# ON THE REGULARITY SET AND ANGULAR INTEGRABILITY FOR THE NAVIER-STOKES EQUATION 

PIERO D'ANCONA AND RENATO LUCÀ

#### Abstract

We investigate the size of the regular set for suitable weak solutions of the Navier-Stokes equation, in the sense of Caffarelli-Kohn-Nirenberg [2]. We consider initial data in weighted Lebesgue spaces with mixed radialangular integrability, and we prove that the regular set increases if the data have higher angular integrability, invading the whole half space $\{t>0\}$ in an appropriate limit. In particular, we obtain that if the $L^{2}$ norm with weight $|x|^{-\frac{1}{2}}$ of the data tends to 0 , the regular set invades $\{t>0\}$; this result improves Theorem D of [2].

## 1. Introduction and main results

We consider the Cauchy problem for the Navier-Stokes equation on $\mathbb{R}^{+} \times \mathbb{R}^{3}$

$$
\left\{\begin{align*}
\partial_{t} u+(u \cdot \nabla) u-\Delta u & =-\nabla P  \tag{1.1}\\
\nabla \cdot u & =0 \\
u(x, 0) & =u_{0}(x)
\end{align*}\right.
$$

describing a viscous incompressible fluid in the absence of external forces, where as usual $u$ is the velocity field of the fluid and $P$ the pressure, and the initial data satisfy the compatibility condition $\nabla \cdot u_{0}=0$. We use the same notation for the norm of scalar, vector or tensor quantities:

$$
\|P\|_{L^{2}}:=\left(\int P^{2} d x\right)^{\frac{1}{2}}, \quad\|u\|_{L^{2}}^{2}:=\sum_{j}\left\|u_{j}\right\|_{L^{2}}^{2}, \quad\|\nabla u\|_{L^{2}}^{2}:=\sum_{j, k}\left\|\partial_{k} u_{j}\right\|_{L^{2}}^{2}
$$

and we write simply $L^{2}\left(\mathbb{R}^{3}\right)$ instead of $\left[L^{2}\left(\mathbb{R}^{3}\right)\right]^{3}$, or $\mathscr{S}^{\prime}\left(\mathbb{R}^{3}\right)$ instead of $\left[\mathscr{S}^{\prime}\left(\mathbb{R}^{3}\right)\right]^{3}$ and so on. Regularity of the global weak solutions constructed in [17, 21] is a notorious open problem, although many partial results exist.

The case of small data is well understood. In the proofs of well posedness for small data, the equation is regarded as a linear heat equation perturbed by a small nonlinear term $(u \cdot \nabla) u$, and the natural approach is a fixed point argument around the heat propagator. More precisely, one rewrites the problem in integral form

$$
\begin{equation*}
u=e^{t \Delta} u_{0}-\int_{0}^{t} e^{(t-s) \Delta} \mathbb{P} \nabla \cdot(u \otimes u)(s) d s \quad \text { in } \quad \mathbb{R}^{+} \times \mathbb{R}^{3} \tag{1.2}
\end{equation*}
$$

where $\mathbb{P}$ is the Leray projection

$$
\mathbb{P} f:=f-\nabla \Delta^{-1}(\nabla \cdot f),
$$

and then the Picard iteration scheme is defined by

$$
\begin{equation*}
u_{1}:=e^{t \Delta} u_{0}, \quad u_{n}:=e^{t \Delta} u_{0}-\int_{0}^{t} e^{(t-s) \Delta} \mathbb{P} \nabla \cdot\left(u_{n-1} \otimes u_{n-1}\right)(s) d s \tag{1.3}
\end{equation*}
$$

Once the velocity is known the pressure can be recovered at each time by $P=$ $-\Delta^{-1} \nabla \otimes \nabla(u \otimes u)$. Small data results fit in the following abstract framework:

[^0]Proposition 1.1 ([20]). Let $X \subset \bigcap_{s<\infty} L_{t}^{2} L_{u l o c, x}^{2}\left((0, s) \times \mathbb{R}^{3}\right)^{1}$ be a Banach space such that the bilinear form

$$
\begin{equation*}
B(u, v):=\int_{0}^{t} e^{(t-s) \Delta} \mathbb{P} \nabla \cdot(u \otimes v)(s) d s \tag{1.4}
\end{equation*}
$$

is bounded from $X \times X$ to $X$ :

$$
\|B(u, v)\|_{X} \leq C_{X}\|u\|_{X}\|v\|_{X}
$$

Moreover, let $X_{0} \subset \mathscr{S}^{\prime}\left(\mathbb{R}^{3}\right)$ be a normed space such that $e^{t \Delta}: X_{0} \rightarrow X$ is bounded:

$$
\left\|e^{t \Delta} f\right\|_{X} \leq A_{X_{0}, X}\|f\|_{X_{0}}
$$

Then for every data $u_{0}$ such that $\left\|u_{0}\right\|_{X_{0}}<1 / 4 C_{X} A_{X_{0}, X}$ the sequence $u_{n}$ is Cauchy in $X$ and converges to a solution $u$ of the integral equation (1.2). The solution satisfies

$$
\|u\|_{X} \leq 2 A_{X_{0}, X}\left\|u_{0}\right\|_{X_{0}}
$$

The space $X$ is usually called an admissible (path) space, while $X_{0}$ is called an adapted space. Many adapted spaces $X_{0}$ have been studied: $L^{3}$ [18], Morrey spaces $[16,33]$, Besov spaces [4, 14, 24] and several others. The largest space in which Picard iteration has been proved to converge is $B M O^{-1}$ [19].

A crucial ingredient in the theory is symmetry invariance. The natural symmetry of the Navier-Stokes equation is the translation-scaling

$$
u_{0}(x) \mapsto \lambda u_{0}\left(\lambda\left(x-x_{0}\right)\right), \quad \lambda \in \mathbb{R}^{+}, \quad x_{0} \in \mathbb{R}^{3},
$$

and indeed all the spaces $X_{0}$ mentioned above are invariant for this transformation. On the other hand, in results of local regularity a role may be played by some spaces which are scaling but not translation invariant, like the weighted $L^{p}$ spaces with norm

$$
\left\||x|^{1-\frac{3}{p}} u(x)\right\|_{L^{p}\left(\mathbb{R}^{3}\right)} .
$$

When $p=2$ this is the weighted $L^{2}$ space with norm $\left\||x|^{-\frac{1}{2}} u(x)\right\|_{L^{2}}$, used in the classical regularity results of [2]. We recall a key definition from that paper:
Definition 1.2. A point $\left(t_{0}, x_{0}\right) \in \mathbb{R}^{+} \times \mathbb{R}^{3}$ is regular for a solution $u(t, x)$ of (1.1) if $u$ is essentially bounded on a neighbourhood of $\left(t_{0}, x_{0}\right)$. It follows that $u(t, x)$ is smooth near $\left(t_{0}, x_{0}\right)$ (see for instance [28]). A subset of $\mathbb{R}^{+} \times \mathbb{R}^{3}$ is regular if all its points are regular.

The following result (Theorem D in [2]) applies to the special class of suitable weak solutions, which are, roughly speaking, solutions with bounded energy; see the beginning of Section 2 for the precise definition. We use the notation

$$
\Pi_{\alpha}:=\left\{(t, x) \in \mathbb{R}^{+} \times \mathbb{R}^{3}: t>\frac{|x|^{2}}{\alpha}\right\}
$$

to denote the paraboloid of aperture $\alpha$ in the upper half space $\mathbb{R}^{+} \times \mathbb{R}^{3}$; note that $\Pi_{\alpha}$ is increasing in $\alpha$.
Theorem 1.3 (Caffarelli-Kohn-Nirenberg). There exists a constant $\varepsilon_{0}>0$ such that the following holds. Let $u$ be a suitable weak solution of Problem (1.1) with divergence free initial data $u_{0} \in L^{2}\left(\mathbb{R}^{3}\right)$. If

$$
\left\||x|^{-1 / 2} u_{0}\right\|_{L^{2}\left(\mathbb{R}^{3}\right)}^{2}=\varepsilon<\varepsilon_{0}
$$

then the paraboloid

$$
\Pi_{\varepsilon_{0}-\varepsilon} \equiv\left\{(t, x): t>\frac{|x|^{2}}{\varepsilon_{0}-\varepsilon}\right\}
$$

[^1]is a regular set.
The theorem states that if the weighted $L^{2}$ norm of the data is sufficiently small, then the solution is smooth on a certain paraboloid with vertex at the origin. If the size of the data tends to 0 , the regular set increases and invades a limit paraboloid $\Pi_{\varepsilon_{0}}$, which is strictly contained in the half space $t>0$.

It is reasonable to expect that the regular set actually invades the whole upper half space $t>0$ when the size of the data tends to 0 . This is indeed a special case of our main result, see Theorem 1.5 below and in particular Corollary 1.6.

However our main goal is a more general investigation of the influence on the regular set of additional angular integrability of the data. We measure angular regularity using the following mixed norms:

$$
\begin{align*}
\|f\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}} & :=\left(\int_{0}^{+\infty}\|f(\rho \cdot)\|_{L^{\tilde{p}}\left(\mathbb{S}^{2}\right)}^{p} \rho^{2} d \rho\right)^{\frac{1}{p}}  \tag{1.5}\\
\|f\|_{L_{|x|}^{\infty} L_{\theta}^{\tilde{p}}} & :=\sup _{\rho>0}\|f(\rho \cdot)\|_{L^{\tilde{p}}\left(\mathbb{S}^{2}\right)}
\end{align*}
$$

The idea of separating radial and angular regularity is not new; it proved useful especially in the context of Strichartz estimates and dispersive equations (see [5], [8], [13], [23], [26] [34]). The $L_{|x|}^{p} L_{\theta}^{\widetilde{p}}$ scale includes the usual $L^{p}$ norms when $\widetilde{p}=p$ :

$$
\|u\|_{L_{|x|}^{p} L_{\theta}^{p}}=\|u\|_{L^{p}\left(\mathbb{R}^{3}\right)} .
$$

Note also that for radial functions the value of $\widetilde{p}$ is irrelevant, in the sense that

$$
u \text { radial } \quad \Longrightarrow \quad\|u\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}} \simeq\|u\|_{L^{p}\left(\mathbb{R}^{3}\right)} \quad \forall p, \widetilde{p} \in[1, \infty]
$$

while for generic functions we have only ${ }^{2}$

$$
\|u\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}} \lesssim\|u\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}_{1}}} \quad \text { if } \quad \widetilde{p} \leq \widetilde{p}_{1} .
$$

With respect to scaling, the mixed radial-angular norm $L_{|x|}^{p} L_{\theta}^{\widetilde{p}}$ behaves like $L^{p}$ and in particular we have for all $\widetilde{p} \in[1, \infty]$ and all $\lambda>0$

$$
\left\||x|^{\alpha} \lambda u_{0}(\lambda x)\right\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}}=\left\||x|^{\alpha} u_{0}(x)\right\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}}, \quad \text { provided } \quad \alpha=1-\frac{3}{p} .
$$

As a first application, we show that for initial data with small $\left\||x|^{\alpha} u_{0}\right\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}}$ norm and $\tilde{p} \geq 2 p /(p-1)$, the problem has a global smooth solution. As we prove in Section 2, this norm controls the $B_{q, \infty}^{-1+3 / q}$ norm (for $q$ large enough), and this space is embedded in $B M O^{-1}$, thus the existence part in Theorem 1.4 could be deduced from the more general results in [4, 19, 24]. However, the quantitative estimate (1.9) is new for such initial data, and it will be a crucial tool for the proof of our main Theorem 1.5.
Theorem 1.4. Let $1<p<5, \widetilde{p} \geq 2 p /(p-1), \alpha=1-3 / p$ and let $u_{0} \in L_{|x|{ }^{\alpha p} d|x|}^{p} L_{\theta}^{\widetilde{p}}$ be divergence free. Moreover, let

$$
\begin{array}{lll}
\frac{2 p}{p-1} \leq q<\infty & \text { if } & 1<p \leq 2 \\
\frac{2 p}{p-1} \leq q<\frac{3 p}{p-2} & \text { if } & 2 \leq p \leq 3  \tag{1.6}\\
p<q<\frac{3 p}{p-2} & \text { if } & 3 \leq p<5
\end{array}
$$

and

$$
\begin{equation*}
\frac{2}{r}+\frac{3}{q}=1 \tag{1.7}
\end{equation*}
$$

[^2]Then there exists an $\bar{\varepsilon}=\bar{\varepsilon}(p, \widetilde{p}, q)>0$ such that, if

$$
\begin{equation*}
\left\||x|^{\alpha} u_{0}\right\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}}<\bar{\varepsilon} \tag{1.8}
\end{equation*}
$$

Problem (1.2) has a unique global smooth solution u satisfying ${ }^{3}$

$$
\begin{equation*}
\|u\|_{L_{t}^{r} L_{x}^{q}} \leq \bar{C}\left\||x|^{\alpha} u_{0}\right\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}} . \tag{1.9}
\end{equation*}
$$

for some constant $\bar{C}=\bar{C}(p, \widetilde{p}, q)$ independent of $u_{0}$.
In the following we shall need only the special case corresponding to the choice

$$
p=2, \quad \widetilde{p}=4, \quad q=4
$$

Thus, using the notations

$$
\begin{equation*}
\varepsilon_{1}:=\bar{\varepsilon}(2,4,4), \quad C_{1}:=\bar{C}(2,4,4), \tag{1.10}
\end{equation*}
$$

we see in particular that for all divergence free initial data with

$$
\begin{equation*}
\left\||x|^{-1 / 2} u_{0}\right\|_{L_{|x|}^{2} L_{\theta}^{4}}<\varepsilon_{1} \tag{1.11}
\end{equation*}
$$

there exists a unique global smooth solution $u(t, x)$, which satisfies the estimate

$$
\begin{equation*}
\|u\|_{L_{t}^{8} L_{x}^{4}} \leq C_{1}\left\||x|^{-1 / 2} u_{0}\right\|_{L_{|x|}^{2} L_{\theta}^{4}} . \tag{1.12}
\end{equation*}
$$

To prepare for our last result, we introduce the notations

$$
\theta_{1}(\widetilde{p}):=\left(\frac{2 \widetilde{p}-4}{4-\widetilde{p}}\right)^{1-\widetilde{p} / 4}, \quad \theta_{2}(\widetilde{p}):=\left(\frac{2 \widetilde{p}-4}{4-\widetilde{p}}\right)^{1-\widetilde{p} / 2}, \quad \widetilde{p} \in(2,4) .
$$

It is easy to check that $\theta_{1}, \theta_{2} \in[0,1]$ and actually

$$
\begin{array}{ll}
\lim _{\widetilde{p} \rightarrow 2^{+}} \theta_{1}=0, & \lim _{\widetilde{p} \rightarrow 4^{-}} \theta_{1}=1 \\
\lim _{\widetilde{p} \rightarrow 2^{+}} \theta_{2}=1, & \lim _{\widetilde{p} \rightarrow 4^{-}} \theta_{2}=0 \tag{1.14}
\end{array}
$$

Thus we may set $\theta_{1}(2)=0, \theta_{2}(2)=1$. We also define the norm

$$
\begin{equation*}
\left[u_{0}\right]_{\tilde{p}}:=\left\||x|^{-\frac{2}{p}} u_{0}\right\|_{L_{|x|}}^{\frac{\tilde{p}}{2}-1} L_{\theta}^{\tilde{p} / 2}\left\||x|^{-\frac{1}{p}} u_{0}\right\|_{L_{x}^{\tilde{p}}}^{2-\frac{\tilde{p}}{2}} . \tag{1.15}
\end{equation*}
$$

Note the following facts:
(1) It is easy to construct initial data such that $\left[u_{0}\right]_{\tilde{p}}$ is arbitrarily small while $\left\|u_{0}\right\|_{B M O^{-1}}$ is arbitrarily large. Indeed, fix a test function $\phi \in C_{c}^{\infty}\left(\mathbb{R}^{3}\right)$ and denote with $\phi_{K}(x):=\phi(x-K \xi)$ its translate in the direction $\xi$ for some $|\xi|=1$ and $K>1$; we have obviously

$$
\left\||x|^{-\frac{1}{p}} \phi_{K}\right\|_{L_{x}^{\tilde{p}}} \simeq K^{-\frac{1}{p}}
$$

since the $L_{x}^{\widetilde{p}}$ norm is translation invariant. On the other hand, if the support of $\phi$ is contained in a sphere $B(0, R)$, we have

$$
\left\||x|^{-\frac{2}{p}} \phi_{K}\right\|_{L_{|x|}^{\widetilde{p}} / 2}^{\widetilde{p} / 2} L_{\theta}^{\tilde{p}}=\int_{0}^{+\infty}\left(\int_{\mathbb{S}^{2}}|\phi(\theta \rho-K \xi)|^{\widetilde{p}} d S_{\theta}\right)^{\frac{1}{2}} \rho d \rho \lesssim \int_{K-R}^{K+R} K^{-1} \rho d \rho \simeq 1
$$

and we obtain

$$
\left[\phi_{K}\right]_{\tilde{p}} \lesssim(1)^{\frac{\tilde{p}}{2}-1}\left(K^{-\frac{1}{p}}\right)^{2-\frac{\tilde{p}}{2}}=K^{\frac{1}{2}-\frac{2}{p}}
$$

Thus, by the translation invariance of $B M O^{-1}$, we conclude that if $\widetilde{p} \in$ $[2,4)$

$$
\begin{equation*}
\left[\phi_{K}\right]_{\widetilde{p}} \rightarrow 0 \quad \text { while } \quad\left\|\phi_{K}\right\|_{B M O^{-1}}=\text { const } \quad \text { as } \quad K \rightarrow \infty \tag{1.16}
\end{equation*}
$$

[^3](2) In the limit cases $\widetilde{p}=2$ and $\widetilde{p}=4$ we have simply
\[

$$
\begin{equation*}
\left[u_{0}\right]_{2}=\left\||x|^{-1 / 2} u_{0}\right\|_{L_{x}^{2}}, \quad\left[u_{0}\right]_{4}=\left\||x|^{-1 / 2} u_{0}\right\|_{L_{|x|}^{2} L_{\theta}^{4}} \tag{1.17}
\end{equation*}
$$

\]

and actually the $[\cdot]_{\widetilde{p}}$ norm arises as an interpolation norm between the two cases (see (4.2), (4.3) and (4.5) below).
We can now state our main result, which interpolates between Theorems 1.3 and 1.4:

Theorem 1.5. There exists a constant $\delta>0$ such that the following holds. Let $u$ be a suitable weak solution of Problem (1.1) with divergence free initial data $u_{0} \in L^{2}\left(\mathbb{R}^{3}\right)$, and let $\widetilde{p} \in[2,4)$ and $M>1$.

If the norm $\left[u_{0}\right]_{\widetilde{p}}$ of the initial data satisfies

$$
\begin{equation*}
\theta_{1} \cdot\left[u_{0}\right]_{\widetilde{p}} \leq \delta, \quad \theta_{2} \cdot\left[u_{0}\right]_{\widetilde{p}} \leq \delta e^{-4 M^{2}} \tag{1.18}
\end{equation*}
$$

then the paraboloid

$$
\begin{equation*}
\Pi_{M \delta}:=\left\{(t, x) \in \mathbb{R}^{+} \times \mathbb{R}^{3}: t>\frac{|x|^{2}}{M \delta}\right\} \tag{1.19}
\end{equation*}
$$

is a regular set for $u(t, x)$.
The result can be interpreted as follows. Since $\theta_{2}(\widetilde{p}) \rightarrow 0$ as $\widetilde{p} \rightarrow 4$, we can choose $\widetilde{p}=\widetilde{p}_{M}$ as a function of $M$ in such a way that

$$
e^{4 M^{2}} \cdot \theta_{2}\left(\widetilde{p}_{M}\right) \rightarrow 0 \quad \text { as } \quad M \rightarrow+\infty
$$

Of course we have $\widetilde{p}_{M} \rightarrow 4^{-}$as $M \rightarrow+\infty$. Then from the theorem it follows that, for all sufficiently large $M$,

$$
\left[u_{0}\right]_{\widetilde{p}_{M}} \leq \delta \quad \Longrightarrow \quad \Pi_{M \delta} \text { is a regular set for } u
$$

In other words, if we take $M \rightarrow+\infty$ and the norm $\left[u_{0}\right]_{\widetilde{p}_{M}}$ is less than $\delta$, then the regular set invades the whole half space $t>0$. Note that, as remarked above, the $\left[u_{0}\right]_{\widetilde{p}_{M}}$ norm can be small even if the $B M O^{-1}$ norm of $u_{0}$ is large.

Even in the special case $\widetilde{p}=2$, which is covered by Theorem D of [2], the result gives some new information on the regular set. Indeed, for $\widetilde{p}=2$ we have $\theta_{1}=0$, $\theta_{2}=1$, and we obtain:

Corollary 1.6. There exists a constant $\delta>0$ such that for any suitable weak solution $u$ with divergence free initial data $u_{0} \in L^{2}\left(\mathbb{R}^{3}\right)$, and for every $M>1$, if the initial data satisfy

$$
\left\||x|^{-1 / 2} u_{0}\right\|_{L_{x}^{2}} \leq \delta e^{-4 M^{2}}
$$

then the paraboloid $\Pi_{M \delta}$ is a regular set for $u$.
Thus, taking $M \rightarrow+\infty$, we see that if the weighted $L^{2}$ norm of the data is sufficiently small, then the regular set invades the whole half space $t>0$, as claimed above.

The rest of the paper is organized as follows. In Section 2 we collect the necessary tools, in particular we recall the fundamental Caffarelli-Kohn-Nirenberg regularity criterion from [2]; in Section 3 we prove Theorem 1.4, and Section 4 is devoted to the proof of Theorem 1.5.

## 2. Preliminaries

We recall some definitions from [2].
Definition 2.1. Let $u_{0} \in L^{2}\left(\mathbb{R}^{3}\right)$. The couple $(u, P)$ is a suitable weak solution of Problem (1.1) if ${ }^{4}$
(1) $(u, P)$ satisfies (1.1) in the sense of distributions;
(2) $u(t) \rightarrow u_{0}$ weakly in $L^{2}$ as $t \rightarrow 0$;
(3) for some constants $E_{0}, E_{1}$

$$
\int_{\mathbb{R}^{3}}|u|^{2}(t) d x \leq E_{0}
$$

for all $t>0$ and

$$
\iint_{\mathbb{R}^{+} \times \mathbb{R}^{3}}|\nabla u|^{2} d t d x \leq E_{1} ;
$$

(4) for all non negative $\phi \in C_{c}^{\infty}\left([0, \infty) \times \mathbb{R}^{3}\right)$ and for all $t>0$

$$
\begin{align*}
& \int_{\mathbb{R}^{3}}|u|^{2} \phi(t)+2 \int_{0}^{t} \int_{\mathbb{R}^{3}}|\nabla u|^{2} \phi  \tag{2.1}\\
\leq & \int_{\mathbb{R}^{3}}\left|u_{0}\right|^{2} \phi(0)+\int_{0}^{t} \int_{\mathbb{R}^{3}}|u|^{2}\left(\phi_{t}+\Delta \phi\right)+\int_{0}^{t} \int_{\mathbb{R}^{3}}\left(|u|^{2}+2 P\right) u \cdot \nabla \phi
\end{align*}
$$

Suitable weak solutions are known to exist for all $L^{2}$ initial data, see [27] or the Appendix in [2]. Such solutions are also $L^{2}$-weakly continous as functions of time (see [35], pp. 281-282), namely

$$
\begin{equation*}
\int_{\mathbb{R}^{3}} u(t, x) w(x) d x \rightarrow \int_{\mathbb{R}^{3}} u\left(t^{\prime}, x\right) w(x) d x \tag{2.2}
\end{equation*}
$$

for all $w \in L^{2}\left(\mathbb{R}^{3}\right)$ as $t \rightarrow t^{\prime}\left(t, t^{\prime} \in[0,+\infty)\right)$; thus it makes sense to impose the initial condition (2).

Next we define the parabolic cylinder of radius $r$ and top point $(t, x)$ as

$$
Q_{r}(t, x):=\left\{(s, y): \quad|x-y|<r, \quad t-r^{2}<s<t\right\}
$$

while the shifted parabolic cylinder is

$$
Q_{r}^{*}(t, x):=Q_{r}\left(t+r^{2} / 8, x\right) \equiv\left\{(s, y): \quad|x-y|<r, \quad t-7 r^{2} / 8<s<t+r^{2} / 8\right\}
$$

The crucial regularity result in [2] ensures that:
Lemma 2.2. There exists an absolute constant $\varepsilon^{*}$ such that if $(u, P)$ is a suitable weak solution of (1.1) and

$$
\begin{equation*}
\limsup _{r \rightarrow 0} \frac{1}{r} \iint_{Q_{r}^{*}(t, x)}|\nabla u|^{2} \leq \varepsilon^{*} \tag{2.3}
\end{equation*}
$$

then $(t, x)$ is a regular point.
We shall make frequent use of the following interpolation inequality from [1] (see also $[9,10]$ for extensions of the inequality):
Lemma 2.3. Assume that
(1) $r \geq 0,0<a \leq 1, \gamma<3 / r, \alpha<3 / 2, \beta<3 / 2$;
(2) $-\gamma+3 / r=a(-\alpha+1 / 2)+(1-a)(-\beta+3 / 2)$;
(3) $a \alpha+(1-a) \beta \leq \gamma$;
(4) when $-\gamma+3 / r=-\alpha+1 / 2$, assume also that $\gamma \leq a(\alpha+1)+(1-a) \beta$.

[^4]Then

$$
\begin{equation*}
\left\|\sigma_{\nu}^{\gamma} u\right\|_{L^{r}\left(\mathbb{R}^{3}\right)} \leq C\left\|\sigma_{\nu}^{\alpha} \nabla u\right\|_{L^{2}\left(\mathbb{R}^{3}\right)}^{a}\left\|\sigma_{\nu}^{\beta} u\right\|_{L^{2}\left(\mathbb{R}^{3}\right)}^{1-a} \tag{2.4}
\end{equation*}
$$

where $\sigma_{\nu}:=\left(\nu+|x|^{2}\right)^{-1 / 2}, \nu \geq 0$, with a constant $C$ independent of $\nu$.
A key role in the following will be played by time-decay estimates for convolutions with the heat and Oseen kernels. It is convenient to introduce the notation

$$
\Lambda(\alpha, p, \widetilde{p}):=\alpha+\frac{2}{p}-\frac{2}{\widetilde{p}}
$$

Proposition 2.4 ([22]). Let $1 \leq p \leq q \leq \infty, 1 \leq \widetilde{p} \leq \widetilde{q} \leq \infty$ and

$$
\begin{equation*}
\beta>-\frac{3}{q}, \quad \alpha<3-\frac{3}{p}, \quad \Lambda(\alpha, p, \widetilde{p}) \geq \Lambda(\beta, q, \widetilde{q}) . \tag{2.5}
\end{equation*}
$$

For every multiindex $\eta$,
(1) if $|\eta|+\frac{3}{p}-\frac{3}{q}+\alpha-\beta \geq 0$, then

$$
\begin{equation*}
\left\||x|^{\beta} \partial^{\eta} e^{t \Delta} u_{0}\right\|_{L_{|x|}^{q} L_{\theta}^{\tilde{q}}} \lesssim \frac{1}{t^{\left||\eta|+\frac{3}{p}-\frac{3}{q}+\alpha-\beta\right) / 2}}\left\||x|^{\alpha} u_{0}\right\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}}, \quad t>0 \tag{2.6}
\end{equation*}
$$

(2) if $1+|\eta|+\frac{3}{p}-\frac{3}{q}+\alpha-\beta>0$, then

$$
\begin{equation*}
\left\||x|^{\beta} \partial^{\eta} e^{t \Delta} \mathbb{P} \nabla \cdot F\right\|_{L_{|x|}^{q} L_{\theta}^{\tilde{q}}} \lesssim \frac{1}{t^{\left(1+|\eta|+\frac{3}{p}-\frac{3}{q}+\alpha-\beta\right) / 2}}\left\||x|^{\alpha} F\right\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}}, \quad t>0 \tag{2.7}
\end{equation*}
$$

An easy consequence of Proposition (2.4) is the embedding

$$
L_{|x|^{\alpha p} d|x|}^{p} L_{d \theta}^{\widetilde{p}} \hookrightarrow B_{q, \infty}^{-1+3 / q} \quad \text { if } \quad \alpha=1-\frac{3}{p}, \quad \widetilde{p} \geq \frac{2 p}{p-1}, \quad q \geq \max (p, \widetilde{p})
$$

which is not needed in the following, but allows to compare Theorem 1.4 with earlier results; recall also that $B_{q, \infty}^{-1+3 / q} \hookrightarrow B M O^{-1}$ for $q>3$. Indeed, using estimate (2.6), we can write

$$
\left\|e^{t \Delta} \phi\right\|_{L^{q}\left(\mathbb{R}^{3}\right)} \leq C t^{-(3 / p-3 / q+\alpha) / 2}\left\||x|^{\alpha} \phi\right\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}} \equiv C t^{-(1-3 / q) / 2}\left\||x|^{\alpha} \phi\right\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}}
$$

and then the embedding follows immediately from the following 'caloric' defininition of Besov spaces (see e.g. [19]):

Definition 2.5. A distribution $\phi \in \mathscr{S}^{\prime}$ belongs to $B_{q, \infty}^{-1+3 / q}\left(\mathbb{R}^{3}\right)(q>3)$ if and only if

$$
\begin{equation*}
\left\|e^{t \Delta} \phi\right\|_{L^{q}\left(\mathbb{R}^{3}\right)} \leq C t^{-(1-3 / q) / 2} \quad \text { for } \quad 0<t \leq 1 \tag{2.8}
\end{equation*}
$$

The best constant $C$ in (2.8) is equivalent to the norm $\|\phi\|_{B_{q, \infty}^{-1+3 / q}\left(\mathbb{R}^{3}\right)}$.
We conclude this section with an estimate for singular integrals in mixed radialangular norms. Let $K \in C^{1}\left(\mathbb{S}^{2}\right)$ with zero mean value and

$$
\begin{equation*}
T f(x):=\mathrm{PV} \int_{\mathbb{R}^{3}} f(x-y) \frac{K(\widehat{y})}{|y|^{n}} d y, \quad \widehat{y}=\frac{y}{|y|} \tag{2.9}
\end{equation*}
$$

Theorem 2.6. Let $1<p<\infty, 1<\widetilde{p}<\infty$. Then

$$
\begin{equation*}
\|T f\|_{L_{|x|}^{p} L_{\theta}^{\tilde{\tilde{p}}}} \lesssim\|f\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}} . \tag{2.10}
\end{equation*}
$$

The inequality (2.10) has been recently proved by A. Córdoba in the case $\widetilde{p}=2$ ([6], Theorem 2.1); essentially the same argument gives also the other cases.

Proof. Consider first the case $p>\widetilde{p}$. Let $1 / q+\widetilde{p} / p=1$ and denote by $X$ the set of all $g \in \mathscr{S}(\mathbb{R})$ with $\int_{0}^{+\infty} g^{q}(\rho) \rho^{2} d \rho=1$. Then we can write

$$
\begin{aligned}
\|T f\|_{L_{|x|}^{p} L_{\theta}^{\widetilde{p}}}^{\widetilde{p}} & =\left(\int_{0}^{+\infty}\left(\int_{\mathbb{S}^{2}}|T f(\rho, \theta)|^{\widetilde{p}} d S_{\theta}\right)^{\frac{p}{p}} \rho^{2} d \rho\right)^{\frac{\tilde{\tilde{p}}}{p}} \\
& =\sup _{g \in X} \int_{0}^{+\infty} \int_{\mathbb{S}^{2}}|T f(\rho, \theta)|^{\widetilde{p}} g(\rho) \rho^{2} d S_{\theta} d \rho \\
& =\sup _{g \in X} \int_{\mathbb{R}^{3}}|T f(x)|^{\widetilde{p}} g(|x|) d x .
\end{aligned}
$$

Write $I(f, g):=\int_{\mathbb{R}^{3}}|T f(x)|^{\widetilde{p}} g(|x|) d x$. By Proposition 1 in [7] we have

$$
I(f, g) \lesssim_{s} \int_{\mathbb{R}^{3}}|f(x)|^{\widetilde{p}}\left(M g^{s}(x)\right)^{\frac{1}{s}} d x
$$

for all $1<s<\infty$, where $M$ is the Hardy-Littelwood maximal operator and $g^{s}(x)=(g(|x|))^{s}$. Since $M g^{s}$ is radially symmetric, this can be written

$$
I(f, g) \lesssim s \int_{0}^{+\infty} \int_{\mathbb{S}^{2}}|f(\rho, \theta)|^{\widetilde{p}}\left(M g^{s}(\rho)\right)^{\frac{1}{s}} \rho^{2} d S_{\theta} d \rho
$$

Now, for $s<q=\frac{p}{p-\widetilde{p}}$, Hölder's inequality with exponents $p / \widetilde{p}, q$ gives

$$
\begin{aligned}
I(f, g) & \lesssim\left(\int_{0}^{+\infty}\left(\int_{\mathbb{S}^{2}}|f(\rho, \theta)|^{\widetilde{p}} d S_{\theta}\right)^{\frac{p}{p}} \rho^{2} d \rho\right)^{\frac{\tilde{p}}{p}}\left(\int_{0}^{+\infty}\left(M g^{s}(\rho)\right)^{\frac{q}{s}} \rho^{2} d \rho\right)^{\frac{1}{q}} \\
& \lesssim\|f\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}}^{\tilde{p}}\left\|M g^{s}\right\|_{L^{q / s}\left(\mathbb{R}^{3}\right)}^{1 / s} \lesssim\|f\|_{L_{|x|}^{p}}^{\tilde{p}}{ }_{\theta}^{\tilde{p}}\left\|g^{s}\right\|_{L^{q / s}\left(\mathbb{R}^{3}\right)}^{1 / s} \\
& \simeq\|f\|_{L_{|x|}^{p} L_{\theta}^{\widetilde{p}}}^{\widetilde{p}}\left(\int_{0}^{+\infty} g^{q}(\rho) \rho^{2} d \rho\right)^{\frac{1}{q}}=\|f\|_{L_{|x|}^{p} L_{\theta}^{\widetilde{p}}}^{\widetilde{p}}
\end{aligned}
$$

and taking the supremum over all $g \in X$ we get the claim in the case $p>\widetilde{p}$. The case $p=\widetilde{p}$ is classical, and the case $p<\widetilde{p}$ follows by duality.

Using the continuity of $T$ in weighted Lebesgue spaces (see Stein [31])

$$
\begin{equation*}
\left\||x|^{\beta} T f\right\|_{L^{p}\left(\mathbb{R}^{3}\right)} \lesssim\left\||x|^{\beta} f\right\|_{L^{p}\left(\mathbb{R}^{3}\right)} \quad \text { for } \quad 1<p<\infty, \quad-\frac{3}{p}<\beta<3-\frac{3}{p} \tag{2.11}
\end{equation*}
$$

we can also obtain weighted versions of (2.10). In particular, by interpolation of

$$
\begin{align*}
& (2.10) \text { in the case }\left(\alpha_{0}, p_{0}, \widetilde{p}_{0}\right)=(0,2,10)  \tag{2.12}\\
& (2.11) \text { in the case }\left(\alpha_{1}, p_{1}, \widetilde{p}_{1}\right)=(-4 / 3,2,2),
\end{align*}
$$

with $\theta=3 / 8\left(\Rightarrow\left(\alpha_{\theta}, p_{\theta}, \widetilde{p}_{\theta}\right)=(-1 / 2,2,4)\right)$, we get

$$
\begin{equation*}
\left\||x|^{-1 / 2} T f\right\|_{L_{|x|}^{2} L_{\theta}^{4}} \lesssim\left\||x|^{-1 / 2} f\right\|_{L_{|x|}^{2} L_{\theta}^{4}} . \tag{2.13}
\end{equation*}
$$

Remark 2.1. We denote with $R_{j}$ the Riesz transform in the direction of the $j$ th coordinate and $R:=\left(R_{1}, R_{2}, R_{3}\right)$. By $(2.11,2.13)$ the boundedness of $R_{j}$ in $L^{2}\left(\mathbb{R}^{3},|x|^{-1} d x\right)$ and $L_{|x|}^{2} L_{\theta}^{4}\left(\mathbb{R}^{3},|x|^{-1} d x\right)$ follows, and so that of $\mathbb{P} \equiv I d+R \otimes R$.

## 3. Proof of Theorem 1.4

We first need two technical lemmas. By standard machinery, integral estimates for the heat flow and for the bilinear operator appearing in the Duhamel representation (1.2) can be deduced by the time-decay estimates of Proposition 2.4.

Lemma 3.1 ([22]). Let $\beta>-3 / q, \alpha<3-3 / p, 1 \leq \widetilde{p} \leq \widetilde{q} \leq \infty, 1<r<\infty$ and

$$
\begin{array}{ll}
1 \leq p \leq q \leq \infty & \text { if } \quad(|\eta|+\alpha-\beta) p+1<0 \\
1 \leq p \leq q<\frac{3 p}{(|\eta|+\alpha-\beta) p+1} & \text { if } \quad(|\eta|+\alpha-\beta) p+1 \geq 0 \tag{3.1}
\end{array}
$$

Assume further that

$$
\begin{equation*}
|\eta|+\alpha+\frac{3}{p}=\beta+\frac{3}{q}+\frac{2}{r}, \quad \Lambda(\alpha, p, \widetilde{p}) \geq \Lambda(\beta, q, \widetilde{q}) \tag{3.2}
\end{equation*}
$$

Then for every multiindex $\eta$ we have

$$
\begin{equation*}
\left\||x|^{\beta} \partial^{\eta} e^{t \Delta} u_{0}\right\|_{L_{t}^{r} L_{|x|}^{q} L_{\theta}^{\tilde{q}}} \lesssim\left\||x|^{\alpha} u_{0}\right\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}} \tag{3.3}
\end{equation*}
$$

Remark 3.1. Once we have assumed the scaling relation in (3.2), it is straighforward to check that the assumption (3.1) is equivalent to $p<r$.

Proof. The family of estimates (3.3) follows by the family of estimates (2.6) and by the Marcinkiewickz interpolation theorem. The condition $p<r$, which as remarked above turns out to be equivalent to (3.1), is necessary in order to apply the Marcinkiewickz theorem (see Proposition 3.4 in [22] for details).

Lemma 3.2. Let $3<q<\infty, 2<r<\infty$ satisfying $2 / r+3 / q=1$. Then

$$
\begin{equation*}
\left\|\int_{0}^{t} e^{(t-s) \Delta} \mathbb{P} \nabla \cdot(u \otimes v)(s) d s\right\|_{L_{t}^{r} L_{x}^{q}} \lesssim\|u\|_{L_{t}^{r} L_{x}^{q}}\|v\|_{L_{t}^{r} L_{x}^{q}} \tag{3.4}
\end{equation*}
$$

The inequality (3.4) is well known, see for instance Theorem 3.1(i) in [12]. The $L_{t}^{r} L_{x}^{q}$ Lebesgue spaces have been extensively used in the context of Navier-Stokes equation since [12, 15].

Using the previous estimates, it is a simple matter to prove Theorem 1.4. We follow the scheme of the proof of Theorem 20.1(B) in [20] and we take advance of the inequalities $(2.6,3.3)$.

Proof of Theorem 1.4. Let $\widetilde{p}_{G}:=2 p /(p-1)$. We show that the space

$$
X:=\left\{u:\|u\|_{L_{t}^{r} L_{x}^{q}}<\infty, \sup _{t>0} t^{1 / 2}\|u\|_{L_{x}^{\infty}}(t)<\infty\right\}
$$

equipped with the norm $\|\cdot\|_{X}:=\|\cdot\|_{L_{t}^{r} L_{x}^{q}}+\sup _{t>0} t^{1 / 2}\|\cdot\|_{L_{x}^{\infty}}(t)$, is an admissible path space with adapted space $X_{0}:=L_{|x|^{\alpha p} d|x|}^{p} L_{\theta}^{\widetilde{p_{G}}}$.

The estimate $\left\|e^{t \Delta} f\right\|_{X} \lesssim\|f\|_{X_{0}}$ follows indeed by the inequalities (2.6, 3.3); it is straightforward to check that (3.1) and $p, \widetilde{p}_{G} \leq q$ are equivalent ${ }^{5}$ to (1.6) and that the last assumption in (3.2) and in (2.5) is satisfied because $\Lambda\left(\alpha, p, \widetilde{p}_{G}\right)=$ $\Lambda(0, q, q)=\Lambda(0, \infty, \infty)=0$. Notice also that the set of $q$ for which the third inequality in (1.6) is satisfied is not empty provided $p<5$.

It remains to show that $\|B(u, v)\|_{X} \lesssim\|u\|_{X}\|v\|_{X}$. The bound $\|B(u, v)\|_{L_{t}^{r} L_{x}^{q}} \lesssim$ $\|u\|_{L_{t}^{r} L_{x}^{q}}\|v\|_{L_{t}^{r} L_{x}^{q}}$ follows by Lemma 3.2. In order too estimate $\sup _{t>0} t^{1 / 2}\|B(u, v)\|_{L^{\infty}}(t)$, we split this quantity as

$$
\sup _{t>0} t^{1 / 2}\|B(u, v)\|_{L_{x}^{\infty}}(t) \leq I+I I
$$

where

$$
\begin{gathered}
I=\sup _{t>0} t^{1 / 2}\left\|\int_{0}^{t / 2} e^{(t-s) \Delta} \mathbb{P} \nabla \cdot(u \otimes v)(s) d s\right\|_{L_{x}^{\infty}} \\
I I=\sup _{t>0} t^{1 / 2}\left\|\int_{t / 2}^{t} e^{(t-s) \Delta} \mathbb{P} \nabla \cdot(u \otimes v)(s) d s\right\|_{L_{x}^{\infty}}
\end{gathered}
$$

[^5]and we use Minkowski inequality and the time-decay estimate (2.7). For $I$ we have
\[

$$
\begin{aligned}
I & \lesssim \sup _{t>0} t^{1 / 2} \int_{0}^{t / 2} \frac{1}{(t-s)^{\left(1+\frac{3}{q / 2}\right) / 2}}\|u\|_{L_{x}^{q}}\|v\|_{L_{x}^{q}}(s) d s \\
& \lesssim \sup _{t>0} t^{-3 / q} \int_{0}^{t / 2}\|u\|_{L_{x}^{q}}\|v\|_{L_{x}^{q}}(s) d s \\
& \lesssim \sup _{t>0} t^{-3 / q}\|u\|_{L_{t}^{r} L_{x}^{q}}\|v\|_{L_{t}^{r} L_{x}^{q}}\left(\int \chi_{[0, t / 2]}(s) d s\right)^{1-\frac{2}{r}} \\
& \lesssim\|u\|_{L_{t}^{r} L_{x}^{q}}\|v\|_{L_{t}^{r} L_{x}^{q}} t^{-3 / q-2 / r+1}=\|u\|_{L_{t}^{r} L_{x}^{q}}\|v\|_{L_{t}^{r} L_{x}^{q}}
\end{aligned}
$$
\]

while for $I I$ we have

$$
\begin{aligned}
I I & \lesssim \sup _{t>0} t^{1 / 2} \int_{t / 2}^{t} \frac{1}{(t-s)^{1 / 2}} \frac{1}{s}\left(s^{1 / 2}\|u\|_{L_{x}^{\infty}}(s)\right)\left(s^{1 / 2}\|v\|_{L_{x}^{\infty}}(s)\right) d s \\
& \lesssim\left(\sup _{t>0} t^{1 / 2}\|u\|_{L_{x}^{\infty}}\right)\left(\sup _{t>0} t^{1 / 2}\|v\|_{L_{x}^{\infty}}\right) \sup _{t>0} t^{-1 / 2} \int_{t / 2}^{t} \frac{1}{(t-s)^{1 / 2}} d s \\
& \lesssim\left(\sup _{t>0} t^{1 / 2}\|u\|_{L_{x}^{\infty}}\right)\left(\sup _{t>0} t^{1 / 2}\|v\|_{L_{x}^{\infty}}\right) \sup _{t>0} t^{-1 / 2}\left[(t-s)^{1 / 2}\right]_{t}^{t / 2} \\
& \lesssim\left(\sup _{t>0} t^{1 / 2}\|u\|_{L_{x}^{\infty}}\right)\left(\sup _{t>0} t^{1 / 2}\|v\|_{L_{x}^{\infty}}\right) .
\end{aligned}
$$

Summing up we obtain
$\|B(u, v)\|_{X} \lesssim\|u\|_{L_{t}^{r} L_{x}^{q}}\|u\|_{L_{t}^{r} L_{x}^{q}}+\left(\sup _{t>0} t^{1 / 2}\|u\|_{L_{x}^{\infty}}\right)\left(\sup _{t>0} t^{1 / 2}\|v\|_{L_{x}^{\infty}}\right) \lesssim\|u\|_{X}\|u\|_{X}$.
The existence of a unique solution $u$ to Problem (1.2) satisfying

$$
\begin{equation*}
\|u\|_{L_{t}^{r} L_{x}^{q}}+\sup _{t>0} t^{1 / 2}\|u\|_{L_{x}^{\infty}}(t) \lesssim\left\||x|^{\alpha} u_{0}\right\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}} \tag{3.5}
\end{equation*}
$$

follows by Proposition 1.1 and by the obvious inequality

$$
\left\||x|^{\alpha} u_{0}\right\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}_{G}}} \lesssim\left\||x|^{\alpha} u_{0}\right\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}}
$$

Finally, inequality (3.5) implies the boundedness of the solution $u$ in $(\delta, \infty) \times \mathbb{R}^{3}$ for all $\delta>0$, and this implies smoothness of the solution (see Theorem 3.4 in [12] or $[11,15,28,30,32,36])$.

We denote with $B C\left([0, \infty) ; L^{2}\right)$ the Banach space of bounded continuous functions $u:[0, \infty) \rightarrow L^{2}$ equipped with the norm $\sup _{t \geq 0}\|u(t)\|_{L^{2}}$.

Corollary 3.3. Assume all the hypotheses of Theorem 1.4 are satisfied, and in addition assume $u_{0} \in L^{2}\left(\mathbb{R}^{3}\right)$. Then the solution $u(t)$ belongs to $B C\left([0, \infty) ; L^{2}\left(\mathbb{R}^{3}\right)\right)$. In particular $u$ is a strong solution of (1.1), $u(t) \rightarrow u_{0}$ strongly in $L^{2}\left(\mathbb{R}^{3}\right)$ as $t \rightarrow 0$, and the energy identity $\|u(t)\|_{L_{x}^{2}}^{2}+2\|\nabla u\|_{L_{t}^{2} L_{x}^{2}}^{2}=\left\|u_{0}\right\|_{L^{2}}^{2}$ holds for all $t>0$.

Proof. Let $X, X_{0}$ be the same admissible and adapted spaces used in the proof of Theorem 1.4. As in that proof, we shall show that the space $X \cap B C\left([0, \infty) ; L_{x}^{2}\right)$ equipped with the norm $\|\cdot\|_{X}+\|\cdot\|_{L_{t}^{\infty} L_{x}^{2}}$ is an admissible path space with adapted space $X_{0} \cap L_{x}^{2}$ equipped with the norm $\|\cdot\|_{X_{0}}+\|\cdot\|_{L_{x}^{2}}$.

The estimate $\left\|e^{t \Delta} f\right\|_{X \cap B C\left([0, \infty) ; L_{x}^{2}\right)} \lesssim\|f\|_{X_{0} \cap L_{x}^{2}}$ again follows by (2.6, 3.3). Since we have already proved $\|B(u, v)\|_{X} \lesssim\|u\|_{X}\|v\|_{X}$, it remains to show that $\|B(u, v)\|_{L_{t}^{\infty} L_{x}^{2}} \lesssim\|u\|_{X \cap B C\left([0, \infty) ; L_{x}^{2}\right)}\|v\|_{X \cap B C\left([0, \infty) ; L_{x}^{2}\right)}$. By Minkowski inequality
and Proposition 2.7,

$$
\begin{align*}
\|B(u, v)\|_{L_{t}^{\infty} L_{x}^{2}} & \lesssim \sup _{t>0} \int_{0}^{t} \frac{1}{(t-s)^{1 / 2}} \frac{1}{s^{1 / 2}}\left(s^{1 / 2}\|u\|_{L_{x}^{\infty}}(s)\right)\|v\|_{L_{x}^{2}}(s) d s  \tag{3.6}\\
& \leq\left(\sup _{t>0} t^{1 / 2}\|u\|_{L_{x}^{\infty}}(t)\right)\|v\|_{L_{t}^{\infty} L_{x}^{2}} \sup _{t>0} \int_{0}^{t}(t-s)^{-1 / 2} s^{-1 / 2} d s
\end{align*}
$$

Since $\int_{0}^{t}(t-s)^{-1 / 2} s^{-1 / 2} d s \leq C$ with $C$ independent of $t$, (3.6) implies
$\|B(u, v)\|_{L_{t}^{\infty} L_{x}^{2}} \lesssim\left(\sup _{t>0} t^{1 / 2}\|u\|_{L_{x}^{\infty}}(t)\right)\|v\|_{L_{t}^{\infty} L_{x}^{2}} \lesssim\|u\|_{X \cap B C\left([0, \infty) ; L_{x}^{2}\right)}\|v\|_{X \cap B C\left([0, \infty) ; L_{x}^{2}\right)}$.
These inequalities allow us to apply Proposition 1.1, and we obtain that $u \in X \cap$ $B C\left([0, \infty) ; L_{x}^{2}\right)$ provided

$$
\begin{equation*}
\left\|u_{0}\right\|_{X_{0}}=\left\||x|^{\alpha} u_{0}\right\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}}+\left\|u_{0}\right\|_{L_{x}^{2}}<\bar{\varepsilon}, \tag{3.8}
\end{equation*}
$$

with an $\bar{\varepsilon}$ possibly smaller than in Theorem 1.4. On the other hand, rescaling the initial data and the solution as

$$
\begin{equation*}
u_{0}^{\lambda}=\lambda u_{0}(\lambda x), \quad u^{\lambda}=\lambda u\left(\lambda^{2} t, \lambda x\right), \quad \lambda>0 \tag{3.9}
\end{equation*}
$$

we see that all norms remain fixed with the exception of

$$
\begin{equation*}
\left\|u_{0}^{\lambda}\right\|_{L_{x}^{2}},\left\|u^{\lambda}\right\|_{L_{t}^{\infty} L_{x}^{2}} \rightarrow 0 \quad \text { as } \quad \lambda \rightarrow+\infty, \tag{3.10}
\end{equation*}
$$

so that (3.8) is satisfied by $u_{0}^{\lambda}$, provided $\left\||x|^{\alpha} u_{0}\right\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}}=\rho<\bar{\varepsilon}$ and $\lambda=\lambda(\rho)$ is large enough. In this way we find that $\left\||x|^{\alpha} u_{0}\right\|_{L_{|x|}^{p} L_{\theta}^{\tilde{p}}}<\bar{\varepsilon}$ implies $u^{\lambda} \in B C\left([0, \infty) ; L_{x}^{2}\right)$ and hence $u \in B C\left([0, \infty) ; L_{x}^{2}\right)$.

In particular we have $u(t) \rightarrow u_{0}$ strongly in $L^{2}\left(\mathbb{R}^{3}\right)$ as $t \rightarrow 0^{+}$. By this remark, and by the smoothness of $u$, it follows that $u$ is a strong solution of (1.1) which satisfies the energy identity

$$
\begin{equation*}
\|u(t)\|_{L_{x}^{2}}^{2}+2\|\nabla u\|_{L_{t}^{2} L_{x}^{2}}^{2}=\left\|u_{0}\right\|_{L^{2}}^{2}, \quad t \geq 0 \tag{3.11}
\end{equation*}
$$

Remark 3.2. It is straightforward to check that the solution constructed in Corollary 3.3 is unique in the class of the weak solutions satisfying the energy inequality. More precisely, if $u^{\prime}$ is another weak solution of (1.1) satisfying

$$
\begin{equation*}
\left\|u^{\prime}(t)\right\|_{L_{x}^{2}}^{2}+2\left\|\nabla u^{\prime}(t)\right\|_{L_{t}^{2} L_{x}^{2}}^{2} \leq\left\|u_{0}\right\|_{L^{2}}^{2}, \quad t>0 \tag{3.12}
\end{equation*}
$$

the boundedness condition $\|u\|_{L_{t}^{r} L_{x}^{q}}<\infty$ allows to apply the well known ProdiSerrin uniqueness criterion ([25,29]) to conclude $u=u^{\prime}$.

## 4. Proof of Theorem 1.5

We note that the statement of Theorem 1.5 is invariant with respect to the natural scaling of the equation

$$
\begin{equation*}
u_{0}(x) \rightarrow u_{0}^{\lambda}(x):=\lambda u_{0}(\lambda x), \quad u(t, x) \rightarrow u^{\lambda}(t, x):=\lambda u\left(\lambda^{2} t, \lambda x\right) . \tag{4.1}
\end{equation*}
$$

Thus it is sufficient to prove the result for $u_{0}^{\lambda}(x), u^{\lambda}(t, x)$ instead of $u_{0}(x), u(t, x)$, for an appropriate choice of the parameter $\lambda$. We choose $\lambda=\bar{\lambda}$ such that the following two quantities are equal:

$$
\begin{align*}
\Gamma_{1}\left(\lambda, u_{0}, \widetilde{p}\right) & :=\left(\int_{0}^{+\infty}\left\|u_{0}^{\lambda}(\rho \cdot)\right\|_{L_{\theta}^{\tilde{p}}}^{\widetilde{\widetilde{p}} / 2} \rho d \rho\right)^{\frac{1}{2}} \equiv \lambda^{\frac{\tilde{p}}{4}-1}\left\||x|^{-\frac{2}{p}} u_{0}\right\|_{L_{|x|}^{\tilde{p}} \mid}^{\frac{\tilde{\tilde{p}}}{\frac{\tilde{p}}{}} L_{\theta}^{\tilde{p}}}  \tag{4.2}\\
\Gamma_{2}\left(\lambda, u_{0}, \widetilde{p}\right) & :=\left(\int_{0}^{+\infty}\left\|u_{0}^{\lambda}(\rho \cdot)\right\|_{L_{\theta}^{\widetilde{p}}}^{\widetilde{\tilde{p}}} \rho d \rho\right)^{\frac{1}{2}} \equiv \lambda^{\tilde{\tilde{p}}-1}\left\||x|^{-\frac{1}{p}} u_{0}\right\|_{L_{x}^{\tilde{p}}}^{\frac{\tilde{p}}{2}} . \tag{4.3}
\end{align*}
$$

It obvious that such a $\bar{\lambda}$ exists and that

$$
\begin{equation*}
\Gamma_{1}\left(\bar{\lambda}, u_{0}, \widetilde{p}\right)=\Gamma_{2}\left(\bar{\lambda}, u_{0}, \widetilde{p}\right)=\left[u_{0}\right]_{\widetilde{p}} \equiv \epsilon . \tag{4.4}
\end{equation*}
$$

In the rest of the proof we shall drop the index $\bar{\lambda}$ and write simply $u_{0}:=u_{0}^{\bar{\lambda}}$, $u:=u^{\bar{\lambda}}$.

We divide the proof into several steps. Note that in the course of the proof we shall reserve the symbol $Z$ to denote several universal constants, which do not depend on $u_{0}, u$ and $\widetilde{p} \in[2,4]$, and which may be different from line to line (and of course the final meaning of $Z$ will be the maximum of all such constants).
4.1. Decomposition of the data. For $s>0$ to be chosen, we write

$$
u_{0,<s}(x):=u_{0}(x) \text { if }\left|u_{0}(x)\right|<s, \quad u_{0,<s}(x):=0 \text { elsewhere }
$$

and we decompose the initial data as

$$
u_{0}=v_{0}+w_{0}, \quad w_{0}:=\mathbb{P} u_{0,<s}, \quad v_{0}:=\mathbb{P}\left(u_{0}-u_{0,<s}\right)
$$

which is possible since $u_{0}=\mathbb{P} u_{0}$. It is clear that $v_{0}, w_{0}$ are divergence free. Moreover one has

$$
\begin{align*}
\left\||x|^{-1 / 2} w_{0}\right\|_{L_{|x|}^{2} L_{\theta}^{4}} \leq Z s^{1-\frac{\tilde{p}}{4}}\left(\int\left\|u_{0}(\rho \cdot)\right\|_{L_{\theta}^{\tilde{p}}}^{\tilde{p} / 2} \rho d \rho\right)^{\frac{1}{2}}=Z s^{1-\frac{\tilde{p}}{4}} \epsilon  \tag{4.5}\\
\left\||x|^{-1 / 2} v_{0}\right\|_{L_{x}^{2}} \leq Z s^{1-\frac{\tilde{\tilde{p}}}{2}}\left(\int\left\|u_{0}(\rho \cdot)\right\|_{L_{\theta}^{\tilde{p}}}^{\widetilde{p}} \rho d \rho\right)^{\frac{1}{2}}=Z s^{1-\frac{\tilde{\tilde{p}}}{2}} \epsilon
\end{align*}
$$

for some universal constant $Z \geq 1$. To prove (4.5), we use first the fact that the Leray projection $\mathbb{P}$ is bounded on the weighted spaces $L^{2}\left(\mathbb{R}^{3},|x|^{-1} d x\right)$ and $L_{|x|}^{2} L_{\theta}^{4}\left(\mathbb{R}^{3},|x|^{-1} d x\right)$ (see Remark 2.1), then the elementary inequalities

$$
\begin{gathered}
\left\||x|^{-1 / 2} u_{0,<s}\right\|_{L_{|x|}^{2} L_{\theta}^{4}} \leq s^{1-\frac{\tilde{\tilde{p}}}{4}}\left(\int\left\|u_{0}(\rho \cdot)\right\|_{L_{\theta}^{\tilde{p}}}^{\tilde{p} / 2} \rho d \rho\right)^{\frac{1}{2}}, \\
\left\||x|^{-1 / 2} u_{0,>s}\right\|_{L_{x}^{2}} \leq s^{1-\frac{\tilde{p}}{2}}\left(\int\left\|u_{0}(\rho \cdot)\right\|_{L_{\theta}^{\tilde{p}}}^{\widetilde{\widetilde{p}} / 2} \rho d \rho\right)^{\frac{1}{2}},
\end{gathered}
$$

and finally property (4.4). Now we choose

$$
s=\frac{2 \widetilde{p}-4}{4-\widetilde{p}}
$$

and this gives, with $\theta_{1}=\theta_{1}(\widetilde{p})$ and $\theta_{2}=\theta_{2}(\widetilde{p})$ defined as above,

$$
\begin{equation*}
\left\||x|^{-1 / 2} w_{0}\right\|_{L_{|x|}^{2} L_{\theta}^{4}} \leq Z \theta_{1} \epsilon, \quad\left\||x|^{-1 / 2} v_{0}\right\|_{L_{x}^{2}} \leq Z \theta_{2} \epsilon . \tag{4.6}
\end{equation*}
$$

4.2. Decomposition of the weak solution. Consider the Cauchy problems

$$
\left\{\begin{array}{rll}
\partial_{t} w+(w \cdot \nabla) w+\nabla P_{w}-\Delta w & = & 0  \tag{4.7}\\
\nabla \cdot w & = & 0 \\
w(0) & = & w_{0} \\
P_{w}=R \otimes R(w \otimes w) & &
\end{array}\right.
$$

and

$$
\left\{\begin{array}{rll}
\partial_{t} v+(v \cdot \nabla) v+(v \cdot \nabla) w+(w \cdot \nabla) v+\nabla P_{v}-\Delta v & = & 0  \tag{4.8}\\
\nabla \cdot v & = & 0 \\
v(0) & = & v_{0} \\
P_{v}=R \otimes R(v \otimes v)+2 R \otimes R(v \otimes w) . & &
\end{array}\right.
$$

Applying Theorem 1.4 (as in (1.11)) and Corollary 3.3, and recalling the first inequality in (4.6), we see that there exist two absolute constants $\varepsilon_{1}, C_{1}$ such that problem (1.1) has a unique global smooth solution $w$ provided the data satisfy

$$
Z \theta_{1} \epsilon<\varepsilon_{1},
$$

and in addition the solution $w$ satisfies the estimate

$$
\|w\|_{L_{t}^{8} L_{x}^{4}} \leq C_{1}\left\||x|^{-1 / 2} w_{0}\right\|_{L_{|x|}^{2} L_{\theta}^{4}} \leq C_{1} Z \theta_{1} \epsilon \quad \Longrightarrow \quad\|w\|_{L_{t}^{8} L_{x}^{4}}^{8} \leq C_{1}^{8}\left(Z \theta_{1} \epsilon\right)^{7} \cdot Z \theta_{1} \epsilon
$$

By possibly increasing $Z$ so that it is larger than both $\varepsilon_{1}^{-1}$ and $C_{1}^{8}$, this implies the following: if $\epsilon$ satisfies

$$
\begin{equation*}
Z \theta_{1} \epsilon \leq 1 \tag{4.9}
\end{equation*}
$$

then problem (4.7) has a unique global smooth solution $w$ such that

$$
\begin{equation*}
\|w\|_{L_{t}^{8} L_{x}^{4}}^{8} \leq Z \theta_{1} \epsilon \tag{4.10}
\end{equation*}
$$

As a consequence, the function $v=u-w$ is a weak solution of the second Cauchy problem $(4.8)^{6}$. Moreover, since $u$ is a suitable weak solution, the function $v$ inherits similar properties (we shall say for short that $v$ is a suitable weak solution of the modified problem (4.8)).
4.3. A change of variables. Let $\xi \in \mathbb{R}^{3} \backslash 0, T>0$ and consider the segment

$$
L(T, \xi):=\{(s, \xi s): s \in(0, T)\}
$$

We ask for which $(T, \xi)$ the set $L(T, \xi)$ is a regular set. To this purpose we introduce the transformation

$$
\begin{equation*}
(t, y)=(t, x-\xi t), \quad v_{\xi}(t, y)=v(t, x), \quad w_{\xi}(t, y)=w(t, x) \tag{4.11}
\end{equation*}
$$

which takes (4.7) into the system

$$
\left\{\begin{align*}
\partial_{t} w_{\xi}+\left(\left(w_{\xi}-\xi\right) \cdot \nabla\right) w_{\xi}+\nabla P_{w_{\xi}}-\Delta w_{\xi} & =0  \tag{4.12}\\
\nabla \cdot w_{\xi} & =0 \\
w_{\xi}(0) & =w_{0} \\
P_{w_{\xi}}=R \otimes R\left(w_{\xi} \otimes w_{\xi}\right) &
\end{align*}\right.
$$

and (4.8) into the system

$$
\left\{\begin{align*}
& \partial_{t} v_{\xi}+\left(\left(v_{\xi}-\xi\right) \cdot \nabla\right) v_{\xi}+\left(v_{\xi} \cdot \nabla\right) w_{\xi}+\left(w_{\xi} \cdot \nabla\right) v_{\xi}+\nabla P_{v_{\xi}}-\Delta v_{\xi}=0  \tag{4.13}\\
& \nabla \cdot v_{\xi}=0 \\
& v_{\xi}(0)=v_{0} \\
& P_{v_{\xi}}=R \otimes R\left(v_{\xi} \otimes v_{\xi}\right)+2 R \otimes R\left(v_{\xi} \otimes w_{\xi}\right)
\end{align*}\right.
$$

Note that this change of coordinates maps $L(T, \xi)$ in $(0, T) \times\{0\}$. Now we fix an arbitrary $M \geq 1$ and we define the set

$$
\begin{equation*}
S(M, T, \xi):=\left\{s \in[0, T]: \int_{s}^{s+T / M} \int_{\mathbb{R}^{3}}|y|^{-1}\left|\nabla v_{\xi}(\tau, y)\right|^{2} d \tau d y>M\right\} \tag{4.14}
\end{equation*}
$$

and the number $\bar{s} \geq 0$

$$
\bar{s}:= \begin{cases}\inf \{s \in S(M, T, \xi)\} & \text { if } \quad S(M, T, \xi) \neq \emptyset  \tag{4.15}\\ T & \text { otherwise }\end{cases}
$$

From the definition of $\bar{s}$ one has immediately

$$
\begin{equation*}
\int_{0}^{\bar{s}} \int_{\mathbb{R}^{3}}|y|^{-1}\left|\nabla v_{\xi}(\tau, y)\right|^{2} d \tau d y \leq M(M+1) \leq 2 M^{2} \tag{4.16}
\end{equation*}
$$

We next distinguish two cases.

[^6]4.4. First case: $\bar{s}=T$. In this case the entire segment $L(T, \xi)$ is a regular set. To prove this, we note first that by (4.16)
\[

$$
\begin{equation*}
\int_{0}^{T} \int_{\mathbb{R}^{3}} \frac{|\nabla v(\tau, x)|^{2}}{|x-\xi \tau|} d \tau d x<+\infty \tag{4.17}
\end{equation*}
$$

\]

Suppose we can also prove that

$$
\begin{equation*}
\int_{0}^{T} \int_{\mathbb{R}^{3}} \frac{|\nabla w(\tau, x)|^{2}}{|x-\xi \tau|} d \tau d x<+\infty \tag{4.18}
\end{equation*}
$$

Then summing the two we obtain

$$
\begin{equation*}
\int_{0}^{T} \int_{\mathbb{R}^{3}} \frac{|\nabla u(\tau, x)|^{2}}{|x-\xi \tau|} d \tau d x<+\infty . \tag{4.19}
\end{equation*}
$$

Now let $0<s<T$, and let $r>0$ be so small that $0<s-7 r^{2} / 8<s+r^{2} / 8<T$ and $|\xi| r \leq 1$. For each $(\tau, x) \in Q_{r}^{*}(s, \xi s)$ we have

$$
|x-\xi \tau| \leq|x-\xi s|+|\xi||s-\tau| \leq r+r^{2}|\xi| \leq 2 r
$$

which implies

$$
\frac{1}{r} \iint_{Q_{r}^{*}(s, \xi s)}|\nabla u(\tau, x)|^{2} d \tau d x \leq 2 \int_{s-\frac{7}{8} r^{2}}^{s+\frac{1}{8} r^{2}} \int_{\mathbb{R}^{3}} \frac{|\nabla u(\tau, x)|^{2}}{|x-\xi \tau|} d \tau d x
$$

By continuity of the integral function, we obtain that the regularity condition (2.3) is satisfied at all $(s, \xi s) \in L(T, \xi)$, i.e. $L(T, \xi)$ is a regular set as claimed.

It remains to prove (4.18). By (4.10), (4.6) we know that

$$
\begin{equation*}
\left\|w_{\xi}\right\|_{L_{t}^{8} L_{x}^{4}}=\|w\|_{L_{t}^{8} L_{x}^{4}}<+\infty, \quad\left\||x|^{-1 / 2} w_{0}\right\|_{L^{2}\left(\mathbb{R}^{3}\right)}<+\infty \tag{4.20}
\end{equation*}
$$

and that $w$, hence $w_{\xi}$, is a smooth solution. Thus we can write the energy inequality

$$
\begin{align*}
& \int_{\mathbb{R}^{3}} \phi\left|w_{\xi}\right|^{2} d x+2 \int_{0}^{t} \int_{\mathbb{R}^{3}} \phi\left|\nabla w_{\xi}\right|^{2} \leq \\
& \quad \leq \int_{\mathbb{R}^{3}} \phi\left|w_{0}\right|^{2} d x+\int_{0}^{t} \int_{\mathbb{R}^{3}}\left|w_{\xi}\right|^{2}\left(\phi_{t}-\xi \cdot \nabla \phi+\Delta \phi\right) \int_{0}^{t} \int_{\mathbb{R}^{3}}\left(\left|w_{\xi}\right|^{2}+2 P_{w_{\xi}}\right) w_{\xi} \cdot \nabla \phi \tag{4.21}
\end{align*}
$$

where $P_{w_{\xi}}=R \otimes R\left(w_{\xi} \otimes w_{\xi}\right)$ and $\phi \in C_{c}^{\infty}\left(\mathbb{R}^{3}\right)$ is any test function $\phi \geq 0$. We choose

$$
\phi(y):=\sigma_{\nu}(y) \chi(\delta|y|), \quad \sigma_{\nu}(y):=\left(\nu+|y|^{2}\right)^{-\frac{1}{2}} \quad \nu, \delta>0
$$

where $\chi$ is a cut-off function supported in $[-1,1]$ and equal to 1 near 0 (compare with the proof of Lemma 8.2 in [2]). Letting $\delta \rightarrow 0$ and using the inequalities

$$
\begin{equation*}
\left|\nabla \sigma_{\nu}\right| \leq\left(\nu+|y|^{2}\right)^{-1}=\sigma_{\nu}^{2}, \quad \Delta \sigma_{\nu}<0 \tag{4.22}
\end{equation*}
$$

we obtain
$\left[\int_{\mathbb{R}^{3}} \sigma_{\nu}\left|w_{\xi}\right|^{2}\right]_{0}^{t}+2 \int_{0}^{t} \int_{\mathbb{R}^{3}} \sigma_{\nu}\left|\nabla w_{\xi}\right|^{2} \leq|\xi| \int_{0}^{t} \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|w_{\xi}\right|^{2}+\int_{0}^{t} \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left(\left|w_{\xi}\right|^{3}+2\left|P_{w_{\xi}}\right|\left|w_{\xi}\right|\right)$.
Our goal is to prove an integral inequality for the quanities

$$
a_{\nu}(t)=\int_{\mathbb{R}^{3}} \sigma_{\nu}\left|w_{\xi}\right|^{2}(t), \quad B_{\nu}(t)=\int_{0}^{t} \int_{\mathbb{R}^{3}} \sigma_{\nu}\left|\nabla w_{\xi}\right|^{2} .
$$

To proceed, we use the weighted $L^{p}$ inequality for the Riesz transform ([31]), uniform in $\nu \geq 0$

$$
\begin{equation*}
\left\|\sigma_{\nu}^{m} R \phi\right\|_{L^{s}} \leq Z\left\|\sigma_{\nu}^{m} \phi\right\|_{L^{s}}, \quad 1<s<\infty, \quad m \in\left(-\frac{3(s-1)}{s}, \frac{3}{s}\right) . \tag{4.23}
\end{equation*}
$$

For the pressure term we have, using (2.4) and (4.23),

$$
\begin{align*}
2 \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|P_{w_{\xi}} \| w_{\xi}\right| & =2 \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|w_{\xi} \| R \otimes R\left(w_{\xi} \otimes w_{\xi}\right)\right| \\
& \leq\left\|\sigma_{\nu} R \otimes R\left(w_{\xi} \otimes w_{\xi}\right)\right\|_{L^{8 / 5}}\left\|\sigma_{\nu} w_{\xi}\right\|_{L^{8 / 3}} \\
& \lesssim\left\|\sigma_{\nu}\left|w_{\xi}\right|^{2}\right\|_{L^{8 / 5}}\left\|\sigma_{\nu} w_{\xi}\right\|_{L^{8 / 3}} \\
& \leq\left\|w_{\xi}\right\|_{L^{4}}\left\|\sigma_{\nu} w_{\xi}\right\|_{L^{8 / 3}}^{2} \\
& \lesssim\left\|w_{\xi}\right\|_{L^{4}}\left\|\sigma_{\nu}^{1 / 2} \nabla w_{\xi}\right\|_{L^{2}}^{7 / 4}\left\|\sigma_{\nu}^{1 / 2} w_{\xi}\right\|_{L^{2}}^{1 / 4} \\
& =\left\|w_{\xi}\right\|_{L^{4}} \dot{B}_{\nu}^{7 / 4} a_{\nu}^{1 / 4} \leq \frac{\dot{B}_{\nu}}{6}+C\left\|w_{\xi}\right\|_{L^{4}}^{8} \cdot a_{\nu} \tag{4.24}
\end{align*}
$$

for some universal constant $C$. In a similar way,

$$
\begin{align*}
\int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|w_{\xi}\right|^{3} & \leq\left\|w_{\xi}\right\|_{L^{4}}\left\|\sigma_{\nu}^{2}\left|w_{\xi}\right|^{2}\right\|_{L^{4 / 3}}  \tag{4.25}\\
& =\left\|w_{\xi}\right\|_{L^{4}}\left\|\sigma_{\nu} w_{\xi}\right\|_{L^{8 / 3}}^{2} \\
& \lesssim\left\|w_{\xi}\right\|_{L^{4}}\left\|\sigma_{\nu}^{1 / 2} \nabla w_{\xi}\right\|_{L^{2}}^{7 / 4}\left\|\sigma_{\nu}^{1 / 2} w_{\xi}\right\|_{L^{2}}^{1 / 4} \\
& \leq \frac{\dot{B}_{\nu}}{6}+C\left\|w_{\xi}\right\|_{L^{4}}^{8} a_{\nu} \tag{4.26}
\end{align*}
$$

and

$$
\begin{equation*}
|\xi| \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|w_{\xi}\right|^{2} \lesssim|\xi| \cdot\left\|\sigma_{\nu}^{1 / 2} \nabla w_{\xi}\right\|_{L^{2}}\left\|\sigma_{\nu}^{1 / 2} w_{\xi}\right\|_{L^{2}}=|\xi|\left(\dot{B}_{\nu} a_{\nu}\right)^{1 / 2} \leq \frac{\dot{B}_{\nu}}{6}+C|\xi|^{2} a_{\nu} . \tag{4.27}
\end{equation*}
$$

Plugging these inequalities in the energy estimate we get

$$
\begin{equation*}
a_{\nu}(t)+B_{\nu}(t) \leq a_{\nu}(0)+\int_{0}^{t}\left(C|\xi|^{2}+3 C\left\|w_{\xi}(s, \cdot)\right\|_{L^{4}}^{8}\right) a(s) d s \tag{4.28}
\end{equation*}
$$

and passing to the limit $\nu \rightarrow 0$ we obtain, for some larger universal constant $C$ (note that $\left\|w_{\xi}(t)\right\|_{L^{4}}=\|w(t)\|_{L^{4}}$ for all $t$ )

$$
a(t)+B(t) \leq a(0)+C \int_{0}^{t}\left(|\xi|^{2}+\|w(s, \cdot)\|_{L^{4}}^{8}\right) a(s) d s
$$

where

$$
a(t)=\int_{\mathbb{R}^{3}}|y|^{-1}\left|w_{\xi}\right|^{2}(t), \quad B(t)=\int_{0}^{t} \int_{\mathbb{R}^{3}}|y|^{-1}\left|\nabla w_{\xi}\right|^{2}
$$

By a standard application of Gronwall's inequality, we obtain $a(t)<+\infty$ for all $t \geq 0$ which implies also $B(t)<+\infty$ for all $t \geq 0$ as claimed.
4.5. Second case: $0 \leq \bar{s}<T$. Since $v_{\xi}$ is a suitable weak solution of Problem (4.13), the following generalized energy inequality is valid (see e.g. [3] for details): for all $t \geq 0$ and $\phi \in C_{c}^{\infty}\left(\mathbb{R}^{+} \times \mathbb{R}^{3}\right)$, we have

$$
\begin{aligned}
\int_{\mathbb{R}^{3}} \phi(t, x)\left|v_{\xi}\right|^{2} d x & +2 \int_{0}^{t} \int_{\mathbb{R}^{3}} \phi\left|\nabla v_{\xi}\right|^{2} \leq \\
\leq & \int_{\mathbb{R}^{3}} \phi(0, x)\left|v_{0}\right|^{2} d x+\int_{0}^{t} \int_{\mathbb{R}^{3}}\left|v_{\xi}\right|^{2}\left(\phi_{t}-\xi \cdot \nabla \phi+\Delta \phi\right)+ \\
& +\int_{0}^{t} \int_{\mathbb{R}^{3}}\left(\left|v_{\xi}\right|^{2}+2 P_{v_{\xi}}\right) v_{\xi} \cdot \nabla \phi+\int_{0}^{t} \int_{\mathbb{R}^{3}}\left|v_{\xi}\right|^{2}\left(w_{\xi} \cdot \nabla \phi\right) \\
& +2 \int_{0}^{t} \int_{\mathbb{R}^{3}}\left(v_{\xi} \cdot w_{\xi}\right)\left(v_{\xi} \cdot \nabla \phi\right)+\phi\left(v_{\xi} \cdot \nabla\right) v_{\xi} \cdot w_{\xi}
\end{aligned}
$$

which implies

$$
\begin{align*}
& \int_{\mathbb{R}^{3}} \phi(t, x)\left|v_{\xi}\right|^{2} d x+2 \int_{0}^{t} \int_{\mathbb{R}^{3}} \phi\left|\nabla v_{\xi}\right|^{2} \leq \\
& \quad \leq \int_{\mathbb{R}^{3}} \phi(0, x)\left|v_{0}\right|^{2} d x+\int_{0}^{t} \int_{\mathbb{R}^{3}}\left|v_{\xi}\right|^{2}\left(\phi_{t}-\xi \cdot \nabla \phi+\Delta \phi\right)+ \\
& \quad+\int_{0}^{t} \int_{\mathbb{R}^{3}}\left(\left|v_{\xi}\right|^{2}+2 P_{v_{\xi}}\right) v_{\xi} \cdot \nabla \phi+\int_{0}^{t} \int_{\mathbb{R}^{3}} 3\left|v_{\xi}\right|^{2}\left|w_{\xi}\right||\nabla \phi|+18|\phi|\left|v_{\xi}\right|\left|\nabla v_{\xi} \| w_{\xi}\right| . \tag{4.29}
\end{align*}
$$

By a standard approximation procedure (see the proof of Lemma 8.3 in [2]) the estimate is valid for any test function of the form

$$
\phi(t, y):=\psi(t) \phi_{1}(y)
$$

with $\phi_{1} \in C_{c}^{\infty}\left(\mathbb{R}^{3}\right), \phi_{1} \geq 0$, and

$$
\psi: \mathbb{R}^{+} \rightarrow \mathbb{R} \quad \text { absolutely continuous with } \quad \dot{\psi} \in L^{1}\left(\mathbb{R}^{+}\right)
$$

We shall choose here

$$
\psi(t) \equiv 1, \quad \phi_{1}=\sigma_{\nu}(y) \chi(\delta|y|)
$$

where $\nu, \delta>0$,

$$
\sigma_{\nu}(y)=\left(\nu+|y|^{2}\right)^{-\frac{1}{2}},
$$

and $\chi: \mathbb{R}^{+} \rightarrow \mathbb{R}^{+}$is a smooth nonincreasing function such that

$$
\chi=1 \text { on }[0,1], \quad \chi=0 \text { on }[2,+\infty] .
$$

Passing to the limit $\delta \rightarrow 0$ in the energy inequality we obtain

$$
\begin{align*}
{\left[\int_{\mathbb{R}^{3}} \sigma_{\nu}\left|v_{\xi}\right|^{2}\right]_{0}^{t} } & +2 \int_{0}^{t} \int_{\mathbb{R}^{3}} \sigma_{\nu}\left|\nabla v_{\xi}\right|^{2} \leq \\
\leq & \int_{0}^{t} \int_{\mathbb{R}^{3}}\left|v_{\xi}\right|^{2}\left(-\xi \cdot \nabla \sigma_{\nu}+\Delta \sigma_{\nu}\right)+\int_{0}^{t} \int_{\mathbb{R}^{3}}\left(\left|v_{\xi}\right|^{2}+2 P_{v_{\xi}}\right) v_{\xi} \cdot \nabla \sigma_{\nu}  \tag{4.30}\\
& +18 \int_{0}^{t} \int_{\mathbb{R}^{3}} \sigma_{\nu}\left|v_{\xi}\right|\left|\nabla v_{\xi}\right|\left|w_{\xi}\right|+3 \int_{0}^{t} \int_{\mathbb{R}^{3}}\left|v_{\xi}\right|^{2}\left|w_{\xi}\right|\left|\nabla \sigma_{\nu}\right|
\end{align*}
$$

Note that a similar argument is used in [2], one of the differences here being the presence of the last two perturbative terms, which we control using (4.10). Recalling (4.22), we deduce the estimate

$$
\begin{align*}
& {\left[\int_{\mathbb{R}^{3}} \sigma_{\nu}\left|v_{\xi}\right|^{2}\right]_{0}^{t}+2 \int_{0}^{t} \int_{\mathbb{R}^{3}} \sigma_{\nu}\left|\nabla v_{\xi}\right|^{2} \leq} \\
& \quad \leq|\xi| \int_{0}^{t} \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|v_{\xi}\right|^{2}+\int_{0}^{t} \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left(\left|v_{\xi}\right|^{3}+2\left|P_{v_{\xi}}\right|\left|v_{\xi}\right|+3\left|v_{\xi}\right|^{2}\left|w_{\xi}\right|\right)+18 \sigma_{\nu}\left|v_{\xi}\right|\left|\nabla v_{\xi}\right|\left|w_{\xi}\right| \tag{4.31}
\end{align*}
$$

We can now proceed as in the first case, using (4.31) to obtain a Gronwall type inequality for the quantities

$$
a_{\nu}(t)=\left\|\sigma_{\nu}^{1 / 2} v_{\xi}\right\|_{L^{2}}^{2}, \quad B_{\nu}(t)=\int_{0}^{t}\left\|\sigma_{\nu}^{1 / 2} \nabla v_{\xi}(s)\right\|_{L^{2}}^{2} d s
$$

We first estimate the term in $P_{v_{\xi}}$; recall that

$$
P_{v_{\xi}}=R \otimes R\left(v_{\xi} \otimes v_{\xi}\right)+2 R \otimes R\left(v_{\xi} \otimes w_{\xi}\right) .
$$

We have
$2 \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|P_{v_{\xi}}\right|\left|v_{\xi}\right| \leq 2 \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|v_{\xi}\right|\left|R \otimes R\left(v_{\xi} \otimes v_{\xi}\right)\right|+4 \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|v_{\xi}\right|\left|R \otimes R\left(v_{\xi} \otimes w\right)\right|=: I+I I$.
Here and in the following, as usual, $Z$ denotes several universal constats, possibly different from line to line. By (4.23) we can write

$$
I \leq 2\left\|\sigma_{\nu} R \otimes R\left(v_{\xi} \otimes v_{\xi}\right)\right\|_{L^{2}} \leq Z\left\|\sigma_{\nu}\left|v_{\xi}\right|^{2}\right\|_{L^{2}}\left\|\sigma_{\nu} v_{\xi}\right\|_{L^{2}} \leq Z\left\|\sigma_{\nu}^{1 / 2} v_{\xi}\right\|_{L^{4}}^{2}\left\|\sigma_{\nu} v_{\xi}\right\|_{L^{2}}
$$

and then by the Caffarelli-Kohn-Nirenberg inequality we obtain
$I \leq Z\left\|\sigma_{\nu}^{1 / 2} \nabla v_{\xi}\right\|_{L^{2}}^{3 / 2}\left\|\sigma_{\nu}^{1 / 2} v_{\xi}\right\|_{L^{2}}^{1 / 2} \cdot\left\|\sigma_{\nu}^{1 / 2} \nabla v_{\xi}\right\|_{L^{2}}^{1 / 2}\left\|\sigma_{\nu}^{1 / 2} v_{\xi}\right\|_{L^{2}}^{1 / 2}=Z \dot{B}_{\nu} a_{\nu}^{1 / 2} \leq \frac{\dot{B}_{\nu}}{6}+Z \dot{B}_{\nu} a_{\nu}$.
In a similar way we have
$I I \leq 4\left\|\sigma_{\nu} R \otimes R\left(v_{\xi} \otimes w\right)\right\|_{L^{\frac{8}{5}}}\left\|\sigma_{\nu} v_{\xi}\right\|_{L^{\frac{8}{3}}} \leq Z\left\|\sigma_{\nu}\left|v_{\xi}\|w \mid\|_{L^{\frac{8}{5}}}\left\|\sigma_{\nu} v_{\xi}\right\|_{L^{\frac{8}{3}}} \leq Z\|w\|_{L^{4}}\left\|\sigma_{\nu} v_{\xi}\right\|_{L^{\frac{8}{3}}}^{2}\right.\right.$ and again by the CKN inequality

$$
\begin{equation*}
I I \leq Z\|w\|_{L^{4}}\left\|\sigma_{\nu}^{1 / 2} v_{\xi}\right\|_{L^{2}}^{1 / 4}\left\|\sigma_{\nu}^{1 / 2} \nabla v_{\xi}\right\|_{L^{2}}^{7 / 4},=Z\|w\|_{L^{4}} a_{\nu}^{\frac{1}{8}} \dot{B}_{\nu}{ }^{\frac{7}{8}} \leq \frac{\dot{B}_{\nu}}{6}+Z\|w\|_{L^{4}}^{8} a_{\nu} \tag{4.33}
\end{equation*}
$$

Consider now the other terms in (4.31). Proceeding as above, we have

$$
\begin{equation*}
|\xi| \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|v_{\xi}\right|^{2} \leq Z|\xi|\left\|\sigma_{\nu}^{1 / 2} \nabla v_{\xi}\right\|_{L^{2}}\left\|\sigma_{\nu}^{1 / 2} v_{\xi}\right\|_{L^{2}}=Z|\xi|\left(\dot{B}_{\nu} a_{\nu}\right)^{1 / 2} \leq \frac{\dot{B}_{\nu}}{6}+Z|\xi|^{2} a_{\nu} \tag{4.34}
\end{equation*}
$$

and

$$
\begin{equation*}
\int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|v_{\xi}\right|^{3}=\left\|\sigma_{\nu}^{2 / 3} v_{\xi}\right\|_{L^{3}}^{3} \leq Z\left\|\sigma_{\nu}^{1 / 2} \nabla v_{\xi}\right\|_{L^{2}}^{2}\left\|\sigma_{\nu}^{1 / 2} v_{\xi}\right\|_{L^{2}}=Z \dot{B}_{\nu} a_{\nu}^{1 / 2} \leq \frac{\dot{B}_{\nu}}{6}+Z \dot{B}_{\nu} a_{\nu} \tag{4.35}
\end{equation*}
$$

while for the perturbative terms we can write

$$
\begin{align*}
3 \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|v_{\xi}\right|^{2}\left|w_{\xi}\right| & \leq 3\left\|w_{\xi}\right\|_{L^{4}}\left\|\sigma_{\nu} v_{\xi}\right\|_{L^{8 / 3}}^{2} \leq Z\left\|w_{\xi}\right\|_{L^{4}}\left\|\sigma_{\nu}^{1 / 2} v_{\xi}\right\|_{L^{2}}^{1 / 4}\left\|\sigma_{\nu}^{1 / 2} \nabla v_{\xi}\right\|_{L^{2}}^{7 / 4} \\
& =Z\left\|w_{\xi}\right\|_{L^{4}} a_{\nu}^{1 / 8} \dot{B}_{\nu}^{7 / 8} \leq \frac{\dot{B}_{\nu}}{6}+Z\left\|w_{\xi}\right\|_{L^{4}}^{8} a_{\nu} \tag{4.36}
\end{align*}
$$

and

$$
\begin{align*}
18 \int_{\mathbb{R}^{3}} \sigma_{\nu}\left|v_{\xi}\left\|\nabla v_{\xi}\right\| w_{\xi}\right| & \leq 18\left\|\sigma_{\nu}^{1 / 2} \nabla v_{\xi}\right\|_{L^{2}}\left\|w_{\xi}\right\|_{L^{4}}\left\|\sigma_{\nu}^{1 / 2} v_{\xi}\right\|_{L^{4}} \\
& \leq Z\left\|\sigma_{\nu}^{1 / 2} \nabla v_{\xi}\right\|_{L^{2}}\left\|w_{\xi}\right\|_{L^{4}}\left\|\sigma_{\nu}^{1 / 2} \nabla v_{\xi}\right\|_{L^{2}}^{3 / 4}\left\|\sigma_{\nu}^{1 / 2} v_{\xi}\right\|_{L^{2}}^{1 / 4}  \tag{4.37}\\
& =Z\left\|w_{\xi}\right\|_{L^{4}} \dot{B}_{\nu}^{7 / 8} a_{\nu}^{1 / 8} \leq \frac{\dot{B}_{\nu}}{6}+Z\left\|w_{\xi}\right\|_{L^{4}}^{8} a_{\nu}
\end{align*}
$$

Now recalling (4.31), summing all the inequalities and absorbing a term $\int_{0}^{t} \dot{B}_{\nu}(s) d s \equiv$ $B_{\nu}(t)$ from the left hand side, we obtain

$$
a_{\nu}(t)+B_{\nu}(t) \leq a_{\nu}(0)+Z \int_{0}^{t}\left(|\xi|^{2}+\dot{B}_{\nu}(s)+\left\|w_{\xi}(s, \cdot)\right\|_{L^{4}}^{8}\right) a(s) d s
$$

and passing to the limit $\nu \rightarrow 0$, we arrive at the estimate

$$
a(t)+B(t) \leq a(0)+Z \int_{0}^{t}\left(|\xi|^{2}+\dot{B}(s)+\left\|w_{\xi}(s, \cdot)\right\|_{L^{4}}^{8}\right) a(s) d s
$$

for some universal constant $Z$, where

$$
a(t)=\int_{\mathbb{R}^{3}}|y|^{-1}\left|v_{\xi}(t, y)\right|^{2} d y, \quad B(t)=\int_{0}^{t} \int_{\mathbb{R}^{3}}|y|^{-1}\left|\nabla v_{\xi}(s, y)\right|^{2} d s d y .
$$

By a standard application of Gronwall's lemma we get for $0 \leq t \leq \bar{s}$

$$
a(t) \leq a(0)\left(1+Z A e^{Z A}\right), \quad A=B(\bar{s})+\|w\|_{L_{t}^{8} L_{x}^{4}}^{8}+\bar{s}|\xi|^{2} .
$$

By (4.16), (4.10) we have $A \leq 2 M^{2}+Z+\bar{s}|\xi|^{2}$, while by (4.6) we have $a(0) \leq\left(Z \theta_{2} \epsilon\right)^{2}$ (note that $w_{\xi}, v_{\xi}$ at fixed $t$ are just translations of $w, v$ respectively). If we restrict to the vectors $\xi$ such that ${ }^{7}$

$$
\begin{equation*}
|\xi|^{2} \bar{s} \leq M^{2} \tag{4.38}
\end{equation*}
$$

the estimate becomes

$$
a(\bar{s}) \leq\left(Z \theta_{2} \epsilon\right)^{2}\left(1+\left(3 M^{2}+Z\right) e^{3 M^{2}+Z}\right)
$$

and taking a possibly larger universal constant $Z$, this implies

$$
\begin{equation*}
a(\bar{s}) \leq Z e^{4 M^{2}}\left(\theta_{2} \epsilon\right)^{2} \tag{4.39}
\end{equation*}
$$

Notice that (4.38) is satisfied provided that

$$
\begin{equation*}
L(T, \xi) \subset\left\{(\tau, z): \tau \geq \frac{|z|^{2}}{M^{2}}\right\} \tag{4.40}
\end{equation*}
$$

${ }^{7}$ Remember that $\bar{s}$ is a function of $\xi$.

We now repeat the argument, starting from the point $(\bar{s}, \bar{s} \xi)$. We write the analogous of the energy inequality (4.29) on the time interval $\bar{s} \leq s \leq t$ with $t \leq \bar{s}+T$, choosing as test function $\phi(t, y):=\psi_{\nu}(t) \sigma_{\nu}(y) \chi(\delta|y|)$ where $\chi$ and $\sigma_{\nu}$ are as before, while

$$
\psi_{\nu}(t):=e^{-k B_{\bar{s}, \nu}(t)}, \quad B_{\bar{s}, \nu}(t):=\int_{\bar{s}}^{t} \int_{\mathbb{R}^{3}} \sigma_{\nu}\left|\nabla v_{\xi}\right|^{2}
$$

with $k$ a positive constant to be specified. Note that $B_{\bar{s}, \nu}$ is bounded if $\nu>0$ by the properties of $v$. In this way we obtain, letting $\delta \rightarrow 0$,

$$
\begin{aligned}
& {\left[\int_{\mathbb{R}^{3}} \psi_{\nu} \sigma_{\nu}\left|v_{\xi}\right|^{2}\right]_{\bar{s}}^{t}+2 \int_{\bar{s}}^{t} \int_{\mathbb{R}^{3}} \psi_{\nu} \sigma_{\nu}\left|\nabla v_{\xi}\right|^{2} \leq} \\
& \quad \leq \int_{\bar{s}}^{t} \int_{\mathbb{R}^{3}} \psi_{\nu}\left|v_{\xi}\right|^{2}\left(-k \dot{B}_{\bar{s}, \nu} \sigma_{\nu}-\xi \cdot \nabla \sigma_{\nu}+\Delta \sigma_{\nu}\right)+\int_{\bar{s}}^{t} \int_{\mathbb{R}^{3}} \psi_{\nu}\left(\left|v_{\xi}\right|^{2}+2 P_{v_{\xi}} v_{\xi}\right) \cdot \nabla \sigma_{\nu} \\
& \quad+18 \int_{\bar{s}}^{t} \int_{\mathbb{R}^{3}} \psi_{\nu} \sigma_{\nu}\left|v_{\xi}\right|\left|\nabla v_{\xi}\right|\left|w_{\xi}\right|+3 \int_{\bar{s}}^{t} \int_{\mathbb{R}^{3}} \psi_{\nu}\left|v_{\xi}\right|^{2}\left|w_{\xi}\right|\left|\nabla \sigma_{\nu}\right|,
\end{aligned}
$$

for $\bar{s} \leq t \leq \bar{s}+T$, and this implies, recalling (4.22),

$$
\begin{align*}
& {\left[\int_{\mathbb{R}^{3}} \psi_{\nu} \sigma_{\nu}\left|v_{\xi}\right|^{2}\right]_{\bar{s}}^{t}+2 \int_{\bar{s}}^{t} \int_{\mathbb{R}^{3}} \psi_{\nu} \sigma_{\nu}\left|\nabla v_{\xi}\right|^{2} \leq} \\
& \quad \leq \int_{\bar{s}}^{t} \int_{\mathbb{R}^{3}} \psi_{\nu}\left|v_{\xi}\right|^{2}\left(|\xi| \sigma_{\nu}^{2}-k \dot{B}_{\bar{s}, \nu} \sigma_{\nu}\right) \\
& \quad \quad+\int_{\bar{s}}^{t} \psi_{\nu} \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left(\left|v_{\xi}\right|^{3}+2\left|P_{v_{\xi}}\right|\left|v_{\xi}\right|+3\left|v_{\xi}\right|^{2}\left|w_{\xi}\right|\right)+18 \sigma_{\nu}\left|v_{\xi}\right|\left|\nabla v_{\xi}\right|\left|w_{\xi}\right| . \tag{4.41}
\end{align*}
$$

Our goal now is to prove an integral inequality involving the quantities

$$
a_{\nu}(t)=\int_{\mathbb{R}^{3}} \sigma_{\nu}\left|v_{\xi}(t, x)\right|^{2} d x, \quad B_{\bar{s}, \nu}(t)=\int_{\bar{s}}^{t} \int_{\mathbb{R}^{3}} \sigma_{\nu}\left|\nabla v_{\xi}\right|^{2} .
$$

We estimate the terms at the right hand side of (4.41). First of all we have
$2 \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|P_{v_{\xi}}\right|\left|v_{\xi}\right| \leq 2 \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|v_{\xi}\right|\left|R \otimes R\left(v_{\xi} \otimes v_{\xi}\right)\right|+4 \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|v_{\xi}\right|\left|R \otimes R\left(v_{\xi} \otimes w\right)\right|=: I+I I$.
With computations similar to those of the first step, using the boundedness of the Riesz transform and the CKN inequality, we obtain

$$
\begin{equation*}
I \leq \frac{\dot{B}_{\bar{s}, \nu}}{8}+Z \dot{B}_{\bar{s}, \nu} a_{\nu} \tag{4.42}
\end{equation*}
$$

and, by possibly increasing the value of $Z$ at each step,
$I I \leq Z\|w\|_{L^{4}}\left\|\sigma_{\nu}^{1 / 2} v_{\xi}\right\|_{L^{2}}^{1 / 4}\left\|\sigma_{\nu}^{1 / 2} \nabla v_{\xi}\right\|_{L^{2}}^{7 / 4}=Z\|w\|_{L^{4}} a_{\nu}^{1 / 8} \dot{B}_{\bar{s}, \nu}^{7 / 8} \leq \frac{\dot{B}_{\bar{s}, \nu}}{8}+\|w\|_{L^{4}}^{8}+Z a_{\nu} \dot{B}_{\bar{s}, \nu}$.
Next we have
$|\xi| \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|v_{\xi}\right|^{2}=|\xi|\left\|\sigma_{\nu} v_{\xi}\right\|_{L^{2}}^{2} \leq Z|\xi|\left\|\sigma_{\nu}^{1 / 2} \nabla v_{\xi}\right\|_{L^{2}}=Z|\xi|\left(\dot{B}_{\bar{s}, \nu} a_{\nu}\right)^{1 / 2} \leq|\xi|^{2}+Z \dot{B}_{\bar{s}, \nu} a_{\nu} ;$
and
$\int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|v_{\xi}\right|^{3}=\left\|\sigma_{\nu}^{2 / 3} v_{\xi}\right\|_{L^{3}}^{3} \leq Z\left\|\sigma_{\nu}^{1 / 2} \nabla v_{\xi}\right\|_{L^{2}}^{2}\left\|\sigma_{\nu}^{1 / 2} v_{\xi}\right\|_{L^{2}}=Z \dot{B}_{\bar{s}, \nu} a_{\nu}^{1 / 2} \leq \frac{\dot{B}_{\bar{s}, \nu}}{8}+Z \dot{B}_{\bar{s}, \nu} a_{\nu}$.
Finally, for the perturbative terms we have

$$
\begin{align*}
3 \int_{\mathbb{R}^{3}} \sigma_{\nu}^{2}\left|v_{\xi}\right|^{2}\left|w_{\xi}\right| & \leq 3\left\|w_{\xi}\right\|_{L^{4}}\left\|\sigma_{\nu} v_{\xi}\right\|_{L^{8 / 3}}^{2} \leq Z\left\|w_{\xi}\right\|_{L^{4}}\left\|\sigma_{\nu}^{1 / 2} v_{\xi}\right\|_{L^{2}}^{1 / 4}\left\|\sigma_{\nu}^{1 / 2} \nabla v_{\xi}\right\|_{L^{2}}^{7 / 4} \\
& =Z\left\|w_{\xi}\right\|_{L^{4}} a_{\nu}^{1 / 8} \dot{B}_{\bar{s}, \nu}^{7 / 8} \leq \frac{\dot{B}_{\bar{s}, \nu}}{8}+\left\|w_{\xi}\right\|_{L^{4}}^{8}+Z \dot{B}_{\bar{s}, \nu} a_{\nu} \tag{4.46}
\end{align*}
$$

and

$$
\begin{align*}
18 \int_{\mathbb{R}^{3}} \sigma_{\nu}\left|v_{\xi}\left\|\nabla v_{\xi}\right\| w_{\xi}\right| & \leq 18\left\|\sigma_{\nu}^{1 / 2} \nabla v_{\xi}\right\|_{L^{2}}\left\|w_{\xi}\right\|_{L^{4}}\left\|\sigma_{\nu}^{1 / 2} v_{\xi}\right\|_{L^{4}} \\
& \leq Z\left\|\sigma_{\nu}^{1 / 2} \nabla v_{\xi}\right\|_{L^{2}}\left\|w_{\xi}\right\|_{L^{4}}\left\|\sigma_{\nu}^{1 / 2} \nabla v_{\xi}\right\|_{L^{2}}^{3 / 4}\left\|\sigma_{\nu}^{1 / 2} v_{\xi}\right\|_{L^{2}}^{1 / 4}  \tag{4.47}\\
& =Z\left\|w_{\xi}\right\|_{L^{4}} a_{\nu}^{1 / 8} \dot{B}_{\bar{s}, \nu}^{7 / 8} \leq \frac{\dot{B}_{\bar{s}, \nu}}{8}+\left\|w_{\xi}\right\|_{L^{4}}^{8}+Z \dot{B}_{\bar{s}, \nu} a_{\nu}
\end{align*}
$$

We now plug the previous inequalities in (4.41) and we obtain

$$
\begin{aligned}
& a_{\nu}(t) \psi_{\nu}(t)-a_{\nu}(\bar{s})+2 \int_{\bar{s}}^{t} \dot{B}_{\bar{s}, \nu}(s) \psi_{\nu}(s) d s \leq \\
& \quad \leq \int_{\bar{s}}^{t} \psi_{\nu}(s)\left[\frac{5}{8} \dot{B}_{\bar{s}, \nu}(s)+6 Z \dot{B}_{\bar{s}, \nu} a_{\nu}+|\xi|^{2}+3\left\|w_{\xi}\right\|_{L^{4}}^{8}-k \dot{B}_{\bar{s}, \nu} a_{\nu}\right] d s .
\end{aligned}
$$

We subtract the first term at the right hand side from the left hand side; then we choose $k=6 Z$ and note that

$$
\int_{\bar{s}}^{t} \dot{B}_{\bar{s}, \nu} \psi_{\nu} \equiv-\frac{1}{6 Z} \int_{\bar{s}}^{t} \dot{\psi}_{\nu}=\frac{\psi_{\nu}(\bar{s})-\psi_{\nu}(t)}{6 Z}=\frac{1-\psi_{\nu}(t)}{6 Z}
$$

so that, for $\bar{s} \leq t \leq \bar{s}+T$, we obtain

$$
\begin{equation*}
a_{\nu}(t) \psi_{\nu}(t)-a_{\nu}(\bar{s})+\frac{1-\psi_{\nu}(t)}{6 Z} \leq|\xi|^{2} \int_{\bar{s}}^{t} \psi_{\nu}(s) d s+3 \int_{\bar{s}}^{t}\left\|w_{\xi}(s, \cdot)\right\|_{L^{4}}^{8} d s \tag{4.48}
\end{equation*}
$$

Consider now the increasing function, for $t \geq \bar{s}$,

$$
\begin{equation*}
B_{\bar{s}}(t):=\int_{\bar{s}}^{t} \int_{\mathbb{R}^{3}}|y|^{-1}\left|\nabla v_{\xi}(s, y)\right|^{2} d y d s \tag{4.49}
\end{equation*}
$$

which may become infinite at some point $t=t_{0}>\bar{s}$. By the definition of $\bar{s}$, we know that $B_{\bar{s}}(t) \geq M$ for $t \geq \bar{s}+T / M$; since $B_{\bar{s}, \nu} \rightarrow B_{\bar{s}}$ pointwise as $\nu \rightarrow 0$, we have also

$$
B_{\bar{s}, \nu}(s) \geq \frac{M}{2} \quad \text { for } \quad s \geq \bar{s}+\frac{T}{M} \quad \text { and } \quad \nu \quad \text { small enough. }
$$

Using this estimate for $s \geq \bar{s}+T / M$ and the obvious one $B_{\bar{s}, \nu} \geq 0$ for $s \leq \bar{s}+T / M$, we have easily

$$
\begin{equation*}
\int_{\bar{s}}^{\bar{s}+T} \psi_{\nu}(s) d s=\int_{\bar{s}}^{\bar{s}+T} e^{-3 Z B_{\bar{s}, \nu}(s)} d s \leq \frac{T}{M}+e^{-3 Z M}\left(T-\frac{T}{M}\right) \leq \frac{2 T}{M} \tag{4.50}
\end{equation*}
$$

(here we assumed $Z \geq 1$ ). We now use the estimate $a(\bar{s}) \leq Z e^{4 M^{2}}\left(\theta_{2} \epsilon\right)^{2}$ (proved in (4.39)) and note that we can assume

$$
\begin{equation*}
\theta_{2} \epsilon \leq 1 \quad \Longrightarrow \quad a(\bar{s}) \leq Z e^{4 M^{2}} \theta_{2} \epsilon \tag{4.51}
\end{equation*}
$$

Moreover by (4.10) we have also

$$
\left\|w_{\xi}\right\|_{L_{t}^{8} L_{x}^{4}}^{8}=\|w\|_{L_{t}^{8} L_{x}^{4}}^{8} \leq Z \theta_{1} \epsilon
$$

so that inequality (4.48) implies

$$
\left(a_{\nu}(t)-\frac{1}{6 Z}\right) \psi_{\nu}(t)+\frac{1}{6 Z}-3 Z \theta_{1} \epsilon-Z e^{4 M^{2}} \theta_{2} \epsilon-2|\xi|^{2} \frac{T}{M} \leq 0
$$

or equivalently

$$
\begin{equation*}
a_{\nu}(t)+\left(\frac{1}{6 Z}-3 Z \theta_{1} \epsilon-Z e^{4 M^{2}} \theta_{2} \epsilon-2|\xi|^{2} \frac{T}{M}\right) e^{6 Z B_{\bar{s}, \nu}(t)} \leq \frac{1}{6 Z} . \tag{4.52}
\end{equation*}
$$

We now assume $\epsilon$ is so small that

$$
\begin{equation*}
3 Z \theta_{1} \epsilon \leq \frac{1}{30 Z}, \quad Z e^{4 M^{2}} \theta_{2} \epsilon \leq \frac{1}{30 Z} \tag{4.53}
\end{equation*}
$$

(this implies also (4.51) and (4.9)), so that (4.52) implies

$$
\begin{equation*}
a_{\nu}(t)+\left(\frac{1}{10 Z}-2|\xi|^{2} \frac{T}{M}\right) e^{6 Z B_{\bar{s}, \nu}(t)} \leq \frac{1}{6 Z} . \tag{4.54}
\end{equation*}
$$

Assume in addition that $\xi$ satisfies

$$
\begin{equation*}
\left(\frac{1}{10 Z}-2|\xi|^{2} \frac{T}{M}\right)>0 \quad \text { i.e. }|\xi|^{2} T<\frac{M}{20 Z} . \tag{4.55}
\end{equation*}
$$

Note that this condition is stronger than the first condition (4.38) on $\xi$, i.e. $|\xi|^{2} \bar{s} \leq$ $M^{2}$, since $M, Z \geq 1$ and $\bar{s} \leq T$. Then, if we let $\nu \rightarrow 0$, we have
$a_{\nu}(t) \rightarrow a(t):=\int_{\mathbb{R}^{3}}|y|^{-1}\left|v_{\xi}(t, y)\right|^{2} d y, \quad B_{\bar{s}, \nu}(t) \rightarrow B_{\bar{s}}(t):=\int_{\bar{s}}^{t} \int_{\mathbb{R}^{3}}|y|^{-1}\left|\nabla v_{\xi}(s, y)\right|^{2} d y d s$
and (4.54) implies, for all $\bar{s} \leq t \leq \bar{s}+T$

$$
\begin{equation*}
a(t)+\left(\frac{1}{10 Z}-2|\xi|^{2} \frac{T}{M}\right) e^{6 Z B_{\bar{s}}(t)} \leq \frac{1}{6 Z} . \tag{4.56}
\end{equation*}
$$

In particular we see that $a(t)$ and $B_{\bar{s}}(t)$ are finite for $\bar{s} \leq t \leq \bar{s}+T$. Since by the definition of $\bar{s}$ we already know that $B(\bar{s}) \leq 2 M^{2}<+\infty$, we conclude that

$$
B(s)<+\infty \quad \text { for all } 0 \leq s \leq \bar{s}+T
$$

In particular we have

$$
\begin{equation*}
B(T)=\int_{0}^{T} \int|y|^{-1}\left|\nabla v_{\xi}(s, y)\right|^{2} d y d s \equiv \int_{0}^{T} \int|x-s \xi|^{-1}|\nabla v(s, x)|^{2} d y d s<+\infty \tag{4.57}
\end{equation*}
$$

and then the same argument used to conclude the proof in the first case $(\bar{s}=T)$ gives also in the second case $(\bar{s}<T)$ that $L(T, \xi)$ is a regular set, provided (4.53), (4.55) are satisfied.
4.6. Conclusion of the proof. Summing up, we have proved that there exists a universal constant $Z$ such that for any $\widetilde{p} \in[2,4), M \geq 1, T>0$ and $\xi \in \mathbb{R}^{3} \backslash 0$ the following holds: if $\epsilon=\left[u_{0}\right]_{\tilde{p}}$ is small enough to satisfy (4.53), and $T, \xi$ are such that (4.55) holds, then the segment $L(T, \xi)$ is a regular set for the weak solution $u$.

Now define

$$
\delta=\frac{1}{90 Z^{2}}
$$

Then (4.53) is implied by

$$
\begin{equation*}
\theta_{1} \epsilon \leq \delta, \quad \theta_{2} \epsilon \leq \delta e^{-4 M^{2}} \tag{4.58}
\end{equation*}
$$

while (4.55) is implied by

$$
|\xi|^{2} T<M \delta \quad \Longleftrightarrow \quad T>\frac{|T \xi|^{2}}{M \delta}
$$

or equivalently

$$
\begin{equation*}
(T, T \xi) \in \Pi_{M \delta}, \quad \Pi_{M \delta}:=\left\{(t, x) \in \mathbb{R}^{+} \times \mathbb{R}^{3}: t>\frac{|x|^{2}}{M \delta}\right\} \tag{4.59}
\end{equation*}
$$

In other words, if $\epsilon$ satisfies (4.58) and $(T, T \xi)$ belongs to the paraboloid $\Pi_{M \delta}$, then $L(T, \xi)$ is a regular set. Since $\Pi_{M \delta}$ is the union of such segments for arbitrary $T>0$, we conclude that $\Pi_{M \delta}$ is a regular set for the solution $u$, provided (4.58) holds.

[^1]:    ${ }^{1}$ The space $L_{u l o c}^{2}$ consists of the functions that are uniformly locally square-integrable (see [20] Definition 11.3). The operator (1.4) is well-defined on $\bigcap_{s<\infty} L_{t}^{2} L_{u l o c, x}^{2}\left((0, s) \times \mathbb{R}^{3}\right) \times$ $\bigcap_{s<\infty} L_{t}^{2} L_{u l o c, x}^{2}\left((0, s) \times \mathbb{R}^{3}\right)$. We refer to [20], Chapter 11, for more details.

[^2]:    ${ }^{2}$ As usual we write $A \lesssim B$ if there is a constant $C$ independent of $A, B$ such that $A \leq C B$ and $A \simeq B$ if $A \lesssim B$ and $B \lesssim A$.

[^3]:    ${ }^{3}$ Here and in the following we use the notation $\|f\|_{X Y Z}:=\| \|\|f\|_{Z}\left\|_{Y}\right\|_{X}$ for nested norms. When we write $\|u\|_{L_{t}^{r} L_{x}^{q}}$ we mean that the inegration is extended to all the times $t>0$.

[^4]:    ${ }^{4}$ This definition of suitable weak solutions is appropriate to work with the initial datum $u_{0}$. For more details compare the Sections 2 and 7 of [2].

[^5]:    ${ }^{5}$ Except that the value $q=p$ is not allowed in (1.6).

[^6]:    ${ }^{6}$ Notice that $v \rightharpoonup v_{0}$ in $L^{2}$ because $u \rightharpoonup u_{0}$ in $L^{2}$ (being $u$ a suitable weak solution of (1.1)) and $w \rightarrow w_{0}$ in $L^{2}$ (by Corollary (3.3)).
