24] to conclude that the following equations are satisfied on $\bar{U}_{T}$ :

$$
\begin{align*}
{\left[e_{0}, e_{J}\right] } & =0  \tag{3.9}\\
\gamma_{0 J} & =0  \tag{3.10}\\
F\left(\left(-\gamma_{00}\right)^{-1 / 2}\right)^{2} & =\operatorname{det}\left(\gamma_{I J}\right), \tag{3.11}
\end{align*}
$$

and

$$
\begin{equation*}
e_{0}\left(\sigma_{l}{ }^{j}{ }_{k}\right)=0 \tag{3.12}
\end{equation*}
$$

where

$$
\begin{equation*}
\sigma_{l}{ }^{j}{ }_{k}:=\theta^{j}\left(\left[e_{l}, e_{k}\right]\right)=\theta_{\lambda}^{j}\left(e_{l}^{\sigma} \partial_{\sigma} e_{k}^{\lambda}-e_{k}^{\sigma} \partial_{\sigma} e_{l}^{\lambda}\right) \tag{3.13}
\end{equation*}
$$

First, we observe that (3.10)-(3.11) show that the constraints (3.8) on the initial data (3.4) propagate, while (3.9) and (3.13) show that $\sigma_{i}{ }^{j}{ }_{k}$ is anti-symmetric in the $i, k$ indices and satisfies

$$
\begin{equation*}
\sigma_{0}{ }^{j}{ }_{k}=\sigma_{k}{ }^{j}{ }_{0}=0 . \tag{3.14}
\end{equation*}
$$

Next, we note that (3.10) implies that the co-vector

$$
\frac{g_{\mu \nu}}{\gamma_{00}} e_{0}^{\nu}
$$

satisfies

$$
\left(\frac{g_{\mu \nu}}{\gamma_{00}} e_{0}^{\nu}\right) e_{i}^{\mu}=\delta_{i}^{0}
$$

But $\theta_{\mu}^{0}$ also satisfies $\theta_{\mu}^{0} e_{i}^{\mu}=\delta_{i}^{0}$, and so, the equality

$$
\begin{equation*}
\theta_{\mu}^{0}=\frac{g_{\mu \nu}}{\gamma_{00}} e_{0}^{\nu} \tag{3.15}
\end{equation*}
$$

must hold. Since $e_{0}^{\mu}=w^{\mu}$ and $\gamma_{00}=g\left(e_{0}, e_{0}\right)$, by definition, we can write the above expression as

$$
\theta_{\mu}^{0}=\frac{1}{g(w, w)} w_{\mu}
$$

which together with (2.9) shows that the fluid vorticity $\Lambda$ is given by the formula

$$
\begin{equation*}
\Lambda=-d \theta^{0} \tag{3.16}
\end{equation*}
$$

Using the Cartan structure equations

$$
\begin{equation*}
d \theta^{i}=-\omega_{j}^{i} \wedge \theta^{j} \tag{3.17}
\end{equation*}
$$

we can write (3.16) as

$$
\Lambda=\left(\omega_{i}{ }_{j}{ }_{j}-\omega_{j}{ }^{0}{ }_{i}\right) \theta^{i} \wedge \theta^{j}
$$

which shows that

$$
\begin{equation*}
\Lambda=0 \quad \Longleftrightarrow \quad \omega_{i}{ }_{j}{ }_{j}-\omega_{j}{ }_{i}{ }_{i}=0 \tag{3.18}
\end{equation*}
$$

Writing the Cartan Structure equations (3.17) in the alternative form

$$
\theta^{k}\left(\left[e_{i}, e_{j}\right]\right)=\omega_{i}^{k}-\omega_{j}^{k}{ }_{i},
$$

we see from (3.13) that $\sigma_{i}{ }^{k}{ }_{j}$ may be expressed as

$$
\begin{equation*}
\sigma_{i}{ }^{k}{ }_{j}=\omega_{i}{ }^{k}{ }_{j}-\omega_{j}{ }^{k}{ }_{i} . \tag{3.19}
\end{equation*}
$$

From this and (3.18), we conclude that

$$
\Lambda=0 \quad \Longleftrightarrow \quad \sigma_{i}{ }_{j}=0
$$

or in other words, the solution to the relativistic Euler equations determined by $w^{\mu}$ is irrotational in $U_{T}$ precisely when $\sigma_{i}{ }^{0}{ }_{j}$ vanishes in $U_{T}$.
Remark 3.2. The above discussion shows that $\sigma_{i}{ }^{0}{ }_{j}$ provides an alternate characterization of the fluid vorticity and that the fluid is irrotational precisely when $\sigma_{i}{ }^{0}{ }_{j}$ vanishes. We also observe that (3.12) implies the statement:

$$
\sigma_{i}{ }^{0}{ }_{j}{\mid \Omega_{0}}=0 \quad \Longrightarrow \quad \sigma_{i}{ }^{0}{ }_{j}=0 \quad \text { in } U_{T},
$$

which is equivalent to the well known fact that if the fluid is initially irrotational, then it remains irrotational under evolution.

It is also worthwhile noting that $\sigma_{i}{ }^{0}{ }_{j} \mid \Omega_{0}=0$ is only a condition on the initial data for $e_{0}^{\mu}=w^{\mu}$ as can be seen via the formula (3.15). In the case that $\sigma_{i}{ }^{0}{ }_{j} \mid \Omega_{0}=0$ is satisfied initially, it is possible to choose the initial data (3.4) for the other frame fields $e_{I}^{\mu}$ so that $\left.\sigma_{i}{ }^{K}{ }_{j}\right|_{\Omega_{0}}=0$ is also satisfied ${ }^{6}$ in addition to the other constraints (3.8). By (3.12), the constraints $\left.\sigma_{i}{ }^{K}{ }_{j}\right|_{\Omega_{0}}=0$ then propagate to yield $\sigma_{i}{ }^{k}{ }_{j}=0$ in $U_{T}$.
3.3. The wave equation. Using the Cartan structure equations (3.17) and

$$
\begin{equation*}
d \gamma_{i j}=\omega_{i j}+\omega_{j i} \tag{3.20}
\end{equation*}
$$

it is not difficult, see the proof of Proposition IV. 1 in [24] for details, to show that (3.9)-(3.12) imply that connection coefficients $\omega_{i}{ }^{j}{ }_{k}$ satisfy

$$
\frac{1}{s^{2} \gamma_{00}} \omega_{k 00}-\gamma^{I J} \omega_{k I J}=0
$$

and

$$
\omega_{k 0 J}+\omega_{k J 0}=0
$$

in $\bar{U}_{T}$. We also note that, due to (3.10), the inverse frame metric $\gamma^{i j}$ satisfies

$$
\begin{align*}
\gamma^{0 J} & =0  \tag{3.21}\\
\left(\gamma^{I J}\right) & =\left(\gamma_{I J}\right)^{-1} \tag{3.22}
\end{align*}
$$

and

$$
\begin{equation*}
\gamma^{00}=\frac{1}{\gamma_{00}} \tag{3.23}
\end{equation*}
$$

which, in turn, allows us to express (3.11) as

$$
\begin{equation*}
F\left(\sqrt{-\gamma^{00}}\right)^{2}=\frac{1}{\operatorname{det}\left(\gamma^{I J}\right)} \tag{3.24}
\end{equation*}
$$

Appealing to the definition of the Hodge star operator and the linear independence of the co-frame $\theta^{i}$, we know that the 1 -form $*\left(\theta^{1} \wedge \theta^{2} \wedge \theta^{3}\right)$ is non-vanishing and orthogonal to the $\theta^{I}$, and consequently,

$$
\begin{equation*}
\theta^{0}=f *\left(\theta^{1} \wedge \theta^{2} \wedge \theta^{3}\right) \tag{3.25}
\end{equation*}
$$

for some non-vanishing function $f$ by (3.21). To determine $f$, we apply the Hodge star operator to (3.25) to get ${ }^{7}$

$$
\begin{equation*}
\frac{1}{f} * \theta^{0}=\theta^{1} \wedge \theta^{2} \wedge \theta^{3} \tag{3.26}
\end{equation*}
$$

Wedging this with $\theta^{0}$ gives

$$
\frac{1}{f} \theta^{0} \wedge * \theta^{0}=\theta^{0} \wedge \theta^{1} \wedge \theta^{2} \wedge \theta^{3}
$$

which we can write $\mathrm{a}: \mathrm{S}_{8}$

$$
\frac{1}{f} \frac{\gamma^{00}}{\sqrt{-\operatorname{det}\left(\gamma^{i j}\right)}} \theta^{0} \wedge \theta^{1} \wedge \theta^{2} \wedge \theta^{3}=\theta^{0} \wedge \theta^{1} \wedge \theta^{2} \wedge \theta^{3}
$$

From this, we conclude that

$$
\begin{equation*}
f=-\frac{-\gamma^{00}}{\sqrt{-\operatorname{det}\left(\gamma^{i j}\right)}} \tag{3.27}
\end{equation*}
$$

[^2]which, with the help of (3.21) and (3.24), implies
\[

$$
\begin{equation*}
f=f(\zeta):=-\zeta F(\zeta) \tag{3.28}
\end{equation*}
$$

\]

where $\zeta=\sqrt{-\gamma^{00}}$.
Applying the operator $* d$ to (3.26) yields

$$
* d\left(\frac{1}{f} * \theta^{0}\right)=*\left(d \theta^{1} \wedge \theta^{2} \wedge \theta^{3}-\theta^{1} \wedge d \theta^{2} \wedge \theta^{3}+\theta^{1} \wedge \theta^{2} \wedge d \theta^{3}\right)
$$

Noting that the right hand side of this vanishes, since

$$
\begin{equation*}
d \theta^{i}=-\frac{1}{2} \sigma_{M}{ }^{i}{ }_{L} \theta^{M} \wedge \theta^{L} \tag{3.29}
\end{equation*}
$$

by (3.14) and (3.17), and

$$
\theta^{I} \wedge \theta^{J} \wedge \theta^{K} \wedge \theta^{L}=0
$$

for any choice of $I, J, K, L \in\{1,2,3\}$, we see that ${ }^{9}$

$$
* d\left(\frac{1}{f} * \theta^{0}\right)=0
$$

or equivalently, in terms of components,

$$
\nabla^{\mu}\left(\frac{1}{f} \theta_{\mu}^{0}\right)=0
$$

Applying the covariant derivative $\nabla_{\nu}$ to this expression, yields, after commuting the covariant derivatives 10 the relation

$$
\begin{equation*}
\nabla^{\mu}\left(\nabla_{\nu}\left(\frac{1}{f} \theta_{\mu}^{0}\right)\right)=\frac{1}{f} R_{\nu}{ }^{\lambda} \theta_{\lambda}^{0} \tag{3.30}
\end{equation*}
$$

Continuing on, we compute

$$
\nabla_{\nu} \zeta=-\frac{g\left(\theta^{0}, \nabla_{\nu} \theta^{0}\right)}{\sqrt{-\gamma^{00}}} \quad\left(\zeta=\sqrt{-\gamma^{00}}\right)
$$

and using (3.28) and (3.6),

$$
\frac{d}{d \zeta} \ln (-f(\zeta))=\frac{1}{\zeta}+\frac{1}{F(\zeta)} \frac{d F}{d \zeta}=\frac{1}{\zeta}-\frac{1}{\zeta s^{2}(\zeta)}
$$

From these two expressions, we find that

$$
\begin{equation*}
\nabla_{\nu}\left(\frac{1}{f} \theta_{\mu}^{0}\right)=\frac{1}{f}\left[\nabla_{\nu} \theta_{\mu}^{0}-\frac{d}{d \zeta} \ln (-f(\zeta)) \nabla_{\nu} \zeta \theta_{\mu}^{0}\right]=\frac{1}{f}\left[\nabla_{\nu} \theta_{\mu}^{0}-\left(1-\frac{1}{s^{2}}\right) \frac{g\left(\theta^{0}, \nabla_{\nu} \theta^{0}\right)}{\gamma^{00}} \theta_{\mu}^{0}\right] \tag{3.31}
\end{equation*}
$$

Using (2.1) and (3.1), it is clear from the definition (1.4) that the projection tensor $h_{\mu \nu}$ can be written as

$$
h_{\mu \nu}=g_{\mu \nu}-\frac{e_{0 \mu} e_{0 \nu}}{\gamma_{00}}
$$

or equivalently

$$
\begin{equation*}
h_{\mu \nu}=g_{\mu \nu}-\frac{1}{\gamma^{00}} \theta_{\mu}^{0} \theta_{\nu}^{0}=g_{\mu \nu}-\gamma_{00} \theta_{\mu}^{0} \theta_{\nu}^{0} \tag{3.32}
\end{equation*}
$$

using (3.15).
Setting $i=0$ in (3.29) and expressing the result in terms of covariant derivatives 11 we get that

$$
\begin{equation*}
\nabla_{\nu} \theta_{\mu}^{0}=\nabla_{\mu} \theta_{\nu}^{0}+\sigma_{M}^{0}{ }_{L} \theta_{\mu}^{M} \theta_{\nu}^{L} \tag{3.33}
\end{equation*}
$$

Using (3.32) and (3.33), we can write (3.31) as

$$
\nabla_{\nu}\left(\frac{1}{f} \theta_{\mu}^{0}\right)=\frac{1}{f}\left(h_{\mu}^{\alpha}+\frac{1}{s^{2}} \frac{\theta^{0 \alpha} \theta_{\mu}^{0}}{g\left(\theta^{0}, \theta^{0}\right)}\right)\left[\nabla_{\alpha} \theta_{\nu}^{0}+\sigma_{M}{ }^{0}{ }_{L} \theta_{\alpha}^{M} \theta_{\nu}^{L}\right]
$$

Substituting this into (3.30) yields the wave equation

$$
\begin{equation*}
\nabla_{\alpha}\left(\frac{1}{f} a^{\alpha \beta}\left[\nabla_{\beta} \theta_{\nu}^{0}+\sigma_{M}{ }^{0}{ }_{L} \theta_{\beta}^{M} \theta_{\nu}^{L}\right]\right)=\frac{1}{f} R_{\nu}{ }^{\lambda} \theta_{\lambda}^{0} \tag{3.34}
\end{equation*}
$$

[^3]where
$$
a^{\alpha \beta}=h^{\alpha \beta}+\frac{1}{s^{2}} \frac{\theta^{0 \alpha} \theta^{0 \beta}}{\gamma^{00}}
$$
which defines our Eulerian wave formulation of the Euler equations.

## Remark 3.3.

(i) From (3.15), it is clear that we can write $a^{\alpha \beta}$ as

$$
\begin{equation*}
a^{\alpha \beta}=h^{\alpha \beta}+\frac{1}{s^{2}} \frac{e_{0}^{\alpha} e_{0}^{\beta}}{\gamma_{00}}=g^{\alpha \beta}-\left(1-\frac{1}{s^{2}}\right) \frac{e_{0}^{\alpha} e_{0}^{\beta}}{\gamma_{00}}, \tag{3.35}
\end{equation*}
$$

or equivalently, using (2.1) and (3.1),

$$
a^{\alpha \beta}=h^{\alpha \beta}-\frac{1}{s^{2}} v^{\mu} v^{\nu},
$$

which we recognize as the inverse of the acoustic metric

$$
a_{\alpha \beta}=h_{\alpha \beta}-s^{2} v_{\mu} v_{\nu}
$$

(ii) Although $\theta_{\mu}^{0}$ is equivalent by (3.15) to the vector field $e_{0}=w$, which we know from the discussion in Section 2 is completely equivalent to the usual parameterization of a barotropic perfect fluid in terms of $\rho$ and $v^{\nu}$, the wave equation (3.34) does not, in general, represent a complete evolution equation for the fluid. This is due to the presence of the co-frame fields $\theta_{\beta}^{M}$, which satisfy their own evolution equations that can be derived from (3.9). The one exception to this is when the fluid is irrotational, which was shown in Section 3.2 to be equivalent to the condition $\sigma_{i}{ }^{0}{ }_{j}=0$. In this case, it is clear that (3.34) reduces to a wave equation involving only $\theta_{\nu}^{0}$, and hence provides a complete evolution equation for the fluid.

Although (3.34) does not, in general, provide a complete evolution equation for the perfect fluid, we show in the next section that this defect can be remedied by transforming to Lagrangian coordinates. The introduction of the Lagrangian coordinates is also essential to fix the free boundary and allow us to work on a fixed domain. To prepare for the change to Lagrangian coordinates, we express the covariant derivatives in (3.34) in terms of the partial derivatives and Christoffel symbols to get

$$
\begin{equation*}
\partial_{\alpha} Y_{\nu}^{\alpha}=-\Gamma_{\alpha \gamma}^{\alpha} Y_{\nu}^{\gamma}+\Gamma_{\alpha \nu}^{\gamma} Y_{\gamma}^{\alpha}+\frac{1}{f} R_{\nu}{ }^{\lambda} \theta_{\lambda}^{0} \tag{3.36}
\end{equation*}
$$

where

$$
\begin{equation*}
Y_{\nu}^{\alpha}=\frac{1}{f} a^{\alpha \beta}\left[\partial_{\beta} \theta_{\nu}^{0}-\Gamma_{\beta \nu}^{\gamma} \theta_{\gamma}^{0}+\sigma_{M}{ }^{0}{ }_{L} \theta_{\beta}^{M} \theta_{\nu}^{L}\right] \tag{3.37}
\end{equation*}
$$

## 4. The Lagrangian wave formulation of the Euler equations

4.1. Lagrangian coordinates. We introduce Lagrangian coordinates ( $\bar{x}^{\mu}$ ) adapted to the vector field $e_{0}=w$ via the formula

$$
\begin{equation*}
x^{\mu}=\phi^{\mu}\left(\bar{x}^{\lambda}\right):=\mathcal{F}_{\bar{x}^{0}}^{\mu}\left(0, \bar{x}^{\Lambda}\right) \tag{4.1}
\end{equation*}
$$

where $\mathcal{F}_{\tau}$ is the flow of $w$ defined by (2.10). From the regularity assumption (A.3) for the components of the vector field $w^{\mu}$ and the standard properties of flows, it is not difficult to verify that $\phi$ defines a $C^{k}$ diffeomorphism

$$
\phi: \Omega_{T}:=[0, T] \times \Omega \longrightarrow U_{T}:\left(\bar{x}^{\lambda}\right) \longmapsto\left(\phi^{\mu}\left(\bar{x}^{\lambda}\right)\right),
$$

and that

$$
\begin{equation*}
\left.\phi\right|_{\Omega_{0}}=\operatorname{id}_{\Omega_{0}} . \tag{4.2}
\end{equation*}
$$

Moreover, since $\phi$ is generated by the flow of $e_{0}$, the pullback

$$
\bar{e}_{0}=\phi^{*} e_{0}
$$

satisfies

$$
\begin{equation*}
\bar{e}_{0}=\bar{\partial}_{0} \quad \Longleftrightarrow \quad \bar{e}_{0}^{\mu}=\delta_{0}^{\mu} \tag{4.3}
\end{equation*}
$$

where here and below, we use

$$
\bar{\partial}_{\mu}=\frac{\partial}{\partial \bar{x}^{\mu}}
$$

to denote the partial derivative with respect to the Lagrangian coordinates $\left(\bar{x}^{\mu}\right)$.
For use below, we let

$$
\begin{equation*}
J=\left(J_{\nu}^{\mu}\right):=\left(\bar{\partial}_{\nu} \phi^{\mu}\right) \tag{4.4}
\end{equation*}
$$

denote the Jacobian matrix of the coordinate transformation (4.1) and

$$
\begin{equation*}
\check{J}=\left(\check{J}_{\nu}^{\mu}\right):=J^{-1} \tag{4.5}
\end{equation*}
$$

its inverse. Using this notation, the components of the pullback $\bar{e}_{0}^{\mu}$ can be computed via the formula

$$
\bar{e}_{0}^{\mu}=\check{J}_{\nu}^{\mu} e_{0}^{\nu} \circ \phi
$$

From this, it follows immediately that

$$
\begin{equation*}
\bar{\partial}_{0} \phi^{\mu}=e_{0}^{\mu} \circ \phi \tag{4.6}
\end{equation*}
$$

is equivalent to (4.3).
4.2. Initial conditions. Since the vector field $e_{0}^{\mu}=w^{\mu}$ completely determines the proper energy density $\rho$ and the fluid four-velocity $v^{\nu}$,

$$
f_{0}^{\mu}:=\left.e_{0}^{\mu}\right|_{\Omega_{0}}
$$

contains all of the initial data for the fluid. We are then free to choose the other initial data $f_{I}^{\mu}$, see (3.4), as we like as long as the constraints (3.8) are satisfied. For our purposes, we need to fix the $f_{I}^{\mu}$ in a specific fashion beyond just satisfying the constraints (3.8). However, before we discuss this, we first make some observations starting with the pullback frame

$$
\begin{equation*}
\bar{e}_{i}=\phi^{*} e_{i} \quad \Longleftrightarrow \quad \bar{e}_{i}^{\mu}=\check{J}_{\nu}^{\mu} \tilde{e}_{i}^{\nu} \tag{4.7}
\end{equation*}
$$

where

$$
\begin{equation*}
\tilde{e}_{i}^{\nu}=e_{i}^{\nu} \circ \phi \tag{4.8}
\end{equation*}
$$

or equivalently

$$
\begin{equation*}
\tilde{e}_{i}^{\mu}=\bar{e}_{i}^{\lambda} \bar{\partial}_{\lambda} \phi^{\mu} \tag{4.9}
\end{equation*}
$$

Since the $e_{i}$ satisfy (3.9) and the Lie bracket is natura. 12 with respect to pullbacks by diffeomorphisms, the $\bar{e}_{i}$ must also satisfy $\left[\bar{e}_{0}, \bar{e}_{I}\right]=0$, or equivalently, by (4.3),

$$
\begin{equation*}
\bar{\partial}_{0} \bar{e}_{j}^{\mu}=0 \tag{4.10}
\end{equation*}
$$

In particular, this shows that the frame fields $\bar{e}_{I}^{\mu}$ are independent of $\bar{x}^{0}$. We also note that

$$
\begin{equation*}
\left.\tilde{e}_{j}^{\mu}\right|_{\{0\} \times \Omega}=f_{j}^{\mu} \tag{4.11}
\end{equation*}
$$

and

$$
\left.\left(J_{\nu}^{\mu}\right)\right|_{\{0\} \times \Omega}=\left(\begin{array}{ll}
f_{0}^{\mu} & \delta_{\Sigma}^{\mu} \tag{4.12}
\end{array}\right)
$$

by (4.2) and (4.6). Using (4.12), we compute

$$
\left.\left(\check{J}_{\nu}^{\mu}\right)\right|_{\{0\} \times \Omega}=\left(\begin{array}{cc}
\frac{1}{f_{0}^{0}} & 0 \\
-\frac{1}{f_{0}^{0}} f_{0}^{\Lambda} & \delta_{\Sigma}^{\Lambda}
\end{array}\right)
$$

From this, (4.11) and the fact that the $\bar{e}_{I}^{\mu}$ are $\bar{x}^{0}$-independent, we find that

$$
\left(\bar{e}_{i}^{\mu}\right)=\left(\begin{array}{cc}
1 & f_{I}^{0}  \tag{4.13}\\
0 & -\frac{1}{f_{0}^{0}} f_{0}^{\Lambda} f_{I}^{0}+f_{I}^{\Lambda}
\end{array}\right)
$$

By assumption, $\bar{e}_{0}=\bar{\partial}_{0}$ is tangent to the matter-vacuum boundary, which is given in Lagrangian coordinates by

$$
\Gamma_{T}:=[0, T] \times \partial \Omega
$$

Using the Gram-Schmidt algorithm, we can complete $\bar{e}_{0}$ to a basis

$$
\begin{equation*}
\left\{\bar{e}_{0}, \bar{z}_{1}=\bar{z}_{1}^{\mu} \bar{\partial}_{\mu}, \bar{z}_{2}=\bar{z}_{2}^{\mu} \bar{\partial}_{\mu}\right\} \tag{4.14}
\end{equation*}
$$

of $\Gamma_{T}$ such that the frame is orthogonal at $\bar{x}^{0}=0$, and the components $\bar{z}_{\mathfrak{A}}{ }^{\mu}, \mathfrak{A}=1,2$, are $\bar{x}^{0}$-independent. Here, the orthogonality at $\bar{x}^{0}=0$ is determined with respect to the pull-back metric

$$
\bar{g}:=\phi^{*} g=\bar{g}_{\alpha \beta} d x^{\alpha} d x^{\beta}
$$

with components given by

$$
\begin{equation*}
\bar{g}_{\alpha \beta}=J_{\alpha}^{\mu} J_{\beta}^{\nu} g_{\mu \nu} \circ \phi \tag{4.15}
\end{equation*}
$$

[^4]We can then extend the basis (4.14) to $\Omega_{T}$, while keeping the components $\bar{z}_{\mathfrak{A}}{ }^{\mu}, \mathfrak{A}=1,2, \bar{x}^{0}$-independent, and complete it to a full frame

$$
\left\{\bar{e}_{0}, \bar{z}_{1}=\bar{z}_{1}^{\mu} \bar{\partial}_{\mu}, \bar{z}_{2}=\bar{z}_{2}^{\mu} \bar{\partial}_{\mu}, \bar{z}_{3}=\bar{z}_{3}^{\mu} \bar{\partial}_{\mu}\right\}
$$

such that: $\bar{z}_{3}$ is outward pointing at the boundary $\Gamma_{T}$, the components $\bar{z}_{3}^{\mu}$ are $\bar{x}^{0}$-independent, and the frame is orthogonal at $\bar{x}^{0}=0$. Thus, in particular,

$$
\begin{equation*}
\operatorname{Span}\left\{\left.\left\{\bar{e}_{0}, \bar{z}_{\mathfrak{A}}\right\}\right|_{T \Gamma_{T}} \mid \mathfrak{A}=1,2\right\}=T \Gamma_{T} \tag{4.16}
\end{equation*}
$$

and

$$
\left.\bar{g}\left(\bar{e}_{0}, \bar{z}_{I}\right)\right|_{\Omega_{0}}=0
$$

We also observe via (4.2), (4.12) and (4.15) that

$$
\left.\bar{g}\left(\bar{z}_{I}, \bar{z}_{J}\right)\right|_{\Omega_{0}}=\left.\left(\bar{z}_{I}^{0} f_{0}^{\mu}+\bar{z}_{I}^{\Sigma} \delta_{\Sigma}^{\mu}\right)\left(\bar{z}_{J}^{0} f_{0}^{\nu}+\bar{z}_{J}^{\Lambda} \delta_{\Lambda}^{\nu}\right) g_{\mu \nu}\right|_{\Omega_{0}}
$$

Next, we set

$$
\begin{equation*}
f_{I}^{0}=\left.\operatorname{det}\left(\bar{g}\left(\bar{z}_{I}, \bar{z}_{J}\right)\right)^{-\frac{1}{6}} F\left(\left(-g_{00}\right)^{\frac{1}{2}}\right) \bar{z}_{I}^{0}\right|_{\Omega_{0}} \tag{4.17}
\end{equation*}
$$

and

$$
\begin{equation*}
f_{I}^{\Lambda}=\left.\operatorname{det}\left(\bar{g}\left(\bar{z}_{I}, \bar{z}_{J}\right)\right)^{-\frac{1}{6}} F\left(\left(-g_{00}\right)^{\frac{1}{2}}\right)\left(\bar{z}_{I}^{\Lambda}+\frac{f_{0}^{\Lambda}}{f_{0}^{0}} \bar{z}_{I}^{0}\right)\right|_{\Omega_{0}} \tag{4.18}
\end{equation*}
$$

From the above two expressions and (4.13), we obtain

$$
\bar{e}_{I}^{\mu}=\operatorname{det}\left(\bar{g}\left(\bar{z}_{I}, \bar{z}_{J}\right)\right)^{-\frac{1}{6}} F\left(\left(-g_{00}\right)^{\frac{1}{2}}\right)^{\frac{1}{3}} \bar{z}_{I}^{\mu}
$$

which, in turn, implies that

$$
\left.g\left(e_{0}, e_{J}\right)\right|_{\Omega_{0}}=\left.\bar{g}\left(\bar{e}_{0}, \bar{e}_{J}\right)\right|_{\Omega_{0}}=0
$$

and

$$
\left.\operatorname{det}\left(g\left(e_{I}, e_{J}\right)\right)\right|_{\Omega_{0}}=\left.\operatorname{det}\left(\bar{g}\left(\bar{e}_{I}, \bar{e}_{J}\right)\right)\right|_{\Omega_{0}}=\left.F\left(\left(-g_{00}\right)^{\frac{1}{2}}\right)^{2}\right|_{\Omega_{0}}
$$

This shows the constraints (3.8) are satisfied for the choice of initial data $f_{I}^{\mu}$ given by (4.17) and (4.18), and that

$$
\begin{equation*}
\operatorname{Span}\left\{\left.\bar{e}_{\mathfrak{a}}\right|_{\Gamma_{T}} \mid \mathfrak{a}=0,1,2\right\}=T \Gamma_{T} \tag{4.19}
\end{equation*}
$$

by virtue of (4.16). It is also not difficult to see from the above construction that we can always ensure that

$$
\begin{equation*}
c_{f}>\operatorname{det}(\bar{e})>\frac{1}{c_{f}}>0 \quad \text { in } \Gamma_{T} \tag{4.20}
\end{equation*}
$$

holds for some positive constant $c_{f}$.
In terms of the co-frame, we have that

$$
\begin{equation*}
\bar{\theta}^{i}=\phi^{*} \bar{\theta}^{i} \quad \Longleftrightarrow \quad \bar{\theta}_{\mu}^{i}=J_{\mu}^{\nu} \tilde{\theta}_{\nu}^{i} \tag{4.21}
\end{equation*}
$$

where

$$
\begin{equation*}
\left(\tilde{\theta}_{\nu}^{i}\right):=\left(\theta_{\nu}^{i} \circ \phi\right)=\left(\tilde{e}_{i}^{\nu}\right)^{-1} \quad \text { and } \quad\left(\bar{\theta}_{\nu}^{i}\right)=\left(\bar{e}_{i}^{\nu}\right)^{-1} . \tag{4.22}
\end{equation*}
$$

By definition, $\bar{\theta}_{\mu}^{3} \bar{e}_{j}^{\mu}=\delta_{j}^{3}$, and so, by (4.3) and (4.19), $\bar{\theta}_{\mu}^{3}$ satisfies $\theta_{0}^{3}=0$, and, consequently,

$$
\begin{equation*}
\nu_{\mu}:=\bar{\theta}_{\mu}^{3}=\delta_{\mu}^{\Sigma} \theta_{\Sigma}^{3} \tag{4.23}
\end{equation*}
$$

defines a $\bar{x}^{0}$-independent, outward pointing (non-normalized) co-normal to the boundary $\Gamma_{T}$, while $\nu_{\Sigma}$ defines an outward pointing co-normal to the boundary $\partial \Omega$. Finally, letting

$$
\left(\check{f}_{\mu}^{j}\right)=\left(f_{\mu}^{j}\right)^{-1}
$$

denote the inverse of $f_{\mu}^{j}$, a short calculation shows that

$$
\left(\bar{\theta}_{\mu}^{j}\right)=\left(\begin{array}{cc}
\delta_{0}^{j} & \check{f}_{\Lambda}^{j} \tag{4.24}
\end{array}\right)
$$

4.3. The wave formulation in Lagrangian coordinates. The key to transforming the wave equation (3.36), or equivalently (3.34), into Lagrangian coordinates is the following well known transformation formula for the divergence of a vector field:

$$
\begin{equation*}
|\bar{g}|^{-\frac{1}{2}} \bar{\partial}_{\mu}\left(|\bar{g}|^{\frac{1}{2}} \bar{X}^{\mu}\right)=\phi^{*}\left(|g|^{-\frac{1}{2}} \partial_{\mu}\left(|g|^{\frac{1}{2}} X^{\mu}\right)\right) \tag{4.25}
\end{equation*}
$$

where

$$
\bar{X}^{\mu}=\check{J}_{\nu}^{\mu} X^{\nu} \circ \phi
$$

$|g|=-\operatorname{det}\left(g_{\mu \nu}\right)$, and $|\bar{g}|=-\operatorname{det}\left(\bar{g}_{\mu \nu}\right)$. Setting

$$
X^{\alpha}=|g|^{-\frac{1}{2}} Y_{\nu}^{\alpha}
$$

where $Y_{\nu}^{\alpha}$ is as defined previously by (3.37), a short calculation, using the chain rule, shows that

$$
\begin{equation*}
|\bar{g}|^{-\frac{1}{2}} \bar{X}^{\alpha}=\left(\frac{|\bar{g}|}{|g| \circ \phi}\right)^{\frac{1}{2}}\left[\frac{1}{\tilde{f}} \bar{a}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{\theta}_{\nu}^{0}+\frac{1}{\tilde{f}} \bar{a}^{\alpha \beta}\left(-J_{\beta}^{\omega} \tilde{\Gamma}_{\omega \nu}^{\gamma} \tilde{\theta}_{\gamma}^{0}+\tilde{\sigma}_{M}{ }^{0}{ }_{L} \bar{\theta}_{\beta}^{M} \tilde{\theta}_{\nu}^{L}\right)\right] \tag{4.26}
\end{equation*}
$$

where

$$
\bar{a}^{\alpha \beta}=\left(\phi^{*} a\right)^{\alpha \gamma}=\check{J}_{\mu}^{\alpha} \check{J}_{\nu}^{\beta} a^{\mu \nu} \circ \phi
$$

denotes the pull-back of the acoustic metric $a^{\mu \nu}$ by $\phi$, and we have introduced the definitions

$$
\begin{align*}
& \tilde{\theta}_{\nu}^{0}=\theta_{\nu}^{0} \circ \phi,  \tag{4.27}\\
& \tilde{\sigma}_{M}{ }^{0}{ }_{L}=\sigma_{M}{ }^{0}{ }_{L} \circ \phi,  \tag{4.28}\\
& \tilde{\Gamma}_{\omega \sigma}^{\mu}=\Gamma_{\omega \sigma}^{\mu} \circ \phi,  \tag{4.29}\\
& \tilde{f}=f \circ \phi \tag{4.30}
\end{align*}
$$

and

$$
\begin{equation*}
\tilde{a}^{\mu \nu}=a^{\mu \nu} \circ \phi \tag{4.31}
\end{equation*}
$$

Next, we define

$$
\begin{equation*}
\tilde{g}_{\mu \nu}=g_{\mu \nu} \circ \phi \quad \text { and } \quad \tilde{g}^{\mu \nu}=g^{\mu \nu} \circ \phi, \tag{4.32}
\end{equation*}
$$

and note that

$$
|\bar{g}|=-\operatorname{det}\left(J_{\nu}^{\alpha} \tilde{g}_{\alpha \beta} J_{\nu}^{\alpha}\right)=\operatorname{det}(J)^{2}|\tilde{g}|=\operatorname{det}(J)^{2}|g| \circ \phi
$$

or equivalently

$$
\begin{equation*}
\left(\frac{|\bar{g}|}{|g| \circ \phi}\right)^{\frac{1}{2}}=\operatorname{det}(J) \tag{4.33}
\end{equation*}
$$

Additionally, we define

$$
\begin{equation*}
\tilde{\gamma}_{i j}=\gamma_{i j} \circ \phi \quad \text { and } \quad \tilde{\gamma}^{i j}=\gamma^{i j} \circ \phi \tag{4.34}
\end{equation*}
$$

and observe that

$$
\begin{equation*}
\tilde{f}=f\left(\left(-\tilde{\gamma}_{00}\right)^{-1 / 2}\right) \tag{4.35}
\end{equation*}
$$

where

$$
\begin{equation*}
\tilde{\gamma}_{00}=\tilde{g}_{\alpha \beta} \tilde{e}_{0}^{\alpha} \tilde{e}_{0}^{\beta}=\frac{1}{\tilde{g}^{\alpha \beta} \tilde{\theta}_{\alpha}^{0} \tilde{\theta}_{\beta}^{0}} \tag{4.36}
\end{equation*}
$$

and

$$
\begin{equation*}
\tilde{a}^{\mu \nu}=\tilde{g}^{\mu \nu}-\frac{1}{\tilde{\gamma}_{00}}\left(1-\frac{1}{\tilde{s}^{2}}\right) \tilde{e}_{0}^{\mu} \tilde{e}_{0}^{\nu}=\tilde{g}^{\mu \nu}-\tilde{\gamma}_{00}\left(1-\frac{1}{\tilde{s}^{2}}\right) \tilde{g}^{\mu \alpha} \tilde{g}^{\nu \beta} \tilde{\theta}_{\alpha}^{0} \tilde{\theta}_{\beta}^{0} \tag{4.37}
\end{equation*}
$$

where

$$
\begin{equation*}
\tilde{s}^{2}=s^{2}\left(\left(-\tilde{\gamma}_{00}\right)^{-1 / 2}\right) \tag{4.38}
\end{equation*}
$$

Using (4.25), (4.26), and (4.33), it follows that the wave equation (3.36) when expressed in Lagrangian coordinates becomes

$$
\begin{equation*}
\bar{\partial}_{\alpha}\left(\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{\theta}_{\nu}^{0}+\tilde{L}_{\nu}^{\alpha}\right)=\tilde{F}_{\nu} \tag{4.39}
\end{equation*}
$$

where

$$
\begin{align*}
\tilde{A}^{\alpha \beta} & =-\frac{\operatorname{det}(J)}{\tilde{f}} \bar{a}^{\alpha \beta}  \tag{4.40}\\
\tilde{L}_{\nu}^{\alpha} & =-\frac{\operatorname{det}(J)}{\tilde{f}} \bar{a}^{\alpha \beta}\left(-J_{\beta}^{\omega} \tilde{\Gamma}_{\omega \nu}^{\gamma} \tilde{\theta}_{\gamma}^{0}+\tilde{\sigma}_{M}{ }^{0}{ }_{L} \bar{\theta}_{\beta}^{M} \tilde{\theta}_{\nu}^{L}\right),  \tag{4.41}\\
\tilde{F}_{\nu} & =-\operatorname{det}(J)\left(-\tilde{\Gamma}_{\alpha \gamma}^{\alpha} \tilde{Y}_{\nu}^{\gamma}+\tilde{\Gamma}_{\alpha \nu}^{\gamma} \tilde{Y}_{\gamma}^{\alpha}+\frac{1}{f} \tilde{R}_{\nu}{ }^{\lambda} \tilde{\theta}_{\lambda}^{0}\right),  \tag{4.42}\\
\tilde{Y}_{\nu}^{\alpha} & =\frac{1}{\tilde{f}} \tilde{a}^{\alpha \beta}\left[\tilde{J}_{\beta}^{\gamma} \bar{\partial}_{\gamma} \tilde{\theta}_{\nu}^{0}-\tilde{\Gamma}_{\beta \nu}^{\gamma} \tilde{\theta}_{\gamma}^{0}+\tilde{\sigma}_{M}{ }^{0}{ }_{L} \tilde{\theta}_{\beta}^{M} \tilde{\theta}_{\nu}^{L}\right] \tag{4.43}
\end{align*}
$$

and

$$
\begin{equation*}
\tilde{R}_{\nu}{ }^{\lambda}=R_{\nu}{ }^{\lambda} \circ \phi . \tag{4.44}
\end{equation*}
$$

From the chain rule, (3.12) and (4.6) it is straightforward to verify that $\tilde{\sigma}_{i}{ }^{k}{ }_{j}$ satisfies the evolution equation

$$
\bar{\partial}_{0} \tilde{\sigma}_{i}{ }^{k}{ }_{j}=0 .
$$

Using this and (4.2), it follows immediately that

$$
\begin{equation*}
\tilde{\sigma}_{i}{ }^{k}{ }_{j}\left(\bar{x}^{0}, \bar{x}^{\Sigma}\right)=\sigma_{i}{ }^{k}{ }_{j}\left(0, \bar{x}^{\Sigma}\right) . \tag{4.45}
\end{equation*}
$$

We also observe that

$$
\begin{equation*}
\bar{\partial}_{0} \phi^{\mu}=\tilde{\gamma}_{00} \tilde{g}^{\mu \nu} \tilde{\theta}_{\nu}^{0} \tag{4.46}
\end{equation*}
$$

follows from (3.15) and (4.6), while

$$
\begin{equation*}
\tilde{\theta}_{\mu}^{I}=\check{J}_{\mu}^{\nu} \bar{\theta}_{\nu}^{I} \tag{4.47}
\end{equation*}
$$

is a consequence of (4.21).
The two evolution equations (4.39) and (4.46) along with the definitions (4.4), (4.5), (4.29), (4.32), (4.35)-(4.38), (4.40)-(4.45), and (4.47) constitute our Lagrangian wave formulation of the Euler equations.

Remark 4.1. In the simpler setting where the pressure never vanishes and there is no free boundary, it already follows from known results that our Lagrangian wave formulation is complete in the sense that the evolution equations (4.39) and (4.46) for the pair $\left(\phi^{\mu}, \tilde{\theta}_{\mu}^{0}\right)$ are well-posed, and in particular, solutions of (4.39) and (4.46) satisfy energy estimates. Indeed, the evolution equations (4.39) and (4.46) fit within the class of wave equations considered in [19]. Although boundary conditions, which do not include the boundary conditions consider in this article, were imposed in [19], it is clear that results of [19] continue to hold in the absence of a boundary, and hence apply to the system (4.39) and (4.46) immediately when no boundary is present.
4.4. The time differentiated wave equation. Due to the free boundary, it is not enough to consider the evolution equations (4.39) and (4.46) alone. Instead, we must supplement them with what amounts to a $\bar{x}^{0}$-differentiated version of the wave equation (4.39). With this in mind, we define

$$
\psi_{\nu}=\left(\nabla_{e_{0}} \theta_{\nu}^{0}\right) \circ \phi
$$

and note using (4.3) and the chain rule that this can be written as

$$
\psi_{\nu}=\bar{\partial}_{0} \tilde{\theta}_{\nu}^{0}+\beta_{\nu}^{\lambda} \tilde{\theta}_{\lambda}^{0}
$$

where we have set

$$
\beta_{\nu}^{\lambda}:=-\tilde{e}_{0}^{\gamma} \tilde{\Gamma}_{\gamma \nu}^{\lambda} \stackrel{\sqrt{3.15}}{=}-\tilde{\gamma}_{00} \tilde{g}^{\gamma \sigma} \tilde{\theta}_{\sigma}^{0} \tilde{\Gamma}_{\gamma \nu}^{\lambda}
$$

Differentiating (4.39) with respect to $\bar{x}^{0}$, a short calculation shows that $\psi_{\nu}$ satisfies the wave equation

$$
\begin{equation*}
\bar{\partial}_{\alpha}\left(\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \psi_{\nu}+L_{\nu}^{\alpha}\right)=F_{\nu} \tag{4.48}
\end{equation*}
$$

where

$$
L_{\nu}^{\alpha}=\bar{\partial}_{0} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{\theta}_{\nu}^{0}+\bar{\partial}_{0} \tilde{L}_{\nu}^{\alpha}+\beta_{\nu}^{\omega} \tilde{L}_{\omega}^{\alpha}-\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \beta_{\nu}^{\omega} \tilde{\theta}_{\omega}^{0}
$$

and

$$
F_{\nu}=\bar{\partial}_{0} \tilde{F}_{\nu}+\beta_{\nu}^{\omega} \tilde{F}_{\omega}+\bar{\partial}_{\alpha} \beta_{\nu}^{\omega}\left(\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{\theta}_{\omega}^{0}+\tilde{L}_{\omega}^{\alpha}\right)
$$

Next, we define a positive definite, symmetric 2-tensor by

$$
\begin{equation*}
m^{\alpha \beta}:=g^{\alpha \beta}-\frac{1}{\gamma_{00}} e_{0}^{\alpha} e_{0}^{\beta} \stackrel{\sqrt{3.15}}{=} g^{\alpha \beta}-\gamma_{00} g^{\mu \alpha} g^{\nu \beta} \theta_{\mu}^{0} \theta_{\nu}^{0} \tag{4.49}
\end{equation*}
$$

and we let

$$
\left(m_{\alpha \beta}\right)=\left(m^{\alpha \beta}\right)^{-1}
$$

denote its inverse. A short calculation then shows that

$$
m_{\alpha \beta}=g_{\mu \nu}-\frac{1}{\gamma^{00}} \theta_{\mu}^{0} \theta_{\nu}^{0}
$$

Setting

$$
\tilde{m}^{\mu \nu}=m^{\mu \nu} \circ \phi \quad \text { and } \quad \tilde{m}_{\mu \nu}=m_{\mu \nu} \circ \phi
$$

we then have that

$$
\begin{gathered}
\tilde{m}_{\alpha \beta}=\tilde{g}_{\alpha \beta}-\frac{2}{\tilde{\gamma}^{00}} \tilde{\theta}_{\alpha}^{0} \theta_{\beta}^{0} \\
\tilde{m}^{\alpha \beta}=\tilde{g}^{\alpha \beta}-\frac{2}{\tilde{\gamma}_{00}} \tilde{e}_{0}^{\alpha} \tilde{e}_{0}^{\beta}=\tilde{g}^{\alpha \beta}-2 \tilde{\gamma}_{00} \tilde{g}^{\mu \alpha} \tilde{g}^{\nu \beta} \tilde{\theta}_{\alpha}^{0} \tilde{\theta}_{\beta}^{0}
\end{gathered}
$$

and

$$
\tilde{m}_{\alpha \beta} \tilde{m}^{\beta \gamma}=\delta_{\alpha}^{\gamma}
$$

Continuing on, we defin 13

$$
\begin{equation*}
\mu=|\psi|_{\tilde{m}} \tag{4.50}
\end{equation*}
$$

and

$$
\begin{equation*}
\hat{\psi}_{\nu}=\frac{1}{\mu} \psi_{\nu} \tag{4.51}
\end{equation*}
$$

Remark 4.2. The variable $\hat{\psi}_{\nu}$ is well defined wherever $\mu=\left|\nabla_{e_{0}} \theta^{0}\right|_{m} \circ \phi$ is positive. As we show in Section 5.2 below, see (5.21) and (5.22), the Taylor sign condition implies that $\mu$ is bounded away from zero on the boundary $\Gamma_{T}$. From the smoothness of the solution it follows immediately that $\mu$ is bounded away from zero in a neighborhood of the boundary. Away from the boundary, we can, via the finite propagation speed, obtain energy estimates using the theory of symmetric hyperbolic systems. Because of this, it is enough to consider the problem in a neighborhood of the boundary, and consequently, we lose no generality by assuming that

$$
\begin{equation*}
\mu \geq c_{\mu}>0 \quad \text { in } \bar{\Omega}_{T} \tag{4.52}
\end{equation*}
$$

for some positive constant $c_{\mu}$.
Differentiating $\hat{\psi}_{\nu}$, we find that

$$
\begin{equation*}
\bar{\partial}_{\mu} \hat{\psi}_{\nu}=\frac{1}{\mu} \pi_{\nu}^{\lambda} \bar{\partial}_{\mu} \psi_{\lambda}-\frac{1}{2} \bar{\partial}_{\mu} \tilde{m}^{\alpha \beta} \hat{\psi}_{\alpha} \hat{\psi}_{\beta} \hat{\psi}_{\nu} \tag{4.53}
\end{equation*}
$$

where

$$
\begin{equation*}
\pi_{\mu}^{\lambda}=\delta_{\nu}^{\lambda}-\hat{\psi}^{\lambda} \hat{\psi}_{\nu} \quad\left(\hat{\psi}^{\lambda}:=\tilde{m}^{\lambda \gamma} \hat{\psi}_{\gamma}\right) \tag{4.54}
\end{equation*}
$$

is the projection operator uniquely defined by the properties

$$
\begin{equation*}
\pi_{\nu}^{\lambda} \hat{\psi}_{\lambda}=0 \quad \text { and } \quad \pi_{\nu}^{\lambda} \pi_{\lambda}^{\mu}=\pi_{\nu}^{\mu} \tag{4.55}
\end{equation*}
$$

while differentiating $\mu$ yields

$$
\begin{equation*}
\bar{\partial}_{\gamma} \mu=\hat{\psi}^{\alpha} \bar{\partial}_{\gamma} \psi_{\alpha}+\frac{\mu}{2} \bar{\partial}_{\gamma} \tilde{m}^{\alpha \beta} \hat{\psi}_{\alpha} \hat{\psi}_{\beta} \tag{4.56}
\end{equation*}
$$

For use below, we define the following variants of the projection operator $\pi_{\nu}^{\mu}$ :

$$
\pi^{\mu \nu}=\tilde{m}^{\mu \lambda} \pi_{\lambda}^{\nu} \quad \text { and } \quad \pi_{\mu \nu}=\tilde{m}_{\mu \lambda} \pi_{\nu}^{\lambda}
$$

From (4.53), we see that

$$
\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \hat{\psi}_{\nu}=\frac{1}{\mu} \pi_{\nu}^{\omega} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \psi_{\omega}-\frac{1}{2} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{m}^{\sigma \gamma} \hat{\psi}_{\sigma} \hat{\psi}_{\gamma} \hat{\psi}_{\nu}
$$

[^5]and hence that
$$
\bar{\partial}_{\alpha}\left(\mu \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \hat{\psi}_{\nu}\right)=\bar{\partial}_{\alpha}\left(\pi_{\nu}^{\omega} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \psi_{\omega}-\frac{\mu}{2} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{m}^{\sigma \gamma} \hat{\psi}_{\sigma} \hat{\psi}_{\gamma} \hat{\psi}_{\nu}\right)
$$

Using this and (4.48), we see that $\hat{\psi}_{\nu}$ satisfies the wave equation

$$
\begin{equation*}
\bar{\partial}_{\alpha}\left(\mu \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \hat{\psi}_{\nu}+\frac{\mu}{2} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{m}^{\sigma \gamma} \hat{\psi}_{\sigma} \hat{\psi}_{\gamma} \hat{\psi}_{\nu}+\pi_{\nu}^{\omega} L_{\omega}^{\nu}\right)=\pi_{\nu}^{\omega} F_{\omega}+\bar{\partial}_{\alpha} \pi_{\nu}^{\omega}\left(\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \psi_{\omega}+L_{\omega}^{\alpha}\right) \tag{4.57}
\end{equation*}
$$

A similar computation starting from the identity

$$
\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \mu=\frac{\psi^{\gamma}}{\mu} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \psi_{\gamma}+\frac{\mu}{2} \bar{\partial}_{\beta} \tilde{m}^{\sigma \gamma} \tilde{A}^{\alpha \beta} \hat{\psi}_{\sigma} \hat{\psi}_{\gamma}
$$

which holds by (4.56), shows that $\mu$ satisfies the wave equation

$$
\begin{equation*}
\bar{\partial}_{\alpha}\left(\tilde{A}^{\alpha \beta} \partial_{\beta} \mu-\frac{\mu}{2} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{m}^{\sigma \gamma} \hat{\psi}_{\sigma} \hat{\psi}_{\gamma}+\hat{\psi}^{\gamma} L_{\gamma}^{\alpha}\right)=\hat{\psi}^{\gamma} F_{\gamma}+\bar{\partial}_{\alpha} \hat{\psi}^{\gamma}\left(\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \psi_{\gamma}+L_{\gamma}^{\alpha}\right) \tag{4.58}
\end{equation*}
$$

Setting

$$
\begin{equation*}
\Psi=\binom{\hat{\psi}_{\nu}}{\mu} \tag{4.59}
\end{equation*}
$$

we combine (4.57) and (4.58) into the single equation

$$
\begin{equation*}
\bar{\partial}_{\alpha}\left(\mathcal{A}^{\alpha \beta} \bar{\partial}_{\beta} \Psi+\mathcal{L}^{\alpha}\right)=\mathcal{F} \tag{4.60}
\end{equation*}
$$

where

$$
\begin{aligned}
\mathcal{A}^{\alpha \beta} & =\left(\begin{array}{cc}
\mu^{2} \tilde{A}^{\alpha \beta} \tilde{m}^{\mu \nu} & 0 \\
0 & \tilde{A}^{\alpha \beta}
\end{array}\right) \\
\mathcal{L}^{\alpha} & =\left(\begin{array}{cc}
\frac{\mu^{2}}{2} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{m}^{\sigma \gamma} \hat{\psi}_{\sigma} \hat{\psi}_{\gamma} \hat{\psi}^{\mu}+\mu \pi^{\omega \mu} L_{\omega}^{\nu} & 0 \\
0 & -\frac{\mu}{2} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{m}^{\sigma \gamma} \hat{\psi}_{\sigma} \hat{\psi}_{\gamma}+\hat{\psi}^{\gamma} L_{\gamma}^{\alpha}
\end{array}\right),
\end{aligned}
$$

and

$$
\mathcal{F}=\binom{f_{\nu}}{f}
$$

with

$$
\begin{aligned}
& f_{\nu}=\mu \tilde{m}^{\mu \nu}\left(\pi_{\nu}^{\omega} F_{\omega}+\bar{\partial}_{\alpha} \pi_{\nu}^{\omega}\left(\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \psi_{\omega}+L_{\omega}^{\alpha}\right)\right) \\
& \quad+\bar{\partial}_{\alpha}\left(\mu \tilde{m}^{\mu \nu}\right)\left(\mu \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \hat{\psi}_{\nu}+\frac{\mu}{2} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{m}^{\sigma \gamma} \hat{\psi}_{\sigma} \hat{\psi}_{\gamma} \hat{\psi}_{\nu}+\pi_{\nu}^{\omega} L_{\omega}^{\nu}\right) \\
& f=\hat{\psi}^{\gamma} F_{\gamma}+\bar{\partial}_{\alpha} \hat{\psi}^{\gamma}\left(\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \psi_{\gamma}+L_{\gamma}^{\alpha}\right)
\end{aligned}
$$

## 5. Boundary conditions

By virtue of (4.3), the boundary condition (2.11) is automatically incorporated into the definition of the Lagrangian coordinates (4.1). Therefore, from this perspective the only non-trivial boundary condition is (2.12), or equivalently (3.5), which in Lagrangian coordinates becomes

$$
\begin{equation*}
\left.\tilde{\gamma}_{00}\right|_{\Gamma_{T}}=-1 \tag{5.1}
\end{equation*}
$$

Written this way, there does not seem to be enough boundary conditions to derive energy estimates using our wave formulation. However, as we show below this single boundary condition does, in fact, imply a sufficient set of boundary conditions. We also note that (3.5) implies, by (3.7), (3.28) and (4.35), that

$$
\begin{equation*}
\left.\tilde{f}\right|_{\Gamma_{T}}=-1 \tag{5.2}
\end{equation*}
$$

5.1. Neumann boundary conditions. The first set of boundary conditions that we derive from (5.1), or equivalently (3.5) in the Eulerian picture, are of Neumann type, albeit degenerate. The derivation of these boundary conditions begins with the identity

$$
\begin{align*}
\theta_{\alpha}^{3} g^{\alpha \beta} \nabla_{\beta} \theta_{\nu}^{0} & =\theta_{\alpha}^{3} g^{\alpha \beta} \nabla_{\nu} \theta_{\beta}^{0}-\sigma_{M}{ }^{0}{ }_{L} \theta_{\alpha}^{3} g^{\alpha \beta} \theta_{\beta}^{I} \theta_{\nu}^{J} & & (\text { by (3.33) ) } \\
& =g\left(\theta^{3}, \nabla_{\nu} \theta^{0}\right)-\sigma_{M}{ }^{0}{ }_{L} g\left(\theta^{3}, \theta^{M}\right) \theta_{\nu}^{L} & & (\text { by (3.21) ) } \\
& =-g\left(\nabla_{\nu} \theta^{3}, \theta^{0}\right)-\sigma_{M}{ }^{0}{ }_{L} g\left(\theta^{3}, \theta^{M}\right) \theta_{\nu}^{L} & & \\
& =-g^{\alpha \beta} \nabla_{\nu} \theta_{\alpha}^{3} \theta_{\beta}^{0}-\sigma_{M}{ }^{0}{ }_{L} g\left(\theta^{3}, \theta^{M}\right) \theta_{\nu}^{L} & & (\text { by (3.21) }) \\
& =-g^{\alpha \beta}\left[\nabla_{\alpha} \theta_{\nu}^{3}-\sigma_{M}{ }^{3}{ }_{L} \theta_{\nu}^{M} \theta_{\alpha}^{L}\right] \theta_{\beta}^{0}-\sigma_{M}{ }^{0}{ }_{L} g\left(\theta^{3}, \theta^{M}\right) \theta_{\nu}^{L} & & (\text { by setting } i=3 \text { in (3.29) }) \\
& =-\theta_{\beta}^{0} g^{\alpha \beta} \nabla_{\alpha} \theta_{\nu}^{3}-\sigma_{M}{ }^{0}{ }_{L} g\left(\theta^{3}, \theta^{M}\right) \theta_{\nu}^{L} & & (\text { by (3.15) }) .
\end{align*}
$$

Noting that

$$
\theta_{\alpha}^{3} g^{\alpha \beta}=\theta_{\alpha}^{3} a^{\alpha \beta}
$$

follows from (3.35), we can write (5.3) as

$$
\begin{equation*}
\theta_{\alpha}^{3}\left(a^{\alpha \beta}\left[\nabla_{\beta} \theta_{\nu}^{0}+\sigma_{M}^{0}{ }_{L} \theta_{\beta}^{M} \theta_{\nu}^{L}\right]\right)=-\frac{1}{\gamma_{00}} e_{0}^{\alpha} \nabla_{\alpha} \theta_{\nu}^{3} \tag{5.4}
\end{equation*}
$$

Transforming this expression into Lagrangian coordinates gives

$$
\begin{equation*}
\left.\nu_{\alpha}\left(\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{\theta}_{\nu}^{0}+\tilde{L}_{\nu}^{\alpha}\right)\right|_{\Gamma_{T}}=\frac{\operatorname{det}(J)}{\tilde{f} \tilde{\gamma}_{00}}\left(\bar{\partial}_{0} \tilde{\theta}_{\nu}^{3}+\beta_{\nu}^{\gamma} \tilde{\theta}_{\gamma}^{3}\right) \tag{5.5}
\end{equation*}
$$

where $\nu_{\alpha}$ is the outward co-normal to $\Gamma_{T}$ defined by (4.23).
Next, we calculate

$$
\begin{aligned}
|g| \circ \phi & =-\operatorname{det}\left(\tilde{g}_{\mu \nu}\right) \\
& =\operatorname{det}\left(\tilde{\theta}_{\mu}^{i} \tilde{\gamma}_{i j} \theta_{\nu}^{j}\right) \\
& =\operatorname{det}(\tilde{\theta})^{2} \operatorname{det}\left(\tilde{\gamma}_{i j}\right) \\
& =\operatorname{det}(\bar{\theta} \check{J})^{2}\left[\tilde{\gamma}_{00} f\left(\left(-\tilde{\gamma}_{00}\right)^{-1 / 2}\right)\right]^{2} \\
& =\left(\frac{\operatorname{det}(\bar{\theta})}{\operatorname{det}(J)}\right)^{2}\left[\tilde{\gamma}_{00} f\left(\left(-\tilde{\gamma}_{00}\right)^{-1 / 2}\right)\right]^{2},
\end{aligned}
$$

which after taking the square root, gives

$$
\begin{equation*}
\operatorname{det}(J)=\frac{\operatorname{det}(\bar{\theta})}{(|g| \circ \phi)^{\frac{1}{2}}} \tilde{\gamma}_{00} \tilde{f} \tag{5.6}
\end{equation*}
$$

and allows us to write (5.5) as

$$
\begin{equation*}
\left.\bar{\theta}_{\alpha}^{3}\left(\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{\theta}_{\nu}^{0}+\tilde{L}_{\nu}^{\alpha}\right)\right|_{\Gamma_{T}}=\frac{\operatorname{det}(\bar{\theta})}{|\tilde{g}|^{\frac{1}{2}}}\left(\bar{\partial}_{0} \tilde{\theta}_{\nu}^{3}+\beta_{\nu}^{\gamma} \tilde{\theta}_{\gamma}^{3}\right) \tag{5.7}
\end{equation*}
$$

We now examine the structure of the righthand side of (5.7). By definition, $\left(\tilde{\theta}_{j}^{\mu}\right)$ is the inverse of $\left(\tilde{e}_{\mu}^{j}\right)$, and so, we must have that

$$
\tilde{\theta}_{\mu}^{3}=\frac{\operatorname{cof}(\tilde{e})_{3}^{\mu}}{\operatorname{det}(\tilde{e})}
$$

But,

$$
\begin{aligned}
\operatorname{det}(\tilde{e}) & =\operatorname{det}(J \bar{e}) & & (\text { by (4.7) }) \\
& =\operatorname{det}(J) \operatorname{det}(\bar{e}) & & (\text { by (5.6) }) \\
& =\frac{\operatorname{det}(\bar{\theta}) \operatorname{det}(\bar{e}) \tilde{\gamma}_{00} \tilde{f}}{\sqrt{|\tilde{g}|}} & & \left(\text { since } \bar{\theta}=\bar{e}^{-1}\right) \\
& =\frac{\tilde{\gamma}_{00} \tilde{f}}{|\tilde{g}|^{\frac{1}{2}}} & &
\end{aligned}
$$

and so

$$
\tilde{\theta}_{\mu}^{3}=\frac{|\tilde{g}|^{\frac{1}{2}}}{\tilde{\gamma}_{00} \tilde{f}} \operatorname{cof}(\tilde{e})_{3}^{\mu} .
$$

By definition of the cofactor matrix $\sqrt{14}$

$$
\operatorname{cof}(\tilde{e})_{3}^{\mu}=-\epsilon_{\mu \alpha \beta \gamma} \tilde{e}_{0}^{\alpha} \tilde{e}_{1}^{\beta} \tilde{e}_{2}^{\gamma},
$$

which gives

$$
\tilde{\theta}_{\mu}^{3}=-\frac{|\tilde{g}|^{\frac{1}{2}}}{\tilde{\gamma}_{00} \tilde{f}_{\mu \alpha \beta \gamma} \tilde{e}_{0}^{\alpha} \tilde{e}_{1}^{\beta} \tilde{e}_{2}^{\gamma} .}
$$

Evaluating this at the boundary, we see, with the help of (5.2), that

$$
\begin{equation*}
\tilde{\theta}_{\mu}^{3}\left|\Gamma_{T}=-|\tilde{g}|^{1 / 2} \epsilon_{\mu \alpha \beta \gamma} \tilde{e}_{0}^{\alpha} \tilde{e}_{1}^{\beta} \tilde{e}_{2}^{\gamma} .\right. \tag{5.8}
\end{equation*}
$$

Differentiating (5.8) with respect to $\bar{x}^{0}$, we find, using (4.9) and (4.10), that

$$
\begin{equation*}
-\left.\bar{\partial}_{0} \tilde{\theta}_{\mu}^{3}\right|_{\Gamma}=|\tilde{g}|^{1 / 2}\left(\epsilon_{\mu \nu \alpha \gamma} \tilde{e}_{1}^{\alpha} \tilde{e}_{2}^{\gamma} \tilde{e}_{0}^{\omega}+\epsilon_{\mu \alpha \nu \gamma} \tilde{e}_{0}^{\alpha} \tilde{e}_{2}^{\gamma} \bar{e}_{1}^{\omega}+\epsilon_{\mu \alpha \gamma \nu} \tilde{e}_{0}^{\alpha} \tilde{e}_{1}^{\gamma} \tilde{e}_{2}^{\omega}\right) \bar{\omega}_{\omega} \tilde{e}_{0}^{\nu}+\frac{1}{2|\tilde{g}|^{1 / 2}} \frac{\partial|\tilde{g}|}{\partial \phi^{\kappa}} \tilde{e}_{0}^{\kappa} \epsilon_{\mu \alpha \beta \gamma} \tilde{e}_{0}^{\alpha} \tilde{e}_{1}^{\beta} \tilde{e}_{2}^{\gamma}, \tag{5.9}
\end{equation*}
$$

while a short calculation, using (3.15), (4.19) and (5.1), shows that

$$
\begin{equation*}
\left.\bar{e}_{\mathfrak{a}}\left(\tilde{e}_{0}^{\nu}\right)\right|_{\Gamma_{T}}=-\tilde{g}^{\nu \omega} \bar{e}_{\mathfrak{a}}\left(\tilde{\theta}_{\omega}^{0}\right)-\bar{e}_{\mathfrak{a}}\left(\tilde{g}^{\nu \omega}\right) \tilde{\theta}_{\omega}^{0}=-\tilde{m}^{\nu \omega} \bar{e}_{\mathfrak{a}}\left(\tilde{\theta}_{\omega}^{0}\right)-\bar{e}_{\mathfrak{a}}\left(\tilde{g}^{\nu \omega}\right) \tilde{\theta}_{\omega}^{0}+\bar{e}_{\mathfrak{a}}\left(\tilde{g}^{\sigma \omega}\right) \tilde{e}_{0}^{\nu} \tilde{\theta}_{\sigma}^{0} \tilde{\theta}_{\omega}^{0} . \tag{5.10}
\end{equation*}
$$

Taken together, (5.7), (5.8), (5.9) and (5.10) imply that

$$
\begin{equation*}
\left.\nu_{\alpha}\left(\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{\theta}_{\nu}^{0}+\tilde{L}_{\nu}^{\alpha}\right)\right|_{\Gamma_{T}}=\tilde{S}_{\nu \mu}{ }^{\omega} \tilde{m}^{\mu \gamma} \bar{\partial}_{\omega} \tilde{\theta}_{\gamma}^{0}+\tilde{Z}_{\nu} \tag{5.11}
\end{equation*}
$$

where

$$
\tilde{S}_{\nu \mu}^{\omega}=\operatorname{det}(\bar{\theta})\left(\epsilon_{\nu \mu \alpha \gamma} \tilde{e}_{1}^{\alpha} \tilde{e}_{2}^{\gamma} \bar{e}_{0}^{\omega}+\epsilon_{\nu \alpha \mu \gamma} \tilde{e}_{0}^{\alpha} \tilde{e}_{2}^{\gamma} \bar{e}_{1}^{\omega}+\epsilon_{\nu \alpha \gamma \mu} \tilde{e}_{0}^{\alpha} \tilde{e}_{1}^{\gamma} \bar{e}_{2}^{\omega}\right),
$$

and

$$
\tilde{Z}_{\nu}=\tilde{S}_{\nu \mu}^{\omega} \bar{\partial}_{\omega}\left(\tilde{g}^{\mu \lambda}\right) \tilde{\theta}_{\lambda}^{0}-\tilde{S}_{\nu \mu}^{\omega} \bar{\partial}_{\omega}\left(\tilde{g}^{\sigma \lambda}\right) \tilde{e}_{0}^{\nu} \tilde{\theta}_{\sigma}^{0} \tilde{\theta}_{\lambda}^{0}-\operatorname{det}(\bar{\theta})\left(\frac{1}{2|\tilde{g}|} \frac{\partial|\tilde{g}|}{\partial \phi^{\kappa}} \tilde{e}_{0}^{\kappa} \delta_{\nu}^{\lambda}+\beta_{\nu}^{\lambda}\right) \epsilon_{\lambda \alpha \beta \gamma} \tilde{e}_{0}^{\alpha} \tilde{e}_{1}^{\beta} \tilde{e}_{2}^{\gamma} .
$$

Setting

$$
\begin{equation*}
\tilde{S}^{\mu \nu \omega}:=\tilde{m}^{\mu \alpha} \tilde{S}_{\alpha \beta}^{\omega} \tilde{m}^{\beta \nu} \tag{5.12}
\end{equation*}
$$

we observe that $\tilde{S}^{\mu \nu \omega}$ satisfies

$$
\begin{equation*}
\tilde{S}^{\mu \nu \omega}=-\tilde{S}^{\nu \mu \omega} \quad \text { and } \quad \nu_{\omega} \tilde{S}^{\mu \nu \omega}=0 . \tag{5.13}
\end{equation*}
$$

Remark 5.1. Equation (5.11) is the fundamental Neumann boundary condition satisfied by our system. It is important to realize that this Neumann boundary condition is degenerate in the sense that it does not yield coercive elliptic estimates of the type (7.18), and as such, is not directly useful for deriving energy estimates. However, by considering the time differentiated version of these boundary conditions, we show below that this degeneracy can be removed, although it should be noted that the resulting boundary conditions are of acoustic type.

To proceed, we differentiate (5.11) with respect to $\bar{x}^{0}$ to find, after a short calculation, that $\psi_{\nu}$ satisfies

$$
\begin{equation*}
\left.\nu_{\alpha}\left(\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \psi_{\nu}+L_{\nu}^{\alpha}\right)\right|_{\Gamma_{T}}=\tilde{S}_{\nu \mu}{ }^{\omega} \tilde{m}^{\mu \gamma} \bar{\partial}_{\omega} \psi_{\gamma}+Z_{\nu} \tag{5.14}
\end{equation*}
$$

where

$$
Z_{\nu}=-\tilde{S}_{\nu \mu}{ }^{\omega} \tilde{m}^{\mu \gamma} \bar{\partial}_{\omega} \beta_{\gamma}^{\lambda} \tilde{\theta}_{\lambda}^{0}+\bar{\partial}_{0}\left(\tilde{S}_{\nu \mu}{ }^{\omega} \tilde{m}^{\mu \gamma}\right) \bar{\partial}_{\omega} \tilde{\theta}_{\gamma}^{0}+\bar{\partial}_{0} \tilde{Z}_{\nu}
$$

From (4.53), (4.55), (4.56), and (5.12), we see also that

$$
\begin{equation*}
\pi_{\nu}^{\delta} \tilde{S}_{\delta \mu}{ }^{\omega} \tilde{m}^{\mu \gamma} \bar{\partial}_{\omega} \psi_{\gamma}=\mu \pi_{\nu \delta} \tilde{S}^{\delta \mu \omega} \pi_{\mu}^{\tau} \bar{\partial}_{\omega} \hat{\psi}_{\tau}+\pi_{\nu \delta} \tilde{S}^{\delta \mu \omega} \hat{\psi}_{\mu} \bar{\partial}_{\omega} \mu-\frac{\mu}{2} \pi_{\nu \delta} \tilde{S}^{\delta \mu \omega} \hat{\psi}_{\mu} \bar{\partial}_{\omega} \tilde{m}^{\sigma \lambda} \hat{\psi}_{\sigma} \hat{\psi}_{\lambda}, \tag{5.15}
\end{equation*}
$$

and

$$
\begin{equation*}
\hat{\psi}^{\nu} \tilde{S}_{\nu \mu}{ }^{\omega} \tilde{m}^{\mu \gamma} \bar{\partial}_{\omega} \psi_{\gamma}=\mu \hat{\psi}_{\nu} \tilde{S}^{\nu \mu \omega} \pi_{\mu}^{\tau} \bar{\partial}_{\omega} \hat{\psi}_{\tau} . \tag{5.16}
\end{equation*}
$$

[^6]where $\epsilon_{\mu_{1} \mu_{2} \ldots \mu_{n}}$ is the completely antisymmetric symbol and all indices are raised using the Kronecker delta $\delta^{\mu \nu}$.

A straightforward calculation using (5.14)-(5.16) then shows that

$$
\begin{align*}
\left.\nu_{\alpha}\left(\mu^{2} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \hat{\psi}_{\nu}+\frac{\mu^{2}}{2} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{m}^{\sigma \gamma} \hat{\psi}_{\sigma} \hat{\psi}_{\gamma} \hat{\psi}_{\nu}+\mu \pi_{\nu}^{\omega} L_{\omega}^{\alpha}\right)\right|_{\Gamma_{T}}=\mu^{2} \pi_{\nu \delta} \tilde{S}^{\delta \mu \omega} \pi_{\mu}^{\tau} \bar{\partial}_{\omega} \hat{\psi}_{\tau} \\
+\mu \pi_{\nu \delta} \tilde{S}^{\delta \mu \omega} \hat{\psi}_{\mu} \bar{\partial}_{\omega} \mu-\frac{\mu^{2}}{2} \pi_{\nu \delta} \tilde{S}^{\delta \mu \omega} \hat{\psi}_{\mu} \bar{\partial}_{\omega} \tilde{m}^{\sigma \lambda} \hat{\psi}_{\sigma} \hat{\psi}_{\lambda}+\mu \pi_{\nu}^{\omega} Z_{\omega} \tag{5.17}
\end{align*}
$$

and

$$
\begin{equation*}
\left.\nu_{\alpha}\left(\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \mu-\frac{\mu}{2} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{m}^{\sigma \gamma} \hat{\psi}_{\sigma} \hat{\psi}_{\gamma}+\hat{\psi}^{\nu} L_{\nu}^{\alpha}\right)\right|_{\Gamma_{T}}=\mu \hat{\psi}_{\nu} \tilde{S}^{\nu \mu \omega} \pi_{\mu}^{\tau} \bar{\partial}_{\omega} \hat{\psi}_{\tau}+\hat{\psi}^{\omega} Z_{\omega} \tag{5.18}
\end{equation*}
$$

Employing the definition (4.59), we collect (5.17)-(5.18) into the single boundary condition

$$
\begin{equation*}
\left.\nu_{\alpha}\left(\mathcal{A}^{\alpha \beta} \bar{\partial}_{\beta} \Psi+\mathcal{L}^{\alpha}\right)\right|_{\Gamma_{T}}=\mathcal{S}^{\omega} \bar{\partial}_{\omega} \Psi+\mathcal{G} \tag{5.19}
\end{equation*}
$$

where

$$
\mathcal{S}^{\omega}=\left(\begin{array}{cc}
\mu^{2} \pi_{\alpha}^{\mu} \tilde{S}^{\alpha \beta \omega} \pi_{\beta}^{\nu} & \mu \pi_{\alpha}^{\mu} \tilde{S}^{\alpha \beta \omega} \hat{\psi}_{\beta} \\
\mu \hat{\psi}_{\alpha} \tilde{S}^{\alpha \beta \omega} \pi_{\beta}^{\nu} & 0
\end{array}\right)
$$

and

$$
\mathcal{G}=\binom{\frac{\mu^{2}}{2} \pi_{\alpha}^{\mu} \tilde{S}^{\alpha \beta \omega} \hat{\psi}_{\beta} \bar{\partial}_{\omega} \tilde{m}^{\sigma \lambda} \hat{\psi}_{\sigma} \hat{\psi}_{\lambda}+\mu \pi^{\mu \omega} Z_{\omega}}{\hat{\psi}^{\omega} Z_{\omega}} .
$$

Additionally, we note that

$$
\begin{equation*}
\left(\mathcal{S}^{\omega}\right)^{\operatorname{tr}}=-\mathcal{S}^{\omega} \quad \text { and } \quad \nu_{\alpha} S^{\omega}=0 \tag{5.20}
\end{equation*}
$$

by (5.13).
5.2. Acoustic boundary conditions. The boundary conditions (5.19) for the time differentiated system are still degenerate in the sense of Remark [5.1. The first step in removing this degeneracy is to observe that at the boundary

$$
\begin{aligned}
\left.\omega_{0}{ }^{0}{ }_{i}\right|_{B_{T}} & =-\omega_{00 i} & & (\text { by (3.5) and (3.10) }) \\
& =-\omega_{i 00} & & (\text { by }(3.14) \text { and (3.19) }) \\
& =-\frac{1}{2} e_{i}\left(\gamma_{00}\right) & & (\text { by }(3.20)) \\
& =-\frac{1}{2} e_{3}\left(\gamma_{00}\right) \delta_{i}^{3} & & (\text { by (3.5) and (4.19) }) .
\end{aligned}
$$

From this and the connection formula

$$
\nabla_{e_{0}} \theta_{\mu}^{0}=-\omega_{0}{ }^{0}{ }_{i} \theta_{\mu}^{i}
$$

we obtain

$$
\begin{equation*}
\left.\theta_{\mu}^{3}\right|_{B_{T}}=\frac{2}{e_{3}\left(\gamma_{00}\right)} \nabla_{e_{0}} \theta_{\mu}^{0} \tag{5.21}
\end{equation*}
$$

which is well defined since

$$
\begin{equation*}
\left.e_{3}\left(\gamma_{00}\right)\right|_{B_{T}} \leq c<0 \tag{5.22}
\end{equation*}
$$

for some constant $c$ by (2.15). Clearly, (5.21) implies that

$$
\left.\theta_{\mu}^{3}\right|_{B_{T}}=-\left|\theta^{3}\right|_{g} \frac{\nabla_{e_{0}} \theta_{\mu}^{0}}{\left|\nabla_{e_{0}} \theta^{0}\right|_{g}}
$$

or equivalently, since $\left.\left|\nabla_{e_{0}} \theta^{0}\right|_{g}\right|_{B_{T}}=\left|\nabla_{e_{0}} \theta^{0}\right|_{m}$ by (3.5) and (4.49),

$$
\left.\theta_{\mu}^{3}\right|_{B_{T}}=-\left|\theta^{3}\right|_{g} \frac{\nabla_{e_{0}} \theta_{\mu}^{0}}{\left|\nabla_{e_{0}} \theta^{0}\right|_{m}}
$$

Using this, we can write (5.4) as

$$
\begin{equation*}
\left.\theta_{\alpha}^{3}\left(a^{\alpha \beta}\left[\nabla_{\beta} \theta_{\nu}^{0}+\sigma_{M}{ }^{0}{ }_{L} \theta_{\beta}^{M} \theta_{\nu}^{L}\right]\right)\right|_{B_{T}}=\frac{1}{\gamma_{00}} \nabla_{e_{0}}\left(\left|\theta^{3}\right|_{g} \frac{\nabla_{e_{0}} \theta_{\mu}^{0}}{\left|\nabla_{e_{0}} \theta^{0}\right|_{m}}\right) \tag{5.23}
\end{equation*}
$$

We also observe that

$$
\begin{align*}
\left.e_{0}\left(\left|\nabla_{e_{0}} \theta^{0}\right|_{m}^{2}\right)\right|_{B_{T}} & =\nabla_{e_{0}}\left(g^{\mu \nu} \nabla_{e_{0}} \theta_{\mu}^{0} \nabla_{e_{0}} \theta_{\mu}^{0}-\frac{\left(g^{\mu \nu} \theta_{\mu}^{0} \nabla_{e_{0}} \theta_{\nu}^{0}\right)^{2}}{\gamma^{00}}\right) \\
& =\nabla_{e_{0}}\left(g^{\mu \nu} \nabla_{e_{0}} \theta_{\mu}^{0} \nabla_{e_{0}} \theta_{\mu}^{0}-\frac{\left(e_{0}\left(\gamma^{00}\right)\right)^{2}}{4 \gamma^{00}}\right) \\
& =2 g^{\mu \nu} \nabla_{e_{0}} \theta_{\mu}^{0} \nabla_{e_{0}} \nabla_{e_{0}} \theta_{\mu}^{0} \\
& =2 m^{\mu \nu} \nabla_{e_{0}} \theta_{\mu}^{0} \nabla_{e_{0}} \nabla_{e_{0}} \theta_{\mu}^{0}+\frac{2}{\gamma^{00}} g^{\mu \nu} \theta_{\mu}^{0} \nabla_{e_{0}} \theta_{\nu}^{0} g^{\alpha \beta} \theta_{\alpha}^{0} \nabla_{e_{0}} \nabla_{e_{0}} \theta_{\beta}^{0} \\
& =2 m^{\mu \nu} \nabla_{e_{0}} \theta_{\mu}^{0} \nabla_{e_{0}} \nabla_{e_{0}} \theta_{\mu}^{0}+\frac{1}{\gamma^{00}} e_{0}\left(\gamma^{00}\right) g^{\alpha \beta} \theta_{\alpha}^{0} \nabla_{e_{0}} \nabla_{e_{0}} \theta_{\beta}^{0} \\
& =2 m^{\mu \nu} \nabla_{e_{0}} \theta_{\mu}^{0} \nabla_{e_{0}} \nabla_{e_{0}} \theta_{\mu}^{0} \tag{5.24}
\end{align*}
$$

When expressed in Lagrangian coordinates, (5.23) and (5.24) become

$$
\begin{equation*}
\left.\bar{\theta}_{\alpha}^{3}\left(\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{\theta}_{\nu}^{0}+\tilde{L}_{\nu}^{\alpha}\right)\right|_{\Gamma_{T}}=-\frac{\operatorname{det}(J)}{\tilde{f} \tilde{\gamma}_{00}} \mathcal{D}_{0}\left(\left|\tilde{\theta}^{3}\right|_{\tilde{g}} \hat{\psi}_{\nu}\right) \stackrel{\widetilde{5.6 \mid}}{=}-\frac{\operatorname{det}(\bar{\theta})}{|\tilde{g}|^{1 / 2}}\left(\left|\tilde{\theta}^{3}\right|_{\tilde{g}} \mathcal{D}_{0} \hat{\psi}_{\nu}+\bar{\partial}_{0}\left|\tilde{\theta}^{3}\right|_{\tilde{g}} \hat{\psi}_{\nu}\right), \tag{5.25}
\end{equation*}
$$

and

$$
\begin{equation*}
\left.\bar{\partial}_{0} \mu^{2}\right|_{\Gamma_{T}}=2 \tilde{m}^{\mu \nu} \psi_{\mu} \mathcal{D}_{0} \psi_{\nu} \tag{5.26}
\end{equation*}
$$

respectively, where $\mathcal{D}_{0}$ is defined by

$$
\mathcal{D}_{0} \zeta_{\nu}=\bar{\partial}_{0} \zeta_{\nu}+\beta_{\nu}^{\lambda} \zeta_{\lambda}
$$

From (4.54) and (5.26), we then obtain

$$
\left.\mathcal{D}_{0} \hat{\psi}_{\nu}\right|_{\Gamma_{T}}=\left.\mathcal{D}_{0}\left(\frac{1}{\mu} \psi_{\nu}\right)\right|_{\Gamma_{T}}=\frac{1}{\mu} \pi_{\nu}^{\omega} \mathcal{D}_{0} \psi_{\omega}
$$

which in turn, implies that

$$
\begin{equation*}
\left.\hat{\psi}^{\nu} \mathcal{D}_{0} \hat{\psi}_{\nu}\right|_{\Gamma_{T}}=0 \tag{5.27}
\end{equation*}
$$

Next, differentiating (5.25) with respect to $\bar{x}^{0}$, we see that

$$
\left.\nu_{\alpha}\left(\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \psi_{\nu}+L_{\nu}^{\alpha}\right)\right|_{\Gamma_{T}}=\mathcal{D}_{0}\left(\alpha \mathcal{D}_{0} \hat{\psi}_{\nu}+\lambda \hat{\psi}_{\nu}\right)
$$

where

$$
\alpha=-\frac{\operatorname{det}(\bar{\theta})\left|\tilde{\theta}^{3}\right|_{\tilde{g}}}{|\tilde{g}|^{1 / 2}}, \quad \lambda=-\frac{\operatorname{det}(\bar{\theta}) \bar{\partial}_{0}\left|\tilde{\theta}^{3}\right|_{\tilde{g}}}{|\tilde{g}|^{1 / 2}}
$$

and it is understood that $\mid \tilde{\theta}^{3}{ }_{\tilde{g}}$ is calculated using the right hand side of (5.8). From this and (4.53), we then get that

$$
\begin{equation*}
\left.\nu_{\alpha}\left(\mu^{2} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \hat{\psi}_{\nu}+\frac{\mu^{2}}{2} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{m}^{\sigma \gamma} \hat{\psi}_{\sigma} \hat{\psi}_{\gamma} \hat{\psi}_{\nu}+\mu \pi_{\nu}^{\omega} L_{\omega}^{\alpha}\right)\right|_{\Gamma_{T}}=\mu \pi_{\nu}^{\omega} \mathcal{D}_{0}\left(\alpha \mathcal{D}_{0} \hat{\psi}_{\omega}+\lambda \hat{\psi}_{\omega}\right) \tag{5.28}
\end{equation*}
$$

But for any $\kappa \in \mathbb{R}$,

$$
\begin{aligned}
\pi_{\nu}^{\omega} \mathcal{D}_{0}\left(\alpha \mathcal{D}_{0} \hat{\psi}_{\omega}+\lambda \hat{\psi}_{\omega}\right) & =\alpha \pi_{\nu}^{\omega} \mathcal{D}_{0} \mathcal{D}_{0} \hat{\psi}_{\nu}+\left(\bar{\partial}_{0} \alpha+\lambda\right) \pi_{\nu}^{\omega} \mathcal{D}_{0} \hat{\psi}_{\omega} \\
& =\alpha \pi_{\nu}^{\omega} \mathcal{D}_{0} \mathcal{D}_{0} \hat{\psi}_{\nu}+\left(\left(\bar{\partial}_{0} \alpha+\lambda\right) \delta_{\nu}^{\omega}+\frac{\kappa}{\mu} \hat{\psi}^{\omega} \hat{\psi}_{\nu}\right) \mathcal{D}_{0} \hat{\psi}_{\omega}
\end{aligned}
$$

and so, we see that
$\left.\nu_{\alpha}\left(\mu^{2} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \hat{\psi}_{\nu}+\frac{\mu^{2}}{2} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{m}^{\sigma \gamma} \hat{\psi}_{\sigma} \hat{\psi}_{\gamma} \hat{\psi}_{\nu}+\mu \pi_{\nu}^{\omega} L_{\omega}^{\alpha}\right)\right|_{\Gamma_{T}}=\mu \alpha \pi_{\nu}^{\omega} \mathcal{D}_{0} \mathcal{D}_{0} \hat{\psi}_{\nu}+\left(\mu\left(\bar{\partial}_{0} \alpha+\lambda\right) \delta_{\nu}^{\omega}+\kappa \hat{\psi}^{\omega} \hat{\psi}_{\nu}\right) \mathcal{D}_{0} \hat{\psi}_{\omega}$
follows from (5.28).
To proceed, we calculate

$$
\begin{align*}
\mathcal{D}_{0} \mathcal{D}_{0} \psi^{\omega} & =\bar{\partial}_{0}^{2} \hat{\psi}_{\omega}+2 \beta_{\omega}^{\lambda} \mathcal{D}_{0} \hat{\psi}_{\lambda}+\bar{\partial}_{0} \beta_{\omega}^{\lambda} \hat{\psi}_{\lambda}-\beta_{\omega}^{\lambda} \beta_{\lambda}^{\gamma} \hat{\psi}_{\gamma} \\
& =\bar{\partial}_{0}^{2} \hat{\psi}_{\omega}+2 \beta_{\omega}^{\lambda}\left(\pi_{\lambda}^{\delta}+\hat{\psi}^{\delta} \hat{\psi}_{\lambda}\right) \mathcal{D}_{0} \hat{\psi}_{\lambda}+\bar{\partial}_{0} \beta_{\omega}^{\lambda} \hat{\psi}_{\lambda}-\beta_{\omega}^{\lambda} \beta_{\lambda}^{\gamma} \hat{\psi}_{\gamma} \\
& =\bar{\partial}_{0}^{2} \hat{\psi}_{\omega}+2 \beta_{\omega}^{\lambda} \pi_{\lambda}^{\delta} \mathcal{D}_{0} \hat{\psi}_{\delta}+\bar{\partial}_{0} \beta_{\omega}^{\lambda} \hat{\psi}_{\lambda}-\beta_{\omega}^{\lambda} \beta_{\lambda}^{\gamma} \hat{\psi}_{\gamma} \tag{5.27}
\end{align*}
$$

Using this, we can express (5.29) as

$$
\begin{equation*}
\left.\nu_{\alpha}\left(\mu^{2} \tilde{m}^{\mu \nu} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \hat{\psi}_{\nu}+\frac{\mu^{2}}{2} \tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{m}^{\sigma \gamma} \hat{\psi}_{\sigma} \hat{\psi}_{\gamma} \hat{\psi}^{\mu}+\mu \pi^{\mu \omega} L_{\omega}^{\alpha}\right)\right|_{\Gamma_{T}}=q^{\mu \nu} \bar{\partial}_{0}^{2} \hat{\psi}_{\nu}+p^{\mu \nu} \bar{\partial}_{0} \hat{\psi}_{\nu}+r^{\mu} \tag{5.30}
\end{equation*}
$$

where

$$
\begin{align*}
q^{\mu \nu} & =\mu \alpha \pi^{\mu \nu}  \tag{5.31}\\
p^{\mu \nu} & =2 \mu \alpha \pi^{\mu \omega} \beta_{\omega}^{\lambda} \pi_{\lambda}^{\nu}+\mu\left(\bar{\partial}_{0} \alpha+\lambda\right) \tilde{m}^{\mu \nu}+\kappa \hat{\psi}^{\mu} \hat{\psi}^{\nu} \tag{5.32}
\end{align*}
$$

and

$$
\begin{equation*}
r^{\mu}=\tilde{m}^{\mu \nu}\left[\mu \alpha \pi_{\nu}^{\omega} \bar{\partial}_{0} \beta_{\omega}^{\lambda} \hat{\psi}_{\lambda}-\mu \alpha \pi_{\nu}^{\omega} \beta_{\omega}^{\lambda} \beta_{\lambda}^{\gamma} \hat{\psi}_{\gamma}+\left(\mu\left(\bar{\partial}_{0} \alpha+\lambda\right) \delta_{\nu}^{\omega}+\kappa \hat{\psi}^{\omega} \hat{\psi}_{\nu}\right) \beta_{\omega}^{\sigma} \hat{\psi}_{\sigma}+2 \mu \alpha \pi_{\nu}^{\omega} \beta_{\omega}^{\lambda} \pi_{\lambda}^{\delta} \beta_{\delta}^{\sigma} \hat{\psi}_{\sigma}\right] \tag{5.33}
\end{equation*}
$$

Remark 5.2. The boundary conditions (5.30) for the wave equation (4.57) are of acoustic type ${ }^{15}$ Although it is not obvious at the moment, these boundary conditions can be used to remove the degeneracy from the Neumann boundary conditions (5.19), and provide effective boundary conditions for the wave equation (4.60). For details, see Lemmas 8.2 and 8.4 .

## 6. The complete initial boundary value problem

From the above calculations and results, in particular, (3.15), (4.39), (4.50), (4.51), (4.59), (4.60), (5.11), (5.19), and (5.30), it follows from a straightforward calculation that, for any choice of $\kappa, \epsilon, \delta \in$ $\mathbb{R}$, the triple $\left\{\phi=\left(\phi^{\mu}\right), \tilde{\theta}^{0}=\left(\theta_{\mu}^{0} \circ \phi\right), \Psi=\left(\hat{\psi}_{\mu}, \mu\right)^{\operatorname{tr}}\right\}$ derived from a solution of the Frauendiener-Walton-Euler equations satisfying the assumptions (A.1)-(A.7) from Section 2, and (4.52) solves the (overdetermined) IBVP:

$$
\begin{align*}
\bar{\partial}_{\alpha}\left(B^{\alpha \beta} \bar{\partial}_{\beta} \tilde{\theta}^{0}+M^{\alpha}\right) & =H & & \text { in } \Omega_{T},  \tag{6.1}\\
\nu_{\alpha}\left(B^{\alpha \beta} \bar{\partial}_{\beta} \tilde{\theta}^{0}+M^{\alpha}\right) & =K & & \text { in } \Gamma_{T},  \tag{6.2}\\
\bar{\partial}_{\alpha}\left(\mathcal{B}^{\alpha \beta} \bar{\partial}_{\beta} \Psi+\mathcal{M}^{\alpha}\right) & =\mathcal{H} & & \text { in } \Omega_{T},  \tag{6.3}\\
\nu_{\alpha}\left(\mathcal{B}^{\alpha \beta} \bar{\partial}_{\beta} \Psi+\mathcal{M}^{\alpha}\right) & =Q \bar{\partial}_{0}^{2} \Psi+P \bar{\partial}_{0} \Psi+\mathcal{K} & & \text { in } \Gamma_{T},  \tag{6.4}\\
\bar{\partial}_{0} \phi^{\mu}-\tilde{\gamma}_{00} \tilde{g}^{\mu \nu} \tilde{\theta}_{\nu}^{0} & =0 & & \text { in } \Omega_{T},  \tag{6.5}\\
\bar{\partial}_{0} \tilde{\theta}_{\mu}^{0}+\beta_{\nu}^{\lambda} \tilde{\theta}_{\lambda}^{0} & =\psi_{\mu} & & \text { in } \Omega_{T},  \tag{6.6}\\
\left(\phi^{0}, \phi^{\Sigma}\right) & =\left(0, \operatorname{id}_{\Omega_{0}}\right) & & \text { in } \Omega_{0},  \tag{6.7}\\
\tilde{\theta}_{\mu}^{0} & =\left.\theta_{\mu}^{0}\right|_{\Omega_{0}} & & \text { in } \Omega_{0},  \tag{6.8}\\
\left(\Psi, \bar{\partial}_{0} \Psi\right) & =\left(\Psi_{0}, \Psi_{1}\right) & & \text { in } \Omega_{0} \tag{6.9}
\end{align*}
$$

where the initial data $\left(\Psi_{0}, \Psi_{1}\right)$ is given by

$$
\begin{aligned}
\Psi_{0} & =\left.\left(\frac{\nabla_{e_{0}} \theta_{\mu}^{0}}{\left|\nabla_{e_{0}} \theta^{0}\right|_{m}},\left|\nabla_{e_{0}} \theta^{0}\right|_{m}\right)^{\operatorname{tr}}\right|_{\Omega_{0}} \\
\Psi_{1} & =\left.\left(\frac{e_{0}\left(\nabla_{e_{0}} \theta_{\mu}^{0}\right)\left|\nabla_{e_{0}} \theta^{0}\right|_{m}-\nabla_{e_{0}} \theta_{\mu}^{0} e_{0}\left(\left|\nabla_{e_{0}} \theta^{0}\right|_{m}\right)}{\left|\nabla_{e_{0}} \theta^{0}\right|_{m}^{2}}, e_{0}\left(\left|\nabla_{e_{0}} \theta^{0}\right|_{m}\right)\right)^{\mathrm{tr}}\right|_{\Omega_{0}}
\end{aligned}
$$

[^7]the system coefficients are defined by
\[

$$
\begin{align*}
B^{\alpha \beta} & =\left(\left(\tilde{m}^{\mu \nu}+\epsilon \pi^{\mu \nu}\right) \tilde{A}^{\alpha \beta}+2 \tilde{S}^{\mu \nu[\alpha} \nu^{\beta]}\right) \quad\left(\nu^{\alpha}:=\frac{\tilde{m}^{\alpha \beta} \nu_{\beta}}{\tilde{m}^{\mu \nu} \nu_{\mu} \nu_{\nu}}\right)  \tag{6.10}\\
M^{\alpha} & =\left(\left(\tilde{m}^{\mu \nu}+\epsilon \pi^{\mu \nu}\right) \tilde{L}_{\nu}^{\alpha}\right),  \tag{6.11}\\
H & =\left(2 \bar{\partial}_{\alpha}\left(\tilde{S}^{\mu \nu[\alpha} \nu^{\beta]}\right) \bar{\partial}_{\beta} \tilde{\theta}_{\nu}^{0}+\left(\tilde{m}^{\mu \nu}+\epsilon \pi^{\mu \nu}\right) \tilde{F}_{\nu}+\bar{\partial}_{\alpha}\left(\tilde{m}^{\mu \nu}+\epsilon \pi^{\mu \nu}\right)\left(\tilde{A}^{\alpha \beta} \bar{\partial}_{\beta} \tilde{\theta}_{\nu}^{0}+\tilde{L}_{\nu}^{\alpha}\right)\right),  \tag{6.12}\\
K & =\left(\epsilon \alpha \pi^{\mu \nu}\left(\bar{\partial}_{0} \hat{\psi}_{\nu}+\beta_{\nu}^{\lambda} \hat{\psi}_{\lambda}\right)+\tilde{m}^{\mu \nu} \tilde{Z}_{\nu}\right),  \tag{6.13}\\
\mathbb{P} & =\left(\begin{array}{cc}
\delta_{\nu}^{\mu} & 0 \\
0 & 0
\end{array}\right),  \tag{6.14}\\
\mathcal{B}^{\alpha \beta} & =(\mathbb{I}+\delta \mathbb{P}) \mathcal{A}^{\alpha \beta}+2 \nu^{[\beta} S^{\alpha]},  \tag{6.15}\\
\mathcal{M}^{\alpha} & =(\mathbb{I}+\delta \mathbb{P}) \mathcal{L}^{\alpha},  \tag{6.16}\\
\mathcal{H} & =(\mathbb{I}+\delta \mathbb{P}) \mathcal{F}+2 \bar{\partial}_{\alpha}\left(\nu^{[\beta} S^{\alpha]}\right) \bar{\partial}_{\beta} \Psi,  \tag{6.17}\\
Q & =\left(\begin{array}{cc}
\delta q^{\mu \nu} & 0 \\
0 & 0
\end{array}\right),  \tag{6.18}\\
P & =\left(\begin{array}{cc}
\delta p^{\mu \nu} & 0 \\
0 & 0
\end{array}\right),  \tag{6.19}\\
\mathcal{K} & =\binom{\frac{\mu^{2}}{2} \pi_{\alpha}^{\mu} \tilde{S}^{\alpha \beta \omega} \hat{\psi}_{\beta} \bar{\partial}_{\omega} \tilde{m}^{\sigma \lambda} \hat{\psi}_{\sigma} \hat{\psi}_{\lambda}+\mu \pi^{\mu \omega} Z_{\omega}+\delta r^{\mu}}{\hat{\psi}^{\omega} Z_{\omega}} \tag{6.20}
\end{align*}
$$
\]

and the other quantities are as previously defined:
Lagrangian variables

$$
\begin{gather*}
J=\left(J_{\nu}^{\mu}\right),  \tag{6.21}\\
J_{\nu}^{\mu}=\bar{\partial}_{\nu} \phi^{\mu}, \\
\left(\check{J}_{\nu}^{\mu}\right)=J^{-1}, \\
\tilde{e}_{i}^{\mu}=e_{i}^{\mu} \circ \phi, \\
\left(\tilde{\theta}_{\mu}^{i}\right)=\left(\tilde{e}_{i}^{\mu}\right)^{-1}, \\
\tilde{g}_{\alpha \beta}=g_{\alpha \beta} \circ \psi, \\
\tilde{\Gamma}_{\alpha \beta}^{\gamma}=\Gamma_{\alpha \beta}^{\gamma} \circ \phi, \\
\tilde{R}_{\alpha \beta}=R_{\alpha \beta} \circ \phi \\
\tilde{\gamma}_{i j}:=\gamma_{i j} \circ \phi=\tilde{g}_{\mu \nu} \tilde{e}_{i}^{\mu} \tilde{e}_{j}^{\nu}, \\
\tilde{\gamma}^{i j}:=\gamma^{i j} \circ \phi=\tilde{g}^{\mu \nu} \tilde{\theta}_{\mu}^{i} \tilde{\theta}_{\nu}^{j}, \\
\tilde{m}^{\alpha \beta}:=m^{\alpha \beta} \circ \phi=\tilde{g}^{\alpha \beta}-\frac{1}{\tilde{\gamma}_{00}} \tilde{e}_{0}^{\alpha} \tilde{e}_{0}^{\beta},  \tag{6.22}\\
\tilde{a}^{\mu \nu}:=a^{\mu \nu} \circ \phi=\tilde{g}^{\mu \nu}-\frac{1}{\tilde{\gamma}_{00}}\left(1-\frac{1}{\tilde{s}^{2}}\right) \tilde{e}_{0}^{\mu} \tilde{e}_{0}^{\nu},  \tag{6.23}\\

\tilde{\gamma}_{00} & =\frac{1}{\tilde{\gamma}^{00}},  \tag{6.39}\\
\left(\tilde{\gamma}_{I J}\right) & =\left(\tilde{\gamma}^{I J}\right)^{-1}, \\
F\left(\sqrt{-\tilde{\gamma}^{00}}\right)^{2} & =\frac{1}{\operatorname{det}\left(\tilde{\gamma}^{I J}\right)},
\end{align*}
$$

where $F$ is defined by (3.6)- (3.7), and
Boundary conditions and propagated boundary constraints

$$
\begin{align*}
\left.\tilde{\gamma}_{00}\right|_{\bar{\Gamma}_{T}} & =-1,  \tag{6.40}\\
\left.\hat{\psi}_{\mu}\right|_{\bar{\Gamma}_{T}} & =-\left|\tilde{\gamma}^{33}\right|^{-1 / 2} \tilde{\theta}_{\mu}^{3},  \tag{6.41}\\
\tilde{f} \overline{\bar{\Gamma}}_{T} & =-1,  \tag{6.42}\\
\left.\tilde{\theta}_{\mu}^{3}\right|_{\Gamma_{T}} & =-|\tilde{g}|^{1 / 2} \epsilon_{\mu \alpha \beta \gamma} \tilde{e}_{0}^{\alpha} \tilde{e}_{1}^{\beta} \tilde{e}_{2}^{\gamma} . \tag{6.43}
\end{align*}
$$

For the purposes of deriving energy estimates, we view (6.3)-(6.6) as the primary evolution equations, while we treat (6.1)-(6.2) as an elliptic constraint for $\tilde{\theta}_{\mu}^{0}$ by using (6.6) to express the time derivatives of $\tilde{\theta}_{\mu}^{0}$ in terms of the variables $\left\{\tilde{\theta}^{0}, \phi, \hat{\psi}\right\}$. We further remark that in the following, it turns out to be convenient to "forget" that $\hat{\psi}_{\nu}$ satisfies $\left|\hat{\psi}_{\nu}\right|=1$. This necessitates redefining $\pi_{\nu}^{\mu}$, see (6.36), as

$$
\begin{equation*}
\pi_{\nu}^{\mu}=\delta_{\nu}^{\mu}-\frac{\hat{\psi}^{\mu} \hat{\psi}_{\nu}}{\mid \hat{\psi}_{\tilde{m}}^{2}} \tag{6.44}
\end{equation*}
$$

so that it remains a projection operator that agrees with the previous definition (4.54) for $\hat{\psi}_{\mu}$ satisfying $|\hat{\psi}|_{\tilde{m}}=1$. We also redefine $p^{\mu \nu}$ by

$$
\begin{equation*}
p^{\mu \nu}=2 \mu \alpha \pi^{\mu \omega} \beta_{\omega}^{\lambda} \pi_{\lambda}^{\nu}+\mu\left(\bar{\partial}_{0} \alpha+\lambda\right) \tilde{m}^{\mu \nu}+\kappa \frac{\hat{\psi}^{\mu} \hat{\psi}^{\nu}}{|\hat{\psi}|_{\tilde{m}}^{2}} \tag{6.45}
\end{equation*}
$$

in order to agree with the previous definition (5.32).
6.1. Coefficient smoothness and structure. We make the following observations about the smoothness of the coefficients as functions of their variables which are a straightforward consequence of the above formulas, the relations (see (4.9), (4.13), and (4.23))

$$
\begin{gather*}
\tilde{e}_{i}^{\mu}=\bar{e}_{i}^{\omega} \bar{\partial}_{\omega} \phi^{\mu},  \tag{6.46}\\
\left(\bar{e}_{i}^{\mu}\right)=\left(\begin{array}{cc}
1 & f_{I}^{0} \\
0 & -\frac{1}{f_{0}^{0}} f_{0}^{\Lambda} f_{I}^{0}+f_{I}^{\Lambda}
\end{array}\right),  \tag{6.47}\\
\left.\nu_{\omega} \bar{e}_{i}^{\omega}\right|_{\Gamma_{T}}=0, \quad i=0,1,2, \tag{6.48}
\end{gather*}
$$

and the time-independence of the initial data (see (4.11) and (4.45))

$$
f_{I}^{\lambda}=f_{I}^{\lambda}\left(\bar{x}^{\Lambda}\right) \quad \text { and } \quad \sigma_{i}{ }^{k}{ }_{j}=\sigma_{i}{ }^{k}{ }_{j}\left(\bar{x}^{\Lambda}\right) .
$$

(i) From the definitions (6.21), (6.27) and (6.28), it is not difficult to verify that the maps

$$
\tilde{A}^{\alpha \beta}=\tilde{A}_{\nu \mu}^{\alpha \beta}(\phi, J), \quad \text { and } \quad \mathcal{A}^{\alpha \beta}=\mathcal{A}^{\alpha \beta}(\phi, J, \mu)
$$

are smooth for $((\phi, J), \mu) \in \mathcal{U} \times \mathbb{R}_{>0}$ where
$\mathcal{U}=\left\{(\phi, J) \in \mathbb{R}^{4} \times \mathbb{M}_{4 \times 4} \mid \operatorname{det}(J)>0,-g_{\mu \nu}(\phi) J_{0}^{\mu} J_{0}^{\nu}>0, s^{2}\left(\left(-g_{\mu \nu}(\phi) J_{0}^{\mu} J_{0}^{\nu}\right)^{-1 / 2}\right)>0\right\}$, and moreover, that

$$
\begin{equation*}
\tilde{A}^{\alpha \beta}=\tilde{A}^{\beta \alpha} \quad \text { and } \quad \mathcal{A}^{\alpha \beta}=\left(\mathcal{A}^{\beta \alpha}\right)^{\mathrm{tr}}, \tag{6.49}
\end{equation*}
$$

respectively, and for any bounded open subsets $\widetilde{\mathcal{U}} \subset \mathcal{U}$ and $\mathcal{I} \subset \mathbb{R}_{>0}$, there exists a constants $c_{\tilde{A}}^{0}, c_{\mathcal{A}}^{0}>0$ such that

$$
\begin{aligned}
\left(\Psi \mid \mathcal{A}^{00}(\phi, J, \mu) \Psi\right) & \leq-c_{\mathcal{A}}^{0}|\Psi|^{2} & & \forall((\phi, J), \mu, \Psi) \in \tilde{\mathcal{U}} \times \mathcal{I} \times \mathbb{R}^{5} \\
\tilde{A}^{00}(\phi, J) & \leq-c_{\tilde{A}}^{0} & & \forall(\phi, J) \in \widetilde{\mathcal{U}}
\end{aligned}
$$

Here and below, we use $(\cdot \mid \cdot)$ and $|\cdot|$ to denote the Euclidean inner product and norm, respectively. (ii) From (6.49), the antisymmetry conditions from (5.13) and (5.20), and the obvious symmetry $\pi^{\mu \nu}=\pi^{\nu \mu}$, it is clear from the definitions (6.10) and (6.15) that $B^{\alpha \beta}$ and $\mathcal{B}^{\alpha \beta}$ satisfy the symmetry conditions

$$
\left(B^{\alpha \beta}\right)^{\operatorname{tr}}=B^{\beta \alpha} \quad \text { and } \quad \mathcal{B}^{\alpha \beta}=\left(\mathcal{B}^{\beta \alpha}\right)^{\operatorname{tr}}
$$

respectively.
(iii) Setting

$$
J_{0}=\left(J_{0}^{\mu}\right),
$$

and letting

$$
\bar{\partial}(\cdot)=\left(\bar{\partial}_{\lambda}(\cdot)\right), \quad \lambda=0,1,2,3, \quad \text { and } \quad \bar{D}(\cdot)=\left(\bar{\partial}_{\Lambda}(\cdot)\right), \quad \Lambda=1,2,3
$$

denote the spacetime and spatial gradients, respectively, we see from the definitions (6.10)-(6.12) and (6.15)-(6.17) that the maps

$$
\begin{align*}
B^{\alpha \beta} & =B^{\alpha \beta}(\bar{x}, \phi, J, \Psi)  \tag{6.50}\\
\mathcal{B}^{\alpha \beta} & =\mathcal{B}^{\alpha \beta}(\bar{x}, \phi, J, \Psi)  \tag{6.51}\\
M^{\alpha} & =M^{\alpha}(\bar{x}, \phi, J, \Psi)  \tag{6.52}\\
\mathcal{M}^{\alpha} & =\mathcal{M}^{\alpha}\left(\bar{x}, \phi, J, \bar{\partial} J_{0}, \Psi\right)  \tag{6.53}\\
H & =H(\bar{x}, \phi, J, \bar{\partial} J, \Psi, \bar{\partial} \Psi) \tag{6.54}
\end{align*}
$$

and

$$
\begin{equation*}
\mathcal{H}=\mathcal{H}\left(\bar{x}, \phi, J, \bar{\partial} J, \bar{\partial} \bar{\partial}_{0} J_{0}, \Psi, \bar{\partial} \Psi\right) \tag{6.55}
\end{equation*}
$$

are well defined and smooth in all variables provided that $16((\phi, J), \Psi) \in \mathcal{U} \times\left(\mathbb{R} \times \mathbb{R}_{\times}^{4}\right)$. It is also worth noting that the dependence of the above maps on the spatial coordinates $\bar{x}=\left(\bar{x}^{\Lambda}\right)$ arises via the time-independent functions $f_{I}^{\mu}$ and $\tilde{\sigma}_{i}{ }^{k}{ }_{j}$.
(iv) Letting

$$
\bar{\partial}(\cdot) \quad \text { and } \quad \bar{D}(\cdot)
$$

denote the derivatives tangent to the spacetime boundary $\Gamma_{T}$ and the spatial boundary $\partial \Omega$, respectively, it is also not difficult to see from (6.13), (6.18)-(6.20), (6.31), (6.32), and the formulas (6.43) and (6.46)-(6.48) that

$$
\begin{align*}
\tilde{S}^{\alpha} & =\left(\tilde{S}^{\mu \nu \alpha}(\bar{x}, \phi, \overline{\not \partial} \phi)\right)  \tag{6.56}\\
\mathcal{S}^{\alpha} & =\mathcal{S}^{\alpha}(\bar{x}, \phi, \bar{\partial} \phi, \Psi)  \tag{6.57}\\
K & =K\left(\bar{x}, \phi, \overline{\not \partial} \phi, \Psi, \bar{\partial}_{0} \Psi\right)  \tag{6.58}\\
\mathcal{K} & =\iota_{1}^{\mu}(\bar{x}, \phi, \overline{\not \partial} \phi, \Psi) \bar{\partial}_{\mu} J_{0}+\kappa_{1}\left(\bar{x}, \phi, \overline{\not \partial} \phi, \bar{\partial}_{0} J_{0}, \Psi\right),  \tag{6.59}\\
P & =\zeta_{2}^{\mu}(\bar{x}, \phi, \overline{\not \partial} \phi, \Psi) \bar{\partial}_{\mu} J_{0}+\kappa_{2}\left(\bar{x}, \phi, \overline{\not \partial} \phi, \bar{\partial}_{0} J_{0}, \Psi\right), \tag{6.60}
\end{align*}
$$

and

$$
\begin{equation*}
Q=Q(\bar{x}, \phi, \overline{\not \partial} \phi, \Psi) \tag{6.61}
\end{equation*}
$$

where

$$
\nu_{\mu} \tau^{\mu}=0, \quad l^{0}=0
$$

and the maps are smooth in all their variables.

[^8]6.2. Fundamental relations under time differentiation. From (6.37), (6.39), (6.46) and (6.47), we have that
$$
\bar{\partial}_{0} \phi^{\mu}=\frac{\tilde{g}^{\mu \nu}}{\tilde{\gamma}^{00}} \tilde{\theta}_{\nu}^{0}
$$
or schematically,
\[

$$
\begin{equation*}
J_{0}=\mathcal{J}\left(\phi, \tilde{\theta}^{0}\right) \quad\left(J_{0}=\left(\bar{\partial} \phi^{\mu}\right)\right) \tag{6.62}
\end{equation*}
$$

\]

for a smooth map $\mathcal{J}$ satisfying $\mathcal{J}(\phi, 0)=0$. Differentiating this with respect to $\bar{x}^{0}$, we find, with the help of the evolution equation (6.6), that

$$
\begin{equation*}
\bar{\partial}_{0} J_{0}=\mathfrak{J}\left(\phi, \tilde{\theta}^{0}, \Psi\right) \tag{6.63}
\end{equation*}
$$

for a smooth map $\mathfrak{J}$ satisfying $\mathfrak{J}(\phi, 0)=0$. Using (6.62) and (6.63), we can alternatively express the functional dependence of the maps (6.52)-(6.55), (6.59) and (6.60) as 17

$$
\begin{align*}
M^{\alpha} & =M^{\alpha}\left(\bar{x}, \phi, \tilde{\theta}^{0}, \Psi\right)  \tag{6.64}\\
\mathcal{M}^{\alpha} & =\mathcal{M}^{\alpha}\left(\bar{x}, \phi, \bar{\partial} \phi, \tilde{\theta}^{0}, \bar{\partial} \tilde{\theta}^{0}, \Psi\right)  \tag{6.65}\\
H & =H\left(\bar{x}, \phi, \bar{D} \phi, \bar{D}^{2} \phi, \tilde{\theta}^{0}, \bar{\partial} \tilde{\theta}^{0}, \Psi, \bar{\partial} \Psi\right)  \tag{6.66}\\
\mathcal{H} & =\mathcal{H}\left(\bar{x}, \phi, \bar{D} \phi, \bar{D}^{2} \phi, \tilde{\theta}^{0}, \bar{\partial} \tilde{\theta}^{0}, \Psi, \bar{\partial} \Psi\right)  \tag{6.67}\\
\mathcal{K} & =\mathcal{l}_{1}^{\mu}(\bar{x}, \phi, \bar{\partial} \phi, \Psi) \bar{\partial}_{\mu}\left(\mathcal{J}\left(\phi, \tilde{\theta}^{0}\right)\right)+\mathcal{K}_{1}\left(\bar{x}, \phi, \bar{\partial} \phi, \tilde{\theta}^{0}, \Psi\right), \tag{6.68}
\end{align*}
$$

and

$$
\begin{equation*}
P=\zeta_{2}^{\mu}(\bar{x}, \phi, \bar{\partial} \phi, \Psi) \bar{\partial}_{\mu}\left(\mathcal{J}\left(\phi, \tilde{\theta}^{0}\right)\right)+\kappa_{2}\left(\bar{x}, \phi, \bar{\not} \phi, \tilde{\theta}^{0}, \Psi\right) \tag{6.69}
\end{equation*}
$$

Differentiating $\mathcal{B}^{\alpha \beta}, \mathcal{M}, Q, \mathcal{K}$, and $\mathcal{l}^{\mu}$ with respect to $\bar{x}^{0}$, we also observe with the help of (6.6) and (6.62) that

$$
\begin{align*}
\bar{\partial}_{0} c_{a}^{\mu} & =\dot{\epsilon}_{a}^{\mu}\left(\bar{x}, \phi, \bar{\not} \phi, \tilde{\theta}^{0}, \bar{\not} \tilde{\theta}^{0}, \Psi, \bar{\partial}_{0} \Psi\right), \quad a=1,2  \tag{6.70}\\
\bar{\partial}_{0} \kappa_{a} & =\dot{\mathcal{K}}_{a}\left(\bar{x}, \phi, \overline{\not \partial} \phi, \tilde{\theta}^{0}, \bar{\partial} \tilde{\theta}^{0}, \Psi, \bar{\partial}_{0} \Psi\right), \quad a=1,2  \tag{6.71}\\
\bar{\partial}_{0} Q & =\dot{Q}\left(\bar{x}, \phi, \bar{\partial} \phi, \tilde{\theta}^{0}, \bar{\partial} \tilde{\theta}^{0}, \Psi, \bar{\partial}_{0} \Psi\right),  \tag{6.72}\\
\bar{\partial}_{0} B^{\alpha \beta} & =\dot{B}^{\alpha \beta}\left(\bar{x}, \phi, \bar{\partial} \phi, \tilde{\theta}^{0}, \Psi, \bar{\partial}_{0} \Psi\right),  \tag{6.73}\\
\bar{\partial}_{0} \mathcal{B}^{\alpha \beta} & =\dot{\mathcal{B}}^{\alpha \beta}\left(\bar{x}, \phi, \bar{\partial} \phi, \tilde{\theta}^{0}, \Psi, \bar{\partial}_{0} \Psi\right), \tag{6.74}
\end{align*}
$$

and

$$
\begin{equation*}
\bar{\partial}_{0} \mathcal{M}^{\alpha}=\dot{\mathcal{M}}^{\alpha}\left(\bar{x}, \phi, \bar{\partial} \phi, \tilde{\theta}^{0}, \bar{\partial} \tilde{\theta}^{0}, \Psi, \bar{\partial} \Psi\right) \tag{6.75}
\end{equation*}
$$

where the maps $\dot{\mathcal{K}}_{a}, \dot{\zeta}_{a}^{\mu}, \dot{Q}, \dot{B}^{\alpha \beta}, \dot{\mathcal{B}}^{\alpha \beta}$ and $\dot{\mathcal{M}}^{\alpha}$ are smooth in their arguments.

## 7. Linear wave equations

With our wave formulation complete, we now turn in this section to the problem of establishing the existence, uniqueness, and energy estimates for solutions to linear equations that include equations of the form (6.3)- (6.4).
7.1. Preliminaries. Before proceeding, we first introduce some notation and fix our conventions that will be used throughout this section. Unlike the previous sections, we work here in arbitrary dimensions.

[^9]7.1.1. Notation. We use $\left(x^{\mu}\right)_{\mu=0}^{n}$ to denote Cartesian coordinates on $\mathbb{R}^{n+1}$, and we use $x^{0}$ and $t$, interchangeably, to denote the time coordinate, and $\left(x^{i}\right)_{i=1}^{n}$ to denote spatial coordinates. We also use $x=\left(x^{1}, \ldots, x^{n}\right)$ to denote spatial points.

As before, partial derivatives are denoted by

$$
\partial_{\mu}=\frac{\partial}{\partial x^{\mu}}
$$

and we use $D u(x)=\left(\partial_{1} u(x), \ldots, \partial_{n} u(x)\right)$ and $\partial u(t, x)=\left(\partial_{0} u(t, x), D u(t, x)\right)$ to denote the spatial and spacetime gradients, respectively. For time derivatives, we often employ the notation

$$
\begin{equation*}
u_{\ell}=\partial_{t}^{\ell} u \tag{7.1}
\end{equation*}
$$

and use

$$
\begin{equation*}
\mathbf{u}_{r}=\left(u_{0}, u_{1}, \ldots, u_{r}\right)^{\operatorname{tr}} \tag{7.2}
\end{equation*}
$$

to denote the collection of partial derivatives of $u$ with respect to $t$.
The notation (7.2) will be employed more generally for vectors with components $u_{\ell}, 0 \leq \ell \leq r$, that are not necessarily of the type (7.1). It will be clear from the context whether $u_{\ell}$ represents some general vector component, or is of the type (7.1). We will find it convenient to use the notation

$$
\begin{equation*}
\partial_{t}^{\ell} \mathbf{u}_{r}=\left(u_{\ell}, u_{\ell+1}, \ldots, u_{\ell+r}\right)^{\operatorname{tr}} \tag{7.3}
\end{equation*}
$$

on occasion, where again the $u_{\ell+j}$ can be thought of as either the time derivative $\partial_{t}^{\ell+j} u$ of some function $u$, or just a component of a vector.

### 7.1.2. Function spaces.

Spatial function spaces: In the following, we let $\Omega$ denote a bounded, open set in $\mathbb{R}^{n}$ with a $C^{\infty}$ boundary, and employ similar notation when $\Omega$ is replaced by a smooth, closed $n$-dimensional manifold. Given a finite dimensional vector space $V$, we let $W^{s, p}(\Omega, V)$, $s \in \mathbb{R}\left(s \in \mathbb{Z}_{\geq 0}\right), 1<p<\infty(1 \leq p \leq \infty)$, denote the space of $V$-valued maps on $\Omega$ with fractional (integral) Sobolev regularity $W^{s, p}$. Particular cases of interest for $V$ will be $V=\mathbb{R}^{N}$ and $V=\mathbb{M}_{N \times N}$, where, here, we use $\mathbb{M}_{N \times N}$ to denote the set of $N$-by- $N$ matrices. In the special case of $V=\mathbb{R}$, we employ the more compact notation $W^{s, p}(\Omega)=W^{s, p}(\Omega, \mathbb{R})$.

When $p=2$, we use the standard notation $H^{s}(\Omega, V)=W^{s, 2}(\Omega, V)$, and on $L^{2}\left(\Omega, \mathbb{R}^{N}\right)$, we denote the inner product by

$$
\langle u \mid v\rangle_{\Omega}=\int_{\Omega}(u(x) \mid v(x)) d^{n} x \quad u, v \in L^{2}\left(\Omega, \mathbb{R}^{N}\right)
$$

where, as previously,

$$
(\xi \mid \zeta)=\xi^{\operatorname{tr}} \zeta, \quad \xi, \zeta \in \mathbb{R}^{N}
$$

is the Euclidean inner product on $\mathbb{R}^{N}$. We will also have occasion to use the standard inner-product on $H^{s}(\Omega)$, which we denote by $\langle\cdot \mid \cdot\rangle_{H^{s}(\Omega)}$.

Given $s=k / 2$, for $k \in \mathbb{Z}_{\geq 0}$, we define the spaces

$$
\begin{equation*}
X^{s, r}(\Omega, V)=\prod_{\ell=0}^{r} H^{s-\frac{\ell}{2}}(\Omega, V) \tag{7.4}
\end{equation*}
$$

for $0 \leq r \leq 2 s$, and set

$$
\begin{equation*}
X^{s}(\Omega, V)=X^{s, 2 s}(\Omega, V) \tag{7.5}
\end{equation*}
$$

Using the vector notation (7.2), we can write the norms for the spaces (7.4) and (7.5) as

$$
\left\|\mathbf{u}_{r}\right\|_{X^{s, r}}^{2}=\sum_{\ell=0}^{r}\left\|u_{\ell}\right\|_{H^{s-\frac{\ell}{2}}(\Omega)}^{2} \quad \text { and } \quad\left\|\mathbf{u}_{2 s}\right\|_{X^{s}}=\left\|\mathbf{u}_{2 s}\right\|_{X^{s, 2 s}}
$$

respectively.
Spacetime function spaces: Given $T>0$, and $s=k / 2$ for $k \in \mathbb{Z}_{\geq 0}$, we define the spaces

$$
\begin{equation*}
X_{T}^{s, r}(\Omega, V)=\bigcap_{\ell=0}^{r} W^{\ell, \infty}\left([0, T], H^{s-\frac{\ell}{2}}(\Omega, V)\right) \tag{7.6}
\end{equation*}
$$

for $0 \leq r \leq 2 s$,

$$
\begin{equation*}
X_{T}^{s}(\Omega, V)=X_{T}^{s, 2 s}(\Omega, V) \tag{7.7}
\end{equation*}
$$

and

$$
\begin{equation*}
\mathcal{X}_{T}^{s}(\Omega, V)=\bigcap_{\ell=0}^{2 s-1} W^{\ell, \infty}\left([0, T], H^{s-\frac{m_{\ell}}{2}}(\Omega, V)\right) \tag{7.8}
\end{equation*}
$$

where

$$
m_{\ell}= \begin{cases}\ell & \text { if } 0 \leq \ell \leq 2 s-2  \tag{7.9}\\ 2 s & \text { if } \ell=2 s-1\end{cases}
$$

Remark 7.1.
(i) The spaces $\mathcal{X}_{T}^{s}(\Omega, V)$ consist of time-dependent functions with spatial regularity of $H^{s}(\Omega)$ that lose $1 / 2$ a derivative of spatial regularity for each time derivative taken until the spatial regularity $H^{1}(\Omega)$ is reached after which the last time derivative reduces the spatial regularity by 1 leaving highest time derivative in $L^{2}(\Omega)$. This type of regularity is necessary for the class of wave equations with acoustic boundary conditions that we consider in the following sections; see, in particular, Section 7.4 for a simplified example that illustrates the need for these spaces.
(ii) The $s$ in the definition of $m_{\ell}$ given by (7.9) refers to the space defined by (7.8). Thus if $s$ is replaced by $s+1$ in (7.8), then $s$ must also be replaced by $s+1$ in the definition of $m_{\ell}$, that is

$$
m_{\ell}= \begin{cases}\ell & \text { if } 0 \leq \ell \leq 2 s \\ 2 s+2 & \text { if } \ell=2 s+1\end{cases}
$$

We define the following energy norms:

$$
\|u\|_{E^{s, r}}^{2}=\sum_{\ell=0}^{r}\left\|\partial_{t}^{\ell} u\right\|_{H^{s-\frac{\ell}{2}}(\Omega)}^{2}, \quad\|u\|_{E^{s}}^{2}=\|u\|_{E^{s, 2 s}}^{2}, \quad \text { and } \quad\|u\|_{\mathcal{E}^{s}}^{2}=\sum_{\ell=0}^{2 s-1}\left\|\partial_{t}^{\ell} u\right\|_{H^{s-\frac{m_{\ell}}{2}}(\Omega)}^{2}
$$

In terms of these energy norms, we can write the norms of the spaces (7.6)-(7.8) as

$$
\|u\|_{X_{T}^{s, r}}=\sup _{0 \leq t \leq T}\|u(t)\|_{E^{s, r}}, \quad\|u\|_{X_{T}^{s}}=\sup _{0 \leq t \leq T}\|u(t)\|_{E^{s}}, \quad \text { and } \quad\|u\|_{\mathcal{X}_{T}^{s}}=\sup _{0 \leq t \leq T}\|u(t)\|_{\mathcal{E}^{s}}
$$

respectively. We also define the subspace

$$
C \mathcal{X}_{T}^{s}(\Omega, V)=\bigcap_{\ell=0}^{2 s-1} C^{\ell}\left([0, T], H^{s-\frac{m_{\ell}}{2}}(\Omega, V)\right)
$$

We conclude with the following elementary, but useful, relations

$$
\begin{aligned}
\|u\|_{E^{s_{1}, r_{1}}} & \leq\|u\|_{E^{s_{2}, r_{2}},} & & s_{1} \leq s_{2}, r_{1} \leq r_{2}, \\
\|u\|_{\mathcal{E}^{s_{1}}} & \leq\|u\|_{\mathcal{E}^{s_{2}}} & & s_{1} \leq s_{2} \\
\|u\|_{\mathcal{E}^{s}}^{2} & =\|u\|_{E^{s, 2 s-2}}^{2}+\left\|\partial_{t}^{2 s-1} u\right\|_{L^{2}(\Omega)}^{2}, & & \\
\|u\|_{E^{s, r}}^{2} & =\|u\|_{H^{s}(\Omega)}^{2}+\left\|\partial_{t} u\right\|_{E^{s-\frac{1}{2}, r-1}}^{2} & & \\
\left\|\partial_{t} u\right\|_{E^{s, r}} & \leq\|u\|_{E^{s+\frac{1}{2}, r+1}}, & & \\
\|D u\|_{E^{s, r}} & \leq\|u\|_{E^{s+1, r}} & & \\
\left\|\partial_{t} u\right\|_{\mathcal{E}^{s}} & \leq\|u\|_{\mathcal{E}^{s+\frac{1}{2}}} & &
\end{aligned}
$$

and

$$
\|D u\|_{\mathcal{E}^{s}} \leq\|u\|_{E^{s+1,2 s-1}} \leq\|u\|_{\mathcal{E}^{s+1}}
$$

7.1.3. Estimates and constants. We employ that standard notation

$$
a \lesssim b
$$

for inequalities of the form

$$
a \leq C b
$$

in situations where the precise value or dependence on other quantities of the constant $C$ is not required. On the other hand, when the dependence of the constant on other inequalities needs to be specified, for example if the constant depends on the norms $\|u\|_{L^{\infty}\left(\mathbb{T}^{n}\right)}$ and $\|v\|_{L^{\infty}(\Omega)}$, we use the notation

$$
C=C\left(\|u\|_{L^{\infty}\left(\mathbb{T}^{n}\right)},\|v\|_{L^{\infty}(\Omega)}\right) .
$$

Constants of this type will always be non-negative, non-decreasing, continuous functions of their arguments.
7.2. A model class of linear wave equations. Rather than directly considering linear wave equations that include equations of the form (6.3)-(6.4), we instead consider a related model class of equations for which it is easier to establish an existence and uniqueness result. The desired existence and uniqueness result will then follow from this one.

The model class that we consider are wave equations of the form:

$$
\begin{align*}
\partial_{\alpha}\left(b^{\alpha \beta} \partial_{\beta} v+L^{\alpha}\right)+\lambda c v & =F & & \text { in } \Omega_{T}=[0, T] \times \Omega  \tag{7.10}\\
\nu_{\alpha}\left(b^{\alpha \beta} \partial_{\beta} v+L^{\alpha}\right) & =q \partial_{t}^{2} v+P \partial_{t} v+G & & \text { in } \Gamma_{T}=[0, T] \times \partial \Omega  \tag{7.11}\\
\left(v, \partial_{t} v\right) & =\left(\tilde{v}_{0}, \tilde{v}_{1}\right) & & \text { in } \Omega_{0},  \tag{7.12}\\
\mathbb{P}_{q} \partial_{t} v & =\tilde{w}_{1} & & \text { in } \Gamma_{0} \tag{7.13}
\end{align*}
$$

where
(i) $\lambda \in \mathbb{R}$,
(ii) $\Omega \subset \mathbb{R}^{n}$ is open and bounded with smooth boundary,
(iii) $\nu_{\alpha}=\delta_{\alpha}^{i} \nu_{i}$ where $\nu_{i}$ is the outward pointing unit normal to $\partial \Omega$,
(iv) $v=v(t, x)$ is a $\mathbb{R}^{N}$-valued map,
(v) $L=\left(L^{\alpha}\right) \in W^{1,2}\left([0, T], L^{2}\left(\Omega, \mathbb{R}^{N}\right)\right)$ and $F \in L^{2}\left(\Omega_{T}, \mathbb{R}^{N}\right)$,
(vi) the matrix valued maps $c \in L^{\infty}\left([0, T], L^{n}\left(\Omega, \mathbb{M}_{N \times N}\right)\right), P \in W^{1, \infty}\left(\Omega_{T}, \mathbb{M}_{N \times N}\right)$, and $q \in W^{1, \infty}\left(\Omega_{T}, \mathbb{M}_{N \times N}\right)$ satisfy $\partial_{t} q \in W^{1, \infty}\left(\Omega_{T}, \mathbb{M}_{N \times N}\right) 18$

$$
\begin{equation*}
q^{\operatorname{tr}}=q, \quad q \leq 0, \quad-\frac{1}{\gamma} q \leq q^{2} \leq-\gamma q, \quad \operatorname{rank}(q)=N_{q} \quad \text { in } \Gamma_{T} \tag{7.14}
\end{equation*}
$$

and

$$
\begin{equation*}
c \leq-\sigma \quad \text { in } \Omega_{T} \tag{7.15}
\end{equation*}
$$

for some positive constants $\sigma, \gamma>0$ and $N_{q} \in\{0,1, \ldots, N\}$,
(vii) $\mathbb{P}_{q}$ is the projection onto $\operatorname{ran}(q)$,
(viii) the matrix valued maps $b^{\alpha \beta} \in W^{1, \infty}\left([0, T], L^{\infty}\left(\Omega, \mathbb{M}_{N \times N}\right)\right)$ satisfy

$$
\begin{equation*}
\left(b^{\alpha \beta}\right)^{\operatorname{tr}}=b^{\beta \alpha} \tag{7.16}
\end{equation*}
$$

and

$$
\begin{equation*}
b^{00} \leq-\kappa_{0} \tag{7.17}
\end{equation*}
$$

in $\Omega_{T}$ for some positive constant $\kappa_{0}>0$,
(ix) there exists constants $\kappa_{1}>0$ and $\mu \geq 0$ such that

$$
\begin{equation*}
\left\langle\partial_{i} v \mid b^{i j}(t) \partial_{j} v\right\rangle_{\Omega} \geq \kappa_{1}\|v\|_{H^{1}(\Omega)}^{2}-\mu\|v\|_{L^{2}(\Omega)}^{2} \tag{7.18}
\end{equation*}
$$

for all $v \in H^{1}(\Omega)$ and $t \in[0, T]$,
(x) and the vector valued map $G$ is of the form

$$
\begin{equation*}
G=k^{i} \partial_{i} \theta+g \tag{7.19}
\end{equation*}
$$

$$
\begin{gathered}
\text { were } k^{i} \in W^{1, \infty}\left([0, T], W^{1, \infty}\left(\Omega, \mathbb{M}_{N \times N}\right)\right), \theta \in W^{1, \infty}\left([0, T], H^{1}\left(\Omega, \mathbb{R}^{N}\right)\right), g \in H^{1}\left(\Omega_{T}, \mathbb{R}^{N}\right) \text { and } \\
\qquad \nu_{i} k^{i}=0
\end{gathered}
$$

## Remark 7.2.

(i) The coercive condition (7.18) is known to be equivalent to the matrix $b^{i j}$ being strongly elliptic at each point in $\bar{\Omega}$ and satisfying the strong complementing condition for every point on the boundary $\partial \Omega$. For a proof of this equivalence, see Theorem 3 in Section 6 of 28 .
(ii) Letting $\mathbb{P}_{q}^{\perp}$ denote the projection onto the orthogonal complement of ran $(q)$, we can decompose $\mathbb{R}^{N}$ as

$$
\mathbb{R}^{N}=\mathbb{P}_{q} \mathbb{R}^{N} \oplus \mathbb{R}_{q}^{\perp} \mathbb{R}^{N}
$$

It then follows from the assumptions (7.14) on the matrix $q$ that

$$
q=\mathbb{P}_{q} q \mathbb{P}_{q}
$$

and

$$
\begin{equation*}
-\frac{1}{\gamma}(\xi \mid q \xi) \leq(q \xi \mid q \xi) \leq-\gamma(\xi \mid q \xi), \quad \forall \xi \in \mathbb{R}^{N} \tag{7.20}
\end{equation*}
$$

[^10]which imply that the map
\[

$$
\begin{equation*}
\left.q\right|_{\mathbb{P}_{q} \mathbb{R}^{N}}: \mathbb{P}_{q} \mathbb{R}^{N} \longrightarrow \mathbb{P}_{q} \mathbb{R}^{N} \tag{7.21}
\end{equation*}
$$

\]

is invertible and satisfies

$$
\begin{equation*}
\left|\left(\left.q\right|_{\mathbb{P}_{q} \mathbb{R}^{N}}\right)^{-1} \xi\right| \leq \frac{1}{\gamma}|\xi|, \quad \forall \xi \in \mathbb{P}_{q} \mathbb{R}^{N} \tag{7.22}
\end{equation*}
$$

It also follows directly from (7.20) that the inequality

$$
\begin{equation*}
\frac{1}{\sqrt{\gamma}}\langle w \mid(-q(t)) w\rangle_{\partial \Omega}^{\frac{1}{2}} \leq\|q(t) w\|_{L^{2}(\partial \Omega)} \leq \sqrt{\gamma}\langle w \mid(-q(t)) w\rangle_{\partial \Omega}^{\frac{1}{2}} \tag{7.23}
\end{equation*}
$$

holds on the boundary for each $t \in[0, T]$ and all $w \in L^{2}(\partial \Omega)$.

### 7.3. Weak solutions.

Definition 7.3. A pair $(v, w) \in H^{1}\left(\Omega_{T}, \mathbb{R}^{N}\right) \times L^{2}\left(\Gamma_{T}, \mathbb{R}^{N}\right)$ is called a weak solution of (7.10)-(7.13) if $(v, w)$ define maps $v:[0, T] \rightarrow H^{1}\left(\Omega, \mathbb{R}^{N}\right), \partial_{t} v:[0, T] \rightarrow L^{2}\left(\Omega, \mathbb{R}^{N}\right)$ and $w:[0, T] \longrightarrow L^{2}\left(\Gamma, \mathbb{R}^{N}\right)$ that satisfy 19

$$
\left(u(t), \partial_{t} v(t)\right) \rightharpoonup\left(\tilde{v}_{0}, \tilde{v}_{1}\right) \quad \text { in } H^{1}\left(\Omega, \mathbb{R}^{N}\right) \times L^{2}\left(\Omega, \mathbb{R}^{N}\right), \quad \text { and } \quad w(t) \rightharpoonup \tilde{w}_{1} \quad \text { in } L^{2}\left(\Gamma, \mathbb{R}^{N}\right)
$$

as $t \searrow 0$,

$$
w \in \operatorname{ran}(q) \quad \text { in } \Gamma_{T}
$$

and

$$
\begin{equation*}
\langle q w \mid \phi\rangle_{\Gamma_{T}}=-\left\langle\partial_{t} q v \mid \phi\right\rangle_{\Gamma_{T}}-\left\langle q v \mid \partial_{t} \phi\right\rangle_{\Gamma_{T}} \tag{7.24}
\end{equation*}
$$

and

$$
\begin{equation*}
\left\langle b^{\alpha \beta} \partial_{\beta} v+L^{\alpha} \mid \partial_{\alpha} \phi\right\rangle_{\Omega_{T}}+\left\langle\left(\partial_{t} q-P\right) \partial_{t} v \mid \phi\right\rangle_{\Gamma_{T}}-\langle g \mid \phi\rangle_{\Gamma_{T}}-\left\langle k^{i} \partial_{i} \theta \mid \phi\right\rangle_{\Gamma_{T}}+\left\langle q w \mid \partial_{t} \phi\right\rangle_{\Gamma_{T}}=\langle\lambda c v-F \mid \phi\rangle_{\Omega_{T}} \tag{7.25}
\end{equation*}
$$

for all $\phi \in C_{0}^{1}\left([0, T], C^{1}\left(\bar{\Omega}, \mathbb{R}^{N}\right)\right)$.
Remark 7.4.
(i) As in [19], the boundary terms $\langle g \mid \phi\rangle_{\Gamma_{T}}$ and $\left\langle\left(\partial_{t} q-P\right) \partial_{t} v \mid \phi\right\rangle_{\Gamma_{T}}$ are defined via the expression:20

$$
\begin{equation*}
\langle g \mid \phi\rangle_{\Gamma_{T}}=\left\langle\nu(g)+\partial_{i} \nu^{i} g \mid \phi\right\rangle_{\Omega_{T}}+\langle g \mid \nu(\phi)\rangle_{\Omega_{T}} \tag{7.26}
\end{equation*}
$$

and

$$
\begin{align*}
& \left\langle\left(\partial_{t} q-P\right) \partial_{t} v \mid \phi\right\rangle_{\Gamma_{T}}=\left\langle\nu\left(\partial_{t} q-P\right) \partial_{t} v-\partial_{t}\left(\partial_{t} q-P\right) \nu(v) \mid \phi\right\rangle_{\Omega_{T}} \\
& \quad+\left\langle\partial_{\alpha} \nu^{\alpha}\left(\partial_{t} q-P\right) \partial_{t} v \mid \phi\right\rangle_{\Omega_{T}}+\left\langle\left(\partial_{t} q-P\right) \partial_{t} v \mid \nu(\phi)\right\rangle_{\Omega_{T}}-\left\langle\left(\partial_{t} q-P\right) \nu(v) \mid \partial_{t} \phi\right\rangle_{\Omega_{T}} \tag{7.27}
\end{align*}
$$

respectively, where $\nu(\cdot)=\nu^{\alpha} \partial_{\alpha}(\cdot), \nu^{\alpha}=\delta^{\alpha i} \nu_{i}$, and $\nu_{i}$ is any smooth extension to $\Omega$ of the outward pointing unit normal to $\partial \Omega$.
(ii) The condition (7.24) implies that $v$ weakly satisfies

$$
q w=q \partial_{t} v \quad \text { in } \Gamma_{T}
$$

where here, we are again defining the boundary terms on the right hand side of (7.24) using the same type of formula as (7.26).

[^11]follow from the divergence theorem. The second identity together with one more application of the divergence theorem then yields
$$
\left\langle S \partial_{t} v \mid \phi\right\rangle_{\Gamma_{T}}=\int_{\Omega_{T}} \partial_{\beta}\left[\nu^{\beta}\left(S \partial_{t} v \mid \phi\right)\right] d^{n+1} x=\left\langle\nu(S) \partial_{t} v-\partial_{t} S \nu(v)+\partial_{\alpha} \nu^{\alpha} S \partial_{t} v \mid \phi\right\rangle_{\Omega_{T}}+\left\langle S \partial_{t} v \mid \nu(\phi)\right\rangle_{\Omega_{T}}-\left\langle S \nu(v) \mid \partial_{t} \phi\right\rangle_{\Omega_{T}}
$$
(iii) The interpretation of the boundary term $\left\langle k^{i} \partial_{i} \theta \mid \phi\right\rangle_{\Gamma_{T}}$ is more involved. First, we let
$$
\perp_{j}^{i}=\delta_{j}^{i}-\nu^{i} \nu_{j}
$$
denote the orthogonal projection onto the the subspace orthogonal to the normal vector $\nu_{i}$, and we set
$$
\not \unrhd_{i}=\perp_{i}^{j} \partial_{j},
$$
which defines a complete collection of derivatives tangent to $\partial \Omega$. This allows us to write
$$
k^{i} \partial_{i}=k^{i} \square_{i}
$$
since $k^{i}=\perp_{j}^{i} k^{j}$ by assumption. Letting $\langle$ denote the Laplacian arising from the restriction of the Euclidean metric on $\mathbb{R}^{n}$ to $\partial \Omega$, we then obtain
\[

$$
\begin{align*}
\left|\left\langle\phi \mid k^{i} \partial_{i} \theta\right\rangle_{\partial \Omega}\right| & =\left|\left\langle\phi \mid k^{i} D_{i} \theta\right\rangle_{\partial \Omega}\right| \\
& =\left|\left\langle\left(k^{i}\right)^{\operatorname{tr}} \phi \mid D_{i} \theta\right\rangle_{\partial \Omega}\right| \\
& =\left|\left\langle D_{i}\left(\left(k^{i}\right)^{\operatorname{tr}^{2}} \phi\right) \mid \theta\right\rangle_{\partial \Omega}\right| \\
& =\left\lvert\,\left\langle\left(\left. 1-\not \Delta \Delta^{\frac{1}{4}}(1-\not \Delta)^{-\frac{1}{4}} D_{i}\left(\left(k^{i}\right)^{\operatorname{tr}} \phi\right)|\theta\rangle_{\partial \Omega} \right\rvert\,\right.\right.\right. \\
& =\left|\left\langle\left.(1-\Delta)^{-\frac{1}{4}} D_{i}\left(\left(k^{i}\right)^{\operatorname{tr}} \phi\right) \right\rvert\,(1-\Delta \Delta)^{\frac{1}{4}} \theta\right\rangle_{\partial \Omega}\right| \\
& \lesssim\left\|\left(k^{i}\right)^{\operatorname{tr}} \phi\right\|_{H^{\frac{1}{2}}(\partial \Omega)}\|\theta\|_{H^{\frac{1}{2}}(\partial \Omega)} \\
& \lesssim\left\|\left(k^{i}\right)^{\operatorname{tr}} \phi\right\|_{H^{1}(\Omega)}\|\theta\|_{H^{1}(\Omega)} \tag{7.28}
\end{align*}
$$
\]

where, in deriving the last four lines, we used the self-adjointness and well-known mapping properties of the pseudo-differential operator $(1-\Delta)^{s}$, the Cauchy-Schwartz inequality, and the Trace Theorem, see Theorem A.4. Using (7.28), we see with the help of (B.8) that

$$
\begin{equation*}
\left|\left\langle\phi \mid k^{i} \partial_{i} \theta\right\rangle_{\partial \Omega}\right| \lesssim\|k\|_{L^{\infty}(\Omega) \cap W^{1, n}(\Omega)}\|\phi\|_{H^{1}(\Omega)}\|\theta\|_{H^{1}(\Omega)} \tag{7.29}
\end{equation*}
$$

which we can use to obtain the estimate

$$
\left|\left\langle\phi \mid k^{i} \partial_{i} \theta\right\rangle_{\Gamma_{T}}\right| \leq\|k\|_{L^{\infty}\left([0, T], L^{\infty}(\Omega) \cap W^{1, n}(\Omega)\right)}\|\phi\|_{H^{1}\left(\Omega_{T}\right)}\|\theta\|_{H^{1}\left(\Omega_{T}\right)} .
$$

This estimate implies the continuity of the bilinear map

$$
H^{1}\left(\Omega_{T}, \mathbb{R}^{n}\right) \times H^{1}\left(\Omega_{T}, \mathbb{R}^{n}\right) \ni(\phi, \theta) \longmapsto\left\langle\phi \mid k^{i} \partial_{i} \theta\right\rangle_{\Gamma_{T}} \in \mathbb{R}
$$

and gives meaning to the boundary term $\left\langle k^{i} \partial_{i} \theta \mid \phi\right\rangle_{\Gamma_{T}}$.
When $q=0, k^{i}=0$, and $P \leq 0$, the existence and uniqueness of weak solutions to the IBVP (7.10)(7.12) (in this case, $w=0$ and (7.13) is redundant) is a consequence of Theorem 2.2 from (19. Using similar arguments, we establish the following generalization.
Theorem 7.5. Suppose $\tilde{v}_{0} \in H^{1}\left(\Omega, \mathbb{R}^{N}\right)$, $\tilde{v}_{1} \in L^{2}\left(\Omega, \mathbb{R}^{N}\right)$, $\tilde{w}_{1} \in L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right)$ such that $\tilde{w}_{1} \in \operatorname{ran}\left(\left.q\right|_{t=0}\right)$, the assumptions (i)-(x) from Section 7.2 are fulfilled,

$$
P-\frac{1}{2} \partial_{t} q-\chi q \leq 0 \quad \text { in } \Gamma_{T},
$$

and let

$$
\mathfrak{k}=\|k\|_{W^{1, \infty}\left([0, T], L^{\infty}(\Omega) \cap W^{1, n}(\Omega)\right)} .
$$

Then there exists a unique weak solution $(v, w)$ to the IBVP (7.10)-(7.13), and this solution satisfies the energy estimate

$$
\begin{align*}
E(t) \leq E(0) & +C \int_{0}^{t}\left(1+\left\|\partial_{t} b(\tau)\right\|_{L^{\infty}(\Omega)}+\|\chi(\tau)\|_{L^{\infty}(\partial \Omega)}+|\lambda|\|c(\tau)\|_{L^{n}(\Omega)}\right) E(\tau) \\
& +\left\|\partial_{t} L(\tau)\right\|_{L^{2}(\Omega)}^{2}+\|F(\tau)\|_{L^{2}(\Omega)}^{2}+\|g(\tau)\|_{H^{1}(\Omega)}^{2}+\left\|\partial_{t} g(\tau)\right\|_{L^{2}(\Omega)}^{2}+\left\|\partial_{t} \theta(\tau)\right\|_{H^{1}(\Omega)}^{2} d \tau \tag{7.30}
\end{align*}
$$

for $0 \leq t \leq T$ where $C=C\left(\kappa_{0}, \kappa_{1}, \mu, \gamma, \mathfrak{k}\right)$,

$$
\begin{align*}
E(t)= & \frac{1}{2}\left\langle\partial_{i} v(t) \mid b^{i j}(t) \partial_{j} v(t)\right\rangle_{\Omega}-\frac{1}{2}\left\langle\partial_{t} v(t) \mid b^{00}(t) \partial_{t} v(t)\right\rangle_{\Omega}-\frac{1}{2}\langle w(t) \mid q(t) w(t)\rangle_{\partial \Omega} \\
& +\left\langle\partial_{i} v(t) \mid L^{i}(t)\right\rangle_{\Omega}-\left\langle v(t) \mid k^{i} \partial_{i} \theta(t)\right\rangle_{\partial \Omega}+\frac{\mu}{2}\|v(t)\|_{L^{2}(\Omega)}^{2}+\frac{2}{\kappa_{1}}\|\vec{L}(t)\|_{L^{2}(\Omega)}^{2}+\frac{3 \mathfrak{k}^{2}}{\kappa_{1}}\|\theta(t)\|_{H^{1}(\Omega)}^{2}, \tag{7.31}
\end{align*}
$$

$\vec{L}=\left(L^{i}\right), b=\left(b^{\alpha \beta}\right)$, and $E(t)$ satisfies

$$
E(t) \geq \min \left\{\frac{\kappa_{0}}{2}, \frac{\kappa_{1}}{8}, \frac{1}{2}\right\}\|(v(t), w(t))\|_{E}^{2}
$$

with $\|(v(t), w(t))\|_{E}^{2}$ given by

$$
\begin{equation*}
\|(v(t), w(t))\|_{E}^{2}=\|v(t)\|_{H^{1}(\Omega)}^{2}+\left\|\partial_{t} v\right\|_{L^{2}(\Omega)}^{2}+\langle w(t) \mid(-q(t)) w(t)\rangle_{\partial \Omega} \tag{7.32}
\end{equation*}
$$

Moreover, $(v, w) \in \bigcap_{j=0}^{1} C^{j}\left([0, T], H^{1-j}\left(\Omega, \mathbb{R}^{N}\right)\right) \times C^{0}\left([0, T], L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right)\right)$.
Proof. Existence (restricted initial data): Following the proof of Theorem 2.2 from [19, we employ a Galerkin method to establish the existence of weak solutions to the IBVP (7.10)-(7.13). However, before proceeding, we note that we can absorb $g$ into the coefficients $L^{\alpha}$ and $F$ under the following transformation

$$
g \longmapsto 0, \quad L^{\alpha} \longmapsto L^{\alpha}-\nu^{\alpha} g \quad \text { and } \quad F \longmapsto F-\partial_{\alpha}\left(\nu^{\alpha} g\right) .
$$

Thus, without loss of generality, we may assume that $g=0$.
To start the Galerkin scheme, we consider the following alternate weak formulation of the IBVP obtained by testing (7.10) with $\phi \in C^{\infty}\left(\bar{\Omega}, \mathbb{R}^{N}\right)$ to get

$$
\left\langle\phi \mid \partial_{t}\left(b^{0 \beta} \partial_{\beta} v+L^{0}\right)\right\rangle_{\Omega}+\left\langle\phi \mid \partial_{i}\left(b^{i \beta} \partial_{b} v+L^{i}\right)\right\rangle_{\Omega}+\lambda\langle\phi \mid c v\rangle_{\Omega}=\langle\phi \mid F\rangle_{\Omega}
$$

which we can express after integrating by parts as

$$
\left\langle\phi \mid \partial_{t}\left(b^{0 \beta} \partial_{\beta} v+L^{0}\right)\right\rangle_{\Omega}-\left\langle\partial_{i} \phi \mid b^{i \beta} \partial_{\beta} v+L^{i}\right\rangle_{\Omega}+\left\langle\phi \mid \nu_{\alpha}\left(b^{\alpha \beta} \partial_{\beta} v+L^{\alpha}\right)\right\rangle_{\partial \Omega}+\lambda\langle\phi \mid c v\rangle_{\Omega}=\langle\phi \mid F\rangle_{\Omega}
$$

Applying the boundary condition (7.11) to the above equation, we obtain

$$
\begin{equation*}
\left\langle\phi \mid \partial_{t}\left(b^{0 \beta} \partial_{\beta} v+L^{0}\right)\right\rangle_{\Omega}-\left\langle\partial_{i} \phi \mid b^{i \beta} \partial_{\beta} v+L^{i}\right\rangle_{\Omega}+\left\langle\phi \mid q \partial_{t}^{2} v+P \partial_{t} v+k^{i} \partial_{i} \theta\right\rangle_{\partial \Omega}+\lambda\langle\phi \mid c v\rangle_{\Omega}=\langle\phi \mid F\rangle_{\Omega} \tag{7.33}
\end{equation*}
$$

We now look for solutions of (7.33) where

$$
\begin{equation*}
\phi \in \operatorname{Span}\left\{\phi_{1}, \phi_{2}, \ldots, \phi_{M}\right\} \tag{7.34}
\end{equation*}
$$

and $\left\{\phi_{I}\right\}_{I=1}^{\infty} \subset H^{2}\left(\Omega, \mathbb{R}^{N}\right)$ is a basis for $L^{2}\left(\Omega, \mathbb{R}^{N}\right)$ satisfying:

$$
\begin{align*}
& \left\langle\phi_{I} \mid \phi_{J}\right\rangle_{\Omega}=\delta_{I J},  \tag{7.35}\\
& \left\langle\phi_{I} \mid \phi_{J}\right\rangle_{H^{1}(\Omega)}=0, \quad I \neq J,  \tag{7.36}\\
& \left\|\pi_{M}(u)\right\|_{L^{2}(\Omega)} \leq\|u\|_{L^{2}(\Omega)},  \tag{7.37}\\
& \left\|\pi_{M}(u)\right\|_{H^{1}(\Omega)} \leq\|u\|_{H^{1}(\Omega)} \tag{7.38}
\end{align*}
$$

and

$$
\begin{equation*}
\pi_{M} u \rightarrow u \quad \text { as } M \rightarrow \infty \text { in } L^{2}\left(\Omega, \mathbb{R}^{N}\right) \text { and } H^{1}\left(\Omega, \mathbb{R}^{N}\right) \tag{7.39}
\end{equation*}
$$

where $\pi_{M}: L^{2}\left(\Omega, \mathbb{R}^{N}\right) \longrightarrow L^{2}\left(\Omega, \mathbb{R}^{N}\right)$ is the self-adjoint projection operator defined by

$$
\pi_{M}(u)=\sum_{I=1}^{M}\left\langle\phi_{I} \mid u\right\rangle_{\Omega} \phi_{I}
$$

The existence of such a basis is established in [27]; see, in particular, Problem 5.9.
We consider solutions to (7.33) of the form

$$
\begin{equation*}
v_{M}(t, x)=\sum_{I=1}^{M} V_{I}(t) \phi_{I}(x) \tag{7.40}
\end{equation*}
$$

Substituting $v_{M}$ into (7.33) and setting $\phi=\phi_{J}$, we see that coefficients $V_{I}(t)$ must satisfy a linear differential equation of the form

$$
\begin{equation*}
\sum_{J=1}^{M}\left(A_{I J}(t) V_{J}^{\prime \prime}(t)+B_{I J}(t) V_{I}^{\prime}(t)+C_{I J} V_{J}(t)\right)+D_{I}(t)=0, \quad 0 \leq t \leq T \tag{7.41}
\end{equation*}
$$

where

$$
A_{I J}(t)=\left\langle\phi_{I} \mid b^{00}(t) \phi_{J}\right\rangle_{\Omega}+\left\langle\phi_{I} \mid q(t) \phi_{J}\right\rangle_{\partial \Omega}
$$

and the coefficients $A_{I J}(t) B_{I J}(t), C_{I J}(t)$ and $D_{I}(t)$ are bounded on $[0, T]$. Moreover, it follows from the assumptions (7.14), (7.16) and (7.17) that $A_{I J}(t)$ is invertible with bounded inverse on $[0, T]$. To see this, we first note that

$$
\begin{equation*}
A_{I J}(t)=\left\langle\phi_{I} \mid b^{00}(t) \phi_{J}\right\rangle_{\Omega}+\left\langle\phi_{I} \mid q(t) \phi_{J}\right\rangle_{\partial \Omega}=\left\langle b^{00}(t) \phi_{I} \mid \phi_{J}\right\rangle_{\Omega}+\left\langle q(t) \phi_{I} \mid \phi_{J}\right\rangle=A_{J I}(t) \tag{7.42}
\end{equation*}
$$

or in other words, $A_{I J}(t)$ is a symmetric matrix for all $t \in[0, T]$. Next, we compute

$$
\begin{align*}
\sum_{I, J=1}^{M} c_{I} A_{I J}(t) c_{J} & =\sum_{I, J=1}^{M}\left(\left\langle c_{I} \phi_{I} \mid b^{00}(t) c_{J} \phi_{J}\right\rangle_{\Omega}+\left\langle c_{I} \phi_{I} \mid q(t) c_{J} \phi_{J}\right\rangle_{\partial \Omega}\right) \\
& =\left\langle\sum_{I=1}^{M} c_{I} \phi_{I} \mid b^{00}(t) \sum_{J=1}^{M} c_{J} \phi_{J}\right\rangle_{\Omega}+\left\langle\sum_{I=1}^{M} c_{I} \phi_{I} \mid q(t) \sum_{J=1}^{M} c_{J} \phi_{J}\right\rangle_{\partial \Omega} \\
& \leq-\kappa_{0}\left\langle\sum_{I=1}^{M} c_{I} \phi_{I} \mid \sum_{J=1}^{M} c_{J} \phi_{J}\right\rangle_{\Omega} \\
& =-\kappa_{0} \sum_{I=1}^{M} c_{I}^{2} \tag{7.43}
\end{align*}
$$

where in deriving the second to last line we used the assumptions $b^{00} \leq \kappa_{0}$ and $q \leq 0$, and in deriving the final line we used the orthonormality property (7.35). Since $\kappa_{0}<0$ by assumption, (7.42) and (7.43) imply that $A_{I J}(t)$ is invertible for $t \in[0, T]$.

We are now in a position to apply standard existence and uniqueness theorems for linear differential equations to conclude that there exists a unique solution $V_{I} \in W^{2, \infty}([0, T]), 1 \leq I \leq M$, to (7.41) satisfying the initial conditions

$$
\begin{equation*}
V_{I}(0)=\left\langle\phi_{I} \mid \tilde{v}_{0}\right\rangle_{\Omega} \quad \text { and } \quad V_{I}^{\prime}(0)=\left\langle\phi_{I} \mid \tilde{v}_{1}\right\rangle_{\Omega}, \quad I=1,2, \ldots, M, \tag{7.44}
\end{equation*}
$$

where $\tilde{v}_{0}, \tilde{v}_{1}$ is the initial data (7.12), which, for the moment, we assume satisfies

$$
\left(\tilde{v}_{0}, \tilde{v}_{1}\right) \in H^{1}\left(\Omega, \mathbb{R}^{N}\right) \times H^{1}\left(\Omega, \mathbb{R}^{N}\right)
$$

By construction, the solution (7.40) solves (7.33) for any $\phi$ satisfying (7.34), and hence, in particular, for

$$
\phi(t, x)=\partial_{t} v_{M}(t, x)=\sum_{I=1}^{M} V_{I}^{\prime}(t) \phi_{I}
$$

Substituting this into (7.33) with $v=v_{M}$ yields

$$
\begin{align*}
\left\langle\partial_{t} v_{M}\right| & \left.\partial_{t}\left(b^{0 \beta} \partial_{\beta} v_{M}+L^{0}\right)\right\rangle_{\Omega}-\left\langle\partial_{i} \partial_{t} v_{M} \mid b^{i \beta} \partial_{\beta} v_{M}+L^{i}\right\rangle_{\Omega} \\
& +\left\langle\partial_{t} v_{M} \mid q \partial_{t}^{2} v_{M}+P \partial_{t} v_{M}+k^{i} \partial_{i} \theta\right\rangle_{\partial \Omega}+\lambda\left\langle\partial_{t} v_{M} \mid c v\right\rangle_{\Omega}-\left\langle\partial_{t} v_{M} \mid F\right\rangle_{\Omega}=0 \tag{7.45}
\end{align*}
$$

Next, from the symmetry (7.16) of the $b^{\alpha \beta}$, it is not difficult to see that

$$
\begin{aligned}
\left\langle\partial_{i} \partial_{t} v_{M} \mid b^{i \beta} \partial_{\beta} v_{M}+L^{i}\right\rangle_{\Omega} & =\left\langle\partial_{t} v_{M} \mid \partial_{t}\left(b^{0 i} \partial_{i} v_{M}+L^{0}\right)\right\rangle_{\Omega}-\left\langle\partial_{\alpha} v_{M} \mid \partial_{t} L^{\alpha}\right\rangle_{\Omega}-\left\langle\partial_{t} v_{M} \mid \partial_{t} b^{0 i} \partial_{i} v_{M}\right\rangle_{\Omega} \\
& -\frac{1}{2}\left\langle\partial_{i} v_{M} \mid \partial_{t} b^{i j} \partial_{j} v_{M}\right\rangle_{\Omega}+\partial_{t}\left[\frac{1}{2}\left\langle\partial_{i} v_{M} \mid b^{i j} \partial_{j} v_{M}\right\rangle_{\Omega}+\left\langle\partial_{i} v_{M} \mid L^{i}\right\rangle_{\Omega}\right]
\end{aligned}
$$

Substituting this into (7.45), we obtain with the help the symmetry conditions $\left(b^{00}\right)^{\operatorname{tr}}=b^{00}$ and $q^{\operatorname{tr}}=q$ that

$$
\begin{align*}
& \partial_{t}\left[\frac{1}{2}\left(\left\langle\partial_{t} v_{M} \mid b^{00} \partial_{t} v_{M}\right\rangle_{\Omega}-\left\langle\partial_{i} v_{M} \mid b^{i j} \partial_{j} v_{M}\right\rangle_{\Omega}\right)-\left\langle\partial_{i} v_{M} \mid L^{i}\right\rangle_{\Omega}+\frac{1}{2}\left\langle\partial_{t} v_{M} \mid q \partial_{t} v_{M}\right\rangle_{\partial \Omega}\right. \\
&\left.+\left\langle v_{M} \mid k^{i} \partial_{i} \theta\right\rangle_{\partial \Omega}\right]-\frac{1}{2}\left\langle\partial_{t} v_{M} \mid \partial_{t} b^{00} \partial_{t} v_{M}\right\rangle_{\Omega}+\frac{1}{2}\left\langle\partial_{i} v_{M} \mid \partial_{t} b^{i j} \partial_{j} v_{M}\right\rangle_{\Omega} \\
& \quad+\left\langle\partial_{t} v_{M} \mid \partial_{t} b^{0 j} \partial_{j} v_{M}\right\rangle_{\Omega}+\left\langle\partial_{i} v_{M} \mid \partial_{t} L^{i}\right\rangle_{\Omega}+2\left\langle\partial_{t} v_{M} \mid \partial_{t} L^{0}\right\rangle_{\Omega} \\
&+\left\langle\partial_{t} v_{M} \left\lvert\,\left(P-\frac{1}{2} \partial_{t} q\right) \partial_{t} v_{M}\right.\right\rangle_{\partial \Omega}-\left\langle v_{M} \mid \partial_{t}\left(k^{i} \partial_{i} \theta\right)\right\rangle_{\partial \Omega}+\left\langle\partial_{t} v_{M} \mid \lambda c v_{M}-F\right\rangle_{\Omega}=0 \tag{7.46}
\end{align*}
$$

Introducing the energy

$$
\begin{align*}
E_{M}(t)=- & \frac{1}{2}\left\langle\partial_{t} v_{M}(t) \mid b^{00}(t) \partial_{t} v_{M}(t)\right\rangle_{\Omega}+\frac{1}{2}\left\langle\partial_{i} v_{M}(t) \mid b^{i j}(t) \partial_{j} v_{M}(t)\right\rangle_{\Omega} \\
+\left\langle\partial_{i} v_{M}(t) \mid L^{i}(t)\right\rangle_{\Omega}- & \frac{1}{2}\left\langle\partial_{t} v_{M}(t) \mid q(t) \partial_{t} v_{M}(t)\right\rangle_{\partial \Omega}-\left\langle v_{M}(t) \mid k^{i} \partial_{i} \theta(t)\right\rangle_{\partial \Omega} \\
& +\frac{\mu}{2}\left\|v_{M}(t)\right\|_{L^{2}(\Omega)}^{2}+\frac{2}{\kappa_{1}}\|\vec{L}(t)\|_{L^{2}(\Omega)}^{2}+\frac{3 \mathfrak{k}^{2}}{\kappa_{1}}\|\theta(t)\|_{H^{1}(\Omega)}^{2} \tag{7.47}
\end{align*}
$$

where

$$
\vec{L}=\left(L^{i}\right) \quad \text { and } \quad \mathfrak{k}=\|k\|_{W^{1, \infty}\left([0, T], L^{\infty}(\Omega) \cap W^{1, n}(\Omega)\right)},
$$

we find after differentiating $E_{M}(t)$ that

$$
\left.\begin{array}{rl}
E_{M}^{\prime}(t)= & \partial_{t}\left[-\frac{1}{2}\left\langle\partial_{t} v_{M}(t) \mid b^{00}(t) \partial_{t} v_{M}(t)\right\rangle_{\Omega}\right.
\end{array}+\frac{1}{2}\left\langle\partial_{i} v_{M}(t) \mid b^{i j}(t) \partial_{j} v_{M}(t)\right\rangle_{\Omega}\right), ~ \begin{aligned}
& \left.\quad+\left\langle\partial_{i} v_{M}(t) \mid L^{i}(t)\right\rangle_{\Omega}-\frac{1}{2}\left\langle\partial_{t} v_{M}(t) \mid q(t) \partial_{t} v_{M}(t)\right\rangle_{\partial \Omega}+\left\langle v_{M}(t) \mid k^{i}(t) \partial_{i} \theta(t)\right\rangle_{\partial \Omega}\right] \\
& \\
& \quad+\mu\left\langle v_{M}(t) \mid \partial_{t} v_{M}(t)\right\rangle_{\Omega}+\frac{4}{\kappa_{1}}\left\langle\vec{L}(t) \mid \partial_{t} \vec{L}(t)\right\rangle_{\Omega}+\frac{6 \mathfrak{k}^{2}}{\kappa_{1}}\left\langle\theta(t) \mid \partial_{t} \theta(t)\right\rangle_{H^{1}(\Omega)}
\end{aligned}
$$

From (7.46), the assumption $-\frac{1}{2} \partial_{t} q+P-\chi q \leq 0$, and the estimate (7.29), it then follows that $E_{M}^{\prime}$ satisfies the inequality

$$
\begin{align*}
E_{M}^{\prime} \leq C(\mu, & \left.\kappa_{1}, \mathfrak{k}\right)\left([ 1 + | \lambda | \| c \| _ { L ^ { n } ( \Omega ) } + \| \partial _ { t } b \| _ { L ^ { \infty } ( \Omega ) } + \| \chi \| _ { L ^ { \infty } ( \partial \Omega ) } ] \left(\left\|v_{M}\right\|_{H^{1}(\Omega)}^{2}\right.\right. \\
+ & \left.\left\|\partial_{t} v_{M}\right\|_{L^{2}(\Omega)}^{2}-\left\langle\partial_{t} v_{M} \mid q \partial_{t} v_{M}\right\rangle_{\partial \Omega}\right)+\left(\left\|v_{M}\right\|_{H^{1}(\Omega)}+\left\|\partial_{t} v_{1}\right\|_{L^{2}(\Omega)}\right. \\
& \left.+\|\vec{L}\|_{L^{2}(\Omega)}+\|\theta\|_{H^{1}(\Omega)}\right)\left(\|\theta\|_{H^{1}(\Omega)}+\left\|\partial_{t} \theta\right\|_{H^{1}(\Omega)}+\left\|\partial_{t} L\right\|_{L^{2}(\Omega)}+\|F\|_{L^{2}(\Omega)}\right) \tag{7.48}
\end{align*}
$$

For the energy inequality (7.48) to be useful, we first must verify that $E_{M}$ controls $\left\|\left(v_{M}, \partial_{t} v_{M}\right)\right\|_{E}$ where $\|(\cdot, \cdot)\|_{E}$ is the energy norm defined by (7.32). Using Cauchy-Schwartz and Young's (i.e. $a b \leq \frac{1}{2 \epsilon} a^{2}+\frac{\epsilon}{2} b^{2}$, $a, b \geq 0$ and $\epsilon>0$ ) inequalities together with the assumptions (7.17) and (7.18), it is clear from (7.47) that the energy $E_{M}$ is bounded below by
$E_{M} \geq \frac{\kappa_{1}}{4}\left\|v_{M}\right\|_{H^{1}(\Omega)}^{2}+\frac{\kappa_{0}}{2}\left\|\partial_{t} v_{M}\right\|_{L^{2}(\Omega)}-\frac{1}{2}\left\langle\partial_{t} v_{M} \mid q \partial_{t} v_{M}\right\rangle_{L^{2}(\partial \Omega)}+\frac{1}{\kappa_{1}}\|\vec{L}\|_{L^{2}(\Omega)}^{2}-\left\langle v_{M} \mid k^{i} \partial_{i} \theta\right\rangle_{\partial \Omega}+\frac{3 \mathfrak{k}^{2}}{\kappa_{1}}\|\theta\|_{H^{1}(\Omega)}^{2}$.
From this estimate, we see with the help of Young's inequality and (7.29) that

$$
\begin{equation*}
E_{M} \geq \min \left\{\frac{\kappa_{1}}{8}, \frac{\kappa_{0}}{2}, \frac{1}{2}\right\}\left\|\left(v_{M}, \partial_{t} v_{M}\right)\right\|_{E}^{2}+\frac{1}{\kappa_{1}}\|\vec{L}\|_{L^{2}(\Omega)}^{2}+\frac{\mathfrak{k}^{2}}{\kappa_{1}}\|\theta\|_{H^{1}(\Omega)}^{2} \tag{7.49}
\end{equation*}
$$

Using this lower bound, it follows immediately from (7.48) that $E_{M}$ satisfies

$$
\begin{aligned}
E_{M}^{\prime} \leq C\left(\mu, \kappa_{0}, \kappa_{1}, \mathfrak{k}\right)\left(\left[1+|\lambda|\|c\|_{L^{n}(\Omega)}\right.\right. & \left.+\left\|\partial_{t} b\right\|_{L^{\infty}(\Omega)}+\|\chi\|_{L^{\infty}(\partial \Omega)}\right] E_{M}^{\prime} \\
& \left.+\left\|\partial_{t} L\right\|_{L^{2}(\Omega)}^{2}+\left\|\partial_{t} \theta\right\|_{H^{1}(\Omega)}^{2}+\|F\|_{L^{2}(\Omega)}^{2}\right)
\end{aligned}
$$

Integrating this in time yields the estimate

$$
\begin{align*}
E_{M}(t) \leq C(\mu, & \left.\kappa_{0}, \kappa_{1}, \mathfrak{k}\right)\left(E_{M}(0)+\int_{0}^{t}\left(1+|\lambda|\|c(\tau)\|_{L^{n}(\Omega)}+\left\|\partial_{t} b(\tau)\right\|_{L^{\infty}(\Omega)}\right.\right. \\
& \left.\left.+\|\chi(\tau)\|_{L^{\infty}(\partial \Omega)}\right) E_{M}(\tau)+\left\|\partial_{t} L(\tau)\right\|_{L^{2}(\Omega)}^{2}+\left\|\partial_{t} \theta(\tau)\right\|_{H^{1}(\Omega)}^{2}+\|F(\tau)\|_{L^{2}(\Omega)}^{2} d \tau\right) \tag{7.50}
\end{align*}
$$

which in turn, shows by Gronwall's inequality that

$$
\begin{equation*}
E_{M}(t) \leq C\left(E_{M}(0)+\int_{0}^{t}\left\|\partial_{t} L(\tau)\right\|_{L^{2}(\Omega)}^{2}+\left\|\partial_{t} \theta(\tau)\right\|_{H^{1}(\Omega)}^{2}+\|F(\tau)\|_{L^{2}(\Omega)}^{2} d \tau\right) \tag{7.51}
\end{equation*}
$$

where

$$
C=C\left(\mu, \kappa_{0}, \kappa_{1}, \mathfrak{k},\left\|\partial_{t} b\right\|_{L^{\infty}\left(\Omega_{T}\right)},\|\chi\|_{L^{\infty}\left(\Gamma_{T}\right)},\|c\|_{L^{\infty}\left([0, T], L^{n}(\Omega)\right)}\right)
$$

The next step in constructing the solutions is to to let $M \rightarrow \infty$ and use the inequality (7.51) to provide a uniform bound on the energy norm $\left\|\left(v_{M}(t), \partial_{t} v_{M}(t)\right)\right\|$ for $t \in[0, T]$. However, before we can do this, we must first establish a uniform bound on $E_{M}(0)$. We begin by expressing $v_{M}(0)$ and $\partial_{t} v_{M}(0)$ as

$$
v_{M}(0)=\pi_{M}\left(\tilde{v}_{0}\right) \quad \text { and } \quad \partial_{t} v_{M}(0)=\pi_{M}\left(\tilde{v}_{1}\right)
$$

which is clear from (7.40) and (7.44). Using properties (7.37) and (7.38) of the projection operator $\pi_{M}$, we obtain the bound

$$
\begin{equation*}
\left\|v_{M}(0)\right\|_{H^{1}(\Omega)}^{2}+\left\|\partial_{t} v_{M}(0)\right\|_{L^{2}(\Omega)}^{2} \leq\left\|\tilde{v}_{0}\right\|_{H^{1}(\Omega)}^{2}+\left\|\tilde{v}_{1}\right\|_{L^{2}(\Omega)}^{2} \tag{7.52}
\end{equation*}
$$

Additionally, we observe that

$$
\begin{align*}
-\left\langle\partial_{t} v_{M}(0) \mid q(0) \partial_{t} v_{M}(0)\right\rangle_{\partial \Omega} & \lesssim\left\|q(0) \partial_{t} v_{M}(0)\right\|_{L^{2}(\partial \Omega)}^{2} & & (\text { by }(7.23)) \\
& \lesssim\|q(0)\|_{W^{1, \infty}(\Omega)}^{2}\left\|\partial_{t} v_{M}(0)\right\|_{H^{1}(\Omega)}^{2} & & (\text { by Theorem (A.4) } \\
& \leq\left\|\tilde{v}_{1}\right\|_{H^{1}(\Omega)}^{2} & & (\text { by (7.38) }) . \tag{7.53}
\end{align*}
$$

Taken together, the inequalities (7.52) and (7.53) imply that

$$
E_{M}(0) \lesssim 1, \quad M \geq 1
$$

from which the uniform bound

$$
\begin{equation*}
\left\|v_{M}(t)\right\|_{H^{1}(\Omega)}+\left\|\partial_{t} v_{M}(t)\right\|_{L^{2}(\Omega)}+\left\|\left.q(t) \partial_{t} v_{M}(t)\right|_{\partial \Omega}\right\|_{L^{2}(\partial \Omega)} \leq C, \quad(M, t) \in \mathbb{N} \times[0, T] \tag{7.54}
\end{equation*}
$$

follows by (7.23), (7.49) and (7.51). By the Banach-Alaoglu Theorem, there exists $v \in L^{p}\left([0, T], H^{1}\left(\Omega, \mathbb{R}^{N}\right)\right)$, $\dot{v} \in L^{p}\left([0, T], L^{2}\left(\Omega, \mathbb{R}^{N}\right)\right), \hat{w} \in L^{p}\left([0, T], L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right)\right)$, and a subsequence of $v_{M}$, again denoted $v_{M}$, such that

$$
\begin{array}{ll}
v_{M} \rightharpoonup v & \text { in } L^{p}\left([0, T], H^{1}\left(\Omega, \mathbb{R}^{N}\right)\right) \\
\partial_{t} v_{M} \rightharpoonup \dot{v} & \text { in } L^{p}\left([0, T], L^{2}\left(\Omega, \mathbb{R}^{N}\right)\right) \tag{7.56}
\end{array}
$$

and

$$
\begin{equation*}
\left.q \partial_{t} v_{M}\right|_{\partial \Omega} \rightharpoonup \hat{w} \quad \text { in } L^{p}\left([0, T], L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right)\right) \tag{7.57}
\end{equation*}
$$

for any $p \in(1, \infty)$. Moreover, since the constant $C>0$ in the inequality (7.54) is independent of $p \in(1, \infty)$, we can use the property $\lim _{p \rightarrow \infty}\|f(t)\|_{L^{p}([0, T])}=\|f(t)\|_{L^{\infty}([0, T])}$ of $L^{p}$ norms to conclude that

$$
\begin{equation*}
(v, \dot{v}, \hat{w}) \in L^{\infty}\left([0, T], H^{1}\left(\Omega, \mathbb{R}^{N}\right)\right) \times L^{\infty}\left([0, T], L^{2}\left(\Omega, \mathbb{R}^{N}\right)\right) \times L^{\infty}\left([0, T], L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right)\right) \tag{7.58}
\end{equation*}
$$

Since $q \partial_{t} v_{M}$ satisfies $\mathbb{P}_{q} q \partial_{t} v_{M}=q \partial_{t} v_{M}$ it is not difficult to see that the limit $\hat{w}$ must also satisfy $\mathbb{P}_{q} \hat{w}=\hat{w}$. This together with the invertibility of the map $\left.q\right|_{\mathbb{P}_{q}}$, see (7.21), allows us to write (7.57) as

$$
\begin{equation*}
\left.q \partial_{t} v_{M}\right|_{\partial \Omega} \rightharpoonup q w \quad \text { in } L^{\infty}\left([0, T], L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right)\right) \tag{7.59}
\end{equation*}
$$

where

$$
\begin{equation*}
w:=\left(\left.q\right|_{\mathbb{P}_{q}}\right)^{-1} \hat{w} \in L^{\infty}\left([0, T], L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right)\right) \tag{7.60}
\end{equation*}
$$

Furthermore, since $\partial_{t} v_{M}$ satisfies

$$
\left\langle\partial_{t} v_{M} \mid \phi\right\rangle_{\Omega_{T}}=-\left\langle v_{M} \mid \partial_{t} \phi\right\rangle_{\Omega_{T}}
$$

and

$$
\begin{equation*}
\left\langle q \partial_{t} v_{M} \mid \phi\right\rangle_{\Gamma_{T}}=-\left\langle\partial_{t} q v_{M} \mid \phi\right\rangle_{\Gamma_{T}}-\left\langle q v_{M} \mid \partial_{t} \phi\right\rangle_{\Gamma_{T}} \tag{7.61}
\end{equation*}
$$

for all $\phi \in C_{0}^{1}\left([0, T], C^{1}\left(\Omega, \mathbb{R}^{N}\right)\right)$, it follows from (7.55), (7.56) and (7.59) that 21

$$
\begin{equation*}
\langle\dot{v} \mid \phi\rangle_{\Omega_{T}}=-\left\langle v \mid \partial_{t} \phi\right\rangle_{\Omega_{T}} \quad \text { and } \quad\langle q w \mid \phi\rangle_{\Gamma_{T}}=-\left\langle\partial_{t} q v \mid \phi\right\rangle_{\Gamma_{T}}-\left\langle q v \mid \partial_{t} \phi\right\rangle_{\Gamma_{T}} \tag{7.62}
\end{equation*}
$$

Thus, we the formulas

$$
\begin{equation*}
\dot{v}=\partial_{t} v \tag{7.63}
\end{equation*}
$$

and

$$
q w=q \partial_{t} v
$$

hold in a weak sense.

[^12]Next, in (7.33) with $v=v_{M}$, we set

$$
\begin{equation*}
\phi(t, x)=\sum_{I=1}^{M} c_{I}(t) \phi_{I}(x), \quad c_{I} \in C_{0}^{1}([0, T]), \tag{7.64}
\end{equation*}
$$

and integrate in time from $t=0$ to $t=T$ and by parts to obtain

$$
\left\langle b^{\alpha \beta} \partial_{\beta} v_{M}+L^{\alpha} \mid \partial_{\alpha} \phi\right\rangle_{\Omega_{T}}+\left\langle\left(\partial_{t} q-P\right) \partial_{t} v_{M} \mid \phi\right\rangle_{\Gamma_{T}}-\left\langle k^{i} \partial_{i} \theta \mid \phi\right\rangle_{\Gamma_{T}}+\left\langle q \partial_{t} v_{M} \mid \partial_{t} \phi\right\rangle_{\Gamma_{T}}=\left\langle\lambda c v_{M}-F \mid \phi\right\rangle_{\Omega_{T}},
$$

and hence, that

$$
\begin{equation*}
\left\langle b^{\alpha \beta} \partial_{\beta} v+L^{\alpha} \mid \partial_{\alpha} \phi\right\rangle_{\Omega_{T}}+\left\langle\left(\partial_{t} q-P\right) \partial_{t} v \mid \phi\right\rangle_{\Gamma_{T}}-\left\langle k^{i} \partial_{i} \theta \mid \phi\right\rangle_{\Gamma_{T}}+\left\langle q w \mid \partial_{t} \phi\right\rangle_{\Gamma_{T}}=\langle\lambda c v-F \mid \phi\rangle_{\Omega_{T}} . \tag{7.65}
\end{equation*}
$$

by (7.55), (7.56), (7.59) and (7.63). Furthermore, since $M$ can be chosen arbitrarily large and we can approximate maps $C_{0}^{1}\left([0, T], C^{1}\left(\bar{\Omega}, \mathbb{R}^{N}\right)\right.$ by maps of the form (7.64), it follows that (7.65) continues to hold for all $\phi \in C_{0}^{1}\left([0, T], C^{1}\left(\bar{\Omega}, \mathbb{R}^{N}\right)\right.$.

Thus far, we have shown that the pair $(v, w)$ defined by (7.55) and (7.60) satisfy (7.65) for all $\phi \in$ $C_{0}^{1}\left([0, T], C^{1}\left(\bar{\Omega}, \mathbb{R}^{N}\right)\right.$. The next step is to verify that the pair $(v, w)$ satisfies the initial conditions $\left.v\right|_{t=0}=$ $\tilde{v}_{0},\left.\partial_{t} v\right|_{t=0}=\tilde{v}_{1}$ and $\left.w\right|_{t=0}=\left.\mathbb{P}_{q(0)} \tilde{v}_{1}\right|_{\partial \Omega}$. To see this, we choose a $\phi \in C^{1}\left(\bar{\Omega}_{T}, \mathbb{R}^{N}\right)$ that satisfies $\left.\phi\right|_{t=T}=0$. Since

$$
v \in C^{0}\left([0, T], L^{2}\left(\Omega, \mathbb{R}^{N}\right)\right) \subset W^{1, \infty}\left([0, T], L^{2}\left(\Omega, \mathbb{R}^{N}\right)\right) \quad \text { and } \quad \partial_{t} v \in L^{\infty}\left([0, T], L^{2}\left(\Omega, \mathbb{R}^{N}\right)\right)
$$

by (7.58) and (7.63), we see from integrating

$$
\partial_{t}(\phi \mid v)=\left(\partial_{t} \phi \mid v\right)+\left(\phi \mid \partial_{t} v\right)
$$

over $\Omega_{T}$ that

$$
\begin{equation*}
\langle\phi(0) \mid v(0)\rangle_{\Omega}=\left\langle\partial_{t} \phi \mid v\right\rangle_{\Omega_{T}}+\left\langle\phi \mid \partial_{t} v\right\rangle_{\Omega_{T}} . \tag{7.66}
\end{equation*}
$$

By a similar calculation, we also have that

$$
\left\langle\phi(0) \mid \pi_{M}\left(\tilde{v}_{0}\right)\right\rangle_{\Omega}=\left\langle\partial_{t} \phi \mid v_{M}\right\rangle_{\Omega_{T}}+\left\langle\phi \mid \partial_{t} v_{M}\right\rangle_{\Omega_{T}}
$$

which in turn, implies, after letting $M \rightarrow \infty$, that

$$
\begin{equation*}
\left\langle\phi(0) \mid \tilde{v}_{0}\right\rangle_{\Omega}=\left\langle\partial_{t} \phi \mid v\right\rangle_{\Omega_{T}}+\left\langle\phi \mid \partial_{t} v\right\rangle_{\Omega_{T}} \tag{7.67}
\end{equation*}
$$

by (7.39), (7.55), (7.56) and (7.63). Since (7.66) and (7.67) hold for all $\phi \in C^{1}\left(\bar{\Omega}_{T}, \mathbb{R}^{N}\right)$ satisfying $\left.\phi\right|_{t=T}=0$, we conclude that

$$
\begin{equation*}
v(0)=\tilde{v}_{0} \tag{7.68}
\end{equation*}
$$

To proceed, we set

$$
\phi(t, x)=\sum_{I=1}^{M} c_{I}(t) \phi_{I}(x)
$$

where $c_{I} \in C^{1}([0, T])$ and $c_{I}(T)=0$, in (7.33) with $v=v_{M}$, which we know by construction solves (7.33). Integrating the resulting expression over $t$ from $t=0$ to $t=T$, we find, with the help of (7.44), that

$$
\begin{aligned}
&\left\langle q(0) \pi_{M} \tilde{v}_{1} \mid \phi(0)\right\rangle_{\partial \Omega}+\left\langle b^{00}(0) \pi_{M} \tilde{v}_{1}+b^{0 i}(0) \partial_{i} \pi_{M} \tilde{v}_{0}+L^{0}(0) \mid \phi(0)\right\rangle_{\Omega} \\
&+\left\langle\left(P(0)-\partial_{t} q(0)\right) \nu\left(\pi_{M} \tilde{v}_{0}\right) \mid \phi(0)\right\rangle_{\Omega}+\left\langle b^{\alpha \beta} \partial_{\beta} v_{M}+L^{\alpha} \mid \partial_{\alpha} \phi\right\rangle_{\Omega_{T}}+\left\langle q \partial_{t} v_{M} \mid \partial_{t} \phi\right\rangle_{\Gamma_{T}} \\
&+\left\langle\left(\partial_{t} q-P\right) \partial_{t} v_{M} \mid \phi\right\rangle_{\Gamma_{T}}-\left\langle k^{i} \partial_{i} \theta \mid \phi\right\rangle_{\Gamma_{T}}+\left\langle\lambda c v_{M}-F \mid \phi\right\rangle_{\Omega_{T}}=0
\end{aligned}
$$

where we recall that the "boundary term" $\left\langle\left(\partial_{t} q-P\right) \partial_{t} v_{M} \mid \phi\right\rangle_{\Gamma_{T}}$ is defined via the formula (7.27). Letting $M \rightarrow \infty$ in the above expression, it follows from (7.39), (7.55), (7.56), (7.59) and (7.63) that

$$
\begin{align*}
& \left\langle q(0) \tilde{v}_{1} \mid \phi(0)\right\rangle_{\partial \Omega}+\left\langle b^{00}(0) \tilde{v}_{1}+b^{0 i}(0) \partial_{i} \tilde{v}_{0}+L^{0}(0) \mid \phi(0)\right\rangle_{\Omega} \\
& +\left\langle\left(P(0)-\partial_{t} q(0)\right) \nu\left(\tilde{v}_{0}\right) \mid \phi(0)\right\rangle_{\Omega}+\left\langle b^{\alpha \beta} \partial_{\beta} v+L^{\alpha} \mid \partial_{\alpha} \phi\right\rangle_{\Omega_{T}}+\left\langle q w \mid \partial_{t} \phi\right\rangle_{\Gamma_{T}} \\
& \quad+\left\langle\left(\partial_{t} q-P\right) \partial_{t} v \mid \phi\right\rangle_{\Gamma_{T}}-\left\langle k^{i} \partial_{i} \theta \mid \phi\right\rangle_{\Gamma_{T}}+\langle\lambda c v-F \mid \phi\rangle_{\Omega_{T}}=0 \tag{7.69}
\end{align*}
$$

which, by approximation, holds for all $\phi \in C^{1}\left(\bar{\Omega}_{T}, \mathbb{R}^{N}\right)$ satisfying $\phi_{t=T}=0$. Choosing $\phi$ so that

$$
\phi(t, x)=\eta(t) \psi(x)
$$

where $\eta \in C_{0}^{1}([0, T])$ and $\psi \in C^{1}(\bar{\Omega})$, we see from (7.69), or alternatively (7.65), that

$$
\begin{align*}
\int_{0}^{T} \eta^{\prime}\left[\left\langleb^{0 \beta} \partial_{\beta} v+L^{0}+\right.\right. & \left.\left(P-\partial_{t} q\right) \nu(v)|\psi\rangle_{\Omega}+\langle q w \mid \psi\rangle_{\Omega}\right] d t=\int_{0}^{T} \eta\left[-\left\langle b^{i \beta} \partial_{\beta} v+L^{i} \mid \partial_{i} \psi\right\rangle\right. \\
& +\left\langle k^{i} \partial_{i} \theta \mid \psi\right\rangle_{\partial \Omega}+\left\langle\nu\left(P-\partial_{t} q\right) \partial_{t} v-\partial_{t}\left(P-\partial_{t} q\right) \nu(v) \mid \psi\right\rangle_{\Omega} \\
& \left.+\left\langle\partial_{\alpha} v^{\alpha}\left(P-\partial_{t} q\right) \partial_{t} v \mid \psi\right\rangle_{\Omega}+\left\langle\left(P-\partial_{t} q\right) \partial_{t} v \mid \nu(\psi)\right\rangle_{\Omega}+\langle F-\lambda c v \mid \psi\rangle_{\Omega}\right] d t \tag{7.70}
\end{align*}
$$

From this we conclude that there exists a map $\mathcal{V} \in W^{1, \infty}\left([0, T], H^{1}(\Omega)\right) \subset C^{0}\left([0, T], H^{1}(\Omega)\right)$ such that

$$
\begin{equation*}
\langle\mathcal{V} \mid \psi\rangle_{H^{1}(\Omega)}=\left\langle b^{0 \beta} \partial_{\beta} v+L^{0}+\left(P-\partial_{t} q\right) \nu(v) \mid \psi\right\rangle_{\Omega}+\langle q w \mid \psi\rangle_{\partial \Omega} \tag{7.71}
\end{equation*}
$$

and

$$
\begin{gather*}
\left\langle\partial_{t} \mathcal{V} \mid \psi\right\rangle_{H^{1}(\Omega)}=\left\langle b^{i \beta} \partial_{\beta} v+L^{i} \mid \partial_{i} \psi\right\rangle_{\Omega}-\left\langle k^{i} \partial_{i} \theta \mid \psi\right\rangle_{\partial \Omega}-\left\langle\nu\left(P-\partial_{t} q\right) \partial_{t} v-\partial_{t}\left(P-\partial_{t} q\right) \nu(v) \mid \psi\right\rangle_{\Omega} \\
-\left\langle\partial_{\alpha} v^{\alpha}\left(P-\partial_{t} q\right) \partial_{t} v \mid \psi\right\rangle_{\Omega}-\left\langle\left(P-\partial_{t} q\right) \partial_{t} v \mid \nu(\psi)\right\rangle_{\Omega}-\langle F-\lambda c v \mid \psi\rangle_{\Omega} \tag{7.72}
\end{gather*}
$$

for all $\psi \in H^{1}\left(\Omega, \mathbb{R}^{N}\right)$.
Fixing $\phi \in C^{1}\left(\bar{\Omega}_{T}, \mathbb{R}^{N}\right)$ satisfying $\left.\phi\right|_{t=T}=0$, we see from integrating the identity

$$
\partial_{t}\langle\mathcal{V} \mid \phi\rangle_{H^{1}(\Omega)}=\left\langle\partial_{t} \mathcal{V} \mid \phi\right\rangle_{H^{1}(\Omega)}+\left\langle\mathcal{V} \mid \partial_{t} \phi\right\rangle_{H^{1}(\Omega)}
$$

over $t$ from $t=0$ to $t=T$ and using (7.71)-(7.72) that

$$
\begin{align*}
\langle\mathcal{V}(0) \mid \phi(0)\rangle_{H^{1}(\Omega)}+ & \left\langle b^{\alpha \beta} \partial_{\beta} v+L^{\alpha} \mid \partial_{\alpha} \phi\right\rangle_{\Omega_{T}}+\left\langle q w \mid \partial_{t} \phi\right\rangle_{\Gamma_{T}} \\
& +\left\langle\left(\partial_{t} q-P\right) \partial_{t} v \mid \phi\right\rangle_{\Gamma_{T}}-\left\langle k^{i} \partial_{i} \theta \mid \phi\right\rangle_{\Gamma_{T}}+\langle\lambda c v-F \mid \phi\rangle_{\Omega_{T}}=0 . \tag{7.73}
\end{align*}
$$

Comparing (7.69) and (7.73), we see that

$$
\begin{equation*}
\lim _{t \searrow 0}\langle\mathcal{V}(t) \mid \psi\rangle_{H^{1}(\Omega)}=\left\langle q(0) \tilde{v}_{1} \mid \psi\right\rangle_{\partial \Omega}+\left\langle b^{00}(0) \tilde{v}_{1}+b^{0 i}(0) \partial_{i} \tilde{v}_{0}+L^{0}(0)+\left(P(0)-\partial_{t} q(0)\right) \nu\left(\tilde{v}_{0}\right) \mid \psi\right\rangle_{\Omega} \tag{7.74}
\end{equation*}
$$

for all $\psi \in H^{1}\left(\Omega, \mathbb{R}^{N}\right)$. From the formulas (7.71) and (7.74), and the regularity properties

$$
\begin{gathered}
v \in C^{0}\left([0, T], L^{2}\left(\Omega, \mathbb{R}^{N}\right)\right) \cap L^{\infty}\left([0, T], H^{1}\left(\Omega, \mathbb{R}^{N}\right)\right), \quad \partial_{t} v \in L^{\infty}\left([0, T], L^{2}\left(\Omega, \mathbb{R}^{N}\right)\right) \\
w \in L^{\infty}\left([0, T], L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right)\right) \quad \text { and } \quad \mathcal{V} \in C^{0}\left([0, T], H^{1}\left(\Omega, \mathbb{R}^{N}\right)\right)
\end{gathered}
$$

and (7.68), it is not difficult to verify that

$$
\left\langle\lim _{t \searrow 0} b^{00}(t)\left(\partial_{t} v(t)-\tilde{v}_{1}\right) \mid \psi\right\rangle_{\Omega}=0, \quad \forall \psi \in C_{0}^{1}\left(\Omega, \mathbb{R}^{N}\right)
$$

from which we conclude that the weak limit $\lim _{t \searrow 0} b^{00}(t)\left(\partial_{t} v(t)-\tilde{v}_{1}\right)$ exists in $L^{2}\left(\Omega, \mathbb{R}^{N}\right)$ and is zero. We conclude via the invertibility of $b^{00}$ that

$$
\begin{equation*}
\partial_{t} v(t) \rightharpoonup \tilde{v}_{1} \quad \text { as } t \searrow 0 \text { in } L^{2}\left(\Omega, \mathbb{R}^{N}\right) . \tag{7.75}
\end{equation*}
$$

Using this fact, it follows from (7.69) and (7.73) and similar reasoning that

$$
\begin{equation*}
\left\langle\lim _{t \searrow 0} q(t)\left(w(t)-\left.\tilde{v}_{1}\right|_{\partial \Omega}\right) \mid \psi\right\rangle_{\partial \Omega}=0, \quad \forall \psi \in C^{1}\left(\Omega, \mathbb{R}^{N}\right) \tag{7.76}
\end{equation*}
$$

From this we see that the weak limit $\lim _{t \searrow 0} q(t)\left(w(t)-\left.\tilde{v}_{1}\right|_{\partial \Omega}\right)$ exists in $L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right)$ and is zero, and hence, that

$$
\begin{equation*}
\left.w(t) \rightharpoonup \mathbb{P}_{q(0)} \tilde{v}_{1}\right|_{\partial \Omega} \quad \text { as } t \searrow 0 \text { in } L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right) \tag{7.77}
\end{equation*}
$$

Collectively, (7.62), (7.65), (7.68), (7.75) and (7.77) show that the pair

$$
(v, w) \in \cap_{\ell=0}^{1} W^{\ell, \infty}\left([0, T], H^{1-\ell}(\Omega)\right) \times L^{\infty}\left([0, T], L^{2}(\partial \Omega)\right)
$$

define a weak solution of the IBVP (7.10)-(7.13) for the restricted class of initial data

$$
\left.\left(v, \partial_{t} v\right)\right|_{\Omega_{0}}=\left(\tilde{v}_{0}, \tilde{v}_{1}\right) \in H^{1}(\Omega) \times H^{1}(\Omega) \quad \text { and }\left.\quad w\right|_{\Gamma_{0}}=\left.\mathbb{P}_{q(0)} \tilde{v}_{1}\right|_{\partial \Omega} \in L^{2}(\partial \Omega)
$$

Uniqueness and regularity: By adapting the arguments used by Koch in the proof of Theorem 2.2 from [19], it is not difficult to show that weak solutions $(v, w)$, in the sense of Definition 7.3 and not necessarily the ones constructed from the Galerkin scheme above, to (7.10)-(7.13) are unique, and satisfy the additional regularity

$$
(v, w) \in \bigcap_{j=0}^{1} C^{j}\left([0, T], H^{1-j}\left(\Omega, \mathbb{R}^{N}\right)\right) \times C^{0}\left([0, T], L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right)\right)
$$

and the energy estimate (7.30), which, not surprisingly, is exactly the same as the energy estimate (7.50) satisfied by the Galerkin approximations.

Existence (general initial data): The final step is to approximate general initial data

$$
\begin{equation*}
\left(\tilde{v}_{0}, \tilde{v}_{1}, \tilde{w}\right) \in H^{1}\left(\Omega, \mathbb{R}^{N}\right) \times L^{2}\left(\Omega, \mathbb{R}^{N}\right) \times L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right) \tag{7.78}
\end{equation*}
$$

where $\mathbb{P}_{q(0)} \tilde{w}=\tilde{w}$, by the more regular initial data

$$
\begin{equation*}
\left(\tilde{v}_{0}, \tilde{v}_{1}, \tilde{w}=\left.\mathbb{P}_{q(0)} \tilde{v}_{1}\right|_{\partial \Omega}\right) \in H^{1}\left(\Omega, \mathbb{R}^{N}\right) \times H^{1}\left(\Omega, \mathbb{R}^{N}\right) \times L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right) \tag{7.79}
\end{equation*}
$$

for which we can prove existence via the Galerkin scheme. Weak solutions generated by initial data of the type (7.66) are then obtained by taking weak limits of sequences of solutions generated from initial data satisfying (7.79).

Remark 7.6.
(i) It is clear from the proof of Theorem 7.5 that it continues to hold for $G$ of the form

$$
G=k_{1}^{i} \partial_{i} \theta_{1}+k_{2}^{i} \partial_{i} \theta_{2}+g
$$

where $\nu_{i} k_{a}^{i}=0, a, b=1,2$, provided that we make the replacements

$$
\theta \longmapsto \vec{\theta}=\left(\theta_{1}, \theta_{1}\right) \quad \text { and } \quad k=\left(k^{i}\right) \longmapsto \vec{k}=\left(k_{1}^{i}, k_{2}^{i}\right)
$$

along with the obvious substitutions, e.g. $\|\theta\|_{H^{1}(\Omega)}^{2} \mapsto\|\vec{\theta}\|_{H^{1}(\Omega)}^{2}=\left\|\theta_{1}\right\|_{H^{1}(\Omega)}^{2}+\left\|\theta_{2}\right\|_{H^{1}(\Omega)}^{2}$, in the energy estimate (7.30) and energy norm (7.31).
(ii) It is not difficult to show using an iteration method that the existence and uniqueness statement and the energy estimate from Theorem 7.5 continues to hold if we allow the coefficients $L^{\alpha}, F$, $G$ and $g$ to depend linearly on $v$ provided that they satisfy estimates that preserve the form of the energy estimate. For example, we could have

$$
F=\bar{F}+\hat{F}(v)
$$

where $\bar{F} \in L^{2}\left(\Omega_{T}, \mathbb{R}^{N}\right)$ and

$$
\|\hat{F}(v(t))\|_{L^{2}(\Omega)}^{2} \leq \hat{f}(t) E(t), \quad 0 \leq t \leq T
$$

In this case, we would just replace $\|F(t)\|_{L^{2}(\Omega)}^{2}$ in 7.30 with $\|\bar{F}(t)\|_{L^{2}(\Omega)}^{2}+\hat{f}(t) E(t)$.
7.4. Higher time derivatives: an instructive example. Theorem 7.5 establishes the existence and uniqueness of (weak) solutions to the model problem. However, for the linear results to be applicable to non-linear problems, the existence and uniqueness result of Theorem 7.5 must be generalized to include solutions with more regularity. To give insight into our proof strategy for establishing this type of generalization, we first consider a simplified example that contains the essential ideas, and highlights the major steps involved in the proof. We note that this type of strategy was employed in [2] to establish the existence and uniqueness of solutions to wave equations with jump discontinuities.
7.4.1. The simplified problem. The simplified IBVP that we consider is

$$
\begin{align*}
-\partial_{t}^{2} v+\delta^{i j} \partial_{i} \partial_{j} v-v & =f & & \text { in } \Omega_{T}  \tag{7.80}\\
\nu_{i} \delta^{i j} \partial_{j} v & =q \partial_{t}^{2} v+p \partial_{t} v & & \text { in } \Gamma_{T}  \tag{7.81}\\
\left(v, \partial_{t} v\right) & =\left(\tilde{v}_{0}, \tilde{v}_{1}\right) & & \text { in } \Omega_{0} \tag{7.82}
\end{align*}
$$

where we assume that $q$ and $P$ are constant matrices, i.e. $\partial_{\alpha} q=\partial_{\alpha} p=0, q$ verifies the conditions (7.14), $p$ satisfies $p-\chi q \leq 0$ for some constant $\chi$, and $f \in X_{T}^{\frac{3}{2}}(\Omega)$.
7.4.2. The formally time differentiated system. The first step in obtaining solutions to (7.80)-(7.82) with more regularity is to formally differentiate the equations (7.80)-(7.81) in time. We do this three times to obtain

$$
\begin{align*}
\delta^{i j} \partial_{i} \partial_{j} v_{0}-v_{0} & =v_{2}+f_{0} & & \text { in } \Omega_{T},  \tag{7.83}\\
\nu_{i} \delta^{i j} \partial_{j} v_{0} & =q v_{2}+p v_{1} & & \text { in } \Gamma_{T},  \tag{7.84}\\
\delta^{i j} \partial_{i} \partial_{j} v_{1}-v_{1} & =\partial_{t} v_{2}+f_{1} & & \text { in } \Omega_{T},  \tag{7.85}\\
\nu_{i} \delta^{i j} \partial_{j} v_{1} & =q \partial_{t} v_{2}+p v_{2} & & \text { in } \Gamma_{T},  \tag{7.86}\\
-\partial_{t}^{2} v_{2}+\delta^{i j} \partial_{i} \partial_{j} v_{2}-v_{2} & =f_{2} & & \text { in } \Omega_{T},  \tag{7.87}\\
\nu_{i} \delta^{i j} \partial_{j} v_{2} & =q \partial_{t}^{2} v_{2}+p \partial_{t} v_{2} & & \text { in } \Gamma_{T}, \tag{7.88}
\end{align*}
$$

where

$$
v_{\ell}=\partial_{t}^{\ell} v \quad \text { and } \quad f_{\ell}=\partial_{t}^{\ell} f
$$

Of course, we could consider taking even more time derivatives provided that $f$ was sufficiently regular, but three time derivatives will more than suffice to illustrate the method.
7.4.3. The elliptic-hyperbolic $I B V P$. The next step is to view (7.83)-(7.88) as the following elliptichyperbolic IBVP:

$$
\begin{align*}
\delta^{i j} \partial_{i} \partial_{j} v_{0}-v_{0} & =v_{2}+f_{0} & & \text { in } \Omega_{T}  \tag{7.89}\\
\nu_{i} \delta^{i j} \partial_{j} v_{0} & =q v_{2}+p v_{1} & & \text { in } \Gamma_{T}  \tag{7.90}\\
\delta^{i j} \partial_{i} \partial_{j} v_{1}-v_{1} & =\partial_{t} v_{2}+f_{1} & & \text { in } \Omega_{T}  \tag{7.91}\\
\nu_{i} \delta^{i j} \partial_{j} v_{1} & =q w_{3}+p v_{2} & & \text { in } \Gamma_{T}  \tag{7.92}\\
-\partial_{t}^{2} v_{2}+\delta^{i j} \partial_{i} \partial_{j} v_{2}-v_{2} & =f_{2} & & \text { in } \Omega_{T}  \tag{7.93}\\
\nu_{i} \delta^{i j} \partial_{j} v_{2} & =q \partial_{t}^{2} v_{2}+p \partial_{t} v_{2} & & \text { in } \Gamma_{T}  \tag{7.94}\\
\left(v_{2}, \partial_{t} v_{2}\right) & =\left(\tilde{v}_{2}, \tilde{v}_{3}\right) & & \text { in } \Omega_{0}  \tag{7.95}\\
\partial_{t} v_{2} & =\tilde{w}_{3} & & \text { in } \Gamma_{0} \tag{7.96}
\end{align*}
$$

where

$$
\begin{equation*}
\left(\tilde{v}_{2}, \tilde{v}_{3}, \tilde{w}_{3}\right) \in H^{1}(\Omega) \times L^{2}(\Omega) \times L^{2}(\partial \Omega) \tag{7.97}
\end{equation*}
$$

$\tilde{w}_{3}$ satisfies $\mathbb{P}_{q(0)} \tilde{w}_{3}=\tilde{w}_{3}$, the variables $\left\{u_{0}, u_{1}, u_{2}\right\}$ are now treated as independent, and $f_{\ell}=\partial_{t}^{\ell} f$, $\ell=0,1,2$, as defined above. By Theorem 7.5, we know that there exists a unique weak solution

$$
\begin{equation*}
\left(v_{2}, w_{3}\right) \in \bigcap_{j=0}^{1} C^{j}\left([0, T] H^{1-j}\left(\Omega, \mathbb{R}^{N}\right)\right) \times C^{0}\left([0, T], L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right)\right) \tag{7.98}
\end{equation*}
$$

of (7.93)-(7.96) that is generated by the initial data (7.97) and satisfies the energy estimate

$$
\left\|\left(v_{2}(t), w_{3}(t)\right)\right\|_{E}^{2} \lesssim\left\|\left(v_{2}(0), w_{3}(0)\right)\right\|_{E}^{2}+\int_{0}^{t}\left\|\left(v_{2}(\tau), w_{3}(\tau)\right)\right\|_{E}^{2}+\left\|\partial_{t}^{2} f(\tau)\right\|_{L^{2}(\Omega)}^{2} d \tau, \quad 0 \leq t \leq T
$$

Next, we see that (7.91)-(7.92) can be solved for $v_{1}$ by appealing to Theorem B.3. It clear from the regularity of the solution $\left(v_{2}, w_{3}\right)$ given by (7.98) and Theorem B.4 that

$$
\begin{equation*}
v_{1} \in C^{0}\left([0, T], H^{\frac{3}{2}}\left(\Omega, \mathbb{R}^{N}\right)\right) \tag{7.99}
\end{equation*}
$$

It is important to observe that the $3 / 2$-derivative spatial regularity is a consequence of the fact that we have $L^{2}(\partial \Omega)$ control of the boundary term $q(t) w_{3}(t)$ and no better. Solving (7.89)-(7.90) in the same manner, we again see by Theorems ( (B.3) and ( $\overline{\mathrm{B} .4)}$, and the regularity of the solutions (7.98) and (7.99) that there exists a solution $v_{0}$ of (7.89)-(7.90) satisfying

$$
\begin{equation*}
v_{0} \in C^{0}\left([0, T], H^{2}\left(\Omega, \mathbb{R}^{N}\right)\right) \tag{7.100}
\end{equation*}
$$

Again, it is important to observe that $v_{0}$ gains only a $1 / 2$-derivative in spatial regularity over $v_{1}$. This is due to the boundary control $\left.v_{2}(t)\right|_{\partial \Omega} \in H^{1 / 2}(\Omega)$ for $v_{2}$, which follows from the Trace Theorem, see Theorem A.4, and the interior regularity $v_{2}(t) \in H^{1}(\Omega)$.
7.4.4. Solutions to the simplified system. Collectively, (7.98), (7.99) and (7.100) define a solution of the the elliptic-hyperbolic system (7.89)-(7.96). However, it not clear if $v_{0}$, in any sense, solves the original system (7.80)-(7.82). In order to establish this, we need to verify that the relations

$$
\partial_{t} v_{0}=v_{1} \quad \text { and } \quad \partial_{t} v_{1}=v_{2}
$$

hold. Since $v_{0}$ and $v_{1}$ only depend continuously on time, it is not yet clear in what sense we can differentiate them in time. To address this issue, we smooth, in time, using a mollifier $J_{\omega}$ defined by

$$
\begin{equation*}
J_{\omega} u(t, x)=\frac{1}{\omega} \int_{\mathbb{R}} \rho\left(\frac{t-\tau}{\omega}\right) u(\tau, x) d \tau \tag{7.101}
\end{equation*}
$$

where $\rho \in C_{0}^{\infty}(\mathbb{R})$ satisfies $\int_{\mathbb{R}} \rho(\tau) d \tau=1$. Restricting our attention to $t \in\left(T_{1}, T_{2}\right)$, where $0<T_{1}<$ $T_{2}<T$, and choosing $\omega>0$ small enough so that $J_{\omega} u(t, x)$, for $t \in\left(T_{1}, T_{2}\right)$, only depends on $u(t, x)$, for $t \in(0, T)$, we apply $J_{\omega}$ to (7.89)-(7.92) to get

$$
\begin{align*}
\delta^{i j} \partial_{i} \partial_{j} J_{\omega} v_{0}(t)-J_{\omega} v_{0}(t) & =J_{\omega} v_{2}(t)+J_{\omega} f_{0}(t) & & \text { in } \Omega  \tag{7.102}\\
\nu_{i} \delta^{i j} \partial_{j} J_{\omega} v_{0}(t) & =q J_{\omega} v_{2}(t)+p J_{\omega} v_{1}(t) & & \text { in } \partial \Omega  \tag{7.103}\\
\delta^{i j} \partial_{i} \partial_{j} J_{\omega} v_{1}(t)-J_{\omega} v_{1}(t) & =\partial_{t} J_{\omega} v_{2}(t)+J_{\omega} f_{1}(t) & & \text { in } \Omega  \tag{7.104}\\
\nu_{i} \delta^{i j} \partial_{j} J_{\omega} v_{1}(t) & =q J_{\omega} w_{3}(t)+p J_{\omega} v_{2}(t) & & \text { in } \partial \Omega \tag{7.105}
\end{align*}
$$

for $t \in\left(T_{1}, T_{2}\right)$.
Next, since $\left(v_{2}, w_{3}\right)$ is a weak solution of (7.94)-(7.96), it satisfies

$$
-\left\langle\partial_{t} v_{2} \mid \partial_{t} \phi\right\rangle_{\Omega_{T}}-\left\langle p \partial_{t} v_{2} \mid \phi\right\rangle_{\Gamma_{T}}+\left\langle q w_{3} \mid \partial_{t} \phi\right\rangle_{\Omega_{T}}=-\left\langle v_{2} \mid \phi\right\rangle_{\Omega_{T}}-\left\langle f_{2} \mid \phi\right\rangle_{\Omega_{T}}
$$

Setting $\phi=J_{\omega}(\psi \eta)$, where $\eta \in C^{1}\left(\bar{\Omega}, \mathbb{R}^{N}\right)$ and $\psi \in C_{0}^{1}([0, T])$, we see that

$$
\begin{equation*}
-\left\langle\partial_{t}^{2} J_{\omega} v_{2} \mid \psi \eta\right\rangle_{\Omega_{T}}-\left\langle p \partial_{t} J_{\omega} v_{2} \mid \psi \eta\right\rangle_{\Gamma_{T}}-\left\langle q \partial_{t}^{2} J_{\omega} u_{2} \mid \psi \eta\right\rangle_{\Gamma_{T}}=-\left\langle J_{\omega} v_{2} \mid \eta \psi\right\rangle_{\Omega_{T}}-\left\langle J_{\omega} f_{2} \mid \psi \eta\right\rangle_{\Omega_{T}} \tag{7.106}
\end{equation*}
$$

where in deriving this we have used the property (7.24) of weak solutions, which here, implies that

$$
\begin{equation*}
\left\langle q w_{3} \mid \partial_{t}\left(J_{\omega}(\psi \eta)\right)\right\rangle_{\Gamma_{T}}=-\left\langle q v_{2} \mid \partial_{t}^{2}\left(J_{\omega}(\psi \eta)\right)\right\rangle_{\Gamma_{T}}=-\left\langle q \partial_{t}^{2} J_{\omega} v_{2} \mid \psi \eta\right\rangle_{\Gamma_{T}} \tag{7.107}
\end{equation*}
$$

Since all of the time-dependent quantities appearing in (7.106) and (7.107) are continuous in time, and the test function $\psi=\psi(t)$ is arbitrary, it follows that

$$
-\left\langle\partial_{t}^{2} J_{\omega} v_{2}(t) \mid \eta\right\rangle_{\Omega}-\left\langle p \partial_{t} J_{\omega} v_{2}(t) \mid \eta\right\rangle_{\partial \Omega}-\left\langle q \partial_{t}^{2} J_{\omega} u_{2}(t) \mid \eta\right\rangle_{\partial \Omega}=-\left\langle J_{\omega} v_{2}(t) \mid \eta\right\rangle_{\Omega}-\left\langle J_{\omega} f_{2}(t) \mid \eta\right\rangle_{\Omega}
$$

and

$$
\left\langle q \partial_{t} J_{\omega} w_{3}(t) \mid \eta\right\rangle_{\Omega}=\left\langle q \partial_{t}^{2} J_{\omega} v_{2}(t) \mid \eta\right\rangle_{\Omega}
$$

for $t \in\left(T_{1}, T_{2}\right)$ and $\eta \in C^{1}(\bar{\Omega})$. This shows that we can view $J_{\omega} v_{2}(t), T_{1}<t<T_{2}$, as a weak solution of

$$
\begin{align*}
\delta^{i j} \partial_{i} \partial_{j} J_{\omega} v_{2}(t)-J_{\omega} v_{2}(t) & =\partial_{t}^{2} J_{\omega} v_{2}(t)+J_{\omega} f_{1}(t)  \tag{7.108}\\
\nu_{i} \delta^{i j} \partial_{j} J_{\omega} v_{2}(t) & =q \partial_{t}^{2} J_{\omega} v_{2}+p J_{\omega} v_{2}(t)  \tag{7.109}\\
& \text { in } \partial \Omega
\end{align*}
$$

that satisfies

$$
\begin{equation*}
q \partial_{t} J_{\omega} w_{3}(t)=q \partial_{t}^{2} J_{\omega} v_{2}(t) \quad \text { in } \partial \Omega \tag{7.110}
\end{equation*}
$$

We further observe that the equality

$$
\begin{equation*}
J_{\omega} w_{3}(t)=\partial_{t} J_{\omega} v_{2}(t) \quad \text { in } \partial \Omega \tag{7.111}
\end{equation*}
$$

for $t \in\left(T_{1}, T_{2}\right)$,follows from (7.24), which is satisfied by the weak solution $\left(v_{2}, w_{3}\right)$. This is seen by setting $\phi=J_{\omega}(\psi \eta)$ to get $\left\langle q J_{\omega} w_{3} \mid \psi \eta\right\rangle_{\Gamma_{T}}=-\left\langle q J_{\omega} v_{2} \mid \psi \eta\right\rangle_{\Gamma_{T}}$. Since $\psi \in C_{0}^{1}([0, T])$ is arbitrary it follows that $\left\langle q J_{\omega} w_{3}(t) \mid \eta\right\rangle_{\partial \Omega}=-\left\langle q J_{\omega} v_{2}(t) \mid \eta\right\rangle_{\partial \Omega}$, for $t \in\left(T_{1}, T_{2}\right)$ and all $\eta \in C^{1}(\bar{\Omega})$, which proves the assertion.

Differentiating (7.102)-(7.105) in time, which is now possible due to the smoothing, we see with the help of (7.111) and (7.110) that $\partial_{t} J_{\omega} v_{0}$ and $\partial_{t} J_{\omega} v_{1}$ satisfy

$$
\begin{array}{rlrl}
\delta^{i j} \partial_{i} \partial_{j} \partial_{t} J_{\omega} v_{0}(t)-J_{\omega} \partial_{t} v_{0}(t) & =J_{\omega} \partial_{t} v_{2}(t)+J_{\omega} f_{1}(t) & \text { in } \Omega \\
\nu_{i} \delta^{i j} \partial_{j} \partial_{t} J_{\omega} v_{0}(t) & =q J_{\omega} w_{3}(t)+p \partial_{t} J_{\omega} v_{1}(t) & & \text { in } \partial \Omega \\
\delta^{i j} \partial_{i} \partial_{j} \partial_{t} J_{\omega} v_{1}(t)-\partial_{t} J_{\omega} v_{1}(t) & =\partial_{t}^{2} J_{\omega} v_{2}(t)+J_{\omega} f_{2}(t) & & \text { in } \Omega \\
\nu_{i} \delta^{i j} \partial_{j} \partial_{t} J_{\omega} v_{1}(t) & =q \partial_{t}^{2} J_{\omega} v_{2}(t)+p \partial_{t} J_{\omega} v_{2}(t) & & \text { in } \partial \Omega \tag{7.115}
\end{array}
$$

for $t \in\left(T_{1}, T_{2}\right)$. It then follows from (7.104)-(7.105), (7.108)-(7.109), and (7.112)-(7.115) that the differences $J_{\omega} v_{1}-\partial_{t} J_{\omega} v_{0}$ and $J_{\omega} v_{2}-\partial_{t} J_{\omega} v_{1}$ satisfy the homogenous elliptic system

$$
\begin{array}{rlrl}
\delta^{i j} \partial_{i} \partial_{j}\left(J_{\omega} v_{1}(t)-\partial_{t} J_{\omega} v_{0}(t)\right)-\left(\partial_{t} J_{\omega} v_{1}(t)-J_{\omega} \partial_{t} v_{0}(t)\right) & =0 & & \text { in } \Omega, \\
\nu_{i} \delta^{i j} \partial_{j}\left(J_{\omega} v_{1}(t)-\partial_{t} J_{\omega} v_{0}(t)\right) & =0 & & \text { in } \partial \Omega, \\
\delta^{i j} \partial_{i} \partial_{j}\left(J_{\omega} v_{2}(t)-\partial_{t} J_{\omega} v_{1}(t)\right)-\left(J_{\omega} v_{2}(t)-\partial_{t} J_{\omega} v_{1}(t)\right)=0 & & \text { in } \Omega, \\
\nu_{i} \delta^{i j} \partial_{j}\left(J_{\omega} v_{2}(t)-\partial_{t} J_{\omega} v_{1}(t)\right)=0 & & \text { in } \partial \Omega
\end{array}
$$

for $t \in\left(T_{1}, T_{2}\right)$. By uniqueness of solutions to this system, see Theorem B. 3 we conclude that

$$
J_{\omega} v_{1}=\partial_{t} J_{\omega} v_{0} \quad \text { and } \quad J_{\omega} v_{2}=\partial_{t} J_{\omega} v_{1} \quad \text { in }\left(T_{1}, T_{2}\right) \times \Omega .
$$

Testing these relations with $\phi \in C_{0}^{1}\left([0, T], C^{1}\left(\bar{\Omega}, \mathbb{R}^{N}\right)\right)$, we obtain, for $\omega$ small enough,

$$
\left\langle J_{\omega} \phi \mid v_{1}\right\rangle_{\Omega_{T}}=-\left\langle\partial_{t} \phi \mid J_{\omega} v_{0}\right\rangle_{\Omega_{T}} \quad \text { and } \quad\left\langle J_{\omega} \phi \mid v_{2}\right\rangle=-\left\langle\partial_{t} \phi \mid J_{\omega} v_{1}\right\rangle_{\Omega_{T}} .
$$

Sending $\omega \searrow 0$ gives

$$
\left\langle\phi \mid v_{1}\right\rangle_{\Omega_{T}}=-\left\langle\partial_{t} \phi \mid v_{0}\right\rangle_{\Omega_{T}} \quad \text { and } \quad\left\langle\phi \mid v_{2}\right\rangle_{\Omega_{T}}=-\left\langle\partial_{t} \phi \mid v_{1}\right\rangle_{\Omega_{T}}
$$

From this we conclude that

$$
v_{1}=\partial_{t} v_{0} \quad \text { and } \quad v_{2}=\partial_{t} v_{1} \quad \text { in } \Omega_{T} .
$$

Thus we have established the following: $v_{0} \in C \mathcal{X}_{T}^{2}\left(\Omega, \mathbb{R}^{N}\right), v_{0}$ solves wave equation (7.80)-(7.82), and the pair $\left(\partial_{t}^{2} v_{0}, w_{3}\right)$ define a weak solution of the twice time differentiated version of (7.80)-(7.82).
7.5. The rescaled system. We now proceed with the general existence proof for solutions to the model problem with higher regularity following essentially the same steps taken as for the simplified example from the previous section. All of the technical complications come from the coupling that arises between the equations satisfied by time derivatives due to the presence of variable coefficients. Because of this coupling, the resulting elliptic systems will not be solvable without the introduction of a smallness condition for certain coefficients. To facilitate this, we introduce a small parameter $\epsilon>0$ into the IBVP. Rather than considering the system (7.10)-(7.12) directly, we instead consider the system

$$
\begin{align*}
\partial_{\alpha}\left(B^{\alpha \beta} \partial_{\beta} v+M^{\alpha}\right)+\lambda c v & =F & & \text { in } \Omega_{T},  \tag{7.116}\\
\nu_{\alpha}\left(B^{\alpha \beta} \partial_{\beta} v+M^{\alpha}\right) & =\epsilon q \partial_{t}^{2} v+\epsilon P \partial_{t} v+G & & \text { in } \Gamma_{T},  \tag{7.117}\\
\left(v, \partial_{t} v\right) & =\left(\tilde{v}_{0}, \tilde{v}_{1}\right) & & \text { in } \Omega_{0}, \tag{7.118}
\end{align*}
$$

where

$$
\begin{aligned}
B^{\alpha \beta} & =\epsilon^{2} \delta_{0}^{\alpha} \delta_{0}^{\beta} b^{00}+\epsilon \delta_{0}^{\alpha} \delta_{j}^{\beta} b^{0 j}+\epsilon \delta_{i}^{\alpha} \delta_{0}^{\beta} b^{i 0}+\delta_{i}^{\alpha} \delta_{j}^{\beta} b^{i j}, \\
M^{\alpha} & =\epsilon \delta_{0}^{\alpha} L^{0}+\delta_{i}^{\alpha} L^{i} .
\end{aligned}
$$

Here, we do not assume that $G$ is of the form (7.19).
Remark 7.7. The form of the system (7.116)-(7.117) is consistent with rescaling the spatial coordinates $x=\left(x^{i}\right)$ in (7.10)-(7.11) according to $x \longmapsto \epsilon x$. This fact is exploited in the proof of Theorem 7.16 where it is shown that the problem of existence and uniqueness for the unscaled system (7.10)-(7.12) can be reduced to establishing existence and uniqueness for the rescaled system (7.116)-(7.118) with $\epsilon$ chosen suitably small.
7.6. Elliptic estimates. Formally differentiating (7.116)-(7.117) $\ell$-times with respect to $t$ for $\ell=$ $0,1, \ldots, 2 s-1$, we see, employing the notation (7.1), that the $v_{\ell}, 0 \leq \ell \leq 2 s-1$, satisfy

$$
\begin{align*}
\partial_{i}\left(b_{0}^{i j} \partial_{\beta} v_{\ell}+\epsilon d_{\ell}^{i} v_{\ell}+\mathcal{L}_{\ell}^{i}\right)+\epsilon a_{\ell}^{i} \partial_{i} v_{\ell}+\lambda c_{\ell} v_{\ell} & =\mathcal{F}_{\ell} & & \text { in } \Omega,  \tag{7.119}\\
\nu_{i}\left(b_{0}^{i j} \partial_{\beta} v_{\ell}+\epsilon d_{\ell}^{i} v_{\ell}+\mathcal{L}_{\ell}^{i}\right) & =\epsilon \epsilon_{\ell} v_{\ell}+\mathcal{G}_{\ell} & & \text { in } \partial \Omega \tag{7.120}
\end{align*}
$$

where

$$
\begin{align*}
& d_{\ell}^{i}=\ell b_{1}^{i 0}  \tag{7.121}\\
& a_{\ell}^{i}=(1+\ell) b_{1}^{0 i},  \tag{7.122}\\
& c_{\ell}=c+\frac{\ell(\ell+1)}{2 \lambda} b_{2}^{00},  \tag{7.123}\\
& \mathcal{L}_{\ell}^{i}=\epsilon b_{0}^{i 0} v_{\ell+1}+L_{\ell}^{i}+\epsilon b_{\ell}^{i 0} v_{1}+\epsilon \sum_{r=1}^{\ell-2}\binom{\ell}{r} b_{\ell-r}^{i 0} v_{r+1}+b_{\ell}^{i j} \partial_{j} v_{0}+\sum_{r=1}^{\ell-1}\binom{\ell}{r} b_{\ell-r}^{i j} \partial_{j} v_{r},  \tag{7.124}\\
& \mathcal{F}_{\ell}=\epsilon\left(b_{0}^{0 j} \partial_{j} v_{\ell+1}+\epsilon(\ell+1) b_{1}^{00} v_{\ell+1}+\epsilon b_{0}^{00} v_{\ell+2}\right)+F_{\ell}-\lambda\left(c_{\ell} v_{0}+\sum_{r=1}^{\ell-1}\binom{\ell}{r} c_{\ell-r} v_{r}\right) \\
& \quad-L_{\ell+1}^{0}-\epsilon\left(b_{\ell+1}^{0 j} \partial_{j} v_{0}+b_{\ell}^{0 j} \partial_{j} v_{1}+\sum_{r=1}^{\ell-1}\binom{\ell}{r} b_{\ell+1-r}^{0 j} \partial_{j} v_{r}+\sum_{r=1}^{\ell-2}\binom{\ell}{r} b_{\ell-r}^{0 j} \partial_{j} v_{r+1}\right) \\
&  \tag{7.125}\\
& \quad-\epsilon^{2}\left(b_{\ell+1}^{00} v_{1}+b_{\ell}^{00} v_{2}+\sum_{r=1}^{\ell-2}\binom{\ell}{r} b_{\ell+1-r}^{00} v_{r+1}+\sum_{r=1}^{\ell-3}\binom{\ell}{r} b_{\ell-r}^{00} \partial_{j} v_{r+2}\right),  \tag{7.126}\\
& \kappa_{\ell}=\frac{\ell(\ell-1)}{2} q_{2}+\ell P_{1},
\end{align*}
$$

and

$$
\begin{align*}
\mathcal{G}_{\ell}= & \epsilon q_{0} v_{\ell+2}+\epsilon\left(\ell q_{1}+P_{0}\right) v_{\ell+1}+G_{\ell} \\
& +\epsilon^{2} q_{\ell} v_{2}+\epsilon \sum_{r=1}^{\ell-3}\binom{\ell}{r} q_{\ell-r} v_{r+2}+\epsilon P_{\ell} v_{1}+\epsilon \sum_{r=1}^{\ell-2}\binom{\ell}{r} P_{\ell-r} v_{r+1} \tag{7.127}
\end{align*}
$$

Just as in the simplified example from Section (7.4 we interpret (7.119)-(7.120) as a system of elliptic equations, which will allow us to use elliptic estimates to bound the $v_{\ell}, 0 \leq \ell \leq 2 s-1$. Here, we use $v_{2 s+1}$ as shorthand notation for a pair $\left(v_{2 s+1}, w_{2 s+1}\right) \in L^{2}(\Omega) \times L^{2}(\partial \Omega)$, where we abuse notation and denote $q w_{2 s+1}$ as $\left.q v_{2 s+1}\right|_{\partial \Omega}$.

To prepare for the elliptic estimates, we first estimate the coefficients appearing in (7.119)-(7.120), which we collect in the following lemma. In the following, we freely employ the vector notation (7.2), e.g. $\mathbf{P}_{\ell}=\left(P_{0}, P_{1}, \ldots, P_{\ell}\right)$.
Lemma 7.8. Suppose $s>n / 2, \tilde{s} \in[0, s], 0 \leq \epsilon \leq 1$, and $(s, \tilde{s})=(k / 2, \tilde{k} / 2)$ for $k, \tilde{k} \in \mathbb{Z}$. Then the following estimates hold:
(i)

$$
\begin{aligned}
\left\|\mathcal{G}_{\ell}\right\|_{H^{\tilde{s}-\frac{\ell}{2}}(\Omega)} \lesssim & \epsilon\left(\left\|q_{0}\right\|_{H^{s}(\Omega)}\left\|v_{\ell+2}\right\|_{H^{\tilde{s}+1-\frac{\ell+2}{2}(\Omega)}}+\left(\left\|q_{1}\right\|_{H^{s}(\Omega)}+\left\|P_{0}\right\|_{H^{s}(\Omega)}\right)\left\|v_{\ell+1}\right\|_{H^{\tilde{s}+1-\frac{\ell+1}{2}}(\Omega)}\right) \\
& +\left\|G_{\ell}\right\|_{H^{\tilde{s}-\frac{\ell}{2}}(\Omega)}+\left(\left\|\mathbf{P}_{\ell}\right\|_{X^{s}, \ell}+\left\|\mathbf{q}_{\ell}\right\|_{X^{s, \ell}}+\left\|q_{1}\right\|_{H^{s}(\Omega)}\right)\left\|\mathbf{v}_{\ell-1}\right\|_{X^{\tilde{s}+1, \ell-1}}
\end{aligned}
$$

for $0 \leq \ell \leq 2 \tilde{s}-2$, and

$$
\begin{aligned}
& \left\|\left.\mathcal{G}_{2 \tilde{s}-1}\right|_{\partial \Omega}\right\|_{L^{2}(\partial \Omega)} \lesssim \epsilon\left(\left\|q_{0} v_{2 \tilde{s}+1}\right\|_{L^{2}(\partial \Omega)}+\left(\left\|q_{1}\right\|_{H^{s}(\Omega)}+\left\|P_{0}\right\|_{H^{s}(\Omega)}\right)\left\|v_{2 \tilde{s}}\right\|_{H^{1}(\Omega)}\right)+\left\|\left.G_{2 \tilde{s}-1}\right|_{\partial \Omega}\right\|_{L^{2}(\partial \Omega)} \\
& \quad+\left(\left\|\mathbf{P}_{2 s-2}\right\|_{X^{s, 2 s-2}}+\left\|P_{2 s-1}\right\|_{L^{2}(\partial \Omega)}+\left\|\partial_{t} \mathbf{q}_{2 s-2}\right\|_{X^{s, 2 s-2}}\right)\left\|\mathbf{v}_{2 \tilde{s}-2}\right\|_{X^{\tilde{s}+1,2 \tilde{s}-2}}
\end{aligned}
$$

(ii)

$$
\left\|\mathcal{L}_{\ell}^{i}\right\|_{H^{\tilde{s}-\frac{\ell}{2}}(\Omega)} \lesssim \epsilon\left\|b_{0}\right\|_{H^{s}(\Omega)}\left\|v_{\ell+1}\right\|_{H^{\tilde{s}+1-\frac{\ell+1}{2}(\Omega)}}+\left\|L_{\ell}^{i}\right\|_{H^{\tilde{s}-\frac{\ell}{2}}(\Omega)}+\left\|\mathbf{b}_{\ell}\right\|_{X^{s}, \ell}\left\|\mathbf{v}_{\ell-1}\right\|_{X^{\tilde{s}+1, \ell-1}}
$$

for $0 \leq \ell \leq 2 \tilde{s}-2$, and

$$
\left\|\mathcal{L}_{2 \tilde{s}-1}^{i}\right\|_{L^{2}(\Omega)} \lesssim \epsilon\left\|b_{0}\right\|_{H^{s}(\Omega)}\left\|v_{2 s}\right\|_{H^{1}(\Omega)}+\left\|L_{2 \tilde{s}-1}^{i}\right\|_{L^{2}(\Omega)}+\left\|\mathbf{b}_{2 s-1}\right\|_{X^{s, 2 s-1}}\left\|\mathbf{v}_{2 \tilde{s}-2}\right\|_{X^{\tilde{s}+1,2 \tilde{s}-2}}
$$

(iii) and

$$
\begin{aligned}
\left\|\mathcal{F}_{\ell}\right\|_{H^{\tilde{s}-1-\frac{\ell}{2}}(\Omega)} & \lesssim \epsilon\left(\left\|b_{0}\right\|_{H^{s}(\Omega)}+\left\|b_{1}\right\|_{H^{s-\frac{1}{2}}(\Omega)}\right)\left(\left\|v_{\ell+1}\right\|_{H^{\tilde{s}+1-\frac{\ell+1}{2}(\Omega)}}+\left\|v_{\ell+2}\right\|_{H^{\tilde{s}+1-\frac{\ell+2}{2}}(\Omega)}\right) \\
& +\left\|F_{\ell}\right\|_{H^{\tilde{s}-1-\frac{\ell}{2}}(\Omega)}+\left\|L_{\ell+1}^{0}\right\|_{H^{\tilde{s}-1-\frac{\ell}{2}}(\Omega)}+\left(\left\|\mathbf{b}_{\ell+1}\right\|_{X^{s, \ell+1}}+\left\|\mathbf{c}_{\ell}\right\|_{X^{s, \ell}}\right)\left\|\mathbf{v}_{\ell-1}\right\|_{X^{\tilde{s}+1, \ell-1}}
\end{aligned}
$$

for $0 \leq \ell \leq 2 \tilde{s}-2$, and

$$
\begin{aligned}
\left\|\mathcal{F}_{2 \tilde{s}-1}\right\|_{L^{2}(\Omega)} & \lesssim \epsilon\left(\left\|b_{0}\right\|_{H^{s}(\Omega)}+\left\|b_{1}\right\|_{H^{s-\frac{1}{2}}(\Omega)}\right)\left(\left\|v_{2 \tilde{s}}\right\|_{H^{1}(\Omega)}+\left\|v_{2 \tilde{s}+1}\right\|_{L^{2}(\Omega)}\right)+\left\|F_{2 \tilde{s}-1}\right\|_{L^{2}(\Omega)} \\
& +\left\|L_{2 \tilde{s}}^{0}\right\|_{L^{2}(\Omega)}+\left(\left\|\mathbf{b}_{2 s}\right\|_{X^{s, 2 s}}+\left\|\mathbf{c}_{2 s-1}\right\|_{X^{s, 2 s-1}}\right)\left\|\mathbf{v}_{2 \tilde{s}-2}\right\|_{X^{\tilde{s}+1,2 \tilde{s}-2}} .
\end{aligned}
$$

Proof. From the assumptions $s=k / 2>n / 2$ and $\tilde{s}=\tilde{k} / 2 \in[0, s]$, it follows directly from the fractional multiplication inequality, Theorem A.7, that the estimates

$$
\begin{aligned}
\left\|q_{0} v_{\ell+2}\right\|_{H^{s}-\frac{\ell}{2}(\Omega)} & \lesssim\left\|q_{0}\right\|_{H^{s}(\Omega)}\left\|v_{\ell+2}\right\|_{H^{s+1-\frac{\ell+2}{2}}(\Omega)}, & \\
\left\|\left(\epsilon \ell q_{1}+P_{0}\right) v_{\ell+1}\right\|_{H^{s-\frac{\ell}{2}}(\Omega)} & \lesssim\left(\left\|q_{1}\right\|_{H^{s}(\Omega)}+\left\|P_{0}\right\|_{H^{s}(\Omega)}\left\|v_{\ell+1}\right\|_{H^{\tilde{s}+-\frac{\ell+1}{2}}(\Omega)},\right. & \\
\left\|q_{\ell} v_{2}\right\|_{H^{s-\frac{\ell}{2}}(\Omega)} & \lesssim\left\|q_{\ell}\right\|_{H^{s-\frac{\ell}{2}}(\Omega)}\left\|v_{2}\right\|_{H^{s+1-1}(\Omega)}, & 1 \leq r \leq \ell-3, \\
\left\|q_{\ell-r} v_{r+2}\right\|_{H^{s-\frac{\ell}{2}}(\Omega)} & \lesssim\left\|q_{\ell-r}\right\|_{H^{s-\frac{\ell-r}{2}}(\Omega)}\left\|v_{r+2}\right\|_{H^{\tilde{s}+1-\frac{r+2}{2}}(\Omega)}, & \\
\left\|P_{\ell} v_{1}\right\|_{H^{s-\frac{\ell}{2}}(\Omega)} & \lesssim\left\|P_{\ell}\right\|_{H^{s-\frac{\ell}{2}}(\Omega)}\left\|v_{1}\right\|_{H^{\tilde{s}-1-\frac{1}{2}}(\Omega)}, &
\end{aligned}
$$

and

$$
\left\|P_{\ell-1} v_{r+1}\right\|_{H^{\bar{s}-\frac{\ell}{2}}(\Omega)} \lesssim\left\|P_{\ell-r}\right\|_{H^{s-\frac{\ell-r}{2}}(\Omega)}\left\|v_{r+1}\right\|_{H^{\xi+1-\frac{r+1}{2}}(\Omega)}, \quad 1 \leq r \leq \ell-2,
$$

hold for $0 \leq \ell \leq 2 \tilde{s}-1$. Using these estimates, it is clear from (7.127) that $\mathcal{G}_{\ell}$ can be estimated by

$$
\begin{aligned}
&\left\|\mathcal{G}_{\ell}\right\|_{H^{\tilde{s}-\frac{\ell}{2}}(\Omega)} \lesssim \epsilon\left(\left\|q_{0}\right\|_{H^{s}(\Omega)}\left\|v_{\ell+2}\right\|_{H^{\tilde{s}+1-\frac{\ell+2}{2}}(\Omega)}+\left(\left\|q_{1}\right\|_{H^{s}(\Omega)}+\left\|P_{0}\right\|_{H^{s}(\Omega)}\right)\left\|v_{\ell+1}\right\|_{H^{\tilde{s}+1-\frac{\ell+1}{2}}(\Omega)}\right) \\
&+\left\|G_{\ell}\right\|_{H^{\tilde{s}-\frac{\ell}{2}}(\Omega)}+\left(\left\|\mathbf{P}_{\ell}\right\|_{X^{s, \ell}}+\left\|\mathbf{q}_{\ell}\right\|_{X^{s, \ell}}+\left\|q_{1}\right\|_{H^{s}(\Omega)}\right)\left\|\mathbf{v}_{\ell-1}\right\|_{X^{s}+1, \ell-1}
\end{aligned}
$$

for $0 \leq \ell \leq 2 \tilde{s}-2$, which proves the first estimate. The remaining estimates can be established in a similar fashion.

Proposition 7.9. Suppose $s>n / 2+1, s=k / 2$ for $k \in \mathbb{Z}_{\geq 0}$, $m \in\{0,1,2, \ldots, 2 s-1\}$, and $\left(v_{m+1}, v_{m+2}\right)$ satisfy

$$
\left(v_{m+1}, v_{m+2}\right) \in H^{s+1-\frac{m+1}{2}}\left(\Omega, \mathbb{R}^{N}\right) \times H^{s+1-\frac{m+2}{2}}\left(\Omega, \mathbb{R}^{N}\right), \quad \text { if } 0 \leq m \leq 2 s-2
$$

and

$$
\left(v_{2 s}, v_{2 s+1},\left.q_{0} v_{2 s+1}\right|_{\partial \Omega}\right) \in H^{1}\left(\Omega, \mathbb{R}^{N}\right) \times L^{2}\left(\Omega, \mathbb{R}^{N}\right) \times L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right) \quad \text { if } m=2 s-1 .
$$

Then there exist constants

$$
\lambda^{*}=\lambda^{*}(\sigma, \mu) \geq 1 \quad \text { and } \quad \delta^{*}=\delta^{*}\left(\kappa_{1},\left\|b_{1}^{i 0}\right\|_{H^{s-\frac{1}{2}}(\Omega)},\left\|q_{2}\right\|_{H^{s-1}(\Omega)},\left\|P_{1}\right\|_{H^{s-\frac{1}{2}}(\Omega)}\right) \geq 1,
$$

such that for each $(\lambda, \epsilon) \in\left[\lambda^{*}, \infty\right) \times\left[0, \frac{1}{\delta^{*}}\right]$ there exists a unique solution

$$
\mathbf{v}_{m}=\left(v_{0}, v_{1}, \ldots, v_{m}\right) \in X^{s+1, m}\left(\Omega, \mathbb{R}^{N}\right)
$$

to the sequence of equations (7.119)-(7.120) for $0 \leq \ell \leq m$. Moreover, this solution satisfies the estimate

$$
\left.\left\|\mathbf{v}_{m}\right\|_{X^{s+1, m}} \leq C\left(\left\|\mathbf{F}_{m}\right\|_{X^{s-1, m}}+\left\|\mathbf{L}_{m+1}^{0}\right\|_{X^{s-1, m}}+\left\|\mathbf{G}_{m}\right\|_{X^{s, m}}+\left\|\mathbf{L}_{m}^{i}\right\|_{X^{s, m}}+\epsilon V_{m}\right]\right)
$$

for $0 \leq m \leq 2 s-2$ and

$$
\begin{gathered}
\left\|\mathbf{v}_{2 s-1}\right\|_{X^{s+1,2 s-1}} \leq C\left(\left\|\mathbf{F}_{2 s-2}\right\|_{X^{s-1,2 s-2}}+\left\|F_{2 s-1}\right\|_{L^{2}(\Omega)}+\left\|\mathbf{L}_{2 s-1}^{0}\right\|_{X^{s-1,2 s-2}}+\left\|\mathbf{L}_{2 s}^{0}\right\|_{L^{2}(\Omega)}\right. \\
\left.\left.\quad+\left\|\mathbf{G}_{2 s-2}\right\|_{X^{s, 2 s-2}}+\left\|G_{2 s-1} \mid \partial \Omega\right\|_{L^{2}(\partial \Omega)}+\left\|\mathbf{L}_{2 s-1}^{i}\right\|_{X^{s, 2 s-1}}+\epsilon V_{2 s-1}\right]\right)
\end{gathered}
$$

if $m=2 s-1$, where $\left\{\mathbf{L}_{m+1}^{0}, \mathbf{L}_{m}^{i}, \mathbf{F}_{m}, \mathbf{G}_{m}\right\}$ are defined using the vector notation (7.2),

$$
V_{m}= \begin{cases}\left\|v_{m+1}\right\|_{H^{s+1-\frac{m+1}{2}}(\Omega)}+\left\|v_{m+2}\right\|_{H^{s+1-\frac{m+2}{2}}(\Omega)} & \text { if } 0 \leq m \leq 2 s-2 \\ \left\|v_{m+1}\right\|_{H^{1}(\Omega)}+\left\|v_{m+2}\right\|_{L^{2}(\Omega)}+\left\|q_{0} v_{m+2}\right\|_{L^{2}(\partial \Omega)} & \text { if } m=2 s-1\end{cases}
$$

and

$$
C=C\left(\kappa_{1}, \mu, \sigma, \lambda, \rho\right)
$$

with

$$
\rho=\left(\left\|\mathbf{b}_{2 s}\right\|_{X^{s, 2 s}},\left\|\mathbf{c}_{2 s-1}\right\|_{X^{s, 2 s-1}},\left\|\mathbf{P}_{2 s-2}\right\|_{X^{s, 2 s-2}},\left\|\mathbf{q}_{2 s-2}\right\|_{X^{s, 2 s-2}},\left\|\partial_{t} \mathbf{q}_{2 s-2}\right\|_{X^{s, 2 s-2}},\left\|P_{2 s-1}\right\|_{L^{2}(\partial \Omega)}\right) .
$$

Proof. We use proof by induction.
Base case: From Theorems B. 3 and B.4, Lemma [7.8 and the Sobolev inequalities (Theorems A.2 and A.3), we see that there exists constants ${ }^{22}$

$$
\delta^{*}=\delta^{*}\left(\kappa_{1},\left\|b_{1}^{i 0}\right\|_{H^{s-\frac{1}{2}}(\Omega)},\left\|q_{2}\right\|_{H^{s-1}(\Omega)},\left\|P_{1}\right\|_{H^{s-\frac{1}{2}}(\Omega)}\right) \geq 1 \quad \text { and } \quad \lambda^{*}=\lambda^{*}(\sigma, \mu) \geq 1
$$

such that (7.119)-(7.120) has a unique solution $\mathbf{v}_{0}=v_{0} \in X^{s+1,0}\left(\Omega, \mathbb{R}^{N}\right)=H^{s+1}\left(\Omega, \mathbb{R}^{N}\right)$ for $\ell=0$ and $(\lambda, \epsilon) \in\left[\lambda^{*}, \infty\right) \times\left[0, \frac{1}{\delta^{*}}\right]$ that satisfies the bound

$$
\left.\left\|v_{0}\right\|_{X^{s+1,0}} \leq C_{0}\left(\left\|\mathbf{F}_{0}\right\|_{X^{s-1,0}}+\left\|\mathbf{L}_{1}^{0}\right\|_{X^{s-1,0}}+\left\|\mathbf{G}_{0}\right\|_{X^{s, 0}}+\left\|\mathbf{L}_{0}^{i}\right\|_{X^{s, 0}}+\epsilon V_{0}\right]\right)
$$

where

$$
\begin{equation*}
C_{0}=C_{0}\left(\kappa_{1}, \mu, \sigma, \lambda, \rho\right) \tag{7.128}
\end{equation*}
$$

with $\rho$ and $V_{0}$ as defined above in the statement of the proposition.

Induction hypothesis: With the base case covered, we fix $m \in\{0,1, \ldots, 2 s-3\}$ and assume that the system (7.119)-(7.120), $0 \leq \ell \leq m$, has for $(\lambda, \epsilon) \in\left[\lambda^{*}, \infty\right) \times\left[0, \frac{1}{\delta}\right]$ with $\delta \geq \delta^{*}$ a unique solution $\mathbf{v}_{m} \in X^{s+1, m}\left(\Omega, \mathbb{R}^{N}\right)$ satisfying the bound

$$
\begin{equation*}
\left.\left\|\mathbf{v}_{m}\right\|_{X^{s+1, m}} \leq C_{m}\left(\left\|\mathbf{F}_{m}\right\|_{X^{s-1, m}}+\left\|\mathbf{L}_{m+1}^{0}\right\|_{X^{s-1, m}}+\left\|\mathbf{G}_{m}\right\|_{X^{s, m}}+\left\|\mathbf{L}_{m}^{i}\right\|_{X^{s, m}}+\epsilon V_{m}\right]\right) \tag{7.129}
\end{equation*}
$$

for some constant $C_{m}$ of the form (7.128) and $V_{m}$ is as defined in the statement of the proposition.

Induction step: Appealing again to Theorems B.3 and B.4, we see using Lemma 7.8, and the Sobolev inequalities that for $(\lambda, \epsilon) \in\left[\lambda^{*}, \infty\right) \times\left[0, \frac{1}{\delta^{*}}\right]$ the BVP (7.119)-(7.120) with $\ell=m+1$ has a unique solution $v_{m+1} \in H^{s+1-\frac{m+1}{2}}\left(\Omega, \mathbb{R}^{N}\right)$ satisfying

$$
\begin{align*}
\left\|v_{m+1}\right\|_{H^{s+1-\frac{m+1}{2}(\Omega)}} & \leq c_{m+1}\left(\left\|\mathbf{F}_{m+1}\right\|_{X^{s-1, m+1}}+\left\|\mathbf{L}_{m+2}^{0}\right\|_{X^{s-1, m+1}}\right. \\
& \left.+\left\|\mathbf{G}_{m+1}\right\|_{X^{s, m+1}}+\left\|\mathbf{L}_{m+1}^{i}\right\|_{X^{s, m+1}}+\left\|v_{m}\right\|_{X^{s+1, m}}+\epsilon V_{m+1}\right) \tag{7.130}
\end{align*}
$$

where $c_{m+1}$ is a constant of the form (7.128). Fixing $\delta \geq 2 C_{m} c_{m+1}$, (7.129) and (7.130) imply that the estimate

$$
\begin{aligned}
&\left\|v_{m+1}\right\|_{H^{s+1-\frac{m+1}{2}}(\Omega)} \leq C_{m+1}\left(\left\|\mathbf{F}_{m+1}\right\|_{X^{s-1, m+1}}+\left\|\mathbf{L}_{m+2}^{0}\right\|_{X^{s-1, m+1}}\right. \\
&\left.+\left\|\mathbf{G}_{m+1}\right\|_{X^{s, m+1}}+\left\|\mathbf{L}_{m+1}^{i}\right\|_{X^{s, m+1}}+\epsilon V_{m+1}\right)
\end{aligned}
$$

holds for all $(\lambda, \epsilon) \in\left[\lambda^{*}, \infty\right) \times\left[0, \frac{1}{\delta}\right]$ where $C_{m+1}$ is again a constant of the form (7.128). Combining this estimate with (7.129) yields the desired estimate

$$
\begin{align*}
&\left\|\mathbf{v}_{m+1}\right\|_{X^{s+1, m+1}} \leq C_{m+1}\left(\left\|\mathbf{F}_{m+1}\right\|_{X^{s-1, m+1}}+\left\|\mathbf{L}_{m+2}^{0}\right\|_{X^{s-1, m+1}}\right. \\
&\left.+\left\|\mathbf{G}_{m+1}\right\|_{X^{s, m+1}}+\left\|\mathbf{L}_{m+1}^{i}\right\|_{X^{s, m+1}}+\epsilon V_{m+1}\right) \tag{7.131}
\end{align*}
$$

which holds for $m=0,1, \ldots, 2 s-3$.
Final estimate: For $m=2 s-1$, the final estimate

$$
\begin{aligned}
& \left\|\mathbf{v}_{2 s-1}\right\|_{X^{s+1,2 s-1}} \leq C\left(\left\|\mathbf{F}_{2 s-2}\right\|_{X^{s-1,2 s-2}}+\left\|F_{2 s-1}\right\|_{L^{2}(\Omega)}+\left\|\mathbf{L}_{2 s-1}^{0}\right\|_{X^{s-1,2 s-2}}+\left\|\mathbf{L}_{2 s}^{0}\right\|_{L^{2}(\Omega)}\right. \\
& \left.\left.\quad+\left\|\mathbf{G}_{2 s-2}\right\|_{X^{s, 2 s-2}}+\left\|\left.G_{2 s-1}\right|_{\partial \Omega}\right\|_{L^{2}(\partial \Omega)}+\left\|\mathbf{L}_{2 s-1}^{i}\right\|_{X^{s, 2 s-1}}+\epsilon V_{2 s-1}\right]\right)
\end{aligned}
$$

follows using similar arguments as above from the estimate (7.131), Lemma 7.8, and the elliptic theory from Appendix B

[^13]7.7. Existence and uniqueness for the model problem. Following the analysis of the simplified problem contained in Section 7.4, the first step to obtaining existence and uniqueness for the rescaled model problem (7.116)-(7.118) is to consider the following elliptic-hyperbolic IBVP, which is obtained from formally differentiating the rescaled model problem in time:
\[

$$
\begin{align*}
\partial_{i}\left(b^{i j} \partial_{j} v_{\ell}+\epsilon d_{\ell}^{i} v_{\ell}+\mathcal{L}_{\ell}^{i}\right)+\epsilon a_{\ell}^{i} \partial_{i} v_{\ell}+\lambda c_{\ell} v_{\ell} & =\mathcal{F}_{\ell} & & \text { in } \Omega,  \tag{7.132}\\
\nu_{i}\left(b^{i j} \partial_{j} v_{\ell}+\epsilon d_{\ell}^{i} v_{\ell}+\mathcal{L}_{\ell}^{i}\right) & =\epsilon \xi_{\ell} v+\mathcal{G}_{\ell} & & \text { in } \partial \Omega,  \tag{7.133}\\
\partial_{\alpha}\left(B^{\alpha \beta} \partial_{\beta} v_{2 s}+\mathcal{M}_{2 s}^{\alpha}\right)+\lambda c v_{2 s} & =\mathcal{F}_{2 s} & & \text { in } \Omega_{T},  \tag{7.134}\\
\nu_{\alpha}\left(B^{\alpha \beta} \partial_{\beta} v_{2 s}+\mathcal{M}_{2 s}^{\alpha}\right)-\epsilon^{2} q \partial_{t}^{2} v_{2 s}-\epsilon \mathcal{P} \partial_{t} v_{2 s} & =\mathcal{G}_{2 s} & & \text { in } \Gamma_{T},  \tag{7.135}\\
\left(v_{2 s}, \partial_{t} v_{2 s}\right) & =\left(\tilde{v}_{2 s}, \tilde{v}_{2 s+1}\right) & & \text { in } \Omega_{0},  \tag{7.136}\\
\mathbb{P}_{q} \partial_{t} v_{2 s} & =\tilde{w}_{2 s+1} & & \text { in } \Gamma_{0} \tag{7.137}
\end{align*}
$$
\]

where $0 \leq \ell \leq 2 s-1, \mathbb{P}_{q}$, as defined previously, is the projection onto $\operatorname{ran}(q)$,

$$
\begin{aligned}
\mathcal{M}_{2 s}^{\alpha} & =2 s B_{1}^{\alpha 0} v_{2 s}+\sum_{r=0}^{2 s-2}\binom{2 s}{r} B_{2 s-r}^{\alpha 0} v_{r+1}+\sum_{r=0}^{2 s-1}\binom{2 s}{r} B_{2 s-r}^{\alpha i} \partial_{i} v_{r}+M_{2 s} \\
\mathcal{P} & =P+\epsilon 2 s \partial_{t} q, \\
\mathcal{F}_{2 s} & =F_{2 s}-\lambda \sum_{r=0}^{2 s-1}\binom{2 s}{r} c_{2 s-r} v_{r} \\
\mathcal{G}_{2 s}= & G_{2 s}+\epsilon\left(P_{2 s} v_{1}+\sum_{r=1}^{2 s-2}\binom{2 s}{r} P_{2 s-r} v_{r+1}+2 s P_{1} v_{2 s}\right) \\
& +\epsilon^{2}\left(\sum_{r=0}^{2 s-3}\binom{2 s-1}{r} q_{2 s-r} v_{r+2}+\frac{2 s(2 s-1)}{2} q_{2} v_{2 s}\right)
\end{aligned}
$$

and we are using the notation $v_{2 s+1}=\partial_{t} v_{2 s}$ and $\left.q v_{2 s+1}\right|_{\Gamma_{T}}=q w_{2 s+1}$ while, otherwise, treating the $v_{\ell}$, $0 \leq \ell \leq 2 s-1$, as independent variables. Here, we assume that the coefficients, $B^{\alpha \beta}, P, q$, etc., are time dependent maps, and in the following, we employ the notation (7.1) for time derivatives of these coefficients, and (7.2) and (7.3) for collections of time derivatives.
Lemma 7.10. Suppose $s>n / 2+1,0 \leq \epsilon \leq 1$, and $s=k / 2$ for $k \in \mathbb{Z}_{\geq 0}$. Then the following estimates hold:

$$
\begin{aligned}
\left\|\mathcal{M}_{2 s}^{i}\right\|_{L^{2}(\Omega)} & \lesssim\left\|L_{2 s}^{i}\right\|_{L^{2}(\Omega)}+\|b\|_{E^{s}}\left\|\mathbf{v}_{2 s}\right\|_{X^{s+1,2 s}} \\
\left\|\partial_{t} \mathcal{M}_{2 s}\right\|_{L^{2}(\Omega)} & \lesssim\left\|L_{2 s+1}\right\|_{L^{2}(\Omega)}+\left(\|b\|_{E^{s}}+\left\|\partial_{t} b\right\|_{E^{s}}\right)\left(\left\|\mathbf{v}_{2 s}\right\|_{X^{s+1,2 s}}+\left\|\partial_{t} v_{2 s}\right\|_{L^{2}(\Omega)}\right) \\
\left\|\mathcal{F}_{2 s}\right\|_{L^{2}(\Omega)} & \lesssim\left\|F_{2 s}\right\|_{L^{2}(\Omega)}+\lambda\|c\|_{E^{s}}\left\|\mathbf{v}_{2 s-1}\right\|_{X^{s+1,2 s-1}}
\end{aligned}
$$

and

$$
\left\|\mathcal{G}_{2 s}-\left(G_{2 s}+\epsilon P_{2 s} v_{1}\right)\right\|_{H^{1}(\Omega)} \lesssim\left(\left\|\partial_{t}^{2} \mathbf{q}_{2 s-2}\right\|_{X^{s, 2 s-2}}+\left\|\partial_{t} \mathbf{P}_{2 s-2}\right\|_{X^{s, 2 s-2}}\right)\left\|\mathbf{v}_{2 s}\right\|_{X^{s+1,2 s}}
$$

Proof. The proof of this lemma follows from similar arguments used to prove the estimates from Lemma 7.8. We omit the details.

With the preliminary estimates out of the way, we are now ready to prove the existence and uniqueness of solutions to the elliptic-hyperbolic IBVP (7.132)-(7.137).
Remark 7.11. To simplify the statement of the following existence and uniqueness theorems, we will not explicitly state the spaces in which the coefficients, i.e. $F, L^{\alpha}, b^{\alpha \beta}$, etc., lie. This will be clear from the various norms on the coefficients in that the coefficients will need to lie in the appropriate spaces defined in Section 7.1.2 so that all of the norms that appears make sense.
Theorem 7.12. Suppose $s>n / 2+1, s=k / 2$ for $k \in \mathbb{Z}, \epsilon_{0}>0$, the coefficients $\left\{b^{\alpha \beta}, c, q\right\}$ satisfy (7.14)-(7.18) for constants $\kappa_{0}, \kappa_{1}, \sigma>0$ and $\mu \geq 0$, there exists a function $\chi=\chi(t, x)$ such that

$$
\epsilon P+\epsilon\left(2 s-\frac{3}{2}\right) \partial_{t} q-\chi q \leq 0 \quad \text { in } \Gamma_{T}
$$

for $0<\epsilon \leq \epsilon_{0}, \tilde{v}_{2 s} \in H^{1}\left(\Omega, \mathbb{R}^{N}\right), \tilde{v}_{2 s+1} \in L^{2}\left(\Omega, \mathbb{R}^{N}\right), \tilde{w}_{2 s+1} \in L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right)$ satisfies $\mathbb{P}_{q(0)} \tilde{w}_{2 s+1}=\tilde{w}_{2 s+1}$,

$$
\partial_{t}^{2 s} P=k_{1}^{i} \partial_{i} \theta_{1}+g_{1} \quad \text { and } \quad \partial_{t}^{2 s} G=k_{2}^{i} \partial_{i} \theta_{2}+g_{2}
$$

where $\nu_{i} k_{a}^{i}=0$ for $a=1,2$. Then there exist constants $\lambda^{*}=\lambda^{*}(\sigma, \mu) \geq 1$ and

$$
\delta^{*}=\delta^{*}\left(\kappa_{1}, \sup _{0 \leq t \leq T}\left\|\partial_{t} b^{i 0}(t)\right\|_{H^{s-\frac{1}{2}}(\Omega)}, \sup _{0 \leq t \leq T}\left\|\partial_{t}^{2} q(t)\right\|_{H^{s-1}(\Omega)}, \sup _{0 \leq t \leq T}\left\|\partial_{t} P(t)\right\|_{H^{s-\frac{1}{2}}(\Omega)}\right) \geq 1
$$

such that for each $(\lambda, \epsilon) \in\left[\lambda^{*}, \infty\right) \times\left(0, \min \left\{\frac{1}{\delta^{*}}, \epsilon_{0}\right\}\right]$ there exists a unique solution
$\left(\mathbf{v}_{2 s-1}, v_{2 s}, w_{2 s+1}\right) \in C^{0}\left([0, T], X^{s+1,2 s-1}\left(\Omega, \mathbb{R}^{N}\right)\right) \times \bigcap_{j=0}^{1} C^{j}\left([0, T], H^{1-j}\left(\Omega, \mathbb{R}^{N}\right)\right) \times C\left([0, T], L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right)\right)$,
to (7.132)-(7.137). Moreover, by choosing $\epsilon_{0}>0$ small enough, $\left(\mathbf{v}_{2 s-1}, v_{2 s}, w_{2 s+1}\right)$ satisfies the energy estimate

$$
\begin{aligned}
\left\|\left(\mathbf{v}_{2 s-1}(t), v_{2 s}(t), w_{2 s+1}(t)\right)\right\|_{s+1}^{2} & \leq C\left[\left\|\left(\mathbf{v}_{2 s-1}(0), v_{2 s}(0), w_{2 s+1}(0)\right)\right\|_{s+1}^{2}+\alpha_{0}\right. \\
& \left.+\int_{0}^{t} \alpha_{1}(\tau)\left(\left\|\left(\mathbf{v}_{2 s-1}(\tau), v_{2 s}(\tau), w_{2 s+1}(\tau)\right)\right\|_{s+1}^{2}+\alpha_{2}(\tau)\right) d \tau\right]
\end{aligned}
$$

for $(t, \epsilon) \in[0, T] \times\left(0, \epsilon_{0}\right]$, where $\alpha_{0}=\|F(0)\|_{E^{s-1}}^{2}+\left\|\partial_{t}^{2 s-1} F(0)\right\|_{L^{2}(\Omega)}^{2}+\alpha_{2}(0)$,

$$
\begin{gather*}
\left\|\left(\mathbf{v}_{2 s-1}(t), v_{2 s}(t), w_{2 s+1}(t)\right)\right\|_{s+1}^{2}=\left\|\mathbf{v}_{2 s-1}(t)\right\|_{X^{s+1,2 s-1}}^{2}+\left\|\left(v_{2 s}(t), w_{2 s+1}(t)\right)\right\|_{E}^{2}, \\
\alpha_{1}(t)=1+\|\chi(t)\|_{H^{s}(\Omega)}^{2}+\left\|\partial_{t} b(t)\right\|_{E^{s}}^{2}+\|c(t)\|_{E^{s}}^{2}+\left\|\partial_{t} P(t)\right\|_{E^{s, 2 s-2}}^{2} \\
\quad+\left\|\partial_{t}^{2} q(t)\right\|_{E^{s, 2 s-2}}^{2}+\left\|g_{1}(t)\right\|_{\mathcal{E}^{1}}^{2}+\left\|\theta_{1}(t)\right\|_{H^{1}(\Omega)}^{2}+\left\|\theta_{1}(t)\right\|_{H^{1}(\Omega)}^{2}  \tag{7.138}\\
\alpha_{2}(t)=\left\|\partial_{t} F(t)\right\|_{E^{s-1}}^{2}+\left\|\partial_{t}^{2 s} F(t)\right\|_{L^{2}(\Omega)}^{2}+\|L(t)\|_{E^{s}}^{2}+\left\|\partial_{t} L(t)\right\|_{E^{s}}^{2}+\|G(t)\|_{E^{s, 2 s-2}}^{2} \\
\quad+\left\|\partial_{t} G(t)\right\|_{E^{s, 2 s-2}}^{2}+\left\|g_{2}(t)\right\|_{\mathcal{E}^{1}(\Omega)}^{2}+\left\|\theta_{1}(t)\right\|_{H^{1}(\Omega)}^{2}+\left\|\theta_{1}(t)\right\|_{H^{1}(\Omega)}^{2} \tag{7.139}
\end{gather*}
$$

and

$$
C=C\left(\kappa_{0}, \kappa_{1}, \mu, \sigma, \gamma, \lambda, \rho\right)
$$

with

$$
\begin{align*}
\rho=\|b\|_{X_{T}^{s}}+\|c\|_{X_{T}^{s, 2 s-1}} & +\|P\|_{X_{T}^{s, 2 s-2}}+\left\|\partial_{t}^{2 s-1} P\right\|_{L^{\infty}\left([0, T], L^{2}(\partial \Omega)\right)} \\
& +\|q\|_{L^{\infty}\left([0, T], H^{s}(\Omega)\right)}+\left\|\partial_{t} q\right\|_{X_{T}^{s, 2 s-2}}+\|\vec{k}\|_{W^{1, \infty}\left([0, T], H^{s}(\Omega)\right)} \tag{7.140}
\end{align*}
$$

and $\vec{k}=\left(k_{1}^{i}, k_{2}^{i}\right)$.
Proof. Given $v_{2 s}(t) \in H^{1}\left(\Omega, \mathbb{R}^{N}\right), \partial_{t} v_{2 s}(t) \in L^{2}\left(\Omega, \mathbb{R}^{N}\right)$, and $w_{2 s+1}(t) \in L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right)$ with $\operatorname{ran}\left(w_{2 s+1}(t)\right) \subset$ $\operatorname{ran}(q(t))$, it follows from Proposition 7.9 that there exists constants $\lambda^{*}=\lambda^{*}(\sigma, \mu) \geq 1$ and

$$
\delta^{*}=\delta^{*}\left(\kappa_{1},\left\|\partial_{t} b^{i 0}\right\|_{L^{\infty}\left([0, T], H^{s-\frac{1}{2}}(\Omega)\right)}\left\|\partial_{t}^{2} q\right\|_{L^{\infty}\left([0, T], H^{s-1}(\Omega)\right)},\left\|\partial_{t} P\right\|_{L^{\infty}\left([0, T], H^{s-\frac{1}{2}}(\Omega)\right)}\right) \geq 1
$$

such that for each $(\lambda, \epsilon) \in\left[\lambda^{*}, \infty\right) \times\left(0, \frac{1}{\delta^{*}}\right]$, there exists a unique solution $\mathbf{v}_{2 s-1}(t) \in X^{s+1,2 s-1}\left(\Omega, \mathbb{R}^{N}\right)$ of (7.132)-(7.133) for $\ell=0, \ldots, 2 s-1$ that satisfies

$$
\begin{align*}
\left\|\mathbf{v}_{2 s-1}(t)\right\|_{X^{s+1,2 s-1}} \leq C\left(\|F(t)\|_{E^{s-1}}+\left\|\partial_{t}^{2 s-1} F(t)\right\|_{L^{2}(\Omega)}+\left\|\partial_{t} L^{0}(t)\right\|_{E^{s-1}}+\left\|\partial_{t}^{2 s} L^{0}(t)\right\|_{L^{2}(\Omega)}\right. \\
\quad+\|G(t)\|_{E^{s, 2 s-2}}+\left\|\left.\partial_{t}^{2 s-1} G(t)\right|_{\partial \Omega}\right\|_{L^{2}(\partial \Omega)}+\left\|L^{i}(t)\right\|_{E^{s, 2 s-1}}+\epsilon \|\left(v_{2 s}(t), w(t)_{2 s+1} \|_{E}\right) \tag{7.141}
\end{align*}
$$

where $C=C\left(\kappa_{1}, \mu, \sigma, \gamma, \lambda, \rho\right)$ with $\rho$ given by (7.140). Here, we are interpreting $\mathbf{v}_{2 s-1}(t)$ as a non-local map that depends linearly on $\left(v_{2 s}(t), w_{2 s+1}(t)\right)$ and satisfies the estimates (7.141).

By assumption, $\partial_{t}^{2 s} P=k_{1}^{i} \partial_{i} \theta_{1}+g_{1}$ and $\partial_{t}^{2 s} G=k_{2}^{i} \partial_{i} \theta_{i}+g_{2}$, which implies that

$$
\partial_{t}^{2 s} G+\epsilon \partial_{t}^{2 s} P v_{1}=\epsilon k_{1}^{i} \partial_{i}\left(\theta_{1} v_{1}\right)+k_{2}^{i} \partial_{i} \theta_{2}-k_{1}^{i} \theta_{1} \partial_{i} v_{1}+\epsilon g_{1} v_{1}+g_{2}
$$

From this, the estimate (7.141) and Lemma 7.10 we are able to conclude from Theorem 7.5 the existence of a unique weak solution

$$
\begin{equation*}
\left(v_{2 s}, w_{2 s+1}\right) \in \bigcap_{j=0}^{1} C^{j}\left([0, T], H^{1-j}\left(\Omega, \mathbb{R}^{N}\right)\right) \times C\left([0, T], L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right)\right) \tag{7.142}
\end{equation*}
$$

of the IBVP defined by (7.135)-(7.137) that satisfies the energy estimate

$$
\begin{align*}
& \left\|\left(v_{2 s}(t), w_{2 s+1}(t)\right)\right\|_{E}^{2} \leq C\left(\left\|\left(v_{2 s}(0), w_{2 s+1}(0)\right)\right\|_{E}^{2}+\alpha_{0}\right. \\
& \quad+\int_{0}^{t} \alpha_{1}(\tau)\left(\left\|\left(\mathbf{v}_{2 s-1}(\tau), v_{2 s}(\tau), w_{2 s+1}(\tau)\right)\right\|_{s+1}^{2}+\beta(\tau)\right) d \tau \tag{7.143}
\end{align*}
$$

where $C=C\left(\kappa_{0}, \kappa_{1}, \sigma, \gamma, \mu, \lambda, \rho\right), \alpha_{1}$ is defined by (7.138),

$$
\begin{aligned}
& \beta(t)=\left\|\partial_{t}^{2 s} F(t)\right\|_{L^{2}(\Omega)}^{2}+\left\|\partial_{t}^{2 s} L(t)\right\|_{L^{2}(\Omega)}^{2}+\left\|\partial_{t}^{2 s+1} L(t)\right\|_{L^{2}(\Omega)}^{2} \\
&+\|g(t)\|_{H^{1}(\Omega)}^{2}+\left\|\partial_{t} g(t)\right\|_{L^{2}(\Omega)}^{2}+\|\theta(t)\|_{H^{1}(\Omega)}^{2}+\left\|\partial_{t} \theta(t)\right\|_{H^{1}(\Omega)}^{2}
\end{aligned}
$$

and

$$
\left\|\left(\mathbf{v}_{2 s-1}(t), v_{2 s}(t), w_{2 s+1}(t)\right)\right\|_{s+1}^{2}=\left\|\mathbf{v}_{2 s-1}(t)\right\|_{X^{s+1,2 s-1}}^{2}+\left\|\left(v_{2 s}(t), w_{2 s+1}(t)\right)\right\|_{E}^{2}
$$

Since the linear map $H^{1}\left(\Omega, \mathbb{R}^{N}\right) \times L^{2}\left(\Omega, \mathbb{R}^{N}\right) \times L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right) \in\left(v_{2 s}, \partial_{t} v_{2 s}, w_{2 s+1}\right) \longmapsto \mathbf{v}_{2 s-2} \in X^{s+1,2 s-1}\left(\Omega, \mathbb{R}^{N}\right)$ is bounded, it is clear from (7.142) that

$$
\mathbf{v}_{2 s-1} \in C^{0}\left([0, T], X^{s+1,2 s-1}\left(\Omega, \mathbb{R}^{N}\right)\right)
$$

Next, we observe that the integral estimate

$$
\begin{align*}
& \|F(t)\|_{E^{s-1}}^{2}+\left\|\partial_{t}^{2 s-1} F(t)\right\|_{L^{2}(\Omega)}^{2}+\left\|\partial_{t} L^{0}(t)\right\|_{E^{s-1}}^{2}+\left\|\partial_{t}^{2 s} L^{0}(t)\right\|_{L^{2}(\Omega)}^{2}+\left\|L^{i}(t)\right\|_{E^{s, 2 s-1}}^{2}+\|G(t)\|_{E^{s, 2 s-2}}^{2} \\
& \lesssim\|F(0)\|_{E^{s-1}}^{2}+\left\|\partial_{t}^{2 s-1} F(0)\right\|_{L^{2}(\Omega)}^{2}+\|L(0)\|_{E^{s}}^{2}+\|G(0)\|_{E^{s, 2 s-2}}^{2}+\int_{0}^{t}\left\|\partial_{t} F(\tau)\right\|_{E^{s-1}}^{2} \\
& \quad+\left\|\partial_{t}^{2 s} F(\tau)\right\|_{L^{2}(\Omega)}^{2}+\|L(\tau)\|_{E^{s}}^{2}+\left\|\partial_{t} L(\tau)\right\|_{E^{s}}^{2}+\|G(\tau)\|_{E^{s, 2 s-2}}^{2}+\left\|\partial_{t} G(\tau)\right\|_{E^{s, 2 s-2}}^{2} d \tau \tag{7.144}
\end{align*}
$$

follows directly from Proposition A.15. We also observe that

$$
\begin{aligned}
\partial_{t}\left\|\partial_{t}^{2 s-1} G\right\|_{L^{2}(\partial \Omega)}^{2} & =2\left\langle\partial_{t}^{2 s-1} G \mid \partial_{t}^{2 s} G\right\rangle_{\partial \Omega} \\
& =2\left\langle\partial_{t}^{2 s-1} G \mid k_{2}^{i} \partial_{i} \theta_{2}\right\rangle_{\partial \Omega}+2\left\langle\partial_{t}^{2 s-1} G \mid g_{2}\right\rangle_{\partial \Omega} \\
& \lesssim\left\|k_{2}\right\|_{L^{\infty}\left([0, T], W^{1, \infty}(\Omega)\right)}\left\|\partial_{t}^{2 s-1} G\right\|_{H^{1}(\Omega)}\left(\left\|g_{2}\right\|_{H^{1}(\Omega)}+\left\|\theta_{2}\right\|_{H^{1}(\Omega)}\right)
\end{aligned}
$$

where in deriving the last inequality we used (7.29) and Theorem A.4. Integrating this inequality in time gives

$$
\begin{align*}
\left\|\partial_{t}^{2 s-1} G(t)\right\|_{L^{2}(\partial \Omega)}^{2} & \lesssim\left\|\partial_{t}^{2 s-1} G(0)\right\|_{L^{2}(\partial \Omega)}^{2} \\
& +\left\|k_{2}\right\|_{L^{\infty}\left([0, T], W^{1, \infty}(\Omega)\right)} \int_{0}^{t}\left\|\partial_{t}^{2 s-1} G(\tau)\right\|_{H^{1}(\Omega)}^{2}+\left\|g_{2}(\tau)\right\|_{H^{1}(\Omega)}^{2}+\left\|\theta_{2}(\tau)\right\|_{H^{1}(\Omega)}^{2} d \tau \tag{7.145}
\end{align*}
$$

Combining the estimates (7.141), (7.144), and (7.145), we find that

$$
\begin{equation*}
\left\|\mathbf{v}_{2 s-1}(t)\right\|_{X^{s+1,2 s-1}}^{2} \leq C\left(\alpha_{0}+\int_{0}^{t} \alpha_{2}(\tau) d \tau+\epsilon^{2}\left\|\left(v_{2 s-1}(t), w_{2 s}(t)\right)\right\|_{E}^{2}\right) \tag{7.146}
\end{equation*}
$$

where $C=C\left(\kappa_{1}, \mu, \sigma, \gamma, \lambda, \rho\right)$ and $\alpha_{2}$ is given by (7.139). Since the constant $C$ in (7.146) is independent of $\epsilon$, we see that by choosing $\epsilon_{0}>0$ small enough that

$$
\begin{equation*}
\left\|\mathbf{v}_{2 s-1}(t)\right\|_{X^{s+1,2 s-1}}^{2}-\frac{1}{2}\left\|\left(v_{2 s-1}(t), w_{2 s}(t)\right)\right\|_{E}^{2} \leq C\left(\alpha_{0}+\int_{0}^{t} \alpha_{2}(\tau) d \tau\right) \tag{7.147}
\end{equation*}
$$

for $\epsilon \in\left(0, \epsilon_{0}\right]$. Adding the estimates (7.143) and (7.147) yields the desired energy estimate and completes the proof.
Remark 7.13. From the proof of Theorem 7.12 it is not difficult to see that the energy estimate continues to hold under the following weaker assumptions on the coefficients $L^{\mu}$ provided that we make the following changes:

$$
\|L(t)\|_{E^{s}}^{2}+\left\|\partial_{t} L(t)\right\|_{E^{s}}^{2} \longmapsto\left\|\partial_{t}^{2} L^{0}(t)\right\|_{E^{s-1}}^{2}+\left\|\partial_{t}^{2 s+1} L^{0}(t)\right\|_{L^{2}(\Omega)}^{2}+\left\|\partial_{t} L^{i}(t)\right\|_{E^{s, 2 s-1}}^{2}
$$

in $\alpha_{2}(t)$, and

$$
\alpha_{0} \longmapsto \alpha_{2}(0)+\|F(0)\|_{E^{s-1}}^{2}+\left\|\partial_{t}^{2 s-1} F(0)\right\|_{L^{2}(\Omega)}^{2}+\left\|\partial_{t} L^{0}(0)\right\|_{E^{s-1}}^{2}+\left\|\partial_{t}^{2 s} L^{0}(0)\right\|_{L^{2}(\Omega)}^{2}+\left\|L^{i}(0)\right\|_{E^{s, 2 s-1}}^{2}
$$

Although we will not make use of this observation in this article, we note it here because it may be of use in other application of this linear theory to non-linear problems.

In order to go from solutions of (7.132)-(7.137) to solutions of (7.116)-(7.118), we need to ensure that the initial data

$$
\begin{equation*}
\left.\left(v, \partial_{t} v\right)\right|_{\Omega_{0}}=\left(\tilde{v}_{0}, \tilde{v}_{1}\right) \in H^{s+1}\left(\Omega, \mathbb{R}^{N}\right) \times H^{s+\frac{1}{2}}\left(\Omega, \mathbb{R}^{N}\right) \tag{7.148}
\end{equation*}
$$

satisfies the compatibility conditions given by

$$
\begin{align*}
\tilde{v}_{\ell} & :=\left.\partial_{t}^{\ell} v\right|_{\Omega_{0}} \in H^{s+1-\frac{\ell}{2}}\left(\Omega, \mathbb{R}^{N}\right), \quad 2 \leq \ell \leq 2 s  \tag{7.149}\\
\tilde{v}_{2 s+1} & :=\left.\partial_{t}^{2 s+1} v\right|_{\Omega_{0}} \in L^{2}(\Omega) \tag{7.150}
\end{align*}
$$

where the time derivatives $\left.\partial_{t}^{\ell} v\right|_{\Omega_{0}}, \ell \geq 2$, are generated from the initial data (7.148) by formally differentiating (7.116) with respect to $t$ and evaluating at $t=0$ and are assumed to satisfy $2 s-1$ formal time derivatives of the boundary condtion (7.117) at $t=0$.

Corollary 7.14. Suppose $s>n / 2+1$, $s=k / 2$ for $k \in \mathbb{Z}, \epsilon_{0}>0, \tilde{w}_{2 s+1} \in L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right)$ satisfies $\mathbb{P}_{q(0)} \tilde{w}_{2 s+1}=\tilde{w}_{2 s+1}$, the coefficients $\left\{b^{\alpha \beta}, c, q\right\}$ satisfy (7.14)-(7.18) for constants $\kappa_{0}, \kappa_{1}, \sigma>0$ and $\mu \geq 0$, there exists a function $\chi=\chi(t, x)$ such that

$$
\epsilon P+\epsilon\left(2 s-\frac{3}{2}\right) \partial_{t} q-\chi q \leq 0 \quad \text { in } \Gamma_{T}
$$

for $0<\epsilon \leq \epsilon_{0}$,

$$
\partial_{t}^{2 s} P=k_{1}^{i} \partial_{i} \theta_{1}+g_{1} \quad \text { and } \quad \partial_{t}^{2 s} G=k_{2}^{i} \partial_{i} \theta_{2}+g_{2}
$$

where $\nu_{i} k_{a}^{i}=0$, $a=1,2$, and the initial data $\left(\tilde{v}_{0}, \tilde{v}_{1}\right) \in H^{s+1}\left(\Omega, \mathbb{R}^{N}\right) \times H^{s+\frac{1}{2}}\left(\Omega, \mathbb{R}^{N}\right)$ verify the compatibility conditions (7.149) -(7.150) for $0<\epsilon \leq \epsilon_{0}$. Then there exist constants $\lambda^{*}=\lambda^{*}(\sigma, \mu) \geq 1$ and

$$
\delta^{*}=\delta^{*}\left(\kappa_{1}, \sup _{0 \leq t \leq T}\left\|\partial_{t} b^{i 0}(t)\right\|_{H^{s-\frac{1}{2}}(\Omega)}, \sup _{0 \leq t \leq T}\left\|\partial_{t}^{2} q(t)\right\|_{H^{s-1}(\Omega),} \sup _{0 \leq t \leq T}\left\|\partial_{t} P(t)\right\|_{H^{s-\frac{1}{2}}(\Omega)}\right) \geq 1
$$

such that for each $(\lambda, \epsilon) \in\left[\lambda^{*}, \infty\right) \times\left(0, \min \left\{\frac{1}{\delta^{*}}, \epsilon_{0}\right\}\right]$ there exists a unique solution $v \in C \mathcal{X}_{T}^{s+1}\left(\Omega, \mathbb{R}^{N}\right)$ to the IBVP (7.116) -(7.118). Moreover, there exists a map $w_{2 s+1} \in C\left([0, T], L^{2}\left(\Omega, \mathbb{R}^{N}\right)\right)$ such that
(i) $\left(\partial_{t}^{2 s} v, w_{2 s+1}\right)$ is the unique weak solution of the linear wave equations obtained by differentiating (7.116) - (7.117) $2 s$-times with respect to $t$ satisfying $\left(\partial_{t}^{2 s} v(0), \partial_{t}^{2 s+1} v(0), w_{2 s+1}(0)\right)=\left(\tilde{v}_{2 s}, \tilde{v}_{2 s+1}, \tilde{w}_{2 s+1}\right)$, and
(ii) for $\epsilon_{0}>$ chosen small enough, the pair $\left(v, w_{2 s+1}\right)$ satisfy the energy estimate

$$
\begin{align*}
\left\|\left(v(t), w_{2 s+1}(t)\right)\right\|_{s+1}^{2} \leq C(\| & \left(v(0), w_{2 s+1}(0)\right) \|_{s+1}^{2}+\alpha_{0} \\
& \left.+\int_{0}^{t} \alpha_{1}(\tau)\left(\left\|\left(v(\tau), w_{2 s+1}(\tau)\right)\right\|_{s+1}^{2}+\alpha_{2}(\tau)\right) d \tau\right) \tag{7.151}
\end{align*}
$$

where $C=C\left(\kappa_{0}, \kappa_{1}, \sigma, \gamma, \mu, \lambda, \rho\right), \rho$ and the $\alpha_{i}$ are as defined in Theorem 7.12, and

$$
\left\|\left(v(t), w_{2 s+1}(t)\right)\right\|_{s+1}^{2}=\|v(t)\|_{\mathcal{E}^{s+1}}^{2}+\left\langle w_{2 s+1}(t) \mid(-q(t)) w_{2 s+1}(t)\right\rangle_{\partial \Omega}
$$

Proof. Given initial data $\left(\tilde{v}_{0}, \tilde{v}_{1}\right) \in H^{s+1}\left(\Omega, \mathbb{R}^{N}\right) \times H^{s+\frac{1}{2}}\left(\Omega, \mathbb{R}^{N}\right)$ satisfying the compatibility conditions (7.149)-(7.150), we let
$\left(\mathbf{v}_{2 s-1}, v_{2 s}, w_{2 s+1}\right) \in C^{0}\left([0, T], X^{s+1,2 s-1}\left(\Omega, \mathbb{R}^{N}\right)\right) \times \bigcap_{j=0}^{1} C^{j}\left([0, T], H^{1-j}\left(\Omega, \mathbb{R}^{N}\right)\right) \times C\left([0, T], L^{2}\left(\partial \Omega, \mathbb{R}^{N}\right)\right)$,
denote the unique solution to (7.132)- (7.137), which we know exists for $(\lambda, \epsilon) \in\left[\lambda^{*}, \infty\right) \times\left(0, \min \left\{\frac{1}{\delta^{*}}, \epsilon_{0}\right\}\right]$ by Theorem 7.12. To proceed, we assume that the $v_{\ell}(t), \ell=0, \ldots, 2 s-1$, are differentiable in time and satisfy $\partial_{t} v_{\ell}(t) \in H^{s+1-\frac{\ell+1}{2}}\left(\Omega, \mathbb{R}^{N}\right), \ell=0, \ldots, 2 s-1$. This assumption can be made rigorous by applying the mollifier $J_{\omega}$, see (7.101), to the equations (7.132)-(7.135), in analogy to what was done in the analysis of the simplified problem in Section 7.4. Commuting the mollifiers with the coefficients, which are now variable, it follows that the smoothed variables $J_{\omega} v_{\ell}$ satisfy the same type of equations up to remainder terms involving commutators of the type $\left[J_{\omega},(\cdot)\right]$, where $(\cdot)$ represents the system coefficients. Using standard properties of mollifiers, it is not difficult to see that these remainder terms are harmless as far as this proof is concerned.

Under the differentiability assumption, a straightforward calculation shows that the differences $\mathfrak{v}_{\ell}:=$ $\partial_{t} v_{\ell-1}-v_{\ell}, \ell=1, \ldots, 2 s-1$, define a solution to a collection of elliptic equations of the form

$$
\begin{align*}
\partial_{i}\left(b^{i j} \partial_{\beta} \mathfrak{v}_{\ell}+\epsilon d_{\ell}^{i} \mathfrak{v}_{\ell}+\mathfrak{L}_{\ell}^{i}\right)+\epsilon a_{\ell}^{i} \partial_{i} v_{\ell}+\lambda c_{\ell} v_{\ell} & =\mathfrak{F}_{\ell} & & \text { in } \Omega,  \tag{7.152}\\
\nu_{i}\left(b^{i j} \partial_{\beta} v_{\ell}+\epsilon d_{\ell}^{i} \mathfrak{v}_{\ell}+\mathfrak{L}_{\ell}^{i}\right) & =\epsilon \mathcal{F}_{\ell} \mathfrak{v}_{\ell}+\mathfrak{G}_{\ell} & & \text { in } \partial \Omega \tag{7.153}
\end{align*}
$$

where the source terms $\mathfrak{L}_{\ell}^{i}, \mathfrak{F}_{\ell}$, and $\mathfrak{G}_{\ell}$ are homogenous in the variables $\mathfrak{v}_{\ell}$ and satisfy homogeneous versions of the estimates from Lemma 7.8, that is, estimates that arise from making the replacements: $\left(\mathcal{G}_{\ell}, \mathcal{L}_{\ell}^{i}, \mathcal{F}_{\ell}\right) \mapsto\left(\mathfrak{G}_{\ell}, \mathfrak{L}_{\ell}^{i}, \mathfrak{F}_{\ell}\right)$ and $\left(G_{\ell}, L_{\ell}^{i}, F_{\ell}\right) \mapsto(0,0,0)$ for $1 \leq \ell \leq 2 s-1$. The only point that one has to be somewhat careful about is to remember that on the boundary the equality $q \partial_{t} v_{2 s}-q w_{2 s+1}=0$ holds since it is true in a weak sense, see Remark 7.4(i). Furthermore, it is not difficult to verify that the last term $\mathfrak{v}_{2 s}$ defines a weak solution of an equation of the form (7.152)-(7.153) with $\ell=2 s$, where again the source terms $\mathfrak{L}_{2 s}^{i}, \mathfrak{F}_{2 s}$, and $\mathfrak{G}_{2 s}$ are homogenous in the variables $\mathfrak{v}_{\ell}$ and satisfy the estimates

$$
\left\|\left.\mathfrak{G}_{2 s}\right|_{\partial \Omega}\right\|_{L^{2}(\partial \Omega)}+\left\|\mathfrak{L}_{2 s}^{i}\right\|_{L^{2}(\Omega)}+\left\|\mathfrak{F}_{\ell}\right\|_{L^{2}(\Omega)} \lesssim \sum_{\ell=1}^{2 s}\left\|\mathfrak{v}_{\ell}\right\|_{H^{s+1-\frac{\ell}{2}}(\Omega)}
$$

By Proposition 7.9 and Theorem B.3, we know that solutions to (7.152)-(7.153) are unique for $(\lambda, \epsilon) \in$ $[\lambda *, \infty) \times\left(0, \frac{1}{\delta^{*}}\right]$, and so, we conclude that the trivial solution, given by $\mathfrak{v}_{\ell}=0$ for $1 \leq \ell \leq 2 s$, is the unique solution. From this, we see that $\partial_{t} v_{\ell}=v_{\ell+1}, 0 \leq \ell \leq 2 s-1$, and hence, that

$$
\begin{equation*}
v_{\ell}=\partial_{t}^{\ell} v, \quad 0 \leq \ell \leq 2 s \tag{7.154}
\end{equation*}
$$

The proof now follows since it is clear from the properties of the solution $\left(\mathbf{v}_{2 s-1}, v_{2 s}, w_{2 s+1}\right)$, see Theorem 7.12, and (7.154) that $v \in C \mathcal{X}^{s+1}\left(\Omega, \mathbb{R}^{N}\right), v$ solves the rescaled model problem (7.116)-(7.118), $\left(\partial_{t}^{2 s} v, w_{2 s+1}\right)$ is a weak solution of the linear wave equation obtained by differentiating (7.116)-(7.117) $2 s$-times with respect to $t$, and ( $v, w_{2 s+1}$ ) satisfies the desired energy estimate.

Remark 7.15.
(i) It is clear from the proofs of Theorem 7.12 and Corollary 7.14 that they continue to hold for $P$ and $G$ satisfying

$$
\partial_{t}^{2 s} P=k_{1,1}^{i} \partial_{i} \theta_{1,1}+k_{1,2}^{i} \partial_{i} \theta_{1,2} \quad \text { and } \quad \partial_{t}^{2 s} G=k_{2,1}^{i} \partial_{i} \theta_{2,1}+k_{2,2}^{i} \partial_{i} \theta_{2,2}
$$

where $\nu_{i} k_{a, b}^{i}=0, a, b=1,2$, provided that we make the replacements

$$
\theta_{a} \longmapsto\left(\theta_{a, 1}, \theta_{a, 2}\right), \quad a=1,2, \quad \text { and } \quad \vec{k} \longmapsto\left(k_{1,1}, k_{1,2}, k_{2,1}, k_{2,2}\right)
$$

(ii) There is a generalization of Corollary 7.14 which can be established using an iteration method that allows for coefficients the $L^{\alpha}, F, G$ and $g$ to depend linearly on $v$ provided that they satisfy estimates that preserve the form of the energy estimate. For example, we could have

$$
F=\bar{F}+\hat{F}(v)
$$

where $\bar{F} \in X_{T}^{s}(\Omega)$ and

$$
\|\hat{F}(v(t))\|_{E^{s}}^{2} \leq \hat{f}(t)\left\|\left(v(t), w_{2 s+1}(t)\right)\right\|_{s+1}^{2}, \quad 0 \leq t \leq T
$$

In this case, we would just replace the term $\|F(t)\|_{E^{s}}^{2}$ that appears in the energy estimate (i.e. in $\alpha_{2}(t)$ ) from Corollary 7.14 with $\|\bar{F}(t)\|_{E^{s}}^{2}+\hat{f}(t)\left\|\left(v(t), w_{2 s+1}(t)\right)\right\|_{s+1}^{2}$.
7.8. Local existence and uniqueness. We are now prepared to use the existence and uniqueness results for the model problem to establish an existence and uniqueness result for linear wave equations that include equations of the form (6.3)-(6.4). The precise class of linear wave equations that we consider are:

$$
\begin{align*}
\partial_{\alpha}\left(b^{\alpha \beta} \partial_{\beta} u+\ell^{\alpha}\right) & =f & & \text { in } \Omega_{T}  \tag{7.155}\\
\nu_{\alpha}\left(b^{\alpha \beta} \partial_{\beta} u+\ell^{\alpha}\right) & =q \partial_{t}^{2} u+p \partial_{t} u+g & & \text { in } \Gamma_{T}  \tag{7.156}\\
\left(u, \partial_{t} u\right) & =\left(\tilde{u}_{0}, \tilde{u}_{1}\right) & & \text { in } \Omega_{0}, \tag{7.157}
\end{align*}
$$

where the initial data

$$
\begin{equation*}
\left.\left(u, \partial_{t} u\right)\right|_{\Omega_{0}}=\left(\tilde{u}_{0}, \tilde{u}_{1}\right) \in H^{s+1}\left(\Omega, \mathbb{R}^{N}\right) \times H^{s+\frac{1}{2}}\left(\Omega, \mathbb{R}^{N}\right) \tag{7.158}
\end{equation*}
$$

satisfies compatibility conditions given by

$$
\begin{align*}
\tilde{u}_{\ell} & :=\left.\partial_{t}^{\ell} u\right|_{\Omega_{0}} \in H^{s+1-\frac{\ell}{2}}\left(\Omega, \mathbb{R}^{N}\right), \quad 2 \leq \ell \leq 2 s  \tag{7.159}\\
\tilde{u}_{2 s+1} & :=\left.\partial_{t}^{2 s+1} u\right|_{\Omega_{0}} \in L^{2}\left(\Omega, \mathbb{R}^{N}\right) \tag{7.160}
\end{align*}
$$

where, as before, the higher time derivatives $\left.\partial_{t}^{\ell} u\right|_{\Omega_{0}}, \ell \geq 2$, are generated from the initial data (7.158) by formally differentiating (7.155) with respect to $t$ at $t=0$ and are assumed to satisfy $2 s-1$ formal time derivatives of the boundary conditions (7.156) at $t=0$.

Theorem 7.16. Suppose $s>n / 2+1, s=k / 2$ for $k \in \mathbb{Z}$, $\tilde{w}_{2 s+1} \in L^{2}(\partial \Omega)$ satisfies $\mathbb{P}_{q(0)} \tilde{w}_{2 s+1}=\tilde{w}_{2 s+1}$, the coefficients $\left\{b^{\alpha \beta}, q\right\}$ satisfy (7.14) and (7.16) -(7.18) for constants $\kappa_{0}, \kappa_{1}, \gamma>0$ and $\mu \geq 0$,

$$
p+\left(2 s-\frac{3}{2}\right) \partial_{t} q-\chi q \leq 0, \quad \partial_{t}^{2 s} p=k_{1}^{i} \partial_{i} \theta_{1}+h_{1} \quad \text { and } \quad \partial_{t}^{2 s} g=k_{2}^{i} \partial_{i} \theta_{2}+h_{2}
$$

where $\nu_{i} k_{a}^{i}=0, a=1,2$, and the initial data $\left(\tilde{v}_{0}, \tilde{v}_{1}\right)$ satisfies the compatibility conditions (7.159) - (7.160). Then there exists a unique solution $u \in C \mathcal{X}_{T}^{s+1}\left(\Omega, \mathbb{R}^{N}\right)$ to the IBVP (7.155)-7.157). Moreover, there exists a map $w_{2 s+1} \in C\left([0, T], L^{2}\left(\Omega, \mathbb{R}^{N}\right)\right)$ such that
(i) $\left(\partial_{t}^{2 s} u, w_{2 s+1}\right)$ is the unique weak solution of the linear wave equations obtained by differentiating (7.155) -(7.156) $2 s$-times with respect to $t$ satisfying $\left(\partial_{t}^{2 s} u(0), \partial_{t}^{2 s+1} u(0), w_{2 s+1}(0)\right)=\left(\tilde{u}_{2 s}, \tilde{u}_{2 s+1}, \tilde{w}_{2 s+1}\right)$, and
(ii) the pair $\left(u, w_{2 s+1}\right)$ satisfy the energy estimate

$$
\begin{aligned}
\left\|\left(u(t), w_{2 s+1}(t)\right)\right\|_{s+1}^{2} \leq C & \left(\left\|\left(u(0), w_{2 s+1}(0)\right)\right\|_{s+1}^{2}\right. \\
& \left.+\alpha_{0}+\int_{0}^{t} \alpha_{1}(\tau)\left\|\left(u(\tau), w_{2 s+1}(\tau)\right)\right\|_{s+1}^{2}+\alpha_{2}(\tau) d \tau\right)
\end{aligned}
$$

where $C=C\left(\kappa_{0}, \kappa_{1}, \mu, \gamma, \rho\right), \alpha_{0}=\alpha_{2}(0)+\|f(0)\|_{E^{s-1}}^{2}+\left\|\partial_{t}^{2 s-1} f(0)\right\|_{L^{2}(\Omega)}^{2}$,

$$
\left\|\left(u(t), w_{2 s+1}(t)\right)\right\|_{s+1}^{2}=\|u(t)\|_{\mathcal{E}^{s+1}}^{2}+\left\langle w_{2 s+1}(t) \mid(-q) w_{2 s+1}(t)\right\rangle_{\partial \Omega}
$$

$$
\alpha_{1}(t)=1+\|\chi(t)\|_{H^{s}(\Omega)}^{2}+\left\|\partial_{t} b(t)\right\|_{E^{s}}^{2}+\left\|\partial_{t} p(t)\right\|_{E^{s, 2 s-2}}^{2}
$$

$$
+\left\|\partial_{t} q(t)\right\|_{\mathcal{E}^{s+\frac{1}{2}}}^{2}+\|\vec{h}(t)\|_{\mathcal{E}^{1}}^{2}+\|\vec{\theta}(t)\|_{H^{1}(\Omega)}^{2}+\left\|\partial_{t} \vec{\theta}(t)\right\|_{H^{1}(\Omega)}^{2}
$$

$$
\alpha_{2}(t)=\|f(t)\|_{E^{s-1}}^{2}+\left\|\partial_{t} f(t)\right\|_{E^{s-1}}^{2}+\left\|\partial_{t}^{2 s} f(t)\right\|_{L^{2}(\Omega)}^{2}+\|\ell(t)\|_{E^{s}}^{2}+\left\|\partial_{t} \ell(t)\right\|_{E^{s}}^{2}
$$

$$
+\|g(t)\|_{E^{s, 2 s-2}}^{2}+\left\|\partial_{t} g(t)\right\|_{E^{s, 2 s-2}}^{2}+\|\vec{h}(t)\|_{\mathcal{E}^{1}}^{2}+\|\vec{\theta}(t)\|_{H^{1}(\Omega)}^{2}+\left\|\partial_{t} \vec{\theta}(t)\right\|_{H^{1}(\Omega)}^{2}
$$

and

$$
\begin{aligned}
& \rho=\|b\|_{X_{T}^{s}}+\|p\|_{X_{T}^{s, 2 s-2}}+\left\|\partial_{t}^{2 s-1} p\right\|_{L^{\infty}\left([0, T], L^{2}(\partial \Omega)\right)} \\
& \quad+\|q\|_{L^{\infty}\left([0, T], H^{s}(\Omega)\right)}+\left\|\partial_{t} q\right\|_{X_{T}^{s, 2 s-2}}+\|\vec{k}\|_{W^{1, \infty}\left([0, T], H^{s}(\Omega)\right)}
\end{aligned}
$$

Proof.
Reduction to the model problem: First, a short computation shows that the IBVP (7.155)-(7.157) transform into

$$
\begin{align*}
\partial_{\alpha}\left(b^{\alpha \beta} \partial_{\beta} v+L^{\alpha}\right)+\lambda c v=F & \text { in } \Omega_{T},  \tag{7.161}\\
\nu_{\alpha}\left(b^{\alpha \beta} \partial_{\beta} v+L^{\alpha}\right)=q \partial_{t}^{2} v+P \partial_{t} v+G & \text { in } \Gamma_{T},  \tag{7.162}\\
\left(v, \partial_{t} v\right)=\left(\tilde{v}_{0}, \tilde{v}_{1}\right):=\left(e^{-\omega} \tilde{u}_{0}, e^{-\omega}\left(\tilde{u}_{1}-\partial_{t} \omega \tilde{u}_{0}\right)\right) & \text { in } \Omega_{0}, \tag{7.163}
\end{align*}
$$

the under change of variables $u=e^{\omega} v$, where

$$
\begin{gathered}
c=\frac{1}{\lambda} b^{\alpha \beta} \partial_{\alpha} \omega \partial_{\beta} \omega, \quad F=e^{-\omega} f-e^{-\omega} \ell^{\alpha} \partial_{\alpha} \omega v-\partial_{\alpha} \omega b^{\alpha \beta} \partial_{\beta} v \\
L^{\alpha}=e^{-\omega} \ell^{\alpha}+b^{\alpha \beta} \partial_{\beta} \omega v, \quad P=p+2 \partial_{t} \omega q
\end{gathered}
$$

and

$$
G=e^{-\omega} g+\left[\left(\partial_{t} \omega\right)^{2}+\partial_{t}^{2} \omega\right] q v+\partial_{t} \omega p v
$$

Setting

$$
\omega=\sqrt{\lambda} t, \quad \lambda>0
$$

gives

$$
c=b_{00} \leq-\kappa_{0}
$$

while

$$
P-\left(2 s-\frac{3}{2}\right) \partial_{t} q-(2 \sqrt{\lambda}+\chi) q \leq 0
$$

follows from the assumption $p-\left(2 s-\frac{3}{2}\right) \partial_{t} q-\chi q \leq 0$. Differentiating $G$, we obtain

$$
\begin{align*}
\partial_{t}^{2 s} G=e^{-\omega} k_{2}^{i} \partial_{i} \theta_{2} & +k_{1}^{i} \partial_{i}\left(\theta_{1} \partial_{t} \omega v\right)+\left\{-k_{1}^{i} \theta_{1} \partial_{i}\left(\partial_{t} \omega v\right)+e^{-\omega} h_{2}+h_{1} \partial_{t} \omega v\right. \\
& \left.+\left[\partial_{t}^{2 s}, e^{-\omega}\right] g+\partial_{t}^{2 s}\left(\left[\left(\partial_{t} \omega\right)^{2}+\partial_{t}^{2} \omega\right] q v\right)+\partial_{t}^{2 s}\left(p \partial_{t} \omega v\right)-\partial_{t}^{2 s} p \partial_{t} \omega v\right\} \tag{7.164}
\end{align*}
$$

since $\partial_{t}^{2 s} p=k_{1}^{i} \partial_{i} \theta_{1}+h_{1}$ and $\partial_{t}^{2 s} g=k_{2}^{i} \partial_{i} \theta_{2}+h_{2}$ by assumption. We note that the term $\partial_{t}^{2 s} p$ does not appear in the term $\partial_{t}^{2 s}\left(p \partial_{t} \omega v\right)-\partial_{t}^{2 s} p \partial_{t} \omega v$ from (7.164). Similarly, differentiating $P$, we see that

$$
\partial_{t}^{2 s} P=k^{i} \partial_{i} \theta_{1}+h_{1}+\partial_{t}^{2 s}\left(2 \partial_{t} \omega q\right)
$$

Using the definitions (7.138)-(7.140) for $\alpha_{1}(t), \alpha_{2}(t)$, and $\rho$, where in those formulas $b^{\alpha \beta}, c, F, L^{\alpha}, P$, $G, \theta$ are as defined above, and the following replacements are made

$$
\begin{aligned}
g_{1} & \longmapsto h_{1}+\partial_{t}^{2 s}\left(2 \partial_{t} \omega q\right), \\
g_{2} & \longmapsto\{\cdots\} \text { on the r.h.s of (7.164), } \\
k_{2}^{i} & \longmapsto\left(e^{-\omega} k_{2}^{i}, k_{1}^{i}\right), \\
\theta_{2} & \longmapsto\left(\theta_{2}, \theta_{1} \partial_{t} \omega v\right),
\end{aligned}
$$

and setting

$$
\begin{aligned}
& \tilde{\alpha}_{1}(t)=1+\|\chi(t)\|_{H^{s}(\Omega)}^{2}+\left\|\partial_{t} b(t)\right\|_{E^{s}}^{2}+\left\|\partial_{t} p(t)\right\|_{E^{s, 2 s-2}}^{2} \\
& +\left\|\partial_{t} q(t)\right\|_{\mathcal{E}^{s+\frac{1}{2}}}^{2}+\|\vec{h}(t)\|_{\mathcal{E}^{1}}^{2}+\|\vec{\theta}(t)\|_{H^{1}(\Omega)}^{2}+\left\|\partial_{t} \vec{\theta}(t)\right\|_{H^{1}(\Omega)}^{2}, \\
& \tilde{\alpha}_{2}(t)=\|f(t)\|_{E^{s-1}}^{2}+\left\|\partial_{t} f(t)\right\|_{E^{s-1}}^{2}+\left\|\partial_{t}^{2 s} f(t)\right\|_{L^{2}(\Omega)}^{2}+\|\ell(t)\|_{E^{s}}^{2}+\left\|\partial_{t} \ell(t)\right\|_{E^{s}}^{2} \\
& +\|g(t)\|_{E^{s, 2 s-2}}^{2}+\left\|\partial_{t} g(t)\right\|_{E^{s, 2 s-2}}^{2}+\|\vec{h}(t)\|_{\mathcal{E}^{1}}^{2}+\|\vec{\theta}(t)\|_{H^{1}(\Omega)}^{2}+\left\|\partial_{t} \vec{\theta}(t)\right\|_{H^{1}(\Omega)}^{2}
\end{aligned}
$$

and

$$
\begin{aligned}
& \tilde{\rho}=\|b\|_{X_{T}^{s}}+\|p\|_{X_{T}^{s, 2 s-2}}+\left\|\partial_{t}^{2 s-1} p\right\|_{L^{\infty}\left([0, T], L^{2}(\partial \Omega)\right)} \\
&+\|q\|_{L^{\infty}\left([0, T], H^{s}(\Omega)\right)}+\left\|\partial_{t} q\right\|_{X_{T}^{s, 2 s-2}}+\|\vec{k}\|_{W^{1, \infty}\left([0,1], H^{s}(\Omega)\right)}
\end{aligned}
$$

it is not difficult to verify the inequalities

$$
\rho \lesssim \tilde{\rho}, \quad \alpha_{1}(t) \leq C(\tilde{\rho}) \tilde{\alpha}_{1}(t), \quad \text { and } \quad \alpha_{2}(t) \leq C(\tilde{\rho})\left(\tilde{\alpha}_{2}(t)+\tilde{\alpha}_{1}(t)\|v(t)\|_{\mathcal{E}^{s+1}}\right)
$$

follows from the spacetime calculus inequalities from Appendix A. 2
From the above calculations, it follows that it is enough to consider the IBVP (7.161)-(7.163) where the coefficients $b^{i j}, P, q, c$ and $G$ satisfy the conditions: (7.14)-(7.18),

$$
\begin{equation*}
P-\left(2 s-\frac{3}{2}\right) \partial_{t} q-\chi q \leq 0 \tag{7.165}
\end{equation*}
$$

and

$$
\begin{equation*}
\partial_{t}^{2 s} G=k^{i} \partial_{i} \theta+g \tag{7.166}
\end{equation*}
$$

where $\nu_{i} k^{i}=0$.
Reduction to the rescaled model problem: Letting

$$
\mathbb{H}^{n}=\left\{\left(x^{1}, \ldots, x^{n-1}, x^{n}\right) \mid\left(x^{1}, \ldots, x^{n-1}\right) \in \mathbb{R}^{n-1}, x^{n}>0\right\}
$$

denote the half space, we can always use a smooth coordinate transformation to map a portion of the smooth boundary of $\Omega$ to the region $Q_{1} \cap \partial \mathbb{H}^{n}$, where here, we are using $Q_{\delta}$ to denote an open $n$ cube of width $\delta>0$ centered at $x=0$. Consequently, nothing is lost by just assuming that a portion of the boundary of $\Omega$ is given by $Q_{1} \cap \partial \mathbb{H}^{n}$ and that $Q_{1}^{+} \subset \Omega$, where

$$
Q_{\delta}^{+}:=Q_{\delta} \cap \mathbb{H}^{n}
$$

Next, we rescale the spatial coordinates $x=\left(x^{i}\right)$ by $x \mapsto \epsilon x, 0<\epsilon \leq 1$, which maps the boundary portion $Q_{1}^{+}$to $Q_{1 / \epsilon}^{+}$and transforms (7.161)-(7.163) to

$$
\begin{aligned}
\partial_{\alpha}\left(B_{\epsilon}^{\alpha \beta} \partial_{\beta} v_{\epsilon}+\epsilon M_{\epsilon}^{\alpha}\right)+\epsilon^{2} \lambda c_{\epsilon} v_{\epsilon} & =\epsilon^{2} F_{\epsilon} & & \text { in }[0, T] \times \Omega^{\epsilon}, \\
\nu_{\alpha}\left(B_{\epsilon}^{\alpha \beta} \partial_{\beta} v_{\epsilon}+\epsilon M_{\epsilon}^{\alpha}\right) & =\epsilon q_{\epsilon} \partial_{t}^{2} v_{\epsilon}+\epsilon P_{\epsilon} \partial_{t} v_{\epsilon}+\epsilon G_{\epsilon} & & \text { in }[0, T] \times \partial \Omega^{\epsilon}, \\
\left(v_{\epsilon}, \partial_{t} v_{\epsilon}\right) & =\left(\tilde{v}_{0}^{\epsilon}, \tilde{v}_{1}^{\epsilon}\right) & & \text { in } \Omega^{\epsilon},
\end{aligned}
$$

where $\Omega^{\epsilon}=\left\{x \in \mathbb{R}^{n} \mid \epsilon x \in \Omega\right\}$,

$$
\begin{aligned}
B_{\epsilon}^{\alpha \beta} & =\epsilon^{2} \delta_{0}^{\alpha} \delta_{0}^{\alpha} b_{\epsilon}^{00}+\epsilon \delta_{0}^{\alpha} \delta_{j}^{\beta} b_{\epsilon}^{0 j}+\epsilon \delta_{i}^{\alpha} \delta_{0}^{\beta} b_{\epsilon}^{0 j}+b_{\epsilon}^{i j} \\
M_{\epsilon}^{\alpha} & =\epsilon \delta_{0}^{\alpha} L_{\epsilon}^{0}+\delta_{i}^{\alpha} L_{\epsilon}^{i}
\end{aligned}
$$

and all other quantities appearing with a subscript or superscript $\epsilon$ are obtained by scaling (i.e. $v_{\epsilon}(t, x)=$ $v(t, \epsilon x), F_{\epsilon}(t, x)=F(t, \epsilon x)$, etc.).

Lemma 7.17. Suppose $k>n / 2$ and $f_{\epsilon}(x)=f(\epsilon x)$. Then

$$
\left\|f_{\epsilon}\right\|_{H^{k}\left(Q_{1}^{+}\right)} \lesssim\|f\|_{H^{k}(\Omega)}, \quad 0<\epsilon \leq 1
$$

for all $f \in H^{k}(\Omega)$.
Proof. First, it is straightforward to check that

$$
\left\|D^{k} f_{\epsilon}\right\|_{L^{2}\left(\Omega^{\epsilon}\right)}^{2}=\epsilon^{2 k-n}\|f\|_{H^{k}(\Omega)}^{2}, \quad 0<\epsilon \leq 1
$$

Since $Q_{1}^{+} \subset Q_{1 / \epsilon}^{+} \subset \Omega^{\epsilon}$, and $k>n / 2$ by assumption, we see that

$$
\begin{equation*}
\left\|D^{k} f_{\epsilon}\right\|_{L^{2}\left(Q_{1}^{+}\right)} \leq\|f\|_{H^{k}(\Omega)}^{2}, \quad 0<\epsilon \leq 1 \tag{7.167}
\end{equation*}
$$

Next

$$
\begin{equation*}
\left\|f_{\epsilon}\right\|_{L^{2}\left(Q_{1}^{+}\right)} \leq\left\|f_{\epsilon}\right\|_{L^{\infty}\left(Q_{1}^{+}\right)}\|1\|_{L^{2}\left(Q_{1}^{+}\right)} \lesssim\|f\|_{L^{\infty}\left(Q_{\epsilon}^{+}\right)} \leq\|f\|_{L^{\infty}(\Omega)} \lesssim\|f\|_{H^{k}(\Omega)} \tag{7.168}
\end{equation*}
$$

where in deriving the last inequality we used Sobolev's inequality, see Theorem A.3. The proof now follows from the two inequalities (7.167) and (7.168) together with an application of Ehrling's lemma, see Lemma A. 5

The above lemma shows that we have a bound on the rescaled coefficients given by

$$
\begin{align*}
\left\|b_{\epsilon}^{\alpha \beta}\right\|_{H\left(Q_{1}^{+}\right)} & +\left\|\partial_{t} b_{\epsilon}^{0 i}\right\|_{H^{s-\frac{1}{2}}\left(Q_{1}^{+}\right)}+\left\|\partial_{t} P_{\epsilon}\right\|_{H^{s-\frac{1}{2}}\left(Q_{1}^{+}\right)}+\left\|\partial_{t}^{2} q_{\epsilon}\right\|_{H^{s-1}\left(Q_{1}^{+}\right)} \\
& \lesssim\left\|b^{\alpha \beta}\right\|_{H^{s}(\Omega)}+\left\|\partial_{t} b^{0 i}\right\|_{H^{s-\frac{1}{2}(\Omega)}}+\left\|\partial_{t} P\right\|_{H^{s-\frac{1}{2}}(\Omega)}+\left\|\partial_{t}^{2} q\right\|_{H^{s-1}(\Omega)}, \tag{7.169}
\end{align*}
$$

which holds for all $(t, \epsilon) \in[0, T] \times(0,1]$. Moreover, it is clear from (7.165) and (7.166) that

$$
P_{\epsilon}-\epsilon\left(2 s-\frac{3}{2}\right) \partial_{t} q_{\epsilon}-\chi_{\epsilon} q_{\epsilon} \leq 0 \quad \text { and } \quad \partial_{t}^{2 s} \epsilon G_{\epsilon}=k_{\epsilon}^{i} \partial_{i} \theta_{\epsilon}+\epsilon g_{\epsilon}
$$

where $\nu_{i} k_{\epsilon}^{i}=0$.
By Morrey's inequality and (7.169), we also know that

$$
\left\|b_{\epsilon}^{\alpha \beta}\right\|_{C^{0, \alpha}\left(\overline{Q_{1}^{+}}\right)} \lesssim\left\|b_{\epsilon}^{\alpha \beta}\right\|_{H\left(Q_{1}^{+}\right)} \lesssim 1
$$

for $\alpha \in(0, \min \{1, s-n / 2\})$. This estimate together with $b_{\epsilon}^{i j}(t, 0)=b^{i j}(t, 0)$ implies that for any choice of constant $\beta>0$, there exists a $\delta \in(0,1]$ such that

$$
\left\|b_{\epsilon}^{i j}(t, \cdot)-b^{i j}(t, 0)\right\|_{L^{\infty}\left(Q_{\delta}^{+}\right)} \leq \beta
$$

for all $(t, \epsilon) \in[0, T] \times(0,1]$. Choosing $\beta>0$ small enough, we can, see Remark 7.2 (i), guarantee that $b_{\epsilon}^{i j}$ is strongly elliptic at each point $x \in Q_{\delta}^{+}$and satisfies the strong complementing condition on $\overline{Q_{\delta}^{+}} \cap \partial \mathbb{H}^{n} \subset \partial \Omega^{\epsilon}$.

From the above considerations, it is not difficult to verify that, after suitably modifying the coefficients outside of a region of the form $B_{\delta^{\prime}}(0) \cap \overline{Q_{\delta}^{+}}$for $\delta^{\prime}$ small enough, there exists a bounded domain $\hat{\Omega} \subset Q_{\delta}^{+} \subset$ $\Omega^{\epsilon}$ with $C^{\infty}$ boundary satisfying $\partial \hat{\Omega} \cap \partial \mathbb{H}^{n} \subset \partial \Omega^{\epsilon}$, and an IBVP

$$
\begin{align*}
\partial_{\alpha}\left(\hat{B}_{\epsilon}^{\alpha \beta} \partial_{\beta} \hat{v}_{\epsilon}+\epsilon \hat{M}_{\epsilon}^{\alpha}\right)+\lambda \hat{c}_{\epsilon} v_{\epsilon} & =\epsilon^{2} \hat{F}_{\epsilon} & & \text { in } \hat{\Omega}_{T},  \tag{7.170}\\
\nu_{\alpha}\left(\hat{B}_{\epsilon}^{\alpha \beta} \partial_{\beta} \hat{v}_{\epsilon}+\epsilon \hat{M}_{\epsilon}^{\alpha}\right) & =\epsilon \hat{q}_{\epsilon} \partial_{t}^{2} \hat{v}_{\epsilon}+\epsilon \hat{P}_{\epsilon} \partial_{t} \hat{v}_{\epsilon}+\epsilon \hat{G}_{\epsilon} & & \text { in } \hat{\Gamma}_{T},  \tag{7.171}\\
\left(\hat{v}_{\epsilon}, \partial_{t} \hat{v}_{\epsilon}\right) & =\left(\check{v}_{0}^{\epsilon}, \check{v}_{1}^{\epsilon}\right) & & \text { in } \hat{\Omega}_{0}, \tag{7.172}
\end{align*}
$$

that satisfies the following:
(i) the conditions (7.14)-(7.18) are satisfied for constants $\hat{\gamma}, \hat{\sigma}, \hat{\kappa}_{0}, \kappa_{1}$, and $\hat{\mu}$ which are all $\epsilon$ independent with the exception of $\hat{\kappa}_{0}$,
(ii) all of the systems coefficients (i.e $\hat{B}_{\epsilon}^{\alpha \beta}, \hat{F}_{\epsilon}$, etc.) agree with the "unhatted" coefficients (i.e. $B_{\epsilon}^{\alpha \beta}$, $F^{\epsilon}$, etc.) on $B_{\delta^{\prime}}(0) \cap \overline{Q_{\delta}^{+}} \subset \overline{\hat{\Omega}}$,
(iii) the conditions

$$
\hat{P}_{\epsilon}-\epsilon\left(2 s-\frac{3}{2}\right) \partial_{t} \hat{q}_{\epsilon}-\hat{\chi}_{\epsilon} \hat{q}_{\epsilon} \leq 0, \quad \text { and } \quad \partial_{t}^{2 s} \epsilon \hat{G}_{\epsilon}=\hat{k}_{\epsilon}^{i} \partial_{i} \hat{\theta}_{\epsilon}+\epsilon \hat{g}_{\epsilon}
$$

are satisfied,
(iv) the initial data $\left(\check{v}_{0}^{\epsilon}, \check{v}_{1}^{\epsilon}\right)$ satisfies the compatibility conditions and agrees with the initial data $\left(\tilde{v}_{0}^{\epsilon}, \tilde{v}_{1}^{\epsilon}\right)$ on $B_{\delta^{\prime}}(0) \cap Q_{\delta}^{+}$,
(v) and the uniform bound

$$
\begin{aligned}
\frac{1}{\epsilon}\left\|\partial_{t} \hat{B}_{\epsilon}^{0 j}\right\|_{H^{s-\frac{1}{2}}(\hat{\Omega})} & +\left\|\partial_{t} \hat{P}_{\epsilon}\right\|_{H^{s-\frac{1}{2}}(\hat{\Omega})}+\left\|\partial_{t}^{2} \hat{q}_{\epsilon}\right\|_{H^{s-1}(\hat{\Omega})} \\
& \lesssim\left\|\partial_{t} b^{0 i}\right\|_{H^{s-\frac{1}{2}}(\Omega)}+\left\|\partial_{t} P\right\|_{H^{s-\frac{1}{2}}(\Omega)}+\left\|\partial_{t}^{2} q\right\|_{H^{s-1}(\Omega)}
\end{aligned}
$$

holds for $\epsilon \in(0,1]$.
Choosing $\epsilon$ small enough and $\lambda$ big enough, we are then guaranteed by Corollary 7.14 the existence of a solution $\hat{v} \in C \mathcal{X}_{T}^{s+1}\left(\hat{\Omega}, \mathbb{R}^{N}\right)$ to (7.170)-(7.172) that satisfies the energy estimates (7.151). Appealing to the finite propagation speed property for wave equations, this implies that the solution satisfies the original problem (7.161)-(7.163) in a neighborhood of the boundary point $x=0 \in \partial \Omega$. Using the finite propagation speed property, this is enough to construct a local solution in the neighborhood of the whole boundary by patching the local solutions together. In the interior of $\Omega$, the existence and uniqueness of solutions follows from standard hyperbolic theory. Patching the interior solution with the one that is valid in the neighborhood of the boundary yields the desired solution, which it is not difficult to see satisfies the stated energy estimate that is inherited from the energy estimates satisfied by the local solutions. Uniqueness of the full solution follows from the energy estimate in the standard fashion.

## 8. A priori estimates

We now apply the energy estimates from Theorem 7.16 to obtain a priori estimates for the class of solutions to the relativistic Euler equations detailed in Section 2. The following theorem, which constitutes the main result of this article, contains the precise statement. However, before stating the theorem, we recall the following definitions and assumptions:
(i) The vector field $\left(w^{\mu}\right) \in C^{8}\left(\bar{U}, \mathbb{R}^{4}\right)$ is a solution of the Frauendiener-Walton formulation of the Euler equations satisfying assumptions (A.1)-(A.7) from Section 2.4. We recall that $w^{\mu}$ uniquely determines a solution $\left(\rho, v^{\mu}\right)$ to the standard formulation of the Euler equations given by (1.2)(1.3) via the formulas (2.8) and (2.1).
(ii) The vector fields $\left(e_{I}^{\mu}\right) \in C^{7}\left(\bar{U}_{T}, \mathbb{R}^{4}\right), I=1,2,3$, define the frame field completion of

$$
e_{0}^{\mu}:=w^{\mu}
$$

obtained by solving the Lie transport equations (3.3)-(3.4) with initial data $\left.e_{I}^{\mu}\right|_{\Omega_{0}}=f_{I}^{\mu}$ chosen as in Section 4.2.
(iii) $\theta_{\mu}^{i}$ denotes the frame dual to $e_{i}^{\mu}$, or in other words, $\left(\theta_{\mu}^{i}\right):=\left(e_{i}^{\mu}\right)^{-1}$.
(iv) The map $\phi=\left(\phi^{\mu}\right) \in C^{8}\left(\bar{\Omega}_{T}, \mathbb{R}^{4}\right)$, see Section 4.1 defines the change of coordinates from the Eulerian coordinates $\left(x^{\mu}\right)$ to the Lagrangian coordinates adapted to the vector field $e_{0}^{\mu}=w^{\mu}$ according to the formula

$$
x^{\mu}=\phi^{\mu}\left(\bar{x}^{\lambda}\right)
$$

(v) The field ${ }^{23} \tilde{\theta}^{0}=\left(\tilde{\theta}_{\mu}^{0}\right) \in C^{8}\left(\bar{\Omega}_{T}, \mathbb{R}^{4}\right)$ represents the coframe field components $\theta_{\mu}^{0}$ evaluated in the Lagrangian coordinates, that is

$$
\tilde{\theta}_{\mu}^{0}:=\theta_{\mu}^{0} \circ \phi .
$$

(vi) The field $\psi=\left(\psi_{\nu}\right) \in C^{7}\left(\bar{\Omega}_{T}, \mathbb{R}^{4}\right)$ denotes the components of $\nabla_{e_{0}} \theta^{0}$ evaluated in Lagrangian coordinates so that

$$
\psi_{\nu}:=\left(\nabla_{e_{0}} \theta_{\nu}^{0}\right) \circ \phi
$$

[^14]From $\psi_{\nu}$, we construct the fields

$$
\mu:=|\psi|_{\tilde{m}}=\sqrt{\tilde{m}^{\alpha \beta} \psi_{\alpha} \psi_{\beta}}
$$

and

$$
\hat{\psi}_{\nu}:=\frac{1}{\mu} \psi_{\nu}
$$

where $\tilde{m}^{\alpha \beta}$ is the positive definite metric defined by

$$
\tilde{m}^{\alpha \beta}:=\tilde{g}^{\alpha \beta}-\frac{2}{\tilde{g}^{\lambda \sigma} \tilde{\theta}_{\lambda}^{0} \tilde{\theta}_{\sigma}^{0}} \tilde{g}^{\alpha \mu} \tilde{g}^{\beta \nu} \tilde{\theta}_{\mu}^{0} \tilde{\theta}_{\nu}^{0} \quad\left(\tilde{g}^{\alpha \beta}:=g^{\alpha \beta} \circ \phi\right)
$$

The fields $\hat{\psi}_{\nu}$ and $\mu$ are collectively denoted by the vector

$$
\Psi:=\left(\hat{\psi}_{\nu}, \mu\right)^{\operatorname{tr}} \in C^{7}\left(\bar{\Omega}_{T}, \mathbb{R}^{5}\right)
$$

To ensure that $\hat{\psi}_{\nu}$ is well defined, we further assume that

$$
\begin{equation*}
\mu \geq c_{\mu}>0 \quad \text { in } \bar{\Omega}_{T} \tag{8.1}
\end{equation*}
$$

for some positive constant $c_{\mu}$. As discussed in Remark 4.2, we lose no generality in assuming that (8.1) holds in addition to the assumptions (A.1)-(A.7) for the solution $w^{\mu}$ to the FrauendienerWalton formulation of the Euler equations.
(vii) The symmetric matrix $Q$ is defined by

$$
Q=\left(\begin{array}{cc}
\delta \mu \alpha \pi^{\alpha \beta} & 0 \\
0 & 0
\end{array}\right)
$$

where $\delta$ is a positive constant to be determined, $\pi^{\alpha \beta}$ is the projection operator given by

$$
\pi^{\alpha \beta}=\tilde{m}^{\alpha \beta}-\hat{\psi}^{\alpha} \hat{\psi}^{b} \quad\left(\hat{\psi}^{\alpha}=\tilde{m}^{\alpha \nu} \hat{\psi}_{\nu}\right)
$$

and $\alpha$, a negative function, is given by

$$
\alpha=-\frac{\operatorname{det}(\bar{\theta})\left|\tilde{\theta}^{3}\right|_{\tilde{g}}}{|\tilde{g}|^{1 / 2}}
$$

In the formula for $\alpha$, we recall that $\bar{\theta}=\left(\bar{\theta}_{\mu}^{i}\right)$ is the time-independent co-frame defined by (4.24), and $\tilde{\theta}^{3}$ is computed using the formula (6.43).
Theorem 8.1. Suppose that $\left(w^{\mu}\right) \in C^{8}\left(\bar{U}, \mathbb{R}^{4}\right)$ is a solution of the Frauendiener-Walton formulation of the Euler equations satisfying assumptions (A.1)-(A.7) from Section 2 and the inequality (8.1), the fields

$$
\left(\phi^{\mu}, \tilde{\theta}_{\mu}^{0}, \Psi\right) \in C^{8}\left(\bar{\Omega}_{T}, \mathbb{R}^{4}\right) \times C^{8}\left(\bar{\Omega}_{T}, \mathbb{R}^{4}\right) \times C^{7}\left(\bar{\Omega}_{T}, \mathbb{R}^{5}\right)
$$

are constructed from the solution $w^{\mu}$ according $(i)-(v i)$ above, and let
$\mathcal{R}\left(\bar{x}^{0}\right)=\left\|\phi\left(\bar{x}^{0}\right)\right\|_{E^{s+\frac{3}{2}, 2 s-1}}^{2}+\left\|\phi\left(\bar{x}^{0}\right)\right\|_{\mathcal{E}^{s+1}}^{2}+\left\|\tilde{\theta}^{0}\left(\bar{x}^{0}\right)\right\|_{\mathcal{E}^{s+1}}^{2}+\left\|\Psi\left(\bar{x}^{0}\right)\right\|_{\mathcal{E}^{s+1}}^{2}+\left\langle\bar{\partial}_{0}^{2 s+1} \Psi\left(\bar{x}^{0}\right) \mid\left(-Q\left(\bar{x}^{0}\right)\right) \bar{\partial}_{0}^{2 s+1} \Psi\left(\bar{x}^{0}\right)\right\rangle_{\partial \Omega}$,
where $s=3$. Then there exists a $T_{*}=T_{*}(\mathcal{R}(0)) \in(0, T)$ such that

$$
\left\|\tilde{\theta}^{0}\left(\bar{x}^{0}\right)\right\|_{H^{s+\frac{3}{2}}(\Omega)}^{2}+\mathcal{R}\left(\bar{x}^{0}\right) \leq C(\mathcal{R}(0))
$$

for $0 \leq \bar{x}^{0} \leq T_{*}$.
Proof. We begin by setting $s=3$, and we let

$$
\begin{equation*}
\left(\phi^{\mu}, \tilde{\theta}_{\mu}^{0}, \Psi\right) \in C^{8}\left(\bar{\Omega}_{T}, \mathbb{R}^{4}\right) \times C^{8}\left(\bar{\Omega}_{T}, \mathbb{R}^{4}\right) \times C^{7}\left(\bar{\Omega}_{T}, \mathbb{R}^{5}\right) \tag{8.2}
\end{equation*}
$$

be as given in the statement of the theorem. By the assumptions (A.1)-(A.7) from Section 2, the assumption (8.1), and the formulas (5.21) and (5.22), we see that

$$
\begin{align*}
& \hat{c}(t)=\left\|\left(\tilde{\gamma}_{00}\right)^{-1}\right\|_{L^{\infty}\left(\bar{\Omega}_{t}\right)}+\left\|\operatorname{det}(J)^{-1}\right\|_{L^{\infty}\left(\bar{\Omega}_{t}\right)}+\left\|\mu^{-1}\right\|_{L^{\infty}\left(\bar{\Omega}_{t}\right)} \\
&+\left\|\left|\tilde{\theta}^{3}\right|_{\tilde{g}}^{-1}\right\|_{L^{\infty}\left(\Gamma_{t}\right)}+\left\|\left(1-\tilde{s}^{2}\right)^{-1}\right\|_{L^{\infty}\left(\bar{\Omega}_{t}\right)}+\left\|\left(\tilde{s}^{2}\right)^{-1}\right\|_{L^{\infty}\left(\bar{\Omega}_{t}\right)} \tag{8.3}
\end{align*}
$$

is bounded for $t \in[0, T]$. We also recall that $\tilde{s}^{2},-\tilde{\gamma}_{00}, \operatorname{det}(J)$, and $\left|\tilde{\theta}^{3}\right|_{\tilde{g}}^{2}$ are all positive on $\bar{\Omega}_{T}$. For use below, we define

$$
\begin{equation*}
\check{c}(t)=\|\phi\|_{L^{\infty}\left(\bar{\Omega}_{t}\right)}+\|\bar{\partial} \phi\|_{L^{\infty}\left(\bar{\Omega}_{t}\right)}+\left\|\bar{\partial} \tilde{\theta}^{0}\right\|_{L^{\infty}\left(\bar{\Omega}_{t}\right)}+\|\Psi\|_{L^{\infty}\left(\bar{\Omega}_{t}\right)}+\left\|\bar{\partial}_{0} \Psi\right\|_{L^{\infty}\left(\bar{\Omega}_{t}\right)} \tag{8.4}
\end{equation*}
$$

From the analysis carried out in Sections 3 to 5 , we know that the triplet (8.2) defines a solution of the IBVP (6.1)-(6.9) for any of the freely specifiable constants $\delta, \epsilon, \kappa \in \mathbb{R}$. In order to apply the energy estimates from Theorem 7.16 and the elliptic estimates from Theorem B.4 to the solution (8.2), we first need to show the free parameters $\delta, \epsilon, \kappa$ can be chosen so that $B^{\Sigma \Lambda}$ and $\mathcal{B}^{\Sigma \Lambda}$ satisfy coercive estimates of the form (7.18), and $P$ and $Q$ satisfy the conditions $P+\left(2 s-\frac{3}{2}\right) \bar{\partial}_{0} Q-r Q$ and $c_{Q}^{-1} Q \leq Q^{2} \leq c_{Q} Q$ for some constants $r \in \mathbb{R}$ and $c_{Q}>0$. That this is possible is the content of the following three lemmas.
Lemma 8.2. There exists constants $\delta=\delta(\hat{c}(t), \check{c}(t))>0, c_{\mathcal{B}}=c_{\mathcal{B}}(\hat{c}(t), \check{c}(t))>0$, independent of $\epsilon, \kappa \in \mathbb{R}$, such that

$$
\left\langle\bar{\partial}_{\Sigma} \Xi \mid \mathcal{B}^{\Sigma \Lambda}\left(\bar{x}^{0}\right) \bar{\partial}_{\Lambda} \Xi\right\rangle_{\Omega} \geq c_{\mathcal{B}}\|\bar{D} \Xi\|_{L^{2}(\Omega)}^{2}
$$

for all $\bar{x}^{0} \in[0, t], 0 \leq t \leq T$, and $\Xi \in C^{1}\left(\bar{\Omega}, \mathbb{R}^{5}\right)$.
Proof. From (8.3), (6.22)-(6.24), and (6.37), it is clear that there exists constants $c_{\bar{a}}=c_{\bar{a}}(\hat{c}(t), \check{c}(t))>0$ and $c_{\tilde{m}}=c_{\tilde{m}}(\hat{c}(t), \check{c}(t))>0$ such that

$$
\begin{equation*}
\zeta_{\Sigma} \zeta_{\Lambda} \bar{a}^{\Sigma \Lambda}\left(\bar{x}^{\lambda}\right) \geq c_{\bar{a}}|\zeta|^{2} \quad \text { and } \quad \omega_{\mu} \omega_{\nu} \tilde{m}^{\mu \nu}\left(\bar{x}^{\lambda}\right) \geq c_{\tilde{m}}|\omega|^{2} \tag{8.5}
\end{equation*}
$$

for all $\left(\bar{x}^{\lambda}, \zeta_{\Lambda}, \omega_{\mu}\right) \in \bar{\Omega}_{t} \times \mathbb{R}^{3} \times \mathbb{R}^{4}$. Fixing $\Xi=\left(\xi, \hat{\xi}_{\nu}\right) \in C^{1}\left(\bar{\Omega}, \mathbb{R} \times \mathbb{R}^{4}\right)$, it then follows immediately from the bounds (8.5), the definitions (6.14), (6.28), (6.32), and Hölder's inequality that there exists constants $c_{\mathcal{A}}=c_{\mathcal{A}}(\hat{c}(t), \check{c}(t))>0, c_{\mathcal{S}}=c_{\mathcal{S}}(\hat{c}(t), \check{c}(t))>0$, independent of $\Xi$, such that

$$
\begin{equation*}
\left\langle\bar{\partial}_{\Sigma} \Xi \mid(\mathbb{I}+\delta \mathbb{P}) \mathcal{A}^{\Sigma \Lambda}\left(\bar{x}^{0}\right) \bar{\partial}_{\Lambda} \Xi\right\rangle_{\Omega} \geq c_{\mathcal{A}}\left(\|\bar{D} \xi\|_{L^{2}(\Omega)}^{2}+(1+\delta)\|\bar{D} \hat{\xi}\|_{L^{2}(\Omega)}^{2}\right) \tag{8.6}
\end{equation*}
$$

and

$$
\begin{equation*}
\left|\left\langle\bar{\partial}_{\Sigma} \Xi \mid 2 \nu^{[\Sigma} \mathcal{S}^{\Lambda]}\left(\bar{x}^{0}\right) \bar{\partial}_{\Lambda} \Xi\right\rangle_{L^{2}(\Omega)}\right| \leq c_{\mathcal{S}}\left(\|\bar{D} \hat{\xi}\|_{\Omega}^{2}+\|\bar{D} \xi\|_{L^{2}(\Omega)}\|\bar{D} \hat{\xi}\|_{L^{2}(\Omega)}\right) \tag{8.7}
\end{equation*}
$$

for all $\bar{x}^{0} \in[0, t]$ and $\delta \geq 0$. Applying Young's inequality to the right hand side of (8.7) gives

$$
\begin{equation*}
\left|\left\langle\bar{\partial}_{\Sigma} \Xi \mid 2 \nu^{[\Sigma} \mathcal{S}^{\Lambda]}\left(\bar{x}^{0}\right) \bar{\partial}_{\Lambda} \Xi\right\rangle_{L^{2}(\Omega)}\right| \leq c_{\mathcal{S}}\left(1+\frac{c_{\mathcal{S}}}{2 c_{\mathcal{A}}}\right)\|\bar{D} \hat{\xi}\|_{L^{2}(\Omega)}^{2}+\frac{c_{\mathcal{A}}}{2}\|\bar{D} \xi\|_{L^{2}(\Omega)}^{2} \tag{8.8}
\end{equation*}
$$

Setting

$$
\delta=\frac{c_{\mathcal{S}}}{c_{\mathcal{A}}}\left(1+\frac{c_{\mathcal{S}}}{2 c_{\mathcal{A}}}\right)+\frac{1}{2}
$$

the coercive estimate

$$
\left\langle\partial_{\Sigma} \Xi \mid \mathcal{B}^{\Sigma \Lambda}\left(\bar{x}^{0}\right) \partial_{\Lambda} \Xi\right\rangle_{\Omega} \geq \frac{c_{\mathcal{A}}}{2}\|\bar{D} \Xi\|_{L^{2}(\Omega)}^{2}, \quad 0 \leq \bar{x}^{0} \leq t \leq T
$$

then follows directly from (6.15), and the estimates (8.6) and (8.8).
Lemma 8.3. Suppose $\epsilon>0$ and let $\delta>0$ be as in Lemma 8.2. Then there exist constants $c_{B}^{ \pm}=$ $c^{ \pm}(\hat{c}(t), \check{c}(t))>0$, independent of $\kappa \in \mathbb{R}$, such that

$$
\left\langle\bar{\partial}_{\Sigma} \xi \mid B^{\Sigma \Lambda}\left(\bar{x}^{0}\right) \bar{\partial}_{\Lambda} \xi\right\rangle_{\Omega} \geq c_{B}^{+}\|\bar{D} \xi\|_{L^{2}(\Omega)}^{2}-c_{B}^{-}\|\xi\|_{L^{2}(\Omega)}^{2}
$$

for all $\bar{x}^{0} \in[0, t], 0 \leq t \leq T$, and $\xi \in C^{1}\left(\bar{\Omega}, \mathbb{R}^{4}\right)$.
Proof. From the bounds (8.5), the definition (6.10) and the fact that $\pi^{\mu \nu}$ is non-negative, it is clear that there exists a constant $c_{B}=c_{B}(\hat{c}(t), \check{c}(t))>0$, independent of $\epsilon>0$, such that

$$
\zeta_{\Sigma} \zeta_{\Lambda}\left(\omega \mid B^{\Sigma \Lambda}\left(\bar{x}^{\lambda}\right) \omega\right) \geq c_{B}|\zeta|^{2}|\omega|^{2}
$$

for all $\left(\bar{x}^{\lambda}, \zeta_{\Lambda}, \omega_{\mu}\right) \in \Omega_{t} \times \mathbb{R}^{3} \times \mathbb{R}^{4}$. By definition, this establishes the strong ellipticity of $B^{\Sigma \Lambda}$. From Theorem 3 in Section 6 of [28, we see that the proof follows if we can verify that the BVP

$$
\begin{align*}
\bar{\partial}_{\Sigma}\left(B^{\Sigma \Lambda}\left(\bar{x}^{0}\right) \bar{\partial}_{\Lambda} \xi\right)=0 & \text { in } \Omega  \tag{8.9}\\
\nu_{\Sigma} B^{\Sigma \Lambda}\left(\bar{x}^{0}\right) \bar{\partial}_{\Lambda} \xi=0 & \text { in } \partial \Omega \tag{8.10}
\end{align*}
$$

satisfies the strong complementing condition; see [28, §4] for a precise definition, for each $\bar{x}^{0} \in[0, t]$.
To verify that (8.9)-(8.10) satisfies the complementing condition, we "freeze" the coefficients at a point $\left(\bar{x}^{0}, \bar{x}^{\Lambda}\right) \in[0, t] \times \partial \Omega$, and consider the following BVP on the half-plane:

$$
\begin{align*}
\bar{\partial}_{\Sigma}\left(B_{\mu \nu}^{\Sigma \Lambda} \bar{\partial}_{\Lambda} \xi^{\nu}\right) & =\alpha^{2} \tilde{m}_{\mu \nu} \xi^{\nu} & & \text { in } \mathbb{R}^{2} \times \mathbb{R}_{>0}  \tag{8.11}\\
\nu_{\Sigma} B_{\mu \nu}^{\Sigma \Lambda} \bar{\partial}_{\Lambda} \xi^{\nu} & =0 & & \text { in } \mathbb{R}^{2} \tag{8.12}
\end{align*}
$$

where $\alpha \in \mathbb{R}, \nu_{\Sigma}=-\delta_{\Sigma}^{3}$ is an outward pointing co-normal, $\nu^{\Sigma}=-\delta_{3}^{\Sigma}$,

$$
B_{\mu \nu}^{\Sigma \Lambda}=\left(\tilde{m}_{\mu \nu}+\epsilon \pi_{\mu \nu}\right) \tilde{A}^{\Sigma \Lambda}+2 \tilde{S}_{\mu \nu}^{\left[{ }^{[\Sigma} \nu^{\Lambda]}\right.}
$$

and for notational simplicity, we use the same notation for any of the previously defined geometric objects and their frozen versions, e.g. we denote $\pi^{\mu \nu}\left(\bar{x}^{0}, \bar{x}^{\Lambda}\right)$ by $\pi^{\mu \nu}$. In the following, upper case calligraphic and Fraktur letters, e.g. $\mathcal{A}, \mathcal{B}$ and $\mathfrak{A}, \mathfrak{B}$, will run from 1,2 and index the boundary coordinate and frame indices, respectively.

We proceed by making the following definitions:

$$
\begin{aligned}
S_{i j}^{\Lambda} & =\tilde{S}_{\mu \nu}^{\Lambda} \tilde{e}_{i}^{\mu} \tilde{e}_{j}^{\nu}, \\
m_{i j} & =\tilde{m}_{\mu \nu} \tilde{e}_{i}^{\mu} \tilde{e}_{j}^{\mu}, \\
\pi_{i j} & =\pi_{\mu \nu} \tilde{e}_{i}^{\mu} \tilde{e}_{j}^{\mu}
\end{aligned}
$$

and

$$
\xi^{i}=\tilde{\theta}_{\nu}^{i} \xi^{\nu}
$$

From these definitions, it is not difficult to verify that (8.11)-(8.12) are equivalent to

$$
\begin{align*}
&\left(m_{i j}+\epsilon \pi_{i j}\right) \tilde{A}^{\Sigma \Lambda} \bar{\partial}_{\Sigma} \bar{\partial}_{\Lambda} \xi^{j}=\alpha^{2} m_{i j} \xi^{j}  \tag{8.13}\\
& \text { in } \mathbb{R}^{2} \times \mathbb{R}_{>0}  \tag{8.14}\\
&-\left(m_{i j}+\epsilon \pi_{i j}\right) \tilde{A}^{3 \Lambda} \bar{\partial}_{3} \xi^{j}=S_{i j}{ }^{\Lambda} \bar{\partial}_{\Lambda} \xi^{j} \\
& \text { in } \mathbb{R}^{2}
\end{align*}
$$

It then follows from (6.22), (6.25)-(6.26), (6.30), (6.37)-(6.39), and (6.40)-(6.41) that

$$
\begin{align*}
\left(m_{i j}\right) & =\left(\begin{array}{ccc}
1 & 0 & 0 \\
0 & \tilde{\gamma}_{\mathfrak{A} \mathfrak{B}} & \tilde{\gamma}_{3 \mathfrak{B}} \\
0 & \tilde{\gamma}_{\mathfrak{A} 3} & \tilde{\gamma}_{33}
\end{array}\right)  \tag{8.15}\\
\left(\pi_{i j}\right)= & \left(\begin{array}{ccc}
1 & 0 & 0 \\
0 & \tilde{\gamma}_{\mathfrak{A} \mathfrak{B}} & \tilde{\gamma}_{3 \mathfrak{B}} \\
0 & \tilde{\gamma}_{\mathfrak{A} 3} & \tilde{\gamma}_{33}-\frac{1}{\tilde{\gamma}_{33}}
\end{array}\right) \tag{8.16}
\end{align*}
$$

and

$$
\left(S_{i j}{ }^{\Lambda} \omega_{\Lambda}\right)=\operatorname{det}(\bar{\theta}) \epsilon_{0123}\left(\begin{array}{ccc}
0 & 0 & 0  \tag{8.17}\\
0 & 0 & \bar{e}^{\mathcal{C}} \\
0 \mathfrak{B} \omega_{\mathcal{C}} \\
0 & -\bar{e}^{\mathcal{C}} \mathfrak{A}^{( } \omega_{\mathcal{C}} & 0
\end{array}\right)
$$

where

$$
\epsilon_{0123}=\epsilon_{\mu \nu \gamma \lambda} \tilde{e}_{0}^{\mu} \tilde{e}_{1}^{\nu} \tilde{e}_{2}^{\gamma} \tilde{e}_{3}^{\lambda}=\operatorname{det}(\tilde{e})
$$

The fact that $\nu_{\mu}=-\delta_{\mu}^{3}$ is an outward pointing co-normal to $\Gamma_{T}$ implies via (4.19) that the frame coefficients $\bar{e}_{\mathfrak{A}}^{\mu}$ satisfy $\bar{e}_{\mathfrak{A}}^{3}=0$. Using this together with the boundary condition (6.42) and the identity

$$
\operatorname{det}(J)=\operatorname{det}(J) \operatorname{det}(\bar{e} \bar{\theta})=\operatorname{det}(J \bar{e}) \operatorname{det}(\bar{\theta})=\operatorname{det}(\tilde{e}) \operatorname{det}(\bar{\theta})
$$

allows us to express 8.17) as

$$
\left(S_{i j}{ }^{\Lambda} \omega_{\Lambda}\right)=\ell\left(\begin{array}{ccc}
0 & 0 & 0 \\
0 & 0 & \bar{e}^{\mathcal{C}}{ }_{\mathfrak{B}} \omega_{\mathcal{C}} \\
0 & -\bar{e}^{\mathcal{C}} \mathfrak{A} \omega_{\mathcal{C}} & 0
\end{array}\right)
$$

where

$$
\begin{equation*}
\ell=-\frac{\operatorname{det}(J)}{\tilde{f}}>0 \tag{8.18}
\end{equation*}
$$

We note also that, by making a linear change of coordinates if necessary, we can always arrange that

$$
\begin{equation*}
\bar{a}^{\Sigma \Lambda}=\bar{g}^{\Sigma \Lambda}=\delta^{\Sigma \Lambda} \quad \text { and } \quad \bar{g}^{33}=\tilde{\gamma}^{33}=1 \tag{8.19}
\end{equation*}
$$

Next, we look for bounded exponential solutions to (8.13)-(8.14) that are of the form

$$
\begin{equation*}
\xi^{j}=z^{j}\left(\bar{x}^{3}\right) \exp \left(i \omega_{\mathcal{A}} \bar{x}^{\mathcal{A}}\right), \quad\left(\omega_{\mathcal{A}}\right) \in \mathbb{R}^{2} \tag{8.20}
\end{equation*}
$$

Since $\pi_{i j}$ arises from lowering the index of the projection operator $\pi_{j}^{i}$ using the positive definite metric $m_{i j}$, it follows that there exists an invertible matrix $U_{j}^{i}$ such that

$$
U_{i}^{k} U_{j}^{l} m_{k l}=\delta_{i j} \quad \text { and } \quad U_{i}^{k} U_{j}^{l} \pi_{k l}=\delta_{i j}-\delta_{i}^{3} \delta_{j}^{3}
$$

Letting $\check{U}_{j}^{i}$ denote the inverse of $U_{j}^{i}$, we can write (8.20) as

$$
\xi^{j}=U_{k}^{j} \tilde{z}^{k}\left(\bar{x}^{3}\right) \exp \left(i \omega_{\mathcal{A}} \bar{x}^{\mathcal{A}}\right), \quad \text { where } \quad \tilde{z}^{k}=\check{U}_{l}^{k} z^{l}
$$

Substituting this into (8.13), while noting that $\tilde{A}^{\Sigma \Lambda}=\ell \delta^{\Sigma \Lambda}$ by (6.27), (8.18) and (8.19), we find, after a short calculation, that $\tilde{z}^{j}$ satisfies the differential equation

$$
\begin{equation*}
\tilde{z}^{j \prime \prime}\left(\bar{x}^{3}\right)-\left(|\vec{\omega}|^{2}+\tilde{\alpha}^{2}\right) \tilde{z}^{j}\left(\bar{x}^{3}\right)=0, \quad \bar{x}^{3}>0 \tag{8.21}
\end{equation*}
$$

where

$$
\vec{\omega}=\left(\omega_{\mathcal{A}}\right) \quad \text { and } \quad \tilde{\alpha} \in\left[\frac{\alpha}{\sqrt{\lambda}}, \frac{\alpha}{\sqrt{(1+\epsilon) \lambda}}\right]
$$

for some $\lambda>0$. From standard ODE theory, $\tilde{z}\left(\bar{x}^{3}\right)=\left(\tilde{z}^{j}\left(\bar{x}^{3}\right)\right)$ must be expressible as a linear combination of exponential solutions of the form

$$
\tilde{z}\left(\bar{x}^{3}\right)=\exp \left(i \bar{x}^{3} \omega_{3}\right) \tilde{\Upsilon}, \quad \omega_{3} \in \mathbb{C}, \tilde{\Upsilon}=\left(\tilde{\Upsilon}^{j}\right) \in \mathbb{R}^{4}
$$

Substituting this into (8.21) gives

$$
\left(\omega_{3}^{2}+|\vec{\omega}|^{2}+\tilde{\alpha}^{2}\right) \tilde{\Upsilon}=0
$$

Assuming that $\tilde{\Upsilon} \neq 0$, we see that

$$
\omega_{3}= \pm i \sqrt{|\vec{\omega}|^{2}+\tilde{\alpha}^{2}}
$$

Of these two solutions, only

$$
\begin{equation*}
\omega_{3}=i \sqrt{|\vec{\omega}|^{2}+\tilde{\alpha}^{2}} \tag{8.22}
\end{equation*}
$$

is compatible with $\tilde{z}\left(\bar{x}^{3}\right)$ being bounded as $\bar{x}^{3} \rightarrow \infty$; consequently, every bounded solution of (8.13) must be a linear combination of terms of the form

$$
\begin{equation*}
\xi=\left(\xi^{j}\right)=\exp \left(i \bar{x}^{3} \omega_{3}\right) \exp \left(i \omega_{\mathcal{A}} \bar{x}^{\mathcal{A}}\right) \Upsilon \tag{8.23}
\end{equation*}
$$

with $\omega_{3}$ given by (8.22) and $\Upsilon:=\left(U_{k}^{j} \tilde{\Upsilon}^{k}\right) \in \mathbb{R}_{\times}^{4}$.
Substituting (8.23) into (8.14), we see, using (8.15)-(8.16) and (8.19), that

$$
\begin{equation*}
(1+\epsilon) \sqrt{|\vec{\omega}|^{2}+\tilde{\alpha}^{2}} \Upsilon^{0}=0 \tag{8.24}
\end{equation*}
$$

and

$$
\begin{equation*}
M \vec{\Upsilon}=0 \tag{8.25}
\end{equation*}
$$

where

$$
M=\sqrt{|\vec{\omega}|^{2}+\tilde{\alpha}^{2}}\left(\begin{array}{cc}
(1+\epsilon) \tilde{\gamma}_{\mathfrak{A} \mathfrak{B}} & (1+\epsilon) \tilde{\gamma}_{3 \mathfrak{B}} \\
(1+\epsilon) \tilde{\gamma}_{\mathfrak{A} 3} & (1+\epsilon) \tilde{\gamma}_{33}-\epsilon
\end{array}\right)-i\left(\begin{array}{cc}
0 & \bar{e}^{\mathcal{C}} \mathfrak{B} \omega_{\mathcal{C}} \\
-\bar{e}^{\mathcal{C}} \mathfrak{A}^{1} \omega_{\mathcal{C}} & 0
\end{array}\right), \quad \text { and } \quad \vec{\Upsilon}=\binom{\Upsilon^{\mathfrak{B}}}{\Upsilon^{3}}
$$

With the help of Lemma C. 1 we compute

$$
\operatorname{det}(M)=\left(|\vec{\omega}|^{2}+\tilde{\alpha}^{2}\right)^{3 / 2}\left(\begin{array}{cc}
(1+\epsilon) \tilde{\gamma}_{\mathfrak{A} \mathfrak{B}} & (1+\epsilon) \tilde{\gamma}_{3 \mathfrak{B}}  \tag{8.26}\\
(1+\epsilon) & \tilde{\gamma}_{\mathfrak{A} 3} \\
(1+\epsilon) \tilde{\gamma}_{33}-\epsilon
\end{array}\right)-(1+\epsilon)\left(|\vec{\omega}|^{2}+\tilde{\alpha}^{2}\right)^{1 / 2} \operatorname{det}\left(\tilde{\gamma}_{\mathfrak{A} \mathfrak{B}}\right) \check{\tilde{\gamma}}^{\mathfrak{A} \mathfrak{B}} \bar{e}_{\mathfrak{A}}{ }^{\mathcal{C}} \bar{e}_{\mathfrak{B}}{ }^{\mathcal{D}} \omega_{\mathcal{C}} \omega_{\mathcal{D}}
$$

where

$$
\left(\tilde{\tilde{\gamma}}^{\mathfrak{A} \mathfrak{B}}\right):=\left(\tilde{\gamma}_{\mathfrak{A} \mathfrak{B}}\right)^{-1}
$$

Next, we decompose $\tilde{\gamma}_{I J}$ as

$$
\left(\tilde{\gamma}_{I J}\right)=\left(\begin{array}{cc}
\tilde{\gamma}_{\mathfrak{A} \mathfrak{B}} & \tilde{\gamma}_{3 \mathfrak{B}} \\
\tilde{\gamma}_{\mathfrak{A} 3} & \tilde{\gamma}_{33}
\end{array}\right)=\left(\begin{array}{cc}
\tilde{\gamma}_{\mathfrak{A} \mathfrak{B}} & \beta_{\mathfrak{B}} \\
\beta_{\mathfrak{A}} & n^{2}+\beta_{\mathfrak{C}} \beta^{\mathfrak{C}}
\end{array}\right)
$$

where we have defined

$$
\beta^{\mathfrak{A}}:=\check{\tilde{\gamma}}^{\mathfrak{A} \mathfrak{B}} \beta_{\mathfrak{B}}
$$

Inverting $\left(\tilde{\gamma}_{I J}\right)$, we find that

$$
\left(\tilde{\gamma}^{I J}\right)=\left(\begin{array}{cc}
\tilde{\tilde{\gamma}}^{\mathfrak{A} \mathfrak{B}}+\frac{\beta^{\mathfrak{A}} \beta^{\mathfrak{B}}}{n^{2}} & \beta^{\mathfrak{B}} \\
\beta^{\mathfrak{A}} & \frac{1}{n^{2}}
\end{array}\right)
$$

But, $\tilde{\gamma}^{33}=1$, and so we have that

$$
n=1
$$

and

$$
\left(\tilde{\gamma}^{I J}\right)=\left(\begin{array}{cc}
\tilde{\gamma}^{\mathfrak{A} \mathfrak{B}}+\beta^{\mathfrak{A}} \beta^{\mathfrak{B}} & \beta^{\mathfrak{B}}  \tag{8.27}\\
\beta^{\mathfrak{A}} & 1
\end{array}\right) .
$$

Using Lemma C. 2 we compute

$$
\begin{aligned}
\operatorname{det}\left(\begin{array}{cc}
(1+\epsilon) \tilde{\gamma}_{\mathfrak{A} \mathfrak{B}} & (1+\epsilon) \tilde{\gamma}_{3 \mathfrak{B}} \\
(1+\epsilon) \tilde{\gamma}_{\mathfrak{A} 3} & (1+\epsilon) \tilde{\gamma}_{33}-\epsilon
\end{array}\right) & =(1+\epsilon)^{2} \operatorname{det}\left(\tilde{\gamma}_{\mathfrak{A} \mathfrak{B}}\right)\left((1+\epsilon) \tilde{\gamma}_{33}-\epsilon-(1+\epsilon) \beta_{\mathfrak{A}} \beta^{\mathfrak{A}}\right) \\
& =(1+\epsilon)^{2} \operatorname{det}\left(\tilde{\gamma}_{\mathfrak{A} \mathfrak{B}}\right)
\end{aligned}
$$

where in deriving the last equality, we used $\tilde{\gamma}_{33}-\beta_{\mathfrak{A}} \beta^{\mathfrak{A}}=n^{2}=1$. Substituting the above expression into (8.26) yields

$$
\operatorname{det}(M)=(1+\epsilon)\left(|\vec{\omega}|^{2}+\tilde{a}^{2}\right)^{1 / 2} \operatorname{det}\left(\tilde{\gamma}_{\mathfrak{A} \mathfrak{B}}\right)\left[(1+\epsilon)\left(|\vec{\omega}|^{2}+\tilde{a}^{2}\right)-\check{\tilde{\gamma}}^{\mathfrak{A} \mathfrak{B}} \bar{e}_{\mathfrak{A}}{ }^{\mathcal{C}} \bar{e}_{\mathfrak{B}}{ }^{\mathcal{D}} \omega_{\mathcal{C}} \omega_{\mathcal{D}}\right] .
$$

However,

$$
\begin{aligned}
\tilde{\tilde{\gamma}}^{\mathfrak{A} \mathfrak{B}} \bar{e}_{\mathfrak{A}}{ }^{\mathcal{C}} \bar{e} \mathfrak{B}^{\mathcal{D}} \omega_{\mathcal{C}} \omega_{\mathcal{D}} & =\left(\tilde{\gamma}^{\mathfrak{A} \mathfrak{B}}-\beta^{\mathfrak{A}} \beta^{\mathfrak{B}}\right) \bar{e}_{\mathfrak{A}}{ }^{\mathcal{C}} \bar{e}_{\mathfrak{B}}{ }^{\mathcal{D}} \omega_{\mathcal{C}} \omega_{\mathcal{D}} \\
& =\tilde{\gamma}^{I J} \bar{e}_{I}^{\mathcal{C}} \bar{e}_{J}^{\mathcal{D}} \omega_{\mathcal{C}} \omega_{\mathcal{D}}-2 \tilde{\gamma}^{3 \mathfrak{A}} \bar{e}_{3}^{\mathcal{C}} \bar{e}_{\mathfrak{A}}{ }^{\mathcal{D}} \omega_{\mathcal{C}} \omega_{\mathcal{D}}-\tilde{\gamma}^{33}\left(\bar{e}_{3}^{\mathcal{B}} \omega_{\mathcal{B}}\right)^{2}-\left(\beta^{\mathfrak{A}} \bar{e}_{\mathfrak{A}}^{\mathcal{B}} \omega_{\mathcal{B}}\right)^{2} \\
& =\bar{g}^{\mathcal{C D}} \omega_{\mathcal{C}} \omega_{\mathcal{D}}-2\left(\beta^{\mathfrak{A}} \bar{e}_{\mathfrak{A}}{ }^{\mathcal{C}} \omega_{\mathcal{D}}\right) \bar{e}_{3}^{\mathcal{C}} \omega_{\mathcal{C}}-\left(\bar{e}_{3}^{\mathcal{B}} \omega_{\mathcal{B}}\right)^{2}-\left(\beta^{\mathfrak{A}} \bar{e}_{\mathfrak{A}}^{\mathcal{B}} \omega_{\mathcal{B}}\right)^{2} \\
& =|\vec{\omega}|^{2}-\left[\left(\beta^{\mathfrak{A}} \bar{e}_{\mathfrak{A}}{ }^{\mathcal{B}}+\bar{e}_{3}^{\mathcal{B}}\right) \omega_{\mathcal{B}}\right]^{2}
\end{aligned}
$$

and so, we see that

$$
\operatorname{det}(M)=(1+\epsilon)\left(|\vec{\omega}|^{2}+\tilde{a}^{2}\right)^{1 / 2} \operatorname{det}\left(\tilde{\gamma}_{\mathfrak{A} \mathfrak{B}}\right)\left(\epsilon|\vec{\omega}|^{2}+(1+\epsilon) \tilde{\alpha}^{2}+\left[\left(\beta^{\mathfrak{A}} \bar{e}_{\mathfrak{A}}^{\mathcal{B}}+\bar{e}_{3}^{\mathcal{B}}\right) \omega_{\mathcal{B}}\right]^{2}\right)
$$

Since $\epsilon>0$ and $\operatorname{det}\left(\tilde{\gamma}_{\mathfrak{A} \mathfrak{B}}\right)>0$, we conclude that

$$
\operatorname{det}(M)=0 \quad \Longleftrightarrow \quad \vec{\omega}=0 \quad \text { and } \quad \alpha=0
$$

thereby establishing that all solutions $\Upsilon=\left(\Upsilon^{0}, \vec{\Upsilon}\right)$ to (8.24)-(8.25) with $\vec{\omega} \neq 0$ are trivial. This, in turn, implies that only bounded solutions of the type (8.20) to the frozen BVP (8.11)-(8.12) are those for which the $z^{j}$ are constant (zero if $\alpha \neq 0$ ) and $\omega_{\mathcal{A}}=0$. By definition, this verifies that the BVP (8.9)- (8.10) satisfies the strong complementing condition for each $\left(\bar{x}^{\lambda}\right) \in \Gamma_{t}$, and the proof is complete.

Lemma 8.4. Suppose $\tau \geq 0$ and let $\delta>0$ be as in Lemma 8.2. Then

$$
Q^{\operatorname{tr}}=Q, \quad Q \leq 0, \quad \operatorname{rank} Q=3
$$

and there exist constants $c_{Q}=c_{Q}(\hat{c}(t), \check{c}(t)), r=r(\hat{c}, \check{c}(t), \tau)>0$ and $\kappa=\kappa(\hat{c}(t), \check{c}(t), \tau)<0$ such that

$$
P+\tau \bar{\partial}_{0} Q+r Q \leq 0 \quad \text { and } \quad \frac{1}{c_{Q}} Q \leq Q^{2} \leq c_{Q} Q
$$

in $\Gamma_{t}, 0 \leq t \leq T$.
Proof. From (8.3), (8.4), the choice of initial data from Section 4.2, see in particular (4.20), and the formulas (6.22), (6.29), and (6.33)-(6.35), it is not difficult to verify that there exists constants $c_{2}>c_{1}>0$, where $c_{1}=c_{1}(\hat{c}(t), \check{c}(t))$ and $c_{2}=c_{2}(\hat{c}(t), \check{c}(t))$, such that

$$
\begin{align*}
& c_{1}|\xi|^{2} \leq \xi_{\mu} \tilde{m}^{\mu \nu}\left(\bar{x}^{\lambda}\right) \xi_{\nu} \leq c_{2}|\xi|^{2}  \tag{8.28}\\
& c_{1} \leq-\alpha\left(\bar{x}^{\lambda}\right) \mu\left(\bar{x}^{\lambda}\right) \leq c_{2}  \tag{8.29}\\
&\left|\mu\left(\bar{x}^{\lambda}\right)\left(\bar{\partial}_{0} \alpha\left(\bar{x}^{\lambda}\right)+\lambda\left(\bar{x}^{\lambda}\right)\right)\right| \leq c_{2} \tag{8.30}
\end{align*}
$$

and 24

$$
\begin{equation*}
\left\|\beta\left(\bar{x}^{\lambda}\right)\right\|_{\mathrm{op}}+\left\|\tilde{m}\left(\bar{x}^{\lambda}\right)\right\|_{\mathrm{op}}+\left\|\bar{\partial}_{0} q\left(\bar{x}^{\lambda}\right)\right\|_{\mathrm{op}} \leq c_{2} \tag{8.31}
\end{equation*}
$$

for all $\left(\bar{x}^{\lambda}\right) \in \Gamma_{t}, 0 \leq t \leq T$, and $\xi=\left(\xi_{\mu}\right) \in \mathbb{R}^{4}$. Fixing $\xi=\left(\xi_{\mu}\right) \in \mathbb{R}^{4}$, we then observe that

$$
\begin{equation*}
|\pi \xi|^{2} \leq \frac{1}{c_{1}} \pi_{\mu}^{\lambda} \xi_{\lambda} \tilde{m}^{\mu \nu} \pi_{\nu}^{\omega} \xi_{\omega}=\frac{c_{2}}{c_{1}} \xi_{\lambda} \pi^{\lambda \omega} \xi_{\omega}=\frac{c_{2}}{c_{1}} \frac{1}{\alpha \mu}(\xi \mid q \xi) \tag{8.32}
\end{equation*}
$$

by (8.28), 8.29) and (6.35).

[^15]Next, we estimate

$$
\begin{align*}
\left|\bar{\partial}_{0} q^{\mu \nu} \xi_{\mu} \xi_{\nu}\right| & =\left|\left(\pi_{\mu}^{\lambda} \xi_{\lambda}+\frac{\hat{\psi}^{\lambda} \hat{\psi}_{\mu}}{|\hat{\psi}|_{\tilde{m}}^{2}} \xi_{\lambda}\right) \bar{\partial}_{0} q^{\mu \nu}\left(\pi_{\nu}^{\omega} \xi_{\omega}+\frac{\hat{\psi}^{\omega} \hat{\psi}_{\nu}}{|\hat{\psi}|_{\tilde{m}}^{2}} \xi_{\omega}\right)\right|  \tag{6.44}\\
& \leq\left|\pi_{\mu}^{\lambda} \xi_{\lambda} \bar{\partial}_{0} q^{\mu \nu} \pi_{\nu}^{\omega} \xi_{\omega}\right|+2\left|\xi_{\lambda} \pi_{\mu}^{\lambda} \bar{\partial}_{0} q^{\mu \nu} \frac{\hat{\psi}_{\nu}}{|\hat{\psi}|_{\tilde{m}}}\right|\left|\frac{\hat{\psi}^{\omega}}{|\hat{\psi}|_{\tilde{m}}} \xi_{\omega}\right|+\left|\frac{\hat{\psi}_{\mu}}{|\hat{\psi}|_{\tilde{m}}} \bar{\partial}_{0} q^{\mu \nu} \frac{\hat{\psi}_{\nu}}{|\hat{\psi}|_{\tilde{m}}}\right|\left(\frac{\hat{\psi}^{\omega}}{|\hat{\psi}|_{\tilde{m}} \mid} \xi_{\omega}\right)^{2} \\
& \leq\left\|\bar{\partial}_{0} q\right\|_{\mathrm{op}}|\pi \xi|^{2}+2\left\|\bar{\partial}_{0} q\right\|_{\mathrm{op}} \frac{|\hat{\psi}|}{|\hat{\psi}|_{\tilde{m}}^{2}}|\pi \xi|\left|\hat{\psi}^{\omega} \xi_{\omega}\right|+\left\|\bar{\partial}_{0} q\right\|_{\mathrm{op}} \frac{|\hat{\psi}|^{2}}{|\hat{\psi}|_{\tilde{m}}^{4}}\left(\hat{\psi}^{\omega} \xi_{\omega}\right)^{2} \\
& \leq 2\left\|\bar{\partial}_{0} q\right\|_{\mathrm{op}}|\pi \xi|^{2}+2\left\|\bar{\partial}_{0} q\right\|_{\mathrm{op}} \frac{|\hat{\psi}|^{2}}{|\hat{\psi}|_{\tilde{m}}^{4}}\left(\hat{\psi}^{\omega} \xi_{\omega}\right)^{2} \\
& \leq \frac{2 c_{2}}{c_{1}}\left(\frac{c_{2}}{\mu \alpha}(\xi \mid q \xi)+\left(\frac{\hat{\psi}^{\omega}}{|\hat{\psi}|_{\tilde{m}}} \xi_{\omega}\right)^{2}\right) \tag{8.33}
\end{align*}
$$

where in obtaining the last inequality, we used (8.28) and (8.32). Additionally, we estimate

$$
\begin{align*}
\left|2 \mu \alpha \pi^{\mu \omega} \beta_{\omega}^{\lambda} \pi_{\lambda}^{\mu} \xi_{\mu} \xi_{\nu}\right| & =\left|2 \mu \alpha \pi_{\sigma}^{\mu} \tilde{m}^{\sigma \omega} \beta_{\omega}^{\lambda} \pi_{\lambda}^{\mu} \xi_{\mu} \xi_{\nu}\right| & & \\
& \leq 2 c_{2}^{3}|\pi \xi|^{2} & & (\text { by (8.28), (8.29) \& (8.31) }) \\
& \leq \frac{2 c_{2}^{4}}{c_{1}} \frac{1}{\mu \alpha}(\xi \mid q \xi) & & (\text { by (8.29) \& (8.32) }) \tag{8.34}
\end{align*}
$$

and

$$
\begin{align*}
\left(\mu\left(\bar{\partial}_{0} \alpha+\lambda\right) \tilde{m}^{\mu \nu}+\kappa \frac{\hat{\psi}^{\mu} \hat{\psi}^{\nu}}{|\hat{\psi}|_{\tilde{m}}^{2}}\right) \xi_{\mu} \xi_{\nu} & \left.=\left(\mu\left(\bar{\partial}_{0} \alpha+\lambda\right) \pi^{\mu \nu}+\left[\mu\left(\bar{\partial}_{0} \alpha+\lambda\right)+\kappa\right]\right) \frac{\hat{\psi}^{\mu} \hat{\psi}^{\nu}}{\mid \hat{\psi}_{\tilde{m}}^{2}}\right) \xi_{\mu} \xi_{\nu} \\
& \left.\leq \frac{c_{2}}{\mu \alpha}(\xi \mid q \xi)+\left(c_{2}+\kappa\right)\left(\frac{\hat{\psi}^{\omega}}{|\hat{\psi}|_{\tilde{m}}} \xi_{\omega}\right)^{2}\right) \tag{8.35}
\end{align*}
$$

where in deriving the last inequality, we have used (8.30). Fixing $\tau \geq 0$, it then follows from (6.35) and (6.45), and the inequalities (8.33)-(8.35) that

$$
\left(p^{\mu \nu}+\tau \bar{\partial}_{0} q^{\mu \nu}\right) \xi_{\mu} \xi_{\nu} \leq\left(\kappa+c_{2}+\frac{2 c_{2} \tau}{c_{1}}\right)\left(\frac{\hat{\psi}^{\omega}}{|\hat{\psi}|_{\tilde{m}}} \xi_{\omega}\right)^{2}+\left(c_{2}+\frac{2 c_{2}^{4}}{c_{1}}+\frac{2 c_{2}^{2} \tau}{c_{1}}\right) \frac{1}{-\mu \alpha}(\xi \mid-q \xi)
$$

Setting $\kappa=-c_{2}-\frac{2 c_{2} \tau}{c_{1}}<0$ then yields, with the help of (8.29), the inequality

$$
(\xi \mid p \xi)+\tau\left(\xi \mid \bar{\partial}_{0} q \xi\right)+\left(\frac{c_{2}}{c_{1}}+\frac{2 c_{2}^{4}}{c_{1}^{2}}+\frac{2 c_{2}^{2} \tau}{c_{1}^{2}}\right)(\xi \mid q \xi) \leq 0
$$

or equivalently, see (6.18) and (6.19),

$$
P+\tau \bar{\partial}_{0} Q+\left(\frac{c_{2}}{c_{1}}+\frac{2 c_{2}^{4}}{c_{1}^{2}}+\frac{2 c_{2}^{2} \tau}{c_{1}^{2}}\right) Q \leq 0
$$

To conclude, we note that the statements

$$
Q^{\operatorname{tr}}=Q, \quad Q \leq 0, \quad \text { and } \quad \operatorname{rank} Q=3
$$

are a direct consequence of the formulas (6.18) and (6.35), the fact that $\pi_{\nu}^{\mu}$ is a projection operator with a 1-dimensional kernel, and the positivity of $\delta, \mu$, and $-\alpha$. Moreover, from (8.28) and the definition $\left(\tilde{m}_{\mu \nu}\right)=\left(\tilde{m}^{\mu \nu}\right)^{-1}$, we see that

$$
\frac{1}{c_{2}}|\omega|^{2} \leq \omega^{\mu} \omega^{\nu} \tilde{m}_{\mu \nu} \leq \frac{1}{c_{1}}|\omega|^{2}, \quad \forall \omega=\left(\omega^{\mu}\right) \in \mathbb{R}^{4}
$$

From this, (6.26), and the fact that $\pi_{\nu}^{\mu}$ is a projection operator, we obtain

$$
\frac{1}{c_{2}} \omega_{\mu} \pi^{\mu \alpha} \delta_{\alpha \beta} \pi^{\beta \nu} \omega_{\nu} \leq \omega_{\mu} \pi^{\mu \alpha} \tilde{m}_{\alpha \beta} \pi^{\beta \nu} \omega_{\nu}=\omega_{\mu} \pi^{\mu \nu} \omega_{\nu} \leq \frac{1}{c_{1}} \omega_{\mu} \pi^{\mu \alpha} \delta_{\alpha \beta} \pi^{\beta \nu} \omega_{\nu} \quad \forall \omega=\left(\omega_{\mu}\right) \in \mathbb{R}^{4}
$$

or equivalently

$$
c_{1} \pi \leq \pi^{2} \leq c_{2} \pi
$$

where $\pi=\left(\pi^{\mu \nu}\right)$. We see immediately from this result and (8.29) that $Q$ satisfies

$$
c_{1} Q \leq Q^{2} \leq c_{2} Q
$$

Next, we need to estimate the various coefficients from the equations (6.1)-(6.4). We start by differentiating (6.68) and (6.69) to obtain

$$
\begin{equation*}
\bar{\partial}_{0}^{2 s} P=l_{1}^{\mu} \bar{\partial}_{\mu} \theta+h_{1} \quad \text { and } \quad \bar{\partial}_{0}^{2 s} G=l_{2}^{\mu} \bar{\partial}_{\mu} \theta+h_{2} \tag{8.36}
\end{equation*}
$$

where

$$
\begin{equation*}
\theta=\bar{\partial}_{0}^{2 s-1}\left(\mathfrak{J}\left(\phi, \tilde{\theta}^{0}, \Psi\right)\right) \quad \text { and } \quad h_{a}=\left[\bar{\partial}_{0}^{2 s}, \iota_{a}^{\mu}\right] \bar{\partial}_{\mu} \mathcal{J}\left(\phi, \tilde{\theta}^{0}\right)+\bar{\partial}_{0}^{2 s-1} \dot{\mathcal{K}}_{a}, \quad a=1,2 \tag{8.37}
\end{equation*}
$$

We then define
$\alpha_{1}\left(\bar{x}^{0}\right)=1+\left\|\dot{\mathcal{B}}\left(\bar{x}^{0}\right)\right\|_{E^{s}}^{2}+\left\|\bar{\partial}_{0} P\left(\bar{x}^{0}\right)\right\|_{E^{s, 2 s-2}}^{2}+\left\|\dot{Q}\left(\bar{x}^{0}\right)\right\|_{\mathcal{E}^{s+\frac{1}{2}}}^{2}+\left\|\theta\left(\bar{x}^{0}\right)\right\|_{H^{1}(\Omega)}^{2}+\left\|\bar{\partial}_{0} \theta\left(\bar{x}^{0}\right)\right\|_{H^{1}(\Omega)}^{2}+\left\|\vec{h}\left(\bar{x}^{0}\right)\right\|_{\mathcal{E}^{1}}^{2}$,
and

$$
\begin{aligned}
& \alpha_{2}\left(\bar{x}^{0}\right)=\left\|\mathcal{H}\left(\bar{x}^{0}\right)\right\|_{E^{s-1,2 s-2}}^{2}+\left\|\bar{\partial}_{0} \mathcal{H}\left(\bar{x}^{0}\right)\right\|_{E^{s-1,2 s-2}}^{2}+\left\|\bar{\partial}_{0}^{2 s} \mathcal{H}\left(\bar{x}^{0}\right)\right\|_{L^{2}(\Omega)}^{2}+\left\|\mathcal{M}\left(\bar{x}^{0}\right)\right\|_{E^{s}}^{2}+\left\|\dot{\mathcal{M}}\left(\bar{x}^{0}\right)\right\|_{E^{s}}^{2} \\
&+\left\|\mathcal{K}\left(\bar{x}^{0}\right)\right\|_{E^{s, 2 s-2}}^{2}+\left\|\bar{\partial}_{0} \mathcal{K}\left(\bar{x}^{0}\right)\right\|_{E^{s, 2 s-2}}^{2}+\left\|\vec{h}\left(\bar{x}^{0}\right)\right\|_{\mathcal{E}^{1}}^{2}+\left\|\theta\left(\bar{x}^{0}\right)\right\|_{H^{1}(\Omega)}^{2}+\left\|\bar{\partial}_{0} \theta\left(\bar{x}^{0}\right)\right\|_{H^{1}(\Omega)}^{2}
\end{aligned}
$$

where $\vec{l}=\left(\tau_{1}^{\mu}, \tau_{2}^{\mu}\right), \vec{h}=\left(h_{1}, h_{2}\right)$, and the coefficients with a dot, e.g. $\dot{\mathcal{B}}, \dot{Q}$, etc., are defined by (6.70)(6.75), that is via time differentiation.

Lemma 8.5. Let

$$
\overline{\mathcal{R}}=\|\phi\|_{E^{s+\frac{3}{2}, 2 s-1}}^{2}+\left\|\tilde{\theta}^{0}\right\|_{E^{s+\frac{3}{2}, 2 s-1}}^{2}+\|\phi\|_{\mathcal{E}^{s+1}}^{2}+\left\|\tilde{\theta}^{0}\right\|_{\mathcal{E}^{s+1}}^{2}+\|\Psi\|_{\mathcal{E}^{s+1}}^{2}
$$

Then

$$
\alpha_{1}+\alpha_{2} \leq C(\overline{\mathcal{R}})
$$

Proof. We will only estimate the terms involving $\mathcal{K}$ and $h_{a}$ since the estimates for the remainder of the terms follow from similar arguments. First, we estimate $\mathcal{K}$ by

$$
\|\mathcal{K}\|_{E^{s, 2 s-2}}+\left\|\bar{\partial}_{0} \mathcal{K}\right\|_{E^{s, 2 s-2}} \lesssim\|\mathcal{K}\|_{\mathcal{E}^{s+\frac{1}{2}}} \leq C(\overline{\mathcal{R}})
$$

where the last inequality follows from (6.68) and an application of Proposition A.14 Next, by (6.71) and another application of Proposition A.14 we see that

$$
\begin{equation*}
\left\|\bar{\partial}_{0}^{2 s-1} \dot{\mathcal{K}}_{a}\right\|_{\mathcal{E}^{1}} \lesssim\left\|\dot{\mathcal{K}}_{a}\right\|_{\mathcal{E}^{s+\frac{1}{2}}} \leq C(\overline{\mathcal{R}}) \tag{8.38}
\end{equation*}
$$

while

$$
\begin{align*}
\left\|\left[\bar{\partial}_{0}^{2 s}, \iota_{a}^{\mu}\right] \bar{\partial}_{\mu} \mathcal{J}\left(\phi, \tilde{\theta}^{0}\right)\right\|_{H^{1}(\Omega)} & \lesssim\left\|\dot{\mathcal{L}}_{a}\right\|_{E^{s+\frac{1}{2}, 2 s-1}}\left\|\bar{\partial} \mathcal{J}\left(\phi, \tilde{\theta}^{0}\right)\right\|_{E^{s+\frac{1}{2}, 2 s-1}} \\
& \lesssim\left\|\dot{\mathscr{C}}_{a}\right\|_{\mathcal{E}^{s+\frac{1}{2}}}\left\|\bar{\partial} \mathcal{J}\left(\phi, \tilde{\theta}^{0}\right)\right\|_{\mathcal{E}^{s+\frac{1}{2}}} \\
& \leq C(\overline{\mathcal{R}}) \tag{8.39}
\end{align*}
$$

where the last inequality follows from (6.70) and Proposition A.14 Noting that

$$
\bar{\partial}_{0}\left(\left[\bar{\partial}_{0}^{2 s}, \zeta_{a}^{\mu}\right] \bar{\partial}_{\mu} \mathcal{J}\left(\phi, \tilde{\theta}^{0}\right)\right)=\left[\bar{\partial}_{0}^{2 s+1}, \iota_{a}^{\mu}\right] \bar{\partial}_{\mu} \mathcal{J}\left(\phi, \tilde{\theta}^{0}\right)-\dot{\zeta}_{a}^{\mu} \bar{\partial}_{0}^{2 s} \bar{\partial}_{\mu} \mathcal{J}\left(\phi, \tilde{\theta}^{0}\right)
$$

we find from (6.70), and Propositions A. 8 and A. 13 that

$$
\begin{equation*}
\left\|\bar{\partial}_{0}\left(\left[\bar{\partial}_{0}^{2 s}, \iota_{a}^{\mu}\right] \bar{\partial}_{\mu} \mathcal{J}\left(\phi, \tilde{\theta}^{0}\right)\right)\right\|_{L^{2}(\Omega)} \lesssim\left\|\dot{\mathcal{L}}_{a}\right\|_{E^{s}}\left\|\bar{\partial} \mathcal{J}\left(\phi, \tilde{\theta}^{0}\right)\right\|_{E^{s}} \leq C(\overline{\mathcal{R}}) \tag{8.40}
\end{equation*}
$$

Combining the estimates (8.38), (8.39) and (8.40), we see that $h_{a}$ satisfies

$$
\left\|h_{a}\right\|_{\mathcal{E}^{1}} \leq C(\overline{\mathcal{R}})
$$

Lemma 8.6. Let

$$
\hat{R}=\|\phi\|_{E^{s+\frac{3}{2}, 2 s-1}}^{2}+\|\phi\|_{\mathcal{E}^{s+1}}^{2}+\left\|\tilde{\theta}^{0}\right\|_{\mathcal{E}^{s+1}}^{2}+\|\Psi\|_{\mathcal{E}^{s+1}}^{2}
$$

Then

$$
\begin{aligned}
& \left\|\bar{\partial}_{0}\left(B^{0 \beta} \bar{\partial}_{\beta} \tilde{\theta}^{0}\right)\right\|_{H^{s-\frac{1}{2}}(\Omega)}+\left\|\bar{\partial}_{0} M^{0}\right\|_{H^{s-\frac{1}{2}}(\Omega)}+\|H\|_{H^{s-\frac{1}{2}}(\Omega)} \\
& \quad+\left\|B^{\Sigma \Lambda}\right\|_{H^{s+\frac{1}{2}}(\Omega)}+\left\|B^{\Sigma 0} \bar{\partial}_{0} \tilde{\theta}^{0}\right\|_{H^{s+\frac{1}{2}}(\Omega)}+\left\|M^{\Sigma}\right\|_{H^{s+\frac{1}{2}}(\Omega)}+\|K\|_{H^{s+\frac{1}{2}}(\Omega)} \leq C(\hat{\mathcal{R}})
\end{aligned}
$$

Proof. The proof follows from the same arguments used to establish Lemma 8.5.

Viewing equation (6.1) as an elliptic equation for $\tilde{\theta}_{\mu}^{0}$, we find that

$$
\begin{equation*}
\left\|\tilde{\theta}^{0}\right\|_{H^{s+\frac{3}{2}}(\Omega)}^{2} \leq C(\hat{R}) \tag{8.41}
\end{equation*}
$$

by Theorem B. 4 and Lemma 8.6. But then we note that

$$
\begin{aligned}
\left\|\tilde{\theta}^{0}\right\|_{E^{s+\frac{3}{2}, 2 s-1}}^{2} & =\left\|\tilde{\theta}^{0}\right\|_{H^{s+\frac{3}{2}}(\Omega)}^{2}+\left\|\bar{\partial}_{0} \tilde{\theta}^{0}\right\|_{E^{s+1,2 s-2}}^{2} \\
& \leq\left\|\tilde{\theta}^{0}\right\|_{H^{s+\frac{3}{2}}(\Omega)}^{2}+C(\hat{R})
\end{aligned}
$$

where in the last inequality we used the evolution equation (6.6) and Proposition A.10. Combining the above estimate with (8.41), we see that

$$
\begin{equation*}
\left\|\tilde{\theta}^{0}\right\|_{E^{s+\frac{3}{2}, 2 s-1}}^{2} \leq C(\hat{R}) \tag{8.42}
\end{equation*}
$$

which in turn, implies that

$$
\begin{equation*}
\bar{R} \leq C(\hat{R}) \tag{8.43}
\end{equation*}
$$

We also observe that the estimate

$$
\begin{equation*}
\|\phi(t)\|_{E^{s+\frac{3}{2}, 2 s-1}}^{2}+\|\phi(t)\|_{\mathcal{E}^{s+1}}^{2}+\left\|\tilde{\theta}^{0}(t)\right\|_{\mathcal{E}^{s+1}}^{2} \leq \hat{R}(0)+\int_{0}^{t} C(\hat{R}(\tau)) d \tau \tag{8.44}
\end{equation*}
$$

follows directly from the evolution equations (6.5)-(6.6) and Proposition A.15
Applying the energy estimates from Theorem 7.16 to (6.3)-(6.4), which is possible in view of Lemma 8.2 and Lemma 8.4 with $\tau=2 s-\frac{3}{2}$, we obtain, with the help of (8.44) and Lemma 8.5, the energy estimate

$$
\begin{equation*}
\left\|\Psi\left(\bar{x}^{0}\right)\right\|_{\mathcal{E}^{s+1}}^{2}+\left\langle\bar{\partial}_{0}^{2 s+1} \Psi\left(\bar{x}^{0}\right) \mid(-Q) \bar{\partial}_{0}^{2 s+1} \Psi\left(\bar{x}^{0}\right)\right\rangle_{\Omega} \leq C\left(\rho_{t}\right)\left(\mathcal{R}(0)+\int_{0}^{\bar{x}^{0}} C(\mathcal{R}(\tau)) d \tau\right), \quad 0 \leq \bar{x}^{0} \leq t \tag{8.45}
\end{equation*}
$$

where $t \in(0, T]$,

$$
\mathcal{R}=\hat{R}+\left\langle\bar{\partial}_{0}^{2 s+1} \Psi \mid(-Q) \bar{\partial}_{0}^{2 s+1} \Psi\right\rangle_{\Omega}
$$

and

$$
\begin{aligned}
\rho(t)=\|\mathcal{B}\|_{X_{t}^{s}}+\|P\|_{X_{t}^{s, 2 s-2}}+ & \left\|\bar{\partial}_{0}^{2 s-1} P\right\|_{\left.L^{\infty}\left([0, t], L^{2}(\partial \Omega)\right)\right]}+\|Q\|_{L^{\infty}\left([0, t], H^{s}(\Omega)\right)} \\
& +\|\dot{Q}\|_{X_{t}^{s, 2 s-2}}+\|\vec{c}\|_{W^{1, \infty}\left([0, t], W^{1, \infty}(\Omega)\right)}+\hat{c}(t)+\check{c}(t)
\end{aligned}
$$

with $\hat{c}(t)$ and $\check{c}(t)$ as defined previously by (8.3) and (8.4).
Collectively, the estimates (8.44)-(8.45) imply that

$$
\mathcal{R}\left(\bar{x}^{0}\right) \leq C(\rho(t))\left(\mathcal{R}(0)+\int_{0}^{\bar{x}^{0}} C(\mathcal{R}(\tau)) d \tau\right), \quad 0 \leq \bar{x}^{0} \leq t \leq T
$$

and hence, that

$$
\begin{equation*}
\|\mathcal{R}\|_{L^{\infty}([0, t])} \leq C(\rho(t))\left(\mathcal{R}(0)+\int_{0}^{t} C\left(\|\mathcal{R}\|_{L^{\infty}([0, \tau])}\right) d \tau\right) \tag{8.46}
\end{equation*}
$$

## Lemma 8.7.

$$
\begin{equation*}
\rho(t) \leq C(\mathcal{R}(0))+t C\left(\|\mathcal{R}\|_{L^{\infty}([0, t])}\right), \quad 0 \leq t \leq T \tag{8.47}
\end{equation*}
$$

Proof. We only estimate the terms involving $P$ since the rest of the terms can be bounded in a similar fashion. We begin with the inequality:

$$
\begin{aligned}
\left\|P\left(\bar{x}^{0}\right)\right\|_{E^{s, 2 s-2}}^{2} & \leq\|P(0)\|_{E^{s, 2 s-2}}^{2}+\int_{0}^{\bar{x}^{0}}\|P(\tau)\|_{E^{s, 2 s-2}}^{2}+\left\|\bar{\partial}_{0} P(\tau)\right\|_{E^{s, 2 s-2}}^{2} d \tau & & \text { (by Prop. A.15) } \\
& \leq \mathcal{R}(0)+\int_{0}^{\bar{x}^{0}} C(\overline{\mathcal{R}}(\tau)) d \tau & & \text { (by Lemma 区.5) } \\
& \leq \mathcal{R}(0)+\int_{0}^{\bar{x}^{0}} C(\mathcal{R}(\tau)) d \tau & & \text { (by (8.43)). }
\end{aligned}
$$

From this, it is then clear that

$$
\|P\|_{X_{t}^{s, 2 s-2}}^{2} \leq \mathcal{R}(0)+t C\left(\|\mathcal{R}\|_{L^{\infty}([0, t])}\right), \quad 0 \leq t \leq T
$$

Next, from (8.36) and the argument used to derive (7.145), we have that

$$
\begin{align*}
& \left\|\bar{\partial}_{0}^{2 s-1} P\left(\bar{x}^{0}\right)\right\|_{L^{2}(\partial \Omega)}^{2} \lesssim\left\|\bar{\partial}_{0}^{2 s-1} P(0)\right\|_{L^{2}(\partial \Omega)}^{2} \\
& \quad+\left\|\mathcal{C}_{1}\right\|_{L^{\infty}\left([0, t], W^{1, \infty}(\Omega)\right)} \int_{0}^{\bar{x}^{0}}\left\|\bar{\partial}_{0}^{2 s-1} P(\tau)\right\|_{H^{1}(\Omega)}^{2}+\left\|h_{1}(\tau)\right\|_{H^{1}(\Omega)}^{2}+\|\theta(\tau)\|_{H^{1}(\Omega)}^{2} d \tau \tag{8.48}
\end{align*}
$$

for $0 \leq \bar{x}^{0} \leq t \leq T$. Noting that

$$
\begin{aligned}
\left\|\bar{\partial}_{0}^{2 s-1} P(0)\right\|_{L^{2}(\partial \Omega)} & \lesssim\left\|\bar{\partial}_{0}^{2 s-1} P(0)\right\|_{H^{1}(\Omega)} \lesssim\left\|\bar{\partial}_{0} P(0)\right\|_{E^{s, 2 s-2}} & & \text { (by Theorem A.4), } \\
\left\|\mathcal{C}_{1}\right\|_{L^{\infty}\left([0, t], W^{1, \infty}(\Omega)\right)} & \lesssim\|(\phi, \bar{D} \phi, \Psi)\|_{L^{\infty}\left([0, t], W^{1, \infty}(\Omega)\right)} & & \text { (see (6.69)) }
\end{aligned}
$$

and

$$
\|\theta\|_{H^{1}(\Omega)} \leq\left\|\mathfrak{J}\left(\phi, \tilde{\theta}^{0}, \Psi\right)\right\|_{\mathcal{E}^{s+\frac{1}{2}}},
$$

we conclude from Lemma 8.5. Theorem A.3. Proposition A.12 and the estimates (8.42) and (8.48) that

$$
\left\|\bar{\partial}_{0}^{2 s-1} P\right\|_{L^{\infty}\left([0, t], L^{2}(\partial \Omega)\right)}^{2} \lesssim \bar{R}(0)+t C\left(\|\mathcal{R}\|_{L^{\infty}([0, t])}\right), \quad 0 \leq t \leq T
$$

Taken together, (8.46) and (8.47) imply that $\mathcal{R}\left(\bar{x}^{0}\right)$ satisfies an estimate of the form

$$
\begin{equation*}
\|\mathcal{R}\|_{L^{\infty}([0, t])} \leq c_{1}\left(\mathcal{R}(0)+t c_{2}\left(\|\mathcal{R}\|_{L^{\infty}([0, t])}\right)\right) \tag{8.49}
\end{equation*}
$$

for some non-decreasing, continuous functions $c_{i}:[0, \infty) \rightarrow[1, \infty), i=1,2$. Setting

$$
r(t)=t-\frac{T}{1+c_{2}\left(\|\mathcal{R}\|_{L^{\infty}([0, t])}\right)}
$$

we see that $r:[0, T] \rightarrow \mathbb{R}$ is continuous and satisfies $r(0)<0$ and $r(T)>0$. The Intermediate Value Theorem then guarantees the existence of a $T_{*} \in(0, T)$ such that $r\left(T_{*}\right)=0$, or equivalently

$$
T_{*}=\frac{1}{1+c_{2}\left(\|\mathcal{R}\|_{L^{\infty}\left(\left[0, T_{*}\right]\right)}\right)}
$$

Substituting this into (8.49) yields the estimate

$$
\|\mathcal{R}\|_{L^{\infty}\left(\left[0, T_{*}\right]\right)} \leq c_{1}(\mathcal{R}(0)+1)
$$

which, in turn, implies that

$$
T_{*} \geq \frac{T}{1+c_{2}\left(c_{1}(\mathcal{R}(0)+1)\right)}
$$

Remark 8.8. From the proof of Theorem8.1 it is clear that the same result also holds in the non-physical dimensions $n \neq 3$ for $s$ satisfying $s>n / 2+1$ and $s=k / 2$ with $k \in \mathbb{Z}$.

## Appendix A. Calculus inequalities

In this appendix, we state, for the convenience of the reader, some well known calculus inequalities. As above, $\Omega$ is a bounded, open subset of $\mathbb{R}^{n}, n \geq 2$, with smooth boundary.
A.1. Spatial inequalities. The proof of the following calculus inequalities are well known and may be found, for example, in the references [1, 13, 25, 29]. In the following, $M$ will denote either $\Omega$, or a closed $n$-manifold.

Theorem A.1. [Hölder's inequality] If $0<p, q, r \leq \infty$ satisfy $1 / p+1 / q=1 / r$, then

$$
\|u v\|_{L^{r}(M)} \leq\|u\|_{L^{p}(M)}\|v\|_{L^{q}(M)}
$$

for all $u \in L^{p}(M)$ and $v \in L^{q}(M)$.
Theorem A.2. [Integral Sobolev inequalities] Suppose $s \in \mathbb{Z}_{\geq 1}$ and $1 \leq p<\infty$.
(i) If $s p<n$, then

$$
\|u\|_{L^{q}(M)} \lesssim\|u\|_{W^{s, p}(M)}, \quad p \leq q \leq \frac{n p}{n-s p},
$$

for all $u \in W^{s, p}(M)$.
(ii) (Morrey's inequality) If $s p>n$, then

$$
\|u\|_{C^{0, \mu}(M)} \lesssim\|u\|_{W^{s, p}(M)}, \quad 0<\mu \leq \min \{1, s-n / p\},
$$

for all $u \in W^{s, p}(M)$.
Theorem A.3. [Fractional Sobolev inequalities] Suppose $s \in \mathbb{R}$ and $1<p<\infty$.
(i) If $s p<n$, then

$$
\|u\|_{L^{q}(M)} \lesssim\|u\|_{W^{s, p}(M)}, \quad p \leq q \leq \frac{n p}{n-s p},
$$

for all $u \in W^{s, p}(M)$.
(ii) If $s p>n$, then

$$
\|u\|_{L^{\infty}(M)} \lesssim\|u\|_{W^{s, p}(M)}
$$

for all $u \in W^{s, p}(M)$.
Theorem A.4. [Trace theorem] If $s>1 / 2$, then the trace operator

$$
\left.H^{s}(\Omega) \ni u \longmapsto u\right|_{\partial \Omega} \in H^{s-\frac{1}{2}}(\partial \Omega)
$$

is well-defined, continuous (i.e. bounded), and surjective.
Lemma A.5. [Ehrling's lemma] Suppose $1<p<\infty, s_{0}<s<s_{1}$. Then for any $\delta>0$ there exists a constant $C=C(\delta)$ such that

$$
\|u\|_{W^{s, p}(M)} \leq \delta\|u\|_{W^{s_{1}, p}(M)}+C(\delta)\|u\|_{W^{s, p}(M)}
$$

for all $u \in W^{s_{1}, p}(M)$.
Theorem A.6. [Integral multiplication inequality] Suppose $s_{1}, s_{2}, s_{3} \in \mathbb{Z}_{\geq 0}, s_{1}, s_{2} \geq s_{3}, 1 \leq p \leq \infty$, and $s_{1}+s_{2}-s_{3}>n / p$. Then

$$
\|u v\|_{W^{s_{3, p}(M)}} \lesssim\|u\|_{W^{s_{1, p}(M)}}\|v\|_{W^{s^{2}, p}(M)}
$$

for all $u \in W^{s_{1}, p}(M)$ and $v \in W^{s_{2}, p}(M)$.
Theorem A.7. [Fractional multiplication inequality] Suppose $1<p<\infty, s_{1}, s_{2}, s_{3} \in \mathbb{R}, s_{1}+s_{2}>0$, $s_{1}, s_{2} \geq s_{3}$, and $s_{1}+s_{2}-s_{3}>n / p$. Then

$$
\|u v\|_{W^{s_{3}, p}(M)} \lesssim\|u\|_{W^{s_{1}, p}(M)}\|v\|_{W^{s_{2, p},(M)}}
$$

for all $u \in W^{s_{1}, p}(M)$ and $v \in W^{s_{2}, p}(M)$.
A.2. Spacetime inequalities. In this section, we establish a number of product, commutator, and related estimates for the spaces $X_{T}^{s, r}(M)$ and $\mathcal{X}_{T}^{s}(M)$. We begin with a product estimate.
Proposition A.8. Suppose $s_{1}=k_{1} / 2$ and $s_{2}=k_{2} / 2$ for $k_{1}, k_{2} \in \mathbb{Z}_{\geq 0}, s_{3} \in \mathbb{R}, s_{1}, s_{2} \geq s_{3}, s_{1}+s_{2}-s_{3}>$ $n / 2, r \in \mathbb{Z}$, and $0 \leq r \leq 2 s_{3}$. Then

$$
\left\|\partial_{t}^{\ell}(u(t) v(t))\right\|_{H^{s_{3}-\frac{\ell}{2}}(M)} \leq\|u(t) v(t)\|_{E^{s_{3}, r}} \lesssim\|u(t)\|_{E^{s_{1}, r}}\|v(t)\|_{E^{s_{2}, r}}
$$

for $0 \leq t \leq T, 0 \leq \ell \leq r$, and all $u \in X_{T}^{s_{1}, r}(M)$ and $v \in X_{T}^{s_{2}, r}(M)$.
Proof. By the assumptions on $s_{1}, s_{2}$ and $s_{3}$, we note that

$$
\begin{gathered}
{\left[s_{1}-\left(\frac{\ell-m}{2}\right)\right]+\left[s_{2}-\left(\frac{m}{2}\right)\right]-\left[s_{3}-\left(\frac{\ell}{2}\right)\right]-\frac{n}{2}=s_{1}+s_{2}-s_{3}-\frac{n}{2}>0,} \\
{\left[s_{1}-\left(\frac{\ell-m}{2}\right)\right]-\left[s_{3}-\left(\frac{\ell}{2}\right)\right]=s_{1}-s_{3}+\frac{m}{2} \geq 0, \quad m \geq 0,} \\
{\left[s_{2}-\left(\frac{m}{2}\right)\right]-\left[s_{3}-\left(\frac{\ell}{2}\right)\right]=s_{2}-s_{3}+\left(\frac{\ell-m}{2}\right) \geq 0, \quad m \leq \ell,}
\end{gathered}
$$

and

$$
\left[s_{1}-\left(\frac{\ell-m}{2}\right)\right]+\left[s_{2}-\left(\frac{m}{2}\right)\right]=s_{1}+s_{2}-\frac{\ell}{2}>s_{3}+\frac{n}{2}-\frac{\ell}{2} \geq 0, \quad \ell \leq 2 s_{3}+n
$$

From these observations, we see via the fractional multiplication inequality from Theorem A. 7 that

$$
\begin{equation*}
\left\|\partial_{t}^{\ell-m} u \partial_{t}^{m} v\right\|_{H^{s_{3}-\frac{\ell}{2}(M)}} \lesssim\left\|\partial_{t}^{\ell-m} u\right\|_{H^{s_{1}-\frac{\ell-m}{2}}(M)}\left\|\partial_{t}^{m} v\right\|_{H^{s_{2}-\frac{m}{2}}(M)}, \quad 0 \leq m \leq \ell \leq 2 s_{3}+n \tag{A.1}
\end{equation*}
$$

Next, differentiating the product $u v \ell$-times with respect to $t$, we obtain

$$
\partial_{t}^{\ell}(u v)=\sum_{m=0}^{\ell}\binom{\ell}{m} \partial_{t}^{\ell-m} u \partial_{t}^{m} v
$$

Applying the triangle inequality and (A.1) to this expression, we see that

$$
\left\|\partial_{t}^{\ell}(u v)\right\|_{H^{s_{3}-\frac{\ell}{2}}(M)} \lesssim \sum_{m=0}^{\ell}\left\|\partial_{t}^{\ell-m} u\right\|_{H^{s_{1}-\frac{\ell-m}{2}}(M)}\left\|\partial_{t}^{m} v\right\|_{H^{s_{2}-\frac{m}{2}}(M)}, \quad 0 \leq \ell \leq 2 s_{3}+n
$$

and hence, that

$$
\left\|\partial_{t}^{\ell}(u v)\right\|_{H^{s_{3}-\frac{\ell}{2}}(M)} \lesssim\|u\|_{E^{s_{1}, r}}\|v\|_{E^{s_{2}, r}}, \quad 0 \leq \ell \leq r \leq 2 s_{3}+n
$$

Proposition A.9. Suppose $s_{1}=k_{1} / 2$ and $s_{2}=k_{2} / 2$ for $k_{1}, k_{2} \in \mathbb{Z}_{\geq 0}$, $\ell \in \mathbb{Z}_{\geq 1}, s_{1}+s_{2}-\ell / 2>0$, $s_{3} \in \mathbb{R}, s_{1} \geq s_{3}, s_{2} \geq s_{3}-1 / 2$ and $s_{1}+s_{2}-s_{3}>n / 2$. Then

$$
\left\|\left[\partial_{t}^{\ell}, u(t)\right] v(t)\right\|_{H^{s_{3}-\frac{\ell}{2}}(M)} \lesssim\left\|\partial_{t} u(t)\right\|_{E^{s_{1}-\frac{1}{2}, \ell-1}}\|v(t)\|_{E^{s_{2}, \ell-1}}
$$

for $0 \leq t \leq T$ and all $u \in X_{T}^{s_{1}, \ell}(M)$ and $v \in X_{T}^{s_{2}, \ell-1}(M)$.
Proof. By definition,

$$
\left[\partial_{t}^{\ell}, u\right] v=\partial_{t}^{\ell}(u v)-u \partial_{t}^{\ell} v=\sum_{r=0}^{\ell-1} \partial_{t}^{\ell-r} u \partial_{t}^{r} v
$$

Using this together with the multiplication inequality as in the proof of Proposition A. 8 above, we find that

$$
\left\|\left[\partial_{t}^{\ell}, u\right] v\right\|_{H^{s_{3}-\frac{\ell}{2}}(\Omega)} \lesssim \sum_{r=0}^{\ell-1}\left\|\partial_{t}^{\ell-r} u\right\|_{H^{s_{1}-\frac{\ell-r}{2}(\Omega)}}\left\|\partial_{t}^{r} v\right\|_{H^{s_{2}-\frac{r}{2}}(\Omega)}
$$

since $s_{1} \geq s_{3}, s_{2} \geq s_{3}-1 / 2$ and $s_{1}+s_{2}-\ell / 2>0$ by assumption. The proof follows since

$$
\sum_{r=0}^{\ell-1}\left\|\partial_{t}^{\ell-r} u\right\|_{H^{s_{1}-\frac{\ell-r}{2}}(\Omega)}\left\|\partial_{t}^{r} v\right\|_{H^{s_{2}-\frac{r}{2}}(\Omega)} \lesssim\left\|\partial_{t} u\right\|_{E^{s_{1}-\frac{1}{2}, \ell-1}}\|v\|_{E^{s_{2}, \ell-1}}
$$

In addition to the product estimate from Proposition A.8, we need estimates for more general nonlinear maps. The first estimate of this type is contained in the next proposition and the proof follows from a straightforward adaptation of the proof of Proposition A. 8 from [2] that involves replacing the integral multiplication inequalities used there with their fractional versions, i.e. Theorem A.7, in a similar fashion to the proof of the product estimate above, i.e. Proposition A.8. We omit the proof.

Proposition A.10. Suppose $s=k / 2, s>n / 2, r \in \mathbb{Z}, 0 \leq r \leq 2 s, f \in C^{r}(\mathbb{R})$, and $f(0)=0$. Then

$$
\left\|\partial_{t}^{\ell} f(u(t))\right\|_{H^{s-\frac{\ell}{2}}(M)} \leq\|f(u(t))\|_{E^{s, r}} \leq C\left(\|u(t)\|_{E^{s, r}}\right)\|u(t)\|_{E^{s, r}}
$$

for $0 \leq t \leq T, 0 \leq \ell \leq r$, and all $u \in X_{T}^{s, r}(M)$.
Next, we consider a number of variations on the above basic estimates.
Proposition A.11. Suppose $s_{1}=k_{1} / 2$ and $s_{2}=k_{2} / 2$ for $k_{1}, k_{2} \in \mathbb{Z}_{\geq 0}, s_{3} \in \mathbb{R}$, $s_{1}, s_{2} \geq s_{3}$, and $s_{1}+s_{2}-s_{3}>n / 2$. Then

$$
\|u(t) v(t)\|_{\mathcal{E}^{s_{3}}} \lesssim\|u(t)\|_{\mathcal{E}^{s_{1}}}\|v(t)\|_{\mathcal{E}^{s_{2}}}
$$

for $0 \leq t \leq T$, and all $u \in \mathcal{X}_{T}^{s_{1}}(M)$ and $v \in \mathcal{X}_{T}^{s_{2}}(M)$.

Proof. First, we note that

$$
\begin{align*}
& \|u v\|_{\mathcal{E}^{s_{3}}} \lesssim \sum_{\ell=0}^{2 s_{3}-2}\left\|\partial_{t}^{\ell}(u v)\right\|_{H^{s_{3}-\frac{\ell}{2}}(M)}+\left\|\partial_{t}^{2 s_{3}-1}(u v)\right\|_{L^{2}(M)} \\
& \lesssim\|u\|_{E^{s_{1}, 2 s_{3}-2}}\|v\|_{E^{s_{2}, 2 s_{3}-2}}+\left\|\partial_{t}^{2 s_{3}-1}(u v)\right\|_{L^{2}(M)} \quad \text { (by Proposition A.8) } \\
& \lesssim\|u\|_{\mathcal{E}^{s_{1}}}\|v\|_{\mathcal{E}^{s_{2}}}+\left\|\partial_{t}^{2 s_{3}-1}(u v)\right\|_{L^{2}(M)} . \tag{A.2}
\end{align*}
$$

Next, we find from

$$
\partial_{t}^{2 s_{3}-1}=\sum_{\ell=0}^{2 s_{3}-1}\binom{2 s_{3}-1}{\ell} \partial_{t}^{2 s_{3}-1-\ell} u \partial_{t}^{\ell} v
$$

that

$$
\begin{align*}
\left\|\partial_{t}^{2 s_{3}-1}(u v)\right\|_{L^{2}(M)} & \lesssim \sum_{\ell=1}^{2 s_{3}-2}\left\|\partial_{t}^{2 s_{3}-1-\ell} u \partial_{t}^{\ell} v\right\|_{L^{2}}+\left\|v \partial_{t}^{2 s_{3}-1} u\right\|_{L^{2}(M)}+\left\|v \partial_{t}^{2 s_{3}-1} u\right\|_{L^{2}(M)} \\
& \lesssim\|u\|_{E^{s_{1}, 2 s_{3}-2}}\|v\|_{E^{s_{2}, 2 s_{3}-2}}+\left\|v \partial_{t}^{2 s_{3}-1} u\right\|_{L^{2}(M)}+\left\|v \partial_{t}^{2 s_{3}-1} u\right\|_{L^{2}(M)} \\
& \lesssim\|u\|_{\mathcal{E}^{s_{1}}}\|v\|_{\mathcal{E}^{s_{2}}}+\left\|u \partial_{t}^{2 s_{3}-1} v\right\|_{L^{2}(M)}+\left\|v \partial_{t}^{2 s_{3}-1} u\right\|_{L^{2}(M)} \tag{A.3}
\end{align*}
$$

where in deriving the second inequality we used Proposition A.8.
Letting

$$
\mathcal{I}=\left\|u \partial_{t}^{2 s_{3}-1} v\right\|_{L^{2}(M)}+\left\|v \partial_{t}^{2 s_{3}-1} u\right\|_{L^{2}(M)}
$$

three cases follow:
Case 1: $s_{1}=s_{2}=s_{3}$

$$
\begin{align*}
\mathcal{I} & \lesssim\|u\|_{L^{\infty}(M)}\left\|\partial_{t}^{2 s_{2}-1} v\right\|_{L^{2}(M)}+\|v\|_{L^{\infty}(M)}\left\|\partial_{t}^{2 s_{1}-1} u\right\|_{L^{2}(M)} \\
& \lesssim\|u\|_{H^{s_{1}}(M)}\left\|\partial_{t}^{2 s_{2}-1} v\right\|_{L^{2}(M)}+\|v\|_{H^{s_{2}}(M)}\left\|\partial_{t}^{2 s_{1}-1} u\right\|_{L^{2}(M)} \quad \quad \text { (by Theorem A.3) } \\
& \lesssim\|u\|_{\mathcal{E}^{s_{1}}}\|v\|_{\mathcal{E}^{s_{2}}} . \tag{A.4}
\end{align*}
$$

Case 2: $s_{1}=s_{3}$ and $s_{2}>s_{3}$, or $s_{2}=s_{3}$ and $s_{1}>s_{3}$
Here, we assume that $s_{2}=s_{3}$ and $s_{1}>s_{3}$ so that $s_{1}>n / 2$. The other case, $s_{1}=s_{3}$ and $s_{2}>s_{3}$, follows from switching $u$ and $v$.

$$
\begin{align*}
\mathcal{I} & \lesssim\|u\|_{L^{\infty}(M)}\left\|\partial_{t}^{2 s_{2}-1} v\right\|_{L^{2}(M)}+\left\|v \partial_{t}^{2 s_{3}-1} u\right\|_{L^{2}(M)} \\
& \lesssim\|u\|_{H^{s_{1}}(M)}\left\|\partial_{t}^{2 s_{2}-1} v\right\|_{L^{2}(M)}+\|v\|_{H^{s_{2}(M)}}\left\|\partial_{t}^{2 s_{3}-1} u\right\|_{H^{s_{1}-\frac{2 s_{3}-1}{2}}(M)} \\
& \left.\lesssim\|u\|_{\mathcal{E}^{s_{1}}}\|v\|_{\mathcal{E}^{s_{2}}} \quad \text { (since } 2 s_{3}-1 \leq 2 s_{1}-2\right) \tag{A.5}
\end{align*}
$$

where in deriving this second inequality we used Theorems A. 3 and A. 7
Case 3: $s_{1}>s_{3}$ and $s_{2}>s_{3}$

$$
\begin{align*}
\mathcal{I} & \lesssim\|u\|_{H^{s_{1}(M)}}\left\|\partial_{t}^{2 s_{3}-1} v\right\|_{H^{s_{2}-\frac{2 s_{3}-1}{2}}(M)}+\|v\|_{H^{s_{2}}(M)}\left\|\partial_{t}^{2 s_{3}-1} u\right\|_{H^{s_{1}-\frac{2 s_{3}-1}{2}}(M)} \\
& \lesssim\|u\|_{\mathcal{E}^{s_{1}}}\|v\|_{\mathcal{E}^{s_{2}}} \tag{A.6}
\end{align*}
$$

where in deriving the second inequality we used Theorem A.7
Combining the inequalities (A.2)-(A.6) completes the proof.
Proposition A.12. Suppose $s=k / 2, s>n / 2, f \in C^{2 s-1}(\mathbb{R})$ and $f(0)=0$. Then

$$
\|f(u(t))\|_{\mathcal{E}^{s}} \leq C\left(\|u(t)\|_{\mathcal{E}^{s}}\right)\|u(t)\|_{\mathcal{E}^{s}}
$$

for $0 \leq t \leq T$ and all $u \in \mathcal{X}_{T}^{s}(M)$.
Proof. Again, the proof follow from an adaptation of the proof of Proposition A. 8 from [2] that involves replacing the integral multiplication inequalities used there with their fractional versions, i.e. Theorem A.7. in a similar fashion to the proof of the product estimate from Proposition A.11.

Proposition A.13. Suppose $s=k / 2, s>n / 2, f \in C^{2 s}\left(\mathbb{R} \times \mathbb{R}^{n+1}\right)$ and $f(0,0)=0$. Then

$$
\|f(u(t), \partial u(t))\|_{E^{s}} \leq C\left(\|u(t)\|_{\mathcal{E}^{s+1}}\right)\|u(t)\|_{\mathcal{E}^{s+1}} \quad\left(\partial u=\left(\partial_{t} u, \partial_{i} u\right)\right)
$$

for $t \in[0, T]$ and $u \in \mathcal{X}_{T}^{s+1}(M)$.
Proof. First, we note the following simple inequalities, which follow directly from the definition of the norms $\|\cdot\|_{E^{s}}$ and $\|\cdot\|_{\mathcal{E}^{s+1}}$.

$$
\|u\|_{E^{s}}^{2} \leq\|u\|_{\mathcal{E}^{s+1}}^{2}, \quad\left\|\partial_{t} u\right\|_{E^{s}}^{2} \leq\|u\|_{\mathcal{E}^{s+1}}^{2} \quad \text { and } \quad\|D u\|_{E^{s}}^{2} \leq\|u\|_{\mathcal{E}^{s+1}}^{2}
$$

Using these in conjunction with Proposition A.10, we obtain

$$
\|f(u, \partial u)\|_{E^{s}} \leq C\left(\|u\|_{E^{s}}+\|\partial u\|_{E^{s}}\right)\left(\|u\|_{E^{s}}+\|\partial u\|_{E^{s}}\right) \leq C\left(\|u\|_{\mathcal{E}^{s+1}}\right)\|u\|_{\mathcal{E}^{s+1}}
$$

which completes the proof.
Proposition A.14. Suppose $s=k / 2, s>n / 2, f \in C^{2 s}\left(\mathbb{R} \times \mathbb{R}^{n+1} \times \mathbb{R} \times \mathbb{R}\right)$ and $f(0,0,0,0)=0$. Then

$$
\begin{aligned}
&\left\|f\left(u(t), \partial u(t), v(t), \partial_{t} v(t)\right)\right\|_{\mathcal{E}^{s+\frac{1}{2}}} \leq C\left(\|u(t)\|_{E^{s+\frac{3}{2}, 2 s-1}}+\|u(t)\|_{\mathcal{E}^{s+1}}+\|v(t)\|_{\mathcal{E}^{s+1}}\right) \\
& \times\left(\|u(t)\|_{E^{s+\frac{3}{2}, 2 s-1}}+\|u(t)\|_{\mathcal{E}^{s+1}}+\|v(t)\|_{\mathcal{E}^{s+1}}\right)
\end{aligned}
$$

for all $t \in[0, T], u \in X_{T}^{s+1}(M) \cap X_{T}^{s+\frac{3}{2}, 2 s-1}(M)$, and $v \in \mathcal{X}_{T}^{s+1}(M)$.
Proof. We begin by observing the following simple inequalities that follow directly from the defintion of the norms:

$$
\|v\|_{\mathcal{E}^{s+\frac{1}{2}}}+\left\|\partial_{t} v\right\|_{\mathcal{E}^{s+\frac{1}{2}}} \lesssim\|v\|_{\mathcal{E}^{s+1}}
$$

and

$$
\|u\|_{\mathcal{E}^{s+\frac{1}{2}}}+\left\|\partial_{t} u\right\|_{\mathcal{E}^{s+\frac{1}{2}}}+\|D u\|_{\mathcal{E}^{s+\frac{1}{2}}} \lesssim\|u\|_{E^{s+\frac{3}{2}, 2 s-1}}+\|u\|_{\mathcal{E}^{s+1}}
$$

The desired inequality then follows from these estimates and an application of Proposition A.12,

$$
\begin{aligned}
&\left\|f\left(u, \partial u, v, \partial_{t} v\right)\right\|_{\mathcal{E}^{s+\frac{1}{2}}} \leq C\left(\|u\|_{\mathcal{E}^{s+\frac{1}{2}}}\right.\left.+\|\partial u\|_{\mathcal{E}^{s+\frac{1}{2}}}+\|v\|_{\mathcal{E}^{s+\frac{1}{2}}}+\left\|\partial_{t} v\right\|_{\mathcal{E}^{s+\frac{1}{2}}}\right) \\
& \times\left(\|u\|_{\mathcal{E}^{s+\frac{1}{2}}}+\|\partial u\|_{\mathcal{E}^{s+\frac{1}{2}}}+\|v\|_{\mathcal{E}^{s+\frac{1}{2}}}+\left\|\partial_{t} v\right\|_{\mathcal{E}^{s+\frac{1}{2}}}\right) \\
& \leq C\left(\|u\|_{E^{s+\frac{3}{2}}, 2 s-1}+\|u\|_{\mathcal{E}^{s+1}}+\|v\|_{\mathcal{E}^{s+1}}\right)\left(\|u\|_{E^{s+\frac{3}{2}, 2 s-1}}+\|u\|_{\mathcal{E}^{s+1}}+\|v\|_{\mathcal{E}^{s+1}}\right)
\end{aligned}
$$

We conclude with the following integral estimates for ODEs.
Proposition A.15. Suppose that $s=k / 2, k \in \mathbb{Z}_{\geq 0}, 0 \leq r \leq 2 s, u, \partial_{t} u \in X_{T}^{s, r}(M), f \in X_{T}^{s, r}(M)$, $v, \partial_{t} v \in X_{T}^{s}(M), g \in X_{T}^{s}(M)$, and

$$
\partial_{t} u=f \quad \text { and } \quad \partial_{t} v=g \quad \text { in }[0, T] \times M
$$

Then

$$
\|u(t)\|_{E^{s, r}}^{2} \leq\|u(0)\|_{E^{s, r}}^{2}+\int_{0}^{t}\|u(\tau)\|_{E^{s, r}}^{2}+\|f(\tau)\|_{E^{s, r}}^{2} d \tau
$$

and

$$
\|v(t)\|_{\mathcal{E}^{s}}^{2} \leq\|v(0)\|_{\mathcal{E}^{s}}^{2}+\int_{0}^{t}\|v(\tau)\|_{\mathcal{E}^{s}}^{2}+\|g(\tau)\|_{\mathcal{E}^{s}}^{2} d \tau
$$

for $t \in[0, T]$.
Proof. We only prove the first inequality with the second following from similar arguments. Fixing $\ell \in\{0,1, \ldots, r\}$, we compute

$$
\partial_{t}\|u(t)\|_{H^{s-\frac{\ell}{2}}(M)}^{2}=2\left\langle u \mid \partial_{t} u\right\rangle_{H^{s-\frac{\ell}{2}}(M)} \leq\|u(t)\|_{H^{s-\frac{\ell}{2}}(M)}^{2}+\left\|\partial_{t} u(t)\right\|_{H^{s-\frac{\ell}{2}}(M)}^{2}
$$

where in deriving the last inequality we used Cauchy-Schwartz and Young's inequalities. But, $\partial_{t} u=f$ by assumption, and hence we have that

$$
\partial_{t}\|u(t)\|_{H^{s-\frac{\ell}{2}}(M)}^{2} \leq\|u(t)\|_{H^{s-\frac{\ell}{2}}(M)}^{2}+\|f(t)\|_{H^{s-\frac{\ell}{2}}(M)}^{2}
$$

Integrating this expression in time and summing the result over $\ell$ from 0 to $r$ then gives

$$
\|u(t)\|_{E^{s, r}}^{2} \leq\|u(0)\|_{E^{s, r}}^{2} \leq \int_{0}^{t}\|u(\tau)\|_{E^{s, r}}^{2}+\|f(\tau)\|_{E^{s, r}}^{2} d \tau
$$

which proves the first inequality.

## Appendix B. Elliptic systems

In this appendix, we recall some well known existence and regularity results for elliptic systems of the form

$$
\begin{array}{rlrl}
\partial_{i}\left(b^{i j} \partial_{j} v+\epsilon d^{i} v+L^{i}\right)+\epsilon a^{i} \partial_{i} v-\lambda c v & =F & & \text { in } \Omega \\
\nu_{i}\left(b^{i j} \partial_{j} v+\epsilon d^{i} v+L^{i}\right)=\epsilon h v+G & & \text { in } \partial \Omega \tag{B.2}
\end{array}
$$

where
(i) as above, $\Omega$ is open, bounded in $\mathbb{R}^{n}, n \geq 2$, with smooth boundary,
(ii) $\nu_{i}$ is the outward pointing unit co-normal to $\partial \Omega$,
(iii) $L^{i} \in L^{2}\left(\Omega, \mathbb{R}^{N}\right), F \in L^{2}\left(\Omega, \mathbb{R}^{N}\right)$ and $G \in H^{-1 / 2}\left(\partial \Omega, \mathbb{R}^{N}\right)$,
(iv) $a^{i}, d^{i} \in L^{n}\left(\Omega, \mathbb{M}_{N \times N}\right)$ and $h \in L^{\infty}\left(\Omega, \mathbb{M}_{N \times N}\right) \cap W^{1, n}\left(\Omega, \mathbb{M}_{N \times N}\right)$,
(v) $c \in L^{n}\left(\Omega, \mathbb{M}_{N \times N}\right)$ and satisfies

$$
c \geq \sigma>0 \quad \text { in } \Omega
$$

for some positive constant $\sigma$,
(vi) $b^{i j} \in L^{\infty}\left(\Omega, \mathbb{M}_{N \times N}\right)$ and satisfies

$$
\begin{equation*}
\left(b^{i j}\right)^{\operatorname{tr}}=b^{j i} \tag{B.3}
\end{equation*}
$$

(vii) and there exists a $\kappa_{1}>0$ and $\mu \geq 0$ such that

$$
\begin{equation*}
\left\langle\partial_{i} v \mid b^{i j} \partial_{j} v\right\rangle_{L^{2}(\Omega)} \geq \kappa_{1}\|v\|_{H^{1}(\Omega)}^{2}-\mu\|v\|_{L^{2}(\Omega)}^{2} \tag{B.4}
\end{equation*}
$$

for all $v \in H^{1}(\Omega)$.
Definition B.1. Under the assumptions (i)-(vii) above, $v \in H^{1}\left(\Omega, \mathbb{R}^{N}\right)$ is called a weak solution of (B.1)-( (B.2) if

$$
\begin{align*}
&\left\langle b^{i j} \partial_{i} v \mid \partial_{j} \phi\right\rangle_{\Omega}+\epsilon\left\langle d^{j} v \mid \partial_{j} \phi\right\rangle_{\Omega}-\epsilon\left\langle a^{i} \partial_{i} v \mid \phi\right\rangle_{\Omega}+\lambda\langle c v \mid \phi\rangle_{\Omega} \\
&\left.-\epsilon\left\langle\left.(h v)\right|_{\partial \Omega}\right| \phi|\partial \Omega\rangle_{\partial \Omega}=-\langle F \mid \phi\rangle_{\Omega}-\left\langle L^{j} \mid \partial_{j} \phi\right\rangle_{\Omega}+\left.\langle G| \phi\right|_{\partial \Omega}\right\rangle_{\partial \Omega} \tag{B.5}
\end{align*}
$$

for all $\phi \in H^{1}\left(\Omega, \mathbb{R}^{N}\right)$.
Remark B.2. That the above definition makes sense follows from repeated use of Hölder's inequality, the Trace theorem, the Sobolev inequalities, Ehrling's lemma and the duality relation $\left(H^{s}(\partial \Omega)\right)^{*} \cong H^{-s}(\partial \Omega)$. To see this, we observe from Theorems A. 1 and A. 2 that

$$
\begin{equation*}
\|u v\|_{L^{2}(\Omega)} \leq\|u\|_{L^{n}(\Omega)}\|v\|_{L^{\frac{2 n}{n-2}}(\Omega)} \lesssim\|u\|_{L^{n}(\Omega)}\|v\|_{H^{1}(\Omega)} \tag{B.6}
\end{equation*}
$$

which in turn, implies via the Cauchy-Schwartz inequality that

$$
\begin{equation*}
\langle u v \mid w\rangle_{\Omega} \lesssim\|u\|_{L^{n}(\Omega)}\|v\|_{H^{1}(\Omega)}\|w\|_{L^{2}(\Omega)} \tag{B.7}
\end{equation*}
$$

Using Theorems A.1 A. 2 and A.6 we observe also that

$$
\begin{equation*}
\|u v\|_{H^{1}(\Omega)} \lesssim\|u\|_{L^{\infty}(\Omega)}\|v\|_{H^{1}(\Omega)}+\|u\|_{W^{1, n}(\Omega)}\|v\|_{L^{\frac{2 n}{n-2}}(\Omega)} \lesssim\|u\|_{L^{\infty}(\Omega) \cap W^{1, n}(\Omega)}\|v\|_{H^{1}(\Omega)} \tag{B.8}
\end{equation*}
$$

This inequality, together with Theorem A.4 the Cauchy-Schwartz inequality, and Lemma A.5 implies that

$$
\begin{align*}
\left.\left.\left\langle\left.(u v)\right|_{\partial \Omega}\right| w\right|_{\partial \Omega}\right\rangle_{\partial \Omega} & \lesssim\|u v\|_{H^{1}(\Omega)}\|w\|_{H^{\frac{3}{4}}(\Omega)} \\
& \lesssim\|u\|_{L^{\infty}(\Omega) \cap W^{1, n}(\Omega)}\|v\|_{H^{1}(\Omega)}\left(\gamma\|w\|_{H^{1}(\Omega)}+C(\gamma)\|w\|_{L^{2}(\Omega)}\right) \tag{B.9}
\end{align*}
$$

for any $\gamma>0$. Finally,

$$
\begin{equation*}
\left.\left.\langle u| v\right|_{\partial \Omega}\right\rangle_{\partial \Omega} \lesssim\|u\|_{H^{-\frac{1}{2}}(\partial \Omega)}\|v\|_{H^{1}(\Omega)} \tag{B.10}
\end{equation*}
$$

follows by the duality relation $\left(H^{s}(\partial \Omega)\right)^{*} \cong H^{-s}(\partial \Omega)$ and Theorem A. 4
The following existence result is a slight modification of Theorem B. 2 from [18], and is proved using similar arguments.
Theorem B.3. Suppose assumptions (i)-(vii) above are satisfied. Then
(i) there exists an $\delta^{*}=\delta^{*}\left(\kappa_{1},\|a\|_{L^{n}(\Omega)},\|d\|_{L^{n}(\Omega)},\|h\|_{L^{\infty}(\Omega) \cap W^{1, n}(\Omega)}\right) \geq 1$ such that every weak solution $v$ of (B.1)-(ㅍ.2) with $\epsilon \in\left[0, \frac{1}{\delta^{*}}\right]$ satisfies the estimate

$$
\|v\|_{H^{1}(\Omega)} \leq C\left(\|v\|_{L^{2}(\Omega)}+\|L\|_{L^{2}(\Omega)}+\|F\|_{L^{2}(\Omega)}+\|G\|_{H^{-\frac{1}{2}}(\partial \Omega)}\right)
$$

where

$$
C=C\left(\kappa_{1}, \mu, \lambda,\|a\|_{L^{n}(\Omega)},\|d\|_{L^{n}(\Omega)},\|h\|_{L^{\infty}(\Omega) \cap W^{1, n}(\Omega)},\|c\|_{L^{n}(\Omega)}\right),
$$

and
(ii) there exists a $\lambda^{*}=\lambda^{*}(\sigma, \mu)>0$ such that for $\lambda \geq \lambda^{*}$ and $\epsilon \in\left[0, \epsilon^{*}\right]$ there exists a unique weak solution of (B.1) $-(\overline{\mathrm{B} .2})$.
Proof. (i): Given a weak solution $v$ of ( (B.1)-( B.2), we see, after setting $v=\phi$ in (B.5), and using (B.4) and (B.6)-(B.10), that

$$
\begin{aligned}
& \kappa_{1}\|v\|_{H^{1}(\Omega)}^{2} \leq K\left(\epsilon\|a\|_{L^{n}(\Omega)}+\epsilon\|d\|_{L^{n}(\Omega)}+\epsilon\|h\|_{L^{\infty}(\Omega) \cap W^{1, n}(\Omega)}\right)\|v\|_{H^{1}(\Omega)}^{2}+K\left(\left[|\lambda|\|c\|_{L^{n}(\Omega)}\right.\right. \\
& \left.\left.\quad+\epsilon\|h\|_{L^{\infty}(\Omega) \cap W^{1, n}(\Omega)}+\mu\right]\|v\|_{L^{2}(\Omega)}+\|F\|_{L^{2}(\Omega)}+\|L\|_{L^{2}(\Omega)}+\|G\|_{H^{-\frac{1}{2}}(\partial \Omega)}\right)\|v\|_{H^{1}(\Omega)}
\end{aligned}
$$

for some constant $K>0$ independent of $\epsilon>0$. Setting

$$
\delta^{*}=\max \left\{1, \frac{2 K\left(\|a\|_{L^{n}(\Omega)}+\|d\|_{L^{n}(\Omega)}+\|h\|_{L^{\infty}(\Omega) \cap W^{1, n}(\Omega)}\right)}{\kappa_{1}}\right\}
$$

and choosing $\epsilon \in\left[0, \frac{1}{\delta^{*}}\right]$, it follows immediately from the above estimate that

$$
\|v\|_{H^{1}(\Omega)} \leq C\left(\|v\|_{L^{2}(\Omega)}+\|F\|_{L^{2}(\Omega)}+\|L\|_{L^{2}(\Omega)}+\|G\|_{H^{-\frac{1}{2}}(\partial \Omega)}\right)
$$

where

$$
C=C\left(\kappa_{1}, \mu, \lambda,\|a\|_{L^{n}(\Omega)},\|d\|_{L^{n}(\Omega)},\|h\|_{L^{\infty}(\Omega) \cap W^{1, n}(\Omega)},\|c\|_{L^{n}(\Omega)}\right)
$$

(ii:) Setting

$$
\left.B(v, \phi)=\left\langle b^{i j} \partial_{i} v \mid \partial_{j} \phi\right\rangle_{\Omega}+\left\langle d^{j} v \mid \partial_{j} \phi\right\rangle_{\Omega}-\left\langle a^{i} \partial_{i} v \mid \phi\right\rangle_{\Omega}+\lambda\langle c v \mid \phi\rangle_{\Omega}-\left.\epsilon\left\langle\left.(f v)\right|_{\partial \Omega}\right| \phi\right|_{\partial \Omega}\right\rangle_{\partial \Omega}
$$

and

$$
\left.\Lambda(\phi)=-\langle F \mid \phi\rangle_{\Omega}-\left\langle L^{j} \mid \partial_{j} \phi\right\rangle_{\Omega}+\left.\langle G| \phi\right|_{\partial \Omega}\right\rangle_{\partial \Omega}
$$

it follows from the estimates (B.4) and (B.6)-(B.10) that $B$ and $\Lambda$ define bounded forms on $H^{1}(\Omega)$, and, moreover, that $B$ satisfies the estimate

$$
\begin{aligned}
B(\phi, \phi) \geq & \left(\kappa_{1}-K\left[\epsilon\|d\|_{L^{\infty}(\Omega)}+\epsilon\|a\|_{L^{\infty}(\Omega)}+\epsilon\|h\|_{L^{\infty}(\Omega) \cap W^{1, n}(\Omega)}\right]\right)\|\phi\|_{H^{1}(\Omega)}^{2} \\
& +(\lambda \sigma-\mu)\|\phi\|_{L^{2}(\Omega)}^{2}-\epsilon\|h\|_{L^{\infty}(\Omega) \cap W^{1, n}(\Omega)}\|\phi\|_{L^{2}(\Omega)}\|\phi\|_{H^{1}(\Omega)} .
\end{aligned}
$$

From this estimate and Young's inequality, i.e. $\alpha \beta \leq \frac{\alpha^{2}}{2 \gamma}+\frac{\gamma \beta^{2}}{2}(\alpha, \beta \geq 0, \gamma>0)$, it is clear that there exists a constant $\lambda^{*}=\lambda^{*}(\sigma, \mu)>0$ such that

$$
B(\phi, \phi) \geq \frac{\kappa_{1}}{2}\|\phi\|_{H^{1}(\Omega)}^{2}
$$

whenever $\lambda \geq \lambda^{*}$ and $0 \leq \epsilon \leq \frac{1}{\delta^{*}}$. Fixing $\lambda \in\left[\lambda^{*}, \infty\right)$ and $\epsilon \in\left[0, \frac{1}{\delta^{*}}\right]$, we can apply the Lax-Milgram theorem, see Theorem 1 from Section 6.2 .1 of [11], to obtain the existence of a unique $v \in H^{1}(\Omega)$ satisfying $B(v, \phi)=\Lambda(\phi)$ for all $\phi \in H^{1}(\Omega)$. By definition of $B$ and $\Lambda$, it is clear that $v$ is the desired weak solution of (B.1)- (B.2).

In addition to the above existence result, we will also require the following version of elliptic regularity, where we define

$$
r^{*}= \begin{cases}r-1 & \text { if } r>1 \\ 0 & \text { otherwise }\end{cases}
$$

Theorem B.4. Suppose $r, s \in \mathbb{R}, s>n / 2,0 \leq r \leq s, b^{i j} \in H^{s}\left(\Omega, \mathbb{M}_{N \times N}\right), L^{i} \in H^{r}\left(\Omega, \mathbb{R}^{N}\right), F \in$ $H^{r^{*}}\left(\Omega, \mathbb{R}^{N}\right), G \in H^{r-\frac{1}{2}}\left(\partial \Omega, \mathbb{R}^{N}\right)$, the $b^{i j}$ satisfy (B.3) and (B.4), $a^{i}=c=d=h=0$, and $v$ is a weak solution of (B.1) -(B.2). Then $v \in H^{r+1}\left(\Omega, \mathbb{R}^{N}\right)$ and satisfies

$$
\|v\|_{H^{r+1}(\Omega)} \leq C\left(\|v\|_{H^{r}(\Omega)}+\|F\|_{H^{r^{*}}(\Omega)}+\|L\|_{H^{r}(\Omega)}+\|G\|_{H^{r-1 / 2}(\partial \Omega)}\right)
$$

where $C=C\left(\kappa_{1}, \mu,\|b\|_{H^{s}(\Omega)}\right)$.

## Appendix C. Determinant formulas

Lemma C.1. Suppose that $X, Y \in \mathbb{C}^{2}, N \in \mathbb{C}$, and $L \in \mathrm{Gl}(2, \mathbb{C})$ satisfies $L^{\operatorname{tr}}=L$. Then

$$
\operatorname{det}\left(\begin{array}{cc}
L & X+Y \\
-X^{\operatorname{tr}}+Y^{\operatorname{tr}} & N
\end{array}\right)=\operatorname{det}\left(\begin{array}{cc}
L & Y \\
Y^{\operatorname{tr}} & N
\end{array}\right)+\operatorname{det}(L) X^{\operatorname{tr}} L^{-1} X
$$

Proof. Direct computation.
Lemma C.2. Suppose that $X \in \mathbb{C}^{2}, N \in \mathbb{C}$, and $L \in \mathrm{Gl}(2, \mathbb{C})$ satisfies $L^{\mathrm{tr}}=L$. Then

$$
\operatorname{det}\left(\begin{array}{cc}
L & X \\
X^{\operatorname{tr}} & N+X^{\operatorname{tr}} L^{-1} X
\end{array}\right)=N \operatorname{det}(L)
$$

Proof. Noting that

$$
\begin{aligned}
\operatorname{det}\left(\begin{array}{cc}
L & X \\
X^{\operatorname{tr}} & N+X^{\operatorname{tr}} L^{-1} X
\end{array}\right) & =\operatorname{det}\left(\left(\begin{array}{cc}
\mathbb{I} & 0 \\
0 & -1
\end{array}\right)\left(\begin{array}{cc}
L & X \\
-X^{\operatorname{tr}} & -N-X^{\operatorname{tr}} L^{-1} X
\end{array}\right)\right) \\
& =-\operatorname{det}\left(\begin{array}{cc}
L & X \\
-X^{\operatorname{tr}} & -N-X^{\operatorname{tr}} L^{-1} X
\end{array}\right)
\end{aligned}
$$

the proof follows since

$$
\operatorname{det}\left(\begin{array}{cc}
L & X \\
-X^{\operatorname{tr}} & -N-X^{\operatorname{tr}} L^{-1} X
\end{array}\right)=-N \operatorname{det}(L)
$$

by Lemma C. 1 .

[^0]:    ${ }^{1}$ With the exception of Section 7 we use lower case Greek indices, i.e. $\mu, \nu, \gamma$, to label spacetime coordinate indices which run from 0 to 3 .
    ${ }^{2}$ Following standard conventions, we lower and raise spacetime coordinate indices, i.e. $\mu, \nu, \gamma$, using the metric $g_{\mu \nu}$ and inverse metric $g^{\mu \nu}$, respectively.

[^1]:    ${ }^{3}$ With the exception of Section 7 lower case Latin indices (i.e. $i, j, k$ ) will denote frame indices that run from 0 to 3 .
    ${ }^{4}$ Upper case Latin indices (i.e. $I, J, K$ ) will always run from 1 to 3 and denote the spatial frame indices.
    ${ }^{5}$ In this article, we will follow standard convention and lower and raise the frame indices (i.e. $i, j, k$ ) with the frame and inverse frame metrics $\gamma_{i j}$ and $\gamma^{i j}$, respectively.

[^2]:    ${ }^{6}$ This amounts to choosing the $e_{I}$ to be commuting vector fields on $\Omega_{0}$, i.e. $e_{I} \mid \Omega_{0} \in T \Omega_{0}$ and $\left[e_{I}, e_{J}\right] \mid \Omega_{0}=0$.
    ${ }^{7}$ Recall that $* * \lambda=(-1)^{p(4-p)+1} \lambda$ for p -forms $\lambda$.
    ${ }^{8}$ We are using the well known identity $\lambda \wedge * \beta=g(\lambda, \beta) \mu$, which holds for all one forms $\alpha$ and $\beta$ with $\mu$ the volume form. In terms of the co-frame $\theta^{i}, \mu$ is given by $\mu=\left(-\operatorname{det}\left(\gamma^{i j}\right)\right)^{-1 / 2} \theta^{0} \wedge \theta^{1} \wedge \theta^{2} \wedge \theta^{3}$.

[^3]:    ${ }^{9}$ This is just the relativistic continuity equation (1.7).
    ${ }^{10}$ Here, we use $\nabla_{\mu} \nabla_{\nu} \lambda_{\gamma}-\nabla_{\nu} \nabla_{\mu} \lambda_{\gamma}=R_{\mu \nu \gamma}{ }^{\sigma} \lambda_{\sigma}$ and $R_{\mu \gamma}=R_{\mu \nu \gamma}{ }^{\nu}$.
    ${ }^{11}$ Note that $d \theta^{i}=-\frac{1}{2} \sigma_{M}{ }^{i}{ }_{L} \theta^{M} \wedge \theta^{L} \quad \Longleftrightarrow \nabla_{\nu} \theta_{\mu}^{i}-\nabla_{\mu} \theta_{\nu}^{i}=\sigma_{M}{ }^{i}{ }_{L} \theta_{\mu}^{M} \theta_{\nu}^{L}$.

[^4]:    ${ }^{12}$ That is, the Lie bracket $[\cdot, \cdot]$ satisfies $\psi^{*}[X, Y]=\left[\psi^{*} X, \psi^{*} Y\right]$ for all diffeomorphisms $\psi$ and vector fields $X, Y$.

[^5]:    ${ }^{13}$ Here and below, we use following standard notation for norms: $\left.|X|_{g}=\left(g_{\mu \nu} X^{\mu} X^{\nu}\right)^{\frac{1}{2}},|\chi|_{g}=\left(g^{\mu \nu} \chi_{\mu} \chi_{\nu}\right)\right)^{\frac{1}{2}},|Y|_{m}=$ $\left(m_{\mu \nu} Y^{\mu} Y^{\nu}\right)^{\frac{1}{2}}$ and $|\xi|_{m}=\left(m^{\mu \nu} \xi_{\mu} \xi_{\nu}\right)^{\frac{1}{2}}$ where $X^{\mu}, \chi_{\mu}$ are spacelike and $Y^{\mu}, \xi_{\mu}$ are arbitrary, and similar notation when $g$ and $m$ are replaced with $\tilde{g}$ and $\tilde{m}$.

[^6]:    ${ }^{14}$ Recall for $a=\left(a_{\nu}^{\mu}\right) \in \mathbb{M}_{n \times n}$ that

    $$
    \operatorname{cof}(a)_{\nu}^{\mu}=\frac{1}{(n-1)!} \epsilon^{\mu}{ }_{\mu_{1} \mu_{2} \ldots \mu_{n-1}} \epsilon_{j}^{\nu_{1} \nu_{2} \ldots \nu_{n-1}} a_{\nu_{1}}^{\mu_{1}} a_{\nu_{2}}^{\mu_{2}} \cdots a_{\nu_{n-1}}^{\mu_{n-1}}
    $$

[^7]:    ${ }^{15}$ Acoustic boundary conditions were first defined in 502 and further analyzed in 4]. See also [14] for more recent work and relations to Wentzell boundary conditions.

[^8]:    ${ }^{16}$ Here, we are using the notation $\mathbb{R}_{\times}^{4}=\mathbb{R}^{4} \backslash\{0\}$.

[^9]:    ${ }^{17}$ Here, we are abusing notation and not changing the name of the maps under the change of variables. This will cause no difficulties since the precise form of the functions are not required beyond knowing that they are smooth in their variables on the appropriate domains.

[^10]:    ${ }^{18}$ Given $A, B \in \mathbb{M}_{N \times N}$, we define $A \leq B \Longleftrightarrow(\xi \mid A \xi) \leq(\xi \mid B \xi)$ for all $\xi \in \mathbb{R}^{N}$.

[^11]:    ${ }^{19}$ We use the standard notation $\rightharpoonup$ to denote weak convergence.
    ${ }^{20}$ For sufficiently differentiable vector valued and matrix valued maps $\{v, \phi\}$ and $S$, respectively, such that $\left.\phi\right|_{t}=\left.\phi\right|_{t=T}=$ 0 , the identities

    $$
    \begin{aligned}
    \langle v \mid \phi\rangle_{\Gamma_{T}} & =\int_{\Omega_{T}} \partial_{\alpha}\left[\nu^{\alpha}(v \mid \phi)\right] d^{n+1} x=\left\langle\nu(v)+\partial_{i} \nu^{i} v \mid \phi\right\rangle_{\Omega_{T}}+\langle v \mid \nu(\phi)\rangle_{\Omega_{T}} \\
    0 & =\int_{\Omega_{T}} \partial_{\beta}\left[\delta_{0}^{\beta}(S \nu(v) \mid \phi)\right] d^{n+1} x=\left\langle\partial_{t} S \nu(v)+S \partial_{t} \nu(v) \mid \phi\right\rangle_{\Omega_{T}}+\left\langle S \nu(v) \mid \partial_{t} \phi\right\rangle_{\Omega_{T}}
    \end{aligned}
    $$

[^12]:    ${ }^{21}$ Here, we are interpreting the boundary terms on the righthand side of (7.61) via the formula (7.26).

[^13]:    ${ }^{22}$ We fix here $\delta^{*}$ to be the maximum of the constants computed by setting $a^{i}=a_{\ell}^{i}$, $d^{i}=d_{\ell}^{i}$, and $h=h_{\ell}$ in Theorem B. 3 for $\ell=0,1, \ldots 2 s-1$.

[^14]:    ${ }^{23}$ From the assumption $\left(e_{0}^{\mu}\right) \in C^{8}\left(\bar{U}, \mathbb{R}^{4}\right)$, which, we note implies that $\phi=\left(\phi^{\nu}\right) \in C^{8}\left(\bar{\Omega}_{T}, \mathbb{R}^{4}\right)$ by solving the ODE (4.6), it follows from the definition (4.8) that $\left(\tilde{e}_{0}^{\mu}\right) \in C^{8}\left(\bar{\Omega}_{T}, \mathbb{R}^{4}\right)$. Similarly, from the fact that $e_{I}=\left(e_{I}^{\mu}\right) \in C^{7}\left(\bar{U}_{T}, \mathbb{R}^{4}\right)$, we also have that $\left(\tilde{e}_{I}^{\mu}\right) \in C^{7}\left(\bar{\Omega}_{T}, \mathbb{R}^{4}\right)$. At first glance, these two statements seem to imply via definition 4.22 that $\theta^{0}=\left(\tilde{\theta}_{\mu}^{0}\right) \in C^{7}\left(\bar{\Omega}_{T}, \mathbb{R}^{4}\right)$. However, due to the relation (3.15), the definition $\tilde{\theta}_{\mu}^{0}=\theta_{\mu}^{0} \circ \phi$, and the smoothness of the metric $g_{\mu \nu}$, we, in fact, have that $\tilde{\theta}^{0} \in C^{8}\left(\bar{\Omega}_{T}, \mathbb{R}^{4}\right)$.

[^15]:    ${ }^{24}$ Given $A \in \mathbb{M}_{n \times n}$, the operator norm of $A$ is defined, as usual, by $\|A\|_{\mathrm{op}}=\sup _{|\xi|=1}|A \xi|$.
