On the complete faithfulness of the $p$-free quotient modules of dual Selmer groups

Meng Fai Lim*

Abstract

In this paper, we consider the question of the complete faithfulness of the $p$-free quotient module of the dual Selmer groups of elliptic curves defined over a noncommutative $p$-adic Lie extension. Our question will refine previous questions on the complete faithfulness of dual Selmer groups. We also consider the question of the triviality of the central torsion submodules of these Iwasawa modules and we see that this latter question is intimately related to the former. We will also formulate and study analogous questions for the dual Selmer groups of Hida deformations. We then give positive answer to our questions, and establish “control theorem” results between the questions in certain cases.

Keywords and Phrases: Completely faithful modules, central torsion submodules, Selmer groups, elliptic curves, Hida deformations.

Mathematics Subject Classification 2010: 11F80, 11G05, 11R23, 11R34, 16S34.

1 Introduction

Let $p$ be an odd prime. We are interested in a certain class of modules defined over the Iwasawa algebra

$$Z_p[G] = \lim_{\leftarrow} Z_p[G/U]$$

of a noncommutative compact pro-$p$ torsionfree Lie group $G$. The modules belonging to this class are called completely faithful modules (see Section 2 for the precise definition). The motivation of studying these modules arises from noncommutative Iwasawa theory in the search of a global annihilator for the dual Selmer group of an elliptic curve defined over a noncommutative $p$-adic Lie extension. Such a global annihilator, if it exists, will give insight to the noncommutative $p$-adic $L$-function. Unfortunately, the attempt to find a global annihilator proved futile, and this was first pointed out by Hachimori and Venjakob in [13]. There, by building on a previous work of Venjakob [30], they constructed examples of completely faithful dual Selmer groups over a certain class of $Z_p \rtimes Z_p$-extensions. We should mention that the question of the complete faithfulness of the dual Selmer group was also raised in [5]. Since then, many authors, including the present author, have studied completely faithful modules over Iwasawa algebra of

*School of Mathematics and Statistics, Central China Normal University, 152 Luoyu Road, Wuhan, Hubei, P.R.China 430079. E-mail: limmf@mail.ccnu.edu.cn
other compact $p$-adic Lie groups and constructed examples of completely faithful dual Selmer groups over $p$-adic Lie extensions with Galois groups realized by such $p$-adic Lie groups (see [1] [2] [8] [20]). In this paper, we will consider a refinement of the question of complete faithfulness which we now describe.

Let $F$ be a number field and $E$ an elliptic curve defined over $F$ which has either good ordinary reduction or multiplicative reduction at each prime of $F$ above $p$. Let $F_\infty$ be a $p$-adic Lie extension of $F$ with the properties that the Galois group $G = \text{Gal}(F_\infty/F)$ is a noncommutative compact pro-$p$ Lie group with no $p$-torsion and that $F_\infty$ contains the cyclotomic $\mathbb{Z}_p$-extension $F^{\text{cyc}}$. A common phenomenon in all the examples of completely faithful dual Selmer groups mentioned in the previous paragraph is that they are all finitely generated over $\mathbb{Z}_p[H]$. In fact, the question raised in [5] was also posed under the condition when the dual Selmer group in question is finitely generated over $\mathbb{Z}_p[H]$. It is then natural to ask what can be said if the dual Selmer group is not finitely generated over $\mathbb{Z}_p[H]$. Denote by $X(E/F_\infty)$ the dual Selmer group of $E$ defined over $F_\infty$. We write $X_f(E/F_\infty)$ for the $p$-primary submodule of $X(E/F_\infty)$ and write $X_f(E/F_\infty) = X(E/F_\infty)/X(E/F_\infty)(p)$.

There are examples of $X_f(E/F_\infty)$ being not pseudo-null. Building on this observation, the author has produced examples of faithful dual Selmer groups that are not completely faithful in [20]. Therefore, one may cut off the $p$-primary submodule of $X(E/F_\infty)$, and ask the natural question of whether $X_f(E/F_\infty)$ is completely faithful. This will be the main theme of the paper. Throughout the paper, $X_f(E/F_\infty)$ is said to satisfy Property CF whenever $X_f(E/F_\infty)$ is either pseudo-null or completely faithful, and we will be interested in the question of the validity of Property CF. We also propose and study a question on the triviality of the central torsion submodules of the dual Selmer group, and we say that $X_f(E/F_\infty)$ satisfies Property CT whenever this triviality condition holds. As already observed in literature (see [1] [2] [5] [8]), these two questions are intimately related. We also formulate versions of Property CF and Property CT for an appropriate Selmer group attached to an ordinary Hida deformation (see Section 5). We mention that the variant of the Selmer group used here was first introduced by Greenberg [10] and has been incorporated to the noncommutative situation (for instance, see [6] [26]).

We now describe the main results of this paper. As mentioned in the previous paragraph, Property CF and Property CT are intimately related. In most arithmetic situations, one can deduce the validity of Property CT from the validity of CF (see Sections 4 and 5). The reverse implication is a slightly more subtle issue, and there has been some recent studies of Ardakov [1] and Csige [8] in this direction. In this paper, we will establish a “control theorem” type result which allows the deduction of the validity of Property CT for an elliptic curve from the validity of Property CF over a smaller extension (see Theorem 6.2). We also establish an analogous result which allows us to deduce the validity of Property CT for the Selmer group of the Hida deformation from the validity of Property CF for the Selmer group of its specialization (see Theorem 6.4). The point of our result is that we do not have a control theorem.
for Property CF in general yet. In a previous paper [20], the author established a control theorem for faithfulness of the Selmer group which is a weaker assertion than Property CF (see [20, Section 6]). In view of the theorem obtained there, it is natural to believe (and hope) that there should be a control theorem for Property CF. Since our results are implied by such a control theorem, they can be viewed as partial support to this belief. Furthermore, by combining our “control theorems” with the results of Ardakov [1] and Csige [8], we establish a control theorem for Property CF (see Theorems 7.2 and 7.3) for a certain class of p-adic Lie extensions, thus giving a first concrete substantiation of our belief.

We now give a brief description of the layout of the paper. In Section 2, we will review certain algebraic preliminaries which will be used subsequently in the paper. In Section 3 (resp., Section 4), we formulate Property CF (resp., Property CT) for the Selmer group of an elliptic curve. The analogue of Property CF and Property CT for the Selmer group of a Hida deformation will be introduced in Section 5. In Section 6, we will prove our main “control theorems”. We then combine these theorems with the results of Ardakov and Csige to obtain control theorems for Property CF in Section 7. Finally, in Section 8, we discuss some numerical examples.

2 Algebraic Preliminaries

In this section, we establish some more or less standard algebraic preliminaries and notation which are necessary for the discussion in the paper. Throughout the paper, we will always work with left modules over a ring, where the ring is in turn always assumed to contain 1. Let Λ be a Auslander regular ring (for instance, see [29, Definition 3.3]) with no zero divisors. In particular, Λ is a (not necessarily commutative) Noetherian ring which has no zero divisors. It is then well-known that the ring Λ admits a skew field of fractions K(Λ) which is flat over Λ (see [9, Chapters 6 and 10] or [17, Chapter 4, §9 and §10]). Thanks to this well-known fact, one can define the notion of Λ-rank and Λ-torsion module which we now do. For a finitely generated Λ-module M, its Λ-rank is defined by the following formula:

\[ \text{rank}_\Lambda M = \dim_{K(\Lambda)} K(\Lambda) \otimes_\Lambda M. \]

Then the Λ-module M is said to be torsion if \( \text{rank}_\Lambda M = 0 \).

We now set to define the notion of a completely faithful Λ-module. To prepare for this, we first recall that for a nonzero Λ-module M, the global annihilator ideal of M is defined by

\[ \text{Ann}_\Lambda(M) = \{ \lambda \in \Lambda : \lambda m = 0 \text{ for all } m \in M \}. \]

It is then a fairly straightforward exercise to check that this is a two-sided ideal of Λ, and we will say that M is a faithful Λ-module if \( \text{Ann}_\Lambda(M) = 0 \). Denote by \( \mathcal{M} \) the category of all finitely generated torsion Λ-modules and by \( \mathcal{C} \) the full subcategory of all pseudo-null Λ-modules in \( \mathcal{M} \). Here we recall that a finitely generated torsion Λ-module M is said to be pseudo-null if \( \text{Ext}^1_\Lambda(M, \Lambda) = 0 \). Write \( q : \mathcal{M} \to \mathcal{M}/\mathcal{C} \) for the quotient functor. Equipped with these notions, a finitely generated torsion Λ-module M is then said to be completely faithful if \( \text{Ann}_\Lambda(N) = 0 \) for any \( N \in \mathcal{M} \) such that \( q(N) \) is isomorphic to a non-zero subquotient of \( q(M) \). The following simple observation will be frequently used in the paper.
Lemma 2.1. Suppose that
\[ \alpha : M \rightarrow N \]
is a $\Lambda$-homomorphism of finitely generated torsion $\Lambda$-modules with the property that $\ker \alpha$ and $\coker \alpha$ are pseudo-null $\Lambda$-modules, then $M$ is a completely faithful $\Lambda$-module (resp., pseudo-null $\Lambda$-module) if and only if $N$ is a completely faithful $\Lambda$-module (resp., pseudo-null $\Lambda$-module).

Proof. Since $\ker \alpha$ and $\coker \alpha$ are pseudo-null $\Lambda$-modules, we have that $q(\alpha) : q(M) \rightarrow q(N)$ is an isomorphism in $\mathcal{M}/\mathcal{C}$. The assertion of the lemma is now immediate from this.

We introduce further notation which we will frequently use in this paper without further comment. Let $x \in \Lambda$. Denote by $M[x]$ the set consisting of elements of $M$ annihilated by $x$. In general, $M[x]$ is at most an additive subgroup of $M$. However, if one assumes further that $x\Lambda = \Lambda x$, it is then easy to verify that $M[x]$ is a $\Lambda$-submodule of $M$. Also, one can check easily that $xM = \{xm : m \in M\}$ is a $\Lambda$-submodule of $M$, and that $M/xM$ is a $\Lambda/x\Lambda$-module.

We now introduce the class of Auslander regular rings with no zero divisors that will be considered in this paper. Namely, this class comes from the Iwasawa algebras of compact $p$-adic Lie groups which was first discovered by Venjakob [29]. From now on, $p$ will denote a fixed odd prime, and $G$ will denote a compact pro-$p$ $p$-adic Lie group without $p$-torsion. The completed group algebra of $G$ over $\mathbb{Z}_p$ is given by
\[ \mathbb{Z}_p[G] = \lim_{\leftarrow} U \mathbb{Z}_p[G/U], \]
where $U$ runs over the open normal subgroups of $G$ and the inverse limit is taken with respect to the canonical projection maps. A celebrated theorem of Lazard [18] asserts that the ring $\mathbb{Z}_p[G]$ is Noetherian. Venjakob went one step further by establishing that $\mathbb{Z}_p[G]$ is an Auslander regular ring (see [29, Theorem 3.26]). Furthermore, it follows from an earlier work of Neumann [24] that the ring $\mathbb{Z}_p[G]$ has no zero divisors. Therefore, there is a well-defined notion of $\mathbb{Z}_p[G]$-rank, torsion $\mathbb{Z}_p[G]$-module, pseudo-null $\mathbb{Z}_p[G]$-module and completely faithful $\mathbb{Z}_p[G]$-module. We record another well-known and important result of Venjakob (cf. [30, Example 2.3 and Proposition 5.4]) which we require in the discussion of the paper.

Theorem 2.2 (Venjakob). Suppose that $H$ is a closed normal subgroup of $G$ with $G/H \cong \mathbb{Z}_p$. For a compact $\mathbb{Z}_p[G]$-module $M$ which is finitely generated over $\mathbb{Z}_p[H]$, we have that $M$ is a pseudo-null $\mathbb{Z}_p[G]$-module if and only if $M$ is a torsion $\mathbb{Z}_p[H]$-module.

We record another useful lemma which is a special case of [21, Lemma 4.5].

Lemma 2.3. Let $H$ be a compact pro-$p$ $p$-adic Lie group without $p$-torsion. Let $N$ be a closed normal subgroup of $H$ such that $N \cong \mathbb{Z}_p$ and such that $H/N$ is also a compact pro-$p$ $p$-adic Lie group without $p$-torsion. Let $M$ be a finitely generated $\mathbb{Z}_p[H]$-module. Then $H_1(N,M)$ is finitely generated over $\mathbb{Z}_p[H/N]$.
for each $i$ and $H_i(N, M) = 0$ for $i \geq 2$. Furthermore, we have an equality

Now, for a given finitely generated $\mathbb{Z}_p[[G]]$-module $M$, denote by $M(p)$ the $\mathbb{Z}_p[[G]]$-submodule of $M$ consisting of elements of $M$ which are annihilated by some power of $p$. We shall call $M(p)$ the $p$-primary submodule of $M$. A finitely generated $\mathbb{Z}_p[[G]]$-module $M$ is then said to be $p$-primary if $M = M(p)$. Since the ring $\mathbb{Z}_p[G]$ is Noetherian and $M$ is finitely generated over $\mathbb{Z}_p[[G]]$, the module $M(p)$ is certainly finitely generated over $\mathbb{Z}_p[G]$. As a consequence, there exists a sufficiently large integer $r \geq 0$ such that $p^r$ annihilates $M(p)$. Following [16] Formula (33), we define

$$\mu_G(M) = \sum_{i \geq 0} \text{rank}_{\mathbb{Z}_p}[G] (p^i M(p)/p^{i+1}),$$

which is a finite sum by our discussion. (For another alternative, but equivalent, definition, see [29] Definition 3.32.) It is immediate from the definition that $\mu_G(M) = \mu_G(M(p))$. The following lemma collects several properties of the $\mu_G$-invariant which will be used in the paper.

**Lemma 2.4.** Let $G$ be a compact pro-$p$ $p$-adic Lie group without $p$-torsion and $M$ a finitely generated $\mathbb{Z}_p[[G]]$-module. Then we have the following statements.

(a) The $\mu_G$-invariant is additive on short exact sequences of torsion $\mathbb{Z}_p[[G]]$-modules.

(b) Suppose that $G$ has a closed normal subgroup $H$ such that $G/H \cong \mathbb{Z}_p$. If $M$ is a $\mathbb{Z}_p[[G]]$-module which is finitely generated over $\mathbb{Z}_p[[H]]$, then $\mu_G(M) = 0$.

(c) We have $\mu_G(M) = 0$ if and only if $M(p)$ is pseudo-null over $\mathbb{Z}_p[[G]]$. In particular, if $M$ is a $p$-primary $\mathbb{Z}_p[[G]]$-module, then $\mu_G(M) = 0$ if and only if $M$ is pseudo-null over $\mathbb{Z}_p[[G]]$.

(d) Suppose that $M$ is a completely faithful $\mathbb{Z}_p[[G]]$-module. Then $M(p)$ is pseudo-null over $\mathbb{Z}_p[[G]]$ and $\mu_G(M) = 0$.

**Proof.** Statement (a) follows from [16] Proposition 1.8 (see also [29] Corollary 3.37). Statement (b) is precisely [16] Lemma 2.7. The validity of statement (c) is established in [29] Remark 3.33. We now show statement (d). Since $M(p)$ is a $\mathbb{Z}_p[[G]]$-submodule of $M$ which is annihilated by some power of $p$ and $M$ is completely faithful, we must have that $M(p)$ is a pseudo-null $\mathbb{Z}_p[[G]]$-module. By statement (c), this in turn implies that $\mu_G(M) = \mu_G(M(p)) = 0$. \qed

### 3 A question on complete faithfulness

In this section, we introduce and formulate Property CF for the Selmer group of an elliptic curve. Fix once and for all an algebraic closure $\bar{Q}$ of $Q$. Therefore, an algebraic (possibly infinite) extension of $Q$ will mean an subfield of $\bar{Q}$. A finite extension $F$ of $Q$ will be called a number field. Let $E$ be an elliptic
curve which is defined over a number field $F$. Suppose that for every prime $v$ of $F$ above $p$, the elliptic curve $E$ has either good ordinary reduction or multiplicative reduction at $v$.

Let $v$ be a prime of $F$. For every finite extension $L$ of $F$, we define

$$J_v(E/L) = \bigoplus_{w | v} H^1(L_w, E)_p,$$

where $w$ runs over the (finite) set of primes of $L$ above $v$. For an infinite algebraic extension $\mathcal{L}$ of $F$, set

$$J_v(E/\mathcal{L}) = \lim_{\longrightarrow} J_v(E/L),$$

where the direct limit is taken over all finite extensions $L$ of $F$ contained in $\mathcal{L}$. The Selmer group of $E$ over $\mathcal{L}$ is then denoted and defined by

$$S(E/\mathcal{L}) = \ker \left( H^1(\mathcal{L}, E_{p^\infty}) \rightarrow \bigoplus_v J_v(E/\mathcal{L}) \right),$$

where $v$ runs through all the primes of $F$.

In this paper, we are interested in studying Selmer groups defined over an important class of infinite algebraic extensions of $F$ which we now define. A Galois extension $F_\infty$ of $F$ is said to be an admissible $p$-adic Lie extension of $F$ if (i) $\text{Gal}(F_\infty/F)$ is a compact $p$-adic Lie group, (ii) $F_\infty$ contains the cyclotomic $\mathbb{Z}_p$-extension $F^{\text{cycl}}$ of $F$ and (iii) $F_\infty$ is unramified outside a finite set of primes of $F$. Furthermore, if the group $\text{Gal}(F_\infty/F)$ has no $p$-torsion, we say that $F_\infty$ is a strongly admissible $p$-adic Lie extension of $F$. We shall write $G = \text{Gal}(F_\infty/F)$, $H = \text{Gal}(F_\infty/F^{\text{cycl}})$ and $\Gamma = \text{Gal}(F^{\text{cycl}}/F)$. Let $S$ be any finite set of primes of $F$ which contains the primes above $p$, the infinite primes, the primes at which $E$ has bad reduction and the primes that are ramified in $F_\infty/F$. The maximal algebraic extension of $F$ unramified outside $S$ is then denoted by $F_S$, and for every algebraic extension $\mathcal{L}$ of $F$ contained in $F_S$, we write $G_S(\mathcal{L}) = \text{Gal}(F_S/\mathcal{L})$. The following equivalent description

$$S(E/F_\infty) = \ker \left( H^1(G_S(F_\infty), E_{p^\infty}) \stackrel{\lambda_{E/F_\infty}}{\rightarrow} \bigoplus_{v \in S} J_v(E/F_\infty) \right)$$

of the Selmer group of $E$ over $F_\infty$ is well-known (for instance, see [6, Lemma 2.2]) and will be utilized without further comment. From now on, we shall denote by $X(E/F_\infty)$ the Pontryagin dual of $S(E/F_\infty)$.

As mentioned in the Introduction, when $X(E/F_\infty)$ is finitely generated over $\mathbb{Z}_p[H]$, the question of the complete faithfulness of $X(E/F_\infty)$ has been studied by many authors (see [11, 2, 5, 13, 20]). It is then natural to consider the situation $X(E/F_\infty)$ is not finitely generated over $\mathbb{Z}_p[H]$. In this case, the present author has previously constructed examples of dual Selmer groups which are faithful but not completely faithful (see [21]). As observed loc. cit., these examples of dual Selmer groups have positive $\mu$-invariants. Furthermore, in view of Lemma [2.4, (d)], to be able to speak of complete faithfulness of a general module, one needs to cut off its $p$-primary submodule. We will therefore introduce the following property which will be the main theme of the paper.

Write $X_f(E/F_\infty) := X(E/F_\infty)/X(E/F_\infty)(p)$. We say that $X(E/F_\infty)$ (or $X_f(E/F_\infty)$) satisfies Property CF if $X_f(E/F_\infty)$ is either a pseudo-null $\mathbb{Z}_p[\Gamma]$-module or a completely faithful $\mathbb{Z}_p[\Gamma]$-module.
In this paper, we will be interested in studying the validity of Property CF. We first show that this question covers the original question of Coates et al.

**Lemma 3.1.** Let $E$ be an elliptic curve over $F$ which has either good ordinary reduction or multiplicative reduction at every prime of $F$ above $p$. Let $F_\infty$ be a noncommutative strongly admissible $p$-adic Lie extension of $F$ with $G = \text{Gal}(F_\infty/F)$. Assume that $X(E/F_\infty)$ is finitely generated over $\mathbb{Z}_p[[H]]$. Then the following statements are equivalent.

(a) $X(E/F_\infty)$ is either a pseudo-null $\mathbb{Z}_p[G]$-module or a completely faithful $\mathbb{Z}_p[[G]]$-module.

(b) $X_f(E/F_\infty)$ is either a pseudo-null $\mathbb{Z}_p[G]$-module or a completely faithful $\mathbb{Z}_p[[G]]$-module.

**Proof.** Since $X(E/F_\infty)$ is finitely generated over $\mathbb{Z}_p[[H]]$, so is $X(E/F_\infty)(p)$. It then follows from Lemma 2.4(b) and (c) that $X(E/F_\infty)(p)$ is pseudo-null over $\mathbb{Z}_p[G]$. The equivalence of the statements of the lemma is now an immediate consequence of Lemma 2.1. □

**Remark 3.2.** In fact, if $E$ has good ordinary reduction at all the primes above $p$ and $F_\infty$ is not totally real, we have the following sharper observation. Namely, if $X(E/F_\infty)$ is finitely generated over $\mathbb{Z}_p[[H]]$, then $X(E/F_\infty)(p) = 0$ and $X(E/F_\infty) = X_f(E/F_\infty)$. To see this, first note that since $X(E/F_\infty)$ is finitely generated over $\mathbb{Z}_p[[H]]$, we have that $X(E/L^{\text{cyc}})$ is finitely generated over $\mathbb{Z}_p$ for every finite extension $L$ of $F$ contained in $F_\infty$. Since $F_\infty$ is not totally real, we can rewrite $X(E/F_\infty) = \lim_{\longleftarrow} X(E/L^{\text{cyc}})$, where $L$ runs through all finite non totally real extensions of $F$ contained in $F_\infty$. Since $X(A/L^{\text{cyc}})$ is finitely generated over $\mathbb{Z}_p$, by an application of [22, Proposition 7.5], the multiplication by $p$-map on $X(E/L^{\text{cyc}})$ is an injection. As inverse limit is left exact, it then follows that the multiplication by $p$-map on $X(E/F_\infty)$ is also an injection. Consequently, we have $X(E/F_\infty)(p) = 0$ and $X(E/F_\infty) = X_f(E/F_\infty)$.

The next proposition shows that the validity of Property CF is invariant under isogeny.

**Proposition 3.3.** Let $E_1$ and $E_2$ be two elliptic curves over $F$ with either good ordinary reduction or multiplicative reduction at every prime of $F$ above $p$. Let $F_\infty$ be a noncommutative strongly admissible noncommutative $p$-adic Lie extension of $F$ with $G = \text{Gal}(F_\infty/F)$. Suppose that $E_1$ and $E_2$ are isogenous to each other over $F$, and suppose that $X(E_1/F_\infty)$ is a torsion $\mathbb{Z}_p[[G]]$-module. Then $X(E_2/F_\infty)$ is a torsion $\mathbb{Z}_p[[G]]$-module. Furthermore, $X(E_1/F_\infty)$ satisfies Property CF if and only if $X(E_2/F_\infty)$ satisfies Property CF.

**Proof.** Let $\varphi : E_2 \longrightarrow E_1$ be an isogeny defined over $F$. Then $\varphi$ induces homomorphisms on the cohomology groups and Selmer groups, giving rise to the following commutative diagram

$$
\begin{array}{ccc}
0 & \longrightarrow & S(E_2/F_\infty) \\
\varphi_1 \downarrow & & \downarrow \varphi_2 \\
0 & \longrightarrow & S(E_1/F_\infty)
\end{array}
\begin{array}{ccc}
& & \longrightarrow \\
& & \varphi_3 \\
& & \longrightarrow \\
& & \longrightarrow
\end{array}
\begin{array}{ccc}
H^1(G_S(F_\infty), E_{2,p_\infty}) & \longrightarrow & \bigoplus_{v \in S} J_v(E_2/F_\infty) \\
& & \varphi_3 \\
& & \bigoplus_{v \in S} J_v(E_1/F_\infty) \\
& & \longrightarrow \\
& & \longrightarrow
\end{array}
$$
with exact rows. Since \( \ker \varphi_2 = H^1(G_2(F_\infty), \ker \varphi) \) and \( \coker \varphi_2 \subseteq H^2(G_2(F_\infty), \ker \varphi) \), it follows that \( \ker \varphi_2 \) and \( \coker \varphi_2 \) are killed by the \( p \)-order of \( \ker \varphi \). Similarly, one can also show that \( \ker \varphi_3 \) is killed by the \( p \)-order of \( \ker \varphi \). Hence, by the snake lemma, \( \ker \varphi_1 \) is killed by the \( p \)-order of \( \ker \varphi \), and \( \coker \varphi_1 \) is killed by a square of the \( p \)-order of \( \ker \varphi \). Now consider the following commutative diagram

\[
\begin{array}{cccccc}
0 & \longrightarrow & X(E_1/F_\infty)(p) & \longrightarrow & X(E_1/F_\infty) & \longrightarrow & X_f(E_1/F_\infty) & \longrightarrow & 0 \\
& & f & \downarrow & g & \downarrow & h & \ & \\
0 & \longrightarrow & X(E_2/F_\infty)(p) & \longrightarrow & X(E_2/F_\infty) & \longrightarrow & X_f(E_2/F_\infty) & \longrightarrow & 0
\end{array}
\]

with exact rows, where the map \( g \) is precisely the Pontryagin dual of \( \varphi_1 \). It then follows from the above discussion that \( g \) has kernel and cokernel that are \( p \)-primary \( \mathbb{Z}_p[G] \)-modules. Since \( X(E_1/F_\infty) \) is a torsion \( \mathbb{Z}_p[G] \)-module by the hypothesis, it follows that \( X(E_2/F_\infty) \) is also a torsion \( \mathbb{Z}_p[G] \)-module.

Now, clearly, the map \( f \) has kernel and cokernel that are \( p \)-primary \( \mathbb{Z}_p[G] \)-modules. Combining this with the above observation that the map \( g \) has kernel and cokernel that are \( p \)-primary \( \mathbb{Z}_p[G] \)-modules, we conclude that the map \( h \) also has kernel and cokernel that are \( p \)-primary \( \mathbb{Z}_p[G] \)-modules. Since \( X_f(E_1/F_\infty) \) has no \( p \)-torsion by definition, this implies that \( \ker h = 0 \). Consequently, we have \( \ker f = \ker g \) and the following short exact sequence

\[
0 \longrightarrow \coker f \longrightarrow \coker g \longrightarrow \coker h \longrightarrow 0.
\]

On the other hand, it follows from the exact sequence of torsion \( \mathbb{Z}_p[G] \)-modules

\[
0 \longrightarrow \ker g \longrightarrow X(E_1/F_\infty) \longrightarrow X(E_2/F_\infty) \longrightarrow \coker g \longrightarrow 0
\]

and Lemma 2.4(a) that

\[
\mu_G(\ker g) - \mu_G(\coker g) = \mu_G(X(E_1/F_\infty)) - \mu_G(X(E_2/F_\infty)).
\]

Similarly, we have

\[
\mu_G(\ker f) - \mu_G(\coker f) = \mu_G(X(E_1/F_\infty)(p)) - \mu_G(X(E_2/F_\infty)(p)).
\]

Since \( \mu_G(M) = \mu_G(M(p)) \), the above two equalities combine to give

\[
\mu_G(\ker g) - \mu_G(\coker g) = \mu_G(\ker f) - \mu_G(\coker f).
\]

As we have already observed above that \( \ker f = \ker g \), it then follows that \( \mu_G(\coker f) = \mu_G(\coker g) \) which in turn implies that \( \mu_G(\coker h) = 0 \). But since \( \coker h \) is \( p \)-primary, we have that \( \coker h \) is a pseudo-null \( \mathbb{Z}_p[G] \)-module by an application of Lemma 2.4(c). Therefore, we have shown that the map

\[
h : X_f(E_1/F_\infty) \longrightarrow X_f(E_2/F_\infty)
\]

is injective with a pseudo-null cokernel. The final assertion of the proposition now follows from an application of Lemma 2.1.
Remark 3.4. If one assumes that the $\mathfrak{M}_H(G)$-Conjecture (see below) holds for $X(E_1/F_\infty)$ and $X(E_2/F_\infty)$, then one can give a shorter proof of the preceding proposition. However, we thought it may be of interest to be able to give a proof of the proposition without assuming the $\mathfrak{M}_H(G)$-Conjecture. We also mention that it is still an open question to whether the $\mathfrak{M}_H(G)$-Conjecture is invariant under isogeny (but see [4, Proposition 5.6] for a partial result in this direction).

To facilitate further discussion, we need to introduce a conjecture on our Selmer group which was first proposed in [4]. We say that the $\mathfrak{M}_H(G)$-Conjecture holds for $X(E/F_\infty)$ if $X_f(E/F_\infty)$ is a finitely generated $\mathbb{Z}_p[H]$-module. If one assumes the $\mathfrak{M}_H(G)$-Conjecture and takes Theorem 2.2 into account, then the validity of Property CF is equivalent to saying that $X_f(E/F_\infty)$ is either a torsion $\mathbb{Z}_p[H]$-module or a completely faithful $\mathbb{Z}_p[G]$-module. The following lemma is not used in the paper but we have decided to include it, as we believe that it is an interesting observation.

**Lemma 3.5.** Let $E$ be an elliptic curve over $F$ which has either good ordinary reduction or multiplicative reduction at every prime of $F$ above $p$. Let $F_\infty$ be a noncommutative strongly admissible $p$-adic Lie extension of $F$ with $G = \text{Gal}(F_\infty/F)$. Suppose that $X(E/F_\infty)$ satisfies the $\mathfrak{M}_H(G)$-Conjecture and that $X(E/F_\infty)$ is a completely faithful $\mathbb{Z}_p[G]$-module. Then $X(E/F_\infty)$ is finitely generated over $\mathbb{Z}_p[H]$.

**Proof.** As $X(E/F_\infty)$ is assumed to be completely faithful, we may apply Lemma 2.1(d) to conclude that $\mu_G(X(E/F_\infty)) = 0$. Since $X(E/F_\infty)$ also satisfies the $\mathfrak{M}_H(G)$-Conjecture, it follows from [6, Proposition 2.5] that $X(E/L^{cyc})$ is torsion over $\mathbb{Z}_p[\Gamma_L]$ for every finite extension $L$ of $F$ contained in $F_\infty$, where $\Gamma_L = \text{Gal}(L^{cyc}/L)$. By [19, Corollary 3.4], this in turn implies that all the assumptions of [19, Theorem 3.1] are satisfied, and therefore, we may apply the said theorem to conclude that $\mu_G(X(E/F^{cyc})) = 0$. Combining this with the above observation of $X(E/F^{cyc})$ being torsion over $\mathbb{Z}_p[\Gamma]$, we have that $X(E/F^{cyc})$ is finitely generated over $\mathbb{Z}_p$ by the structure theory of $\mathbb{Z}_p[\Gamma]$-modules. The required conclusion now follows from an application of [6, Theorem 2.1].

**Remark 3.6.** The conclusion of Lemma 3.5 is false if we replace $X(E/F_\infty)$ by an arbitrary $\mathbb{Z}_p[G]$-module. Suppose that $G$ satisfies (NH) (see below). We shall now construct a class of modules which are completely faithful over $\mathbb{Z}_p[G]$ and are not finitely generated over $\mathbb{Z}_p[H]$. Let $M_0$ be any $\mathbb{Z}_p[G]$-module which is finitely generated over $\mathbb{Z}_p[H]$ with positive $\mathbb{Z}_p[H]$-rank. Let $M$ be the module $M_0 \oplus (\mathbb{Z}_p[\Gamma]/p)$, where $G$ acts on $\Gamma$ via the quotient $G \to \Gamma$. Clearly, $M/M(p)$ is finitely generated over $\mathbb{Z}_p[H]$, and we have a short exact sequence

$$0 \to M_0 \to M \to \mathbb{Z}_p[\Gamma]/p \to 0.$$ 

Clearly, $\mathbb{Z}_p[\Gamma]/p$ has trivial $\mu_G$-invariant, and therefore, is a pseudo-null $\mathbb{Z}_p[G]$-module by Lemma 2.1(d). It then follows from Lemma 2.1 and Theorem 3.7 that $M$ is completely faithful over $\mathbb{Z}_p[G]$. On the other hand, since the module $\mathbb{Z}_p[\Gamma]/p$ is not finitely generated over $\mathbb{Z}_p$ and $H$ acts trivially on $\mathbb{Z}_p[\Gamma]/p$, it is not finitely generated over $\mathbb{Z}_p[H]$. Hence $M$ is also not finitely generated over $\mathbb{Z}_p[H]$.

For the remainder of the section, we will show that the results in [20, 30] can be applied to verify Property CF in certain cases. We shall first recall the result that we require. The group $G$ is said to satisfy (NH) if it contains two closed normal subgroups $N$ and $H$ with the following two properties:
(i) $N \subseteq H$, $G/H \cong \mathbb{Z}_p$ and $G/N$ is a non-abelian group isomorphic to $\mathbb{Z}_p \rtimes \mathbb{Z}_p$.

(ii) There is a finite family of closed normal subgroups $N_i$ of $G$ such that $1 = N_0 \subseteq N_1 \subseteq \cdots \subseteq N_r = N$ and such that for $1 \leq i \leq r$, one has $N_i/N_{i-1} \cong \mathbb{Z}_p$.

**Proposition 3.7.** Suppose that $G$ satisfies $(NH)$. Let $M$ be a $\mathbb{Z}_p[H]$-module which is finitely generated over $\mathbb{Z}_p[H]$ with positive $\mathbb{Z}_p[H]$-rank. Then $M$ is a completely faithful $\mathbb{Z}_p[H]$-module.

**Proof.** When $r = 0$, this is precisely [30, Corollary 4.3]. For $r > 0$, one proceeds by an inductive argument. We refer readers to [20, Theorem 3.3] for the details.

We can now verify the validity of Property CF when the strongly admissible extension has a Galois group of the form $(NH)$.

**Proposition 3.8.** Let $E$ be an elliptic curve over $F$ which has either good ordinary reduction or multiplicative reduction at every prime of $F$ above $p$. Let $F_\infty$ be a strongly admissible $p$-adic Lie extension of $F$ with $G = \text{Gal}(F_\infty/F)$. Suppose that the following statements hold.

(i) The $\mathfrak{M}_H(G)$ conjecture holds for $X(E/F_\infty)$.

(ii) $G$ satisfies $(NH)$.

Then $X_f(E/F_\infty)$ satisfies Property CF.

**Proof.** If $X_f(E/F_\infty)$ is a torsion $\mathbb{Z}_p[H]$-module, then the conclusion of the proposition will follow from by an application of Theorem 2.2. In the case that $X_f(E/F_\infty)$ is a finitely generated $\mathbb{Z}_p[H]$-module with positive $\mathbb{Z}_p[H]$-rank, we can apply Proposition 3.7 to conclude that $X_f(E/F_\infty)$ is a completely faithful $\mathbb{Z}_p[H]$-module.

At this point of writing, we feel that there is currently insufficient evidence for a positive answer to the question of Property CF being satisfied in general. Hence it may be premature to make a conjecture on Property CF, and therefore, we have refrained from doing so.

### 4 A question on the triviality of central torsion submodule

Retain the notation of the Section 3. We now introduce another property of the dual Selmer groups which we like to investigate in this paper. Denote by $C$ the center of $G = \text{Gal}(F_\infty/F)$, where $F_\infty$ is a noncommutative strongly admissible $p$-adic Lie extension of $F$. We say that $X(E/F_\infty)$ (or $X_f(E/F_\infty)$) satisfies Property CT if the $\mathbb{Z}_p[C]$-torsion submodule of $X_f(E/F_\infty)$ is zero. We note that it has been shown in [25, Theorem 6.5] that the $\mathbb{Z}_p[C]$-torsion submodule $X(E/F_\infty)$ is either trivial or not finitely generated over $\mathbb{Z}_p[C]$. The next proposition records the isogeny invariance of Property CT.
Proposition 4.1. Let $E_1$ and $E_2$ be two elliptic curves over $F$ with either good ordinary reduction or multiplicative reduction at every prime of $F$ above $p$ which are isogenous to each other. Let $F_{\infty}$ be a noncommutative strongly admissible noncommutative $p$-adic Lie extension of $F$ with $G = \text{Gal}(F_{\infty}/F)$. Assume that $X(E_1/F_{\infty})$ is a torsion $\mathbb{Z}_p[G]$-module (and hence so is $X(E_2/F_{\infty})$). Then $X(E_1/F_{\infty})$ satisfies Property CT if and only if $X(E_2/F_{\infty})$ satisfies Property CT.

Proof. Let $\varphi : E_2 \to E_1$ be an isogeny defined over $F$. From the proof of Proposition 3.3, we see that $\varphi$ induces an injection

$$h : X_f(E_1/F_{\infty}) \to X_f(E_2/F_{\infty}).$$

Therefore, if the central torsion submodule of $X_f(E_2/F_{\infty})$ is trivial, so is the central torsion submodule of $X_f(E_1/F_{\infty})$. By considering the dual isogeny $\tilde{\varphi} : E_1 \to E_2$, we obtain the reverse implication.

We now mention how we can deduce the validity of Property CT in certain situations by appealing to Proposition 3.3. As a start, we begin with a general observation.

Proposition 4.2. Let $E$ be an elliptic curve over $F$ which has either good ordinary reduction or multiplicative reduction at every prime of $F$ above $p$. Let $F_{\infty}$ be a noncommutative strongly admissible $p$-adic Lie extension of $F$. Suppose that the following statements hold.

(i) The $\mathcal{M}_H(G)$ conjecture holds for $X(E/F_{\infty})$.

(ii) $X(E/F_{\infty})$ has no nonzero pseudo-null $\mathbb{Z}_p[G]$-submodule.

(iii) Suppose that either (a) or (b) holds.

(a) $X_f(E/F_{\infty})$ satisfies Property CF.

(b) The center $C$ of $G = \text{Gal}(F_{\infty}/F)$ is contained in $H$.

Then $X_f(E/F_{\infty})$ satisfies Property CT.

Proof. Since $X(E/F_{\infty})$ has no nonzero pseudo-null $\mathbb{Z}_p[G]$-submodule, it follows from [28, Lemma 4.2] that $X_f(E/F_{\infty})$ also has no nonzero pseudo-null $\mathbb{Z}_p[G]$-submodule. We first consider the case when condition (iii)(a) holds. If $X_f(E/F_{\infty})$ is pseudo-null, then it follows that $X_f(E/F_{\infty}) = 0$, and in particular, its $\mathbb{Z}_p[C]$-torsion submodule also vanishes. Now suppose that $X_f(E/F_{\infty})$ is completely faithful over $\mathbb{Z}_p[G]$. As $X_f(E/F_{\infty})$ is a Noetherian $\mathbb{Z}_p[G]$-module, so is its $\mathbb{Z}_p[C]$-torsion submodule. As a consequence, the $\mathbb{Z}_p[C]$-torsion submodule of $X_f(E/F_{\infty})$ has a global annihilator, and therefore, must be pseudo-null over $\mathbb{Z}_p[G]$ by the complete faithfulness of $X_f(E/F_{\infty})$. But since we have shown that $X_f(E/F_{\infty})$ has no nonzero pseudo-null $\mathbb{Z}_p[G]$-submodule, this in turn implies that the $\mathbb{Z}_p[C]$-torsion submodule of $X_f(E/F_{\infty})$ is zero.

We now consider the case when condition (iii)(b) holds. Let $W$ be the $\mathbb{Z}_p[C]$-torsion submodule of $X_f(E/F_{\infty})$. Clearly, $W$ is a $\mathbb{Z}_p[G]$-submodule, and at the same time, a $\mathbb{Z}_p[H]$-submodule of $X_f(E/F_{\infty})$. Since $X_f(E/F_{\infty})$ is finitely generated over $\mathbb{Z}_p[H]$, we can find $z \in \mathbb{Z}_p[C]$ such that $zW = 0$. Since
by condition (iii)(b), this in turn implies that $W$ is a torsion $\mathbb{Z}_p[H]$-module. Hence, by Theorem 2.2, $W$ is a pseudo-null $\mathbb{Z}_p[G]$-module. But we have shown above that $X_f(E/F_\infty)$ has no nonzero pseudo-null $\mathbb{Z}_p[G]$-submodule, and therefore, we must have $W = 0$. 

We mention that condition (ii) of the preceding proposition is known to hold in many cases when $E$ has good ordinary reduction at every prime of $F$ above $p$ (see [12, Theorem 3.2], [13, Theorem 2.6] and [25, Theorem 5.1]). Hence we can combine these results with Theorem 3.8 to obtain many cases where Property CT is satisfied.

In the event when we do not know the validity of condition (ii), we have the following result which will be useful in the discussion of most numerical examples.

**Proposition 4.3.** Let $E$ be an elliptic curve over $F$ which has good ordinary reduction at every prime of $F$ above $p$. Let $F_\infty$ be a noncommutative strongly admissible $p$-adic Lie extension of $F$ which is not totally real. Assume that the center $C$ of $G = \text{Gal}(F_\infty/F)$ is contained in $H$. Suppose that there is an elliptic curve $E'$ which is isogenous to $E$ over $F$ and has the property that $X(E'/F'^{\text{cycl}})$ is finitely generated over $\mathbb{Z}_p$. Then $X_f(E/F_\infty)$ satisfies Property CT.

**Proof.** By virtue of Proposition 4.1 and Remark 3.2, it suffices to show that the $\mathbb{Z}_p[C]$-torsion submodule of $X(E'/F_\infty)$ is zero. Also, it follows from [2] Remark 2.6 and Corollary 6.1 (on p. 1243) that $X(E'/F_\infty)$ has no nonzero pseudo-null $\mathbb{Z}_p[G]$-submodule. The conclusion now follows from a similar argument to that in Proposition 4.2. 

**Remark 4.4.** Note that since the property of having no nonzero pseudo-null $\mathbb{Z}_p[G]$-submodule is not known to be isogeny invariant, we cannot deduce that $X(E/F_\infty)$ has no nonzero pseudo-null $\mathbb{Z}_p[G]$-submodule.

## 5 Analogue of Property CF and Property CT for Hida deformations

In this section, we formulate and discuss an analogue of Property CF and Property CT for Selmer groups of Hida deformations. As before, $p$ will denote an odd prime. Let $E$ be an elliptic curve over $\mathbb{Q}$ with ordinary reduction at $p$ and assume that $E[p]$ is an absolutely irreducible $\text{Gal}(\overline{\mathbb{Q}}/\mathbb{Q})$-representation. By Hida theory (for instance, see [14, 15]; also see [23, 31]), there exists a commutative complete Noetherian local domain $R$ which is flat over the power series ring $\mathbb{Z}_p[X]$ in one variable, and a free $R$-module $T$ of rank 2 with $T/P \cong T_p E$ for some prime ideal $P$ of $R$. (Note that the freeness of $T$ over $R$ is guaranteed by our assumption that $E[p]$ is an absolutely irreducible $\text{Gal}(\overline{\mathbb{Q}}/\mathbb{Q})$-representation; see [23] for details.) From now on, we will assume that $R = \mathbb{Z}_p[X]$ in all our discussion. The prime ideal $P$ can be expressed as the ideal generated by $X - a$ for some $a \in p\mathbb{Z}_p$. We now mention two more properties of $T$ which we require to attach an appropriate Selmer group to the Hida deformation (For more detailed description of fundamental and important arithmetic properties of the Hida deformations,
we refer readers to \[14, 15, 31\]). The first is that \( T \) is unramified outside the set \( S \), where \( S \) is any finite set of primes of \( F \) which contains the primes above \( p \), the infinite primes, the primes at which \( E \) has bad reduction and the primes that are ramified in \( F_\infty/F \) (see \[14, Theorem 2.1\] or \[31, Theorem 2.2.1\]). The second property we will mention is that there exists an \( R \)-submodule \( T^+ \) of \( T \) which is invariant under the action of \( \text{Gal}(\overline{\mathbb{Q}}_p/\mathbb{Q}_p) \) and such that both \( T^+ \) and \( T/T^+ \) are free \( R \)-modules of rank one (see \[31, Theorem 2.2.2\] for details; and noting that \( T \) is free over \( R \) by our assumption and \[23, Section 2, Corollary 6\]).

Set \( A = T \otimes_R \text{Hom}_\text{cts}(R, \mathbb{Q}_p/\mathbb{Z}_p) \) and \( A^+ = T^+ \otimes_R \text{Hom}_\text{cts}(R, \mathbb{Q}_p/\mathbb{Z}_p) \). We note that \( E_{p^\infty} = A[P] \).

We now define a variant of Selmer group for the Hida deformation. The notion of such a Selmer group was introduced by Greenberg in \[10\], where he defined his Selmer group over a cyclotomic \( \mathbb{Z}_p \)-extension. Since then, his idea has been adapted to the situation of an admissible \( p \)-adic Lie extension \( F_\infty \) (see \[6, Section 4\] and \[26, Section 6\]). Following their footsteps, we define the Selmer group of the Hida deformation over an admissible \( p \)-adic Lie extension \( F_\infty \) of \( \mathbb{Q} \) by

\[
S(A/F_\infty) = \ker \left( \bigcap_{v \in S} J_v(A, F_\infty) \right),
\]

where

\[
J_v(A, F_\infty) = \begin{cases} 
\prod_{w|v} H^1(F_\infty, A/A^+), & \text{if } v \text{ divides } p, \\
\prod_{w|v} H^1(F_\infty, A), & \text{if } v \text{ does not divide } p.
\end{cases}
\]

We denote by \( X(A/F_\infty) \) the Pontryagin dual of \( S(A/F_\infty) \), and consider this dual Selmer group as a (compact) Gal(\( F_\infty/F \))-module for some finite extension \( F \) of \( \mathbb{Q} \) in \( F_\infty \), where \( F_\infty \) is a strongly admissible \( p \)-adic Lie extension of \( F \).

Let us briefly turn to algebra. For a \( R[G] \)-module \( M \), denote by \( M(R) \) the \( R \)-torsion submodule of \( M \). It is an easy exercise to verify that this is a \( R[G] \)-submodule of \( M \). We now record the following lemma.

**Lemma 5.1.** Suppose that \( M \) is a completely faithful \( R[G] \)-module. Then \( M(R) \) is pseudo-null over \( R[G] \).

*Proof.* Since \( M \) is finitely generated over \( R[G] \), we can find \( x \in R \) such that \( M(R) = M[x] \). Since \( M \) is completely faithful over \( R[G] \), this in turn implies that \( M(R) \) is pseudo-null over \( R[G] \).

Therefore, the above result shows that in considering complete faithfulness of a \( R[G] \)-module, we must first cut off its \( R \)-torsion submodule. Returning to arithmetic, write \( X_R(A/F_\infty) = X(A/F_\infty)/X(A/F_\infty)(R) \).

We then say that \( X_R(A/F_\infty) \) satisfies Property CF if \( X_R(A/F_\infty) \) is either a pseudo-null \( R[G] \)-module or a completely faithful \( R[G] \)-module. It will be of interest to establish a general control theorem relating the validity of Property CF for the Selmer group of an elliptic curve and the Selmer group of its Hida deformation. At this point of writing, we are only able to prove such a relation for a specific class of strongly admissible \( p \)-adic Lie extensions (see Theorem \[7,3\]). We now record the following lemma which is the analogue of Lemma \[5.1\] and has a similar proof.
Lemma 5.2. Let $F_\infty$ be a noncommutative strongly admissible $p$-adic Lie extension of $F$ with $G = \text{Gal}(F_\infty/F)$. Suppose that $X(A/F_\infty)$ is finitely generated over $R[H]$. Then the following statements are equivalent.

(a) $X(A/F_\infty)$ is either a pseudo-null $R[G]$-module or a completely faithful $R[G]$-module.

(b) $X_R(A/F_\infty)$ is either a pseudo-null $R[G]$-module or a completely faithful $R[G]$-module.

To facilitate further discussion, we recall the $\mathfrak{M}_H(G)$-conjecture for Hida deformations which was first formulated in [6]. We say that $X(A/F_\infty)$ satisfies the $\mathfrak{M}_H(G)$-Conjecture if $X_R(A/F_\infty)$ is a finitely generated $R[H]$-module.

To facilitate further discussion, we recall the $\mathfrak{M}_H(G)$-conjecture for Hida deformations which was first formulated in [6]. We say that $X(A/F_\infty)$ satisfies the $\mathfrak{M}_H(G)$-Conjecture if $X_R(A/F_\infty)$ is a finitely generated $R[H]$-module.

A parallel argument to that in Proposition 3.8 will establish the following.

Proposition 5.3. Let $F_\infty$ be a strongly admissible $p$-adic Lie extension of $F$ with $G = \text{Gal}(F_\infty/F)$. Suppose that the following statements hold.

(i) The $\mathfrak{M}_H(G)$ conjecture holds for $X(A/F_\infty)$.

(ii) $G$ satisfies (NH).

Then Property CF holds for $X_R(A/F_\infty)$.

We now propose an analogue of Property CT for Selmer groups of Hida deformations. As in Section 3, denote by $C$ the center of $G = \text{Gal}(F_\infty/F)$, where $F_\infty$ is a noncommutative strongly admissible $p$-adic Lie extension of $F$. We then say that $X(A/F_\infty)$ (or $X_R(A/F_\infty)$) satisfies Property CT if the $R[C]$-torsion submodule of $X_R(A/F_\infty)$ is zero. The following analogue of Proposition 4.2 has a similar proof which we will omit.

Proposition 5.4. Let $F_\infty$ be a noncommutative strongly admissible $p$-adic Lie extension of $F$. Suppose that all of the following statements hold.

(i) The $\mathfrak{M}_H(G)$ conjecture holds for $X(A/F_\infty)$.

(ii) $X(A/F_\infty)$ has no nonzero pseudo-null $R[G]$-submodule.

(iii) Suppose that either (a) or (b) holds.

(a) $X_R(A/F_\infty)$ satisfies Property CF.

(b) The centre $C$ of $G = \text{Gal}(F_\infty/F)$ is contained in $H$.

Then $X_R(A/F_\infty)$ satisfies Property CT.

Condition (ii) of the preceding proposition is known to hold in some situations (see [20, Theorems 6.10 and 6.12]). Therefore, one can combine these observation with Theorem 5.3 to obtain examples of $X_R(A/F_\infty)$ which satisfies Property CT. We end this section by mentioning a further interesting corollary which can be viewed as a slight refinement of [6, Corollary 6.3] and [20, Proposition 8.2].

Corollary 5.5. Retain the assumptions of Proposition 5.4. Suppose further that $X(A/F_\infty)$ is finitely generated over $R[H]$ with positive $R[H]$-rank. Then the $R[C]$-torsion submodule of $X(A/F_\infty)$ is zero.
6 Control theorems from Property CF to Property CT

In this section, we will prove our main result. Namely, we will prove a control theorem which allows us to conclude that the dual Selmer group satisfies Property CT if we know that the dual Selmer group satisfies Property CF in a smaller field. We also establish an analogous result for Hida deformation which says that if the dual Selmer group of an elliptic curve satisfies Property CF, then the Selmer group of its Hida deformation satisfies Property CT. As a start, we begin with an algebraic result.

Lemma 6.1. Let $G$ be a nonabelian pro-$p$ $p$-adic Lie group with no $p$-torsion. Suppose that $G$ contains two normal closed subgroups $N$ and $H$ such that $N \subseteq H$, $G/H \cong \mathbb{Z}_p$, $N \cong \mathbb{Z}_p$ and $G/N$ is a non-abelian pro-$p$ $p$-adic Lie group without $p$-torsion. Let $M$ be a $\mathbb{Z}_p[G]$-module which satisfies all the following properties.

(i) $M$ is finitely generated over $\mathbb{Z}_p[H]$.

(ii) $M$ has no nonzero pseudo-null $\mathbb{Z}_p[G]$-submodule.

(iii) $H_1(N, M) = 0$.

(iv) $M_N$ is either pseudo-null or completely faithful over $\mathbb{Z}_p[G/N]$.

Then the $\mathbb{Z}_p[C]$-torsion submodule of $M$ is zero, where $C$ denotes the center of $G$.

Proof. We first suppose that $M_N$ is a pseudo-null $\mathbb{Z}_p[G/N]$-module. Since $M$ is finitely generated over $\mathbb{Z}_p[H]$, its $N$-invariant $M_N$ is certainly finitely generated over $\mathbb{Z}_p[H/N]$. It then follows from Theorem 2.2 that $M_N$ is a finitely generated torsion $\mathbb{Z}_p[H/N]$-module. By Lemma 2.3, we have

$$0 = \text{rank}_{\mathbb{Z}_p[H/N]} M_N = \text{rank}_{\mathbb{Z}_p[H]} M + \text{rank}_{\mathbb{Z}_p[H/N]} H_1(N, M)$$

which in turn implies that $\text{rank}_{\mathbb{Z}_p[H]} M = 0$. Hence $M$ is a finitely generated torsion $\mathbb{Z}_p[H]$-module, or equivalently, a pseudo-null $\mathbb{Z}_p[G]$-module. But since $M$ has no nonzero pseudo-null $\mathbb{Z}_p[G]$-submodule, we have $M = 0$, and in particular, the $\mathbb{Z}_p[C]$-torsion submodule of $M$ is zero.

We now suppose that $M_N$ is a completely faithful $\mathbb{Z}_p[G/N]$-module. Write $W$ for the $\mathbb{Z}_p[C]$-torsion submodule of $M$. Since $C$ is the center of $G$ and $M$ is finitely generated over $\mathbb{Z}_p[G]$, we have $W \subseteq M[z]$ for some $z \in \mathbb{Z}_p[C]$. The reverse inclusion is evident from the definition of $W$ being the $\mathbb{Z}_p[C]$-torsion submodule of $M$. As $z$ is a central element of $\mathbb{Z}_p[G]$, the multiplication by $z$-map on $M$ is a $\mathbb{Z}_p[G]$-homomorphism. This homomorphism in turn gives an identification $zM \cong M/M[z] = M/W$, where the last equality follows from the above discussion. It then follows from this that $M/W$ can be viewed as a $\mathbb{Z}_p[G]$-submodule of $M$. Since $H_1(N, M) = 0$ by hypothesis and $H_1(N, -)$ is left exact, we have $H_1(N, M/W) = 0$. The left exactness of $H_1(N, -)$ also yields $H_1(N, W) = 0$ which is equivalent to saying that $W[\gamma_N - 1] = 0$, where $\gamma_N$ is a topological generator of $N$. Note that the augmentation kernel $I_N$ of $\mathbb{Z}_p[G] \rightarrow \mathbb{Z}_p[G/N]$ is generated by $\gamma_N - 1$. Since $I_N = \mathbb{Z}_p[G](\gamma_N - 1) = (\gamma_N - 1)\mathbb{Z}_p[G]$, we may therefore write $z = z'(\gamma_N - 1)^m$ for some $z' \notin I_N$ and nonnegative integer $m$. By virtue of $W[\gamma_N - 1] = 0$,
one checks easily that \( W = M[z] = M[z'] \). Hence we may assume that \( W = M[z] \) with \( z \notin I_N \) which we do. Therefore, the image of \( z \) in \( \mathbb{Z}_p[[G/N]] \), which we denote by \( \bar{z} \), is nonzero. Now, applying \( N \)-invariant to the short exact sequence

\[
0 \longrightarrow W \longrightarrow M \longrightarrow M/W \longrightarrow 0,
\]
we obtain a short exact sequence

\[
0 \longrightarrow W_N \longrightarrow M_N \longrightarrow (M/W)_N \longrightarrow 0,
\]

where the injectivity of the leftmost map is a consequence of the above observation that \( H_1(N, M/W) = 0 \). Clearly, \( \bar{z} \) is a global annihilator of \( W_N \). But since \( M_N \) is assumed to be a completely faithful \( \mathbb{Z}_p[[G/N]] \)-module, this forces \( W_N \) to be a pseudo-null \( \mathbb{Z}_p[[G/N]] \)-module. On the other hand, since \( M \), and hence \( W \), is finitely generated over \( \mathbb{Z}_p[[H/N]] \), we have that \( \bar{z} \) is a global annihilator of \( W_N \). But since \( M_N \) is assumed to be a completely faithful \( \mathbb{Z}_p[[G/N]] \)-module, this forces \( W_N \) to be a pseudo-null \( \mathbb{Z}_p[[G/N]] \)-module. On the other hand, since \( M \), and hence \( W \), is finitely generated over \( \mathbb{Z}_p[[H/N]] \), we have that \( W_N \) is finitely generated over \( \mathbb{Z}_p[[H/N]] \). It then follows from Theorem \( 2.2 \) that \( W_N \) is a torsion \( \mathbb{Z}_p[[H/N]] \)-module. By Lemma \( 2.3 \) this implies that \( W \) is a torsion \( \mathbb{Z}_p[[H]] \)-module. Now, by another application of Theorem \( 2.2 \) we have that \( W \) is pseudo-null over \( \mathbb{Z}_p[[G]] \). Since \( M \) has no nonzero pseudo-null \( \mathbb{Z}_p[[G]] \)-submodule by the hypothesis of the lemma, we conclude that \( W = 0 \), completing the proof of the lemma.

We can now prove the first of our main theorem. Before doing so, we introduce further notation. Let \( F_\infty \) be a strongly admissible \( p \)-adic Lie extension of \( F \) and \( E \) an elliptic curve over \( F \). For the remainder of the paper, \( S \) will denote a fixed finite set of primes of \( F \) which contains the primes above \( p \), the infinite primes, the primes at which \( E \) has bad reduction and the primes that ramify in \( F_\infty/F \). We then denote by \( S_p \) the subset of \( S \) consisting of primes of \( F \) above \( p \) and by \( S_2(F_\infty/F) \) the subset of \( S \) consisting of primes of \( F \) whose decomposition group of \( \text{Gal}(F_\infty/F) \) at \( w \) has dimension \( \geq 2 \), where \( w \) is a prime of \( F_\infty \) above \( v \).

**Theorem 6.2.** Let \( E \) be an elliptic curve over \( F \) with either good ordinary reduction or multiplicative reduction at every prime of \( F \) above \( p \). Let \( F_\infty \) be a strongly admissible \( p \)-adic Lie extension of \( F \) with \( G = \text{Gal}(F_\infty/F) \). Suppose that the following statements hold.

(i) \( N \) is a closed normal subgroup of \( G \) which is contained in \( H \) and \( N \cong \mathbb{Z}_p \).

(ii) \( G/N \) is a non-abelian pro-\( p \) \( p \)-adic Lie group without \( p \)-torsion. (In particular, the dimension of the \( p \)-adic Lie group \( G/N \) is necessarily \( \geq 2 \).)

(iii) Suppose that the \( \mathfrak{M}_H(G) \) conjecture holds for \( X(E/F_\infty) \) and that \( X(E/F_\infty) \) has no nonzero pseudo-null \( \mathbb{Z}_p[[G]] \)-submodules.

(iv) \( X_f(E/L_\infty) \) satisfies Property CF. Here \( L_\infty := F_N^\infty \).

(v) Suppose that either (a) or (b) holds.

(a) \( S = S_2(L_\infty/F) \).

16
Proof of Theorem 6.2. It suffices to verify that all the hypothesis of Lemma 6.1 are satisfied (taking $M = \mathbb{Z}$ generated over $\mathbb{Z}$ have that $X$ have that $H$ have $H$). Then $X_f(E/F_\infty)$ satisfies Property CT.

Remark 6.3. Of course, if the center $C$ is contained in $H$, then the conclusion of the theorem is immediate from Proposition 4.2. The point of the above theorem is that we do not assume that the center $C$ is contained in $H$.

Proof of Theorem 6.2. It suffices to verify that all the hypothesis of Lemma 6.1 are satisfied (taking $M = X_f(E/F_\infty)$). The first assertion of assumption (iii) guarantees us that $X_f(E/F_\infty)$ is finitely generated over $\mathbb{Z}_p[H]$. Combining the second assertion of assumption (iii) with [28, Lemma 4.2], we have that $X_f(E/F_\infty)$ has no nonzero pseudo-null $\mathbb{Z}_p[G]$-submodules. By the argument in [20, Remark 6.2], we have $H_1(N, X(E/F_\infty)) = 0$. Since $X_f(E/F_\infty) = p^m X(E/F_\infty)$ for a large enough $m$, we also have $H_1(N, X_f(E/F_\infty)) = 0$ by the left exactness of $H_1(N, -)$. Therefore, it remains to show that $X_f(E/F_\infty)_N$ is either pseudo-null or completely faithful over $\mathbb{Z}_p[G/N]$. By a standard well-known argument (for instance, see [6, Lemma 2.4]), one can show that the map

$$\alpha : X(E/F_\infty)_N \to X(E/L_\infty)$$

has kernel which is finitely generated over $\mathbb{Z}_p[H/N]$, and cokernel which is finitely generated over $\mathbb{Z}_p$. We further claim that under the hypothesis of the theorem, ker $\alpha$ is a finitely generated torsion $\mathbb{Z}_p[H/N]$-module, and therefore, is pseudo-null over $\mathbb{Z}_p[G/N]$. To prove our claim, we first note that since the Pontryagin dual of the map

$$a : S(E/L_\infty) \to S(E/F_\infty)^N$$

is precisely the map

$$\alpha : X(E/F_\infty)_N \to X(E/L_\infty),$$

we are reduced to showing that coker $a$ is a cofinitely generated torsion $\mathbb{Z}_p[H/N]$-module. Now consider the following commutative diagram

$$
\begin{array}{cccccc}
0 & \to & S(E/L_\infty) & \to & H^1(G_S(L_\infty), E_{p^\infty}) & \to & \bigoplus_{v \in S} J_v(E/L_\infty) & \to & 0 \\
& & a & & b & & c = \oplus c_v \\
0 & \to & S(E/F_\infty)^N & \to & H^1(G_S(F_\infty), E_{p^\infty}^N) & \to & \bigoplus_{v \in S} J_v(E/F_\infty)^N & \to & 0
\end{array}
$$

with exact rows. (The surjectivity of the last map in the top exact sequence can be shown by a similar argument in the proof of Lemma 5.3.) Since $N \cong \mathbb{Z}_p$, the map $b$ is surjective. Thus, it suffices via the snake lemma to show that ker $c$ is a cofinitely generated torsion $\mathbb{Z}_p[H/N]$-module. Since $S$ is finite, we are reduced to showing that ker $c_v$ is a cofinitely generated torsion $\mathbb{Z}_p[H/N]$-module for every $v \in S$. To
see this, we first observe that one can apply a similar argument in the spirit of the proof of [20] Lemma 8.7 to show that \( \ker c_\alpha \) is a cofinitely generated torsion \( \mathbb{Z}_p[\hat{H}/\hat{N}] \)-module for \( v \in S_2 \). It therefore remains to consider the case when \( v \in S \setminus S_2 \) in assumption (iv)(b). Write \( c_v = \oplus c_w \), where the sum runs over the primes of \( L_\infty \) above \( v \). It is then an easy exercise to verify that \( \ker c_w = H_1(N_u, E(F_{\infty,w})_{p^\infty}) \), where \( u \) is a prime of \( F_\infty \) above \( w \) and \( N_a \) is the decomposition group of \( N = \text{Gal}(F_\infty/L_\infty) \) at \( u \). Now suppose that the decomposition group of \( \text{Gal}(F_{\infty}/F) \) at \( v \) has dimension 1. Since \( v \) does not divide \( p \) (because \( S_p \subseteq S_2(L_\infty/F) \) and \( F_\infty \) contains \( F_{\text{cyc}} \), we have \( F_{\infty,w} = F_{\text{ur},v} \), where \( F_{\text{ur},v} \) is the maximal unramified pro-\( p \) extension of \( F_v \). Similarly, we have \( L_{\infty,w} = F_{\text{ur},v} \). Hence this implies that \( L_{\infty,w} = F_{\infty,w} \), or in other words, \( N_u = 0 \). In particular, we have \( \ker c_w = 0 \) when the decomposition group of \( \text{Gal}(L_\infty/F) \) at \( v \) has dimension 1. Now suppose that \( E \) has non split multiplicative reduction or additive reduction at \( v \). Since \( p \) is odd (and \( p \geq 5 \) if \( E \) has additive reduction), \( E \) also has non split multiplicative reduction or additive reduction at every primes \( x \) of \( F_{\text{cyc}} \) above \( v \). It then follows from [11] Proposition 5.1(iii) that \( E(F_{\text{cyc}})_{p^\infty} = 0 \). Since \( F_{\infty,w}/F_{\text{cyc}} \) is a pro-\( p \) extension, we have \( E(F_{\infty,w})_{p^\infty} = 0 \) and thus one also has \( \ker c_v = 0 \) in this case. In conclusion, we have that \( \ker c \) is a cofinitely generated torsion \( \mathbb{Z}_p[\hat{H}/\hat{N}] \)-module. This completes the verification of our claim that \( \ker \alpha \) is a finitely generated torsion \( \mathbb{Z}_p[\hat{H}/\hat{N}] \)-module.

Now consider the following commutative diagram

\[
\begin{array}{cccccc}
0 & \longrightarrow & X(E/F_\infty)(p)_N & \longrightarrow & X(E/F_\infty)_N & \longrightarrow & X_f(E/F_\infty)_N & \longrightarrow & 0 \\
& \alpha' \Big| & \alpha \Big| & \alpha'' \Big| & & & & & \\
0 & \longrightarrow & X(E/L_\infty)(p) & \longrightarrow & X(E/L_\infty) & \longrightarrow & X_f(E/L_\infty) & \longrightarrow & 0
\end{array}
\]

with exact rows (Here the top exact row follows from the above mentioned fact that \( H_1(N,X_f(E/F_\infty)) = 0 \)). Since \( \ker \alpha \) is finitely generated over \( \mathbb{Z}_p \) and the dimension of \( G/N \) is \( \geq 2 \), we have that \( \ker \alpha \) is pseudo-null over \( \mathbb{Z}_p[G/N] \). It then follows from the above commutative diagram that \( \ker \alpha'' \) is pseudo-null over \( \mathbb{Z}_p[G/N] \). We shall now show that \( \ker \alpha'' \) is pseudo-null over \( \mathbb{Z}_p[G/N] \). By assumption (iii) of the theorem, we have that \( X_f(E/F_\infty)_N \) is finitely generated over \( \mathbb{Z}_p[G/N] \) and this in turn implies that \( \ker \alpha'' \) is finitely generated over \( \mathbb{Z}_p[G/N] \). Combining this with the observation that \( \ker \alpha \) is finitely generated over \( \mathbb{Z}_p \), we have that \( \ker \alpha' \) is finitely generated over \( \mathbb{Z}_p[G/N] \). Since \( \ker \alpha' \) is \( p \)-primary, it follows from Lemma 2.4(b) and (c) that \( \ker \alpha' \) is pseudo-null over \( \mathbb{Z}_p[G/N] \). Now, combining this with the above proven claim that \( \ker \alpha \) is pseudo-null over \( \mathbb{Z}_p[G/N] \), we have that \( \ker \alpha'' \) is pseudo-null over \( \mathbb{Z}_p[G/N] \). Hence we conclude that the map

\[
\alpha'' : X_f(E/F_\infty)_N \longrightarrow X_f(E/L_\infty)
\]

has kernel and cokernel that are pseudo-null over \( \mathbb{Z}_p[G/N] \). Since \( X_f(E/L_\infty) \) satisfies Property CF, it then follows from an application of Lemma 2.1 that \( X_f(E/F_\infty)_N \) is either pseudo-null or completely faithful over \( \mathbb{Z}_p[G/N] \). The proof of Theorem 6.2 is now complete.

We now consider a variant of Theorem 6.2 for an elliptic curve and its Hida deformation. Recall that \( A \) is the \( R \)-cofree Galois module attached to the Hida deformation as defined in Section 5.
that the following statements hold.

Let Theorem 6.4.

The proof is essentially similar to that in Theorem 6.2, where we choose an identification \( R \cong \mathbb{Z}_p[N \times G] \) such that \( M/PM = M_N \) for every \( R[G] \)-module \( M \). Here \( N \cong \mathbb{Z}_p \). The only thing which perhaps requires additional attention is to establish the following commutative diagram with exact rows. By the preceding lemma, \( X(A/F_\infty)(R)/P \) is \( p \)-primary (noting that \( X(A/F_\infty)(R)[X - a] = H_1(N, X(A/F_\infty)(R)) = 0 \) by a similar argument to that in Theorem 6.2). This in turn implies that \( X(A/F_\infty)(R)/P \) is sent into \( X(E/F_\infty)(p) \) under \( \alpha \), and thus inducing the required maps \( \alpha' \) and \( \alpha'' \). The remainder of the proof proceeds as in Theorem 6.2.
7 Control theorems for Property CF

In [20 Section 6], the author has established control theorems for the faithfulness of dual Selmer groups. It will be of interest to obtain analogous results for Property CF. In this section, we will establish such a control theorem for Property CF over certain class of strongly admissible $p$-adic Lie extensions. We first prove the control theorem which concerns extensions of strongly admissible $p$-adic Lie extensions. We will assume that $p \geq 5$ throughout the section.

As a start, we record the following theorem of Csige [8 Theorem 2.4.1] which generalizes a previous result of Ardakov [1 Theorem 1.3].

Theorem 7.1 (Ardakov, Csige). Let $p \geq 5$. Given that $G \cong \mathbb{Z}_p^r \times H_0 \times \Gamma$. Here $r \geq 0$, and $H_0$ is a torsion-free compact $p$-adic analytic group, whose Lie algebra is split semisimple over $\mathbb{Q}_p$. Let $M$ be $\mathbb{Z}_p[G]$-module which has no nonzero pseudo-null $\mathbb{Z}_p[G]$-submodules. Write $C = \mathbb{Z}_p^r \times \Gamma$. Then $M$ is a completely faithful $\mathbb{Z}_p[G]$-module if and only if the $\mathbb{Z}_p[C]$-torsion submodule of $M$ is trivial.

We can now state and prove our control theorems.

Theorem 7.2. Let $p \geq 5$. Let $E$ be an elliptic curve over $F$ with either good ordinary reduction or multiplicative reduction at every prime of $F$ above $p$. Let $F_\infty$ be a strongly admissible $p$-adic Lie extension of $F$ with $G = \text{Gal}(F_\infty/F)$. Suppose that the following statements hold.

(i) $X(E/F_\infty)$ satisfies the $\mathfrak{M}_H(G)$ conjecture.

(ii) $G = H \times \Gamma$, where $H \cong N \times \mathbb{Z}_p^r \times H_0$. Here $r \geq 0$, $H_0$ is a torsion-free compact $p$-adic analytic group, whose Lie algebra is split semisimple over $\mathbb{Q}_p$ and $N \cong \mathbb{Z}_p$.

(iii) $X(E/F_\infty)$ has no nonzero pseudo-null $\mathbb{Z}_p[G]$-submodules.

(iv) Set $L_\infty := F_\infty^N$. For every prime $v$ of $F$ above $p$, the decomposition group of $\text{Gal}(L_\infty/F)$ at $v$ has dimension $\geq 2$.

(v) $X_f(E/L_\infty)$ satisfies Property CF.

Then $X_f(E/F_\infty)$ satisfies Property CF.

Proof. By Theorem 7.1 it suffices to show that the $\mathbb{Z}_p[C]$-torsion submodule of $X_f(E/F_\infty)$ is trivial. By Lemma 6.1 we are then reduced to showing that $X_f(E/F_\infty)_N$ is either pseudo-null or completely faithful over $\mathbb{Z}_p[G/N]$. The proof is essentially similar to that in Theorem 6.2. As the decomposition group condition in this theorem differs slightly from those in Theorem 6.2, the only thing which perhaps requires additional attention is to verify that $\text{ker} \; c$ (see Theorem 6.2 for notation) is a cofinitely generated torsion $\mathbb{Z}_p[H/N]$-module. For each $v \in S$ such that the decomposition group of $\text{Gal}(L_\infty/F)$ at $v$ has dimension $\geq 2$, we can apply a similar argument in the spirit of the proof of [26 Lemma 8.7] to show that $\text{ker} \; c_v$ is a cofinitely generated torsion $\mathbb{Z}_p[H/N]$-module. Let $v \in S$ such that the decomposition group of $\text{Gal}(L_\infty/F)$ at $v$ has dimension 1. Then $v$ does not divide $p$ by assumption (iv). Let $w$ be a prime of
$F_\infty$ above $v$. By abuse of notation, we also denote by $w$ the prime of $L_\infty$ below $w$. As the decomposition group of $\text{Gal}(L_\infty/F)$ at $v$ has dimension 1, we have $L_{\infty,w} = F_{\infty,w}^{ur} = F_{\infty,w}^{\text{nr},p}$, where $F_{\infty,w}^{\text{nr},p}$ is the maximal unramified pro-$p$ extension of $F_w$. Since $F_\infty$ is obtained from $L_\infty$ by adjoining a $\mathbb{Z}_p$-extension of $F$, it follows that $F_\infty/L_\infty$ is also unramified outside $p$. Since $L_{\infty,w}$ is the maximal unramified pro-$p$ extension of $F_w$, we have $L_{\infty,w} = F_{\infty,w}$, or in other words, we have $N_w = 0$, where $N_w$ is the decomposition group of $N = \text{Gal}(F_\infty/L_\infty)$ at $w$. Hence we have $\ker c_v = 0$ if the decomposition group of $\text{Gal}(L_\infty/F)$ at $v$ has dimension 1. In conclusion, we have shown that $\ker c$ is a cofinitely generated torsion $\mathbb{Z}_p[H/N]$-module. The remainder of the proof proceeds as in Theorem 6.2.

The following is an analogue of Theorem 7.2 for an elliptic curve and its Hida deformations which has a similar proof that we will omit.

**Theorem 7.3.** Let $p \geq 5$. Let $F_\infty$ be a strongly admissible p-adic Lie extension of $F$ with Galois group $G$. Suppose that the following statements hold.

(i) The $\mathfrak{M}_H(G)$ conjecture holds for $X(A/F_\infty)$.

(ii) $G = H \times \Gamma$, where $H \cong \mathbb{Z}_p^r \times H_0$. Here $r \geq 0$, and $H_0$ is a torsion-free compact p-adic analytic group, whose Lie algebra is split semisimple over $\mathbb{Q}_p$.

(iii) $X(A/F_\infty)$ has no nonzero pseudo-null $R[G]$-submodules.

(iv) For every $v \in S$, the decomposition group of $\text{Gal}(F_\infty/F)$ at $v$ has dimension $\geq 2$.

(v) $X_f(E/F_\infty)$ satisfies Property CF.

Then $X_R(A/F_\infty)$ satisfies Property CF.

### 8 Examples

In this section, we will give some examples to illustrate the results in this paper.

(a) Let $E$ be the elliptic curve 11a2 of Cremona’s table which is given by

$$y^2 + y = x^3 - x.$$ 

Take $p = 5, F = \mathbb{Q}(\mu_5)$ and $L_\infty = \mathbb{Q}(\mu_5^{11}, 11^{5-\infty})$. Let $F_\infty$ be a strongly admissible 5-adic Lie extension of $F$ that contains $L_\infty$ and that the group $N = \text{Gal}(F_\infty/L_\infty)$ satisfies the conditions in Theorem 6.3. As observed in [13, 20], $X(E/F_\infty)$, and hence $X_f(E/F_\infty)$, is finitely generated over $\mathbb{Z}_5[H]$ with positive $\mathbb{Z}_5[H]$-rank. By [14, Proposition 5.6], the $\mathfrak{M}_H(G)$-conjecture holds for $X(E'/F_\infty)$, where $E'$ is either 11a1 or 11a3. From the proof of Proposition 6.3, we also see that $X_f(E'/F_\infty)$ has the same $\mathbb{Z}_5[H]$-rank as $X(E/F_\infty)$. Proposition 6.3 then tells us that $X_f(A/F_\infty)$ is completely faithful over $\mathbb{Z}_5[G]$, and in particular satisfies Property CF for $A = 11a1, 11a2$ and 11a3.
Furthermore, it follows from an application of Proposition 4.3 that the \( \mathbb{Z}_5[C] \)-torsion submodules of \( X_f(A/F_\infty) \) are zero, where \( C \) is the center of \( G = \text{Gal}(F_\infty/F) \). Some interesting examples of strongly admissible 5-adic extensions \( F_\infty \) of \( F \) that one can take are

\[
M_\infty(\mu_5, 2^{5^{-\infty}}, 11^{5^{-\infty}}), \quad M_\infty(\mu_5, 3^{5^{-\infty}}, 11^{5^{-\infty}}), \quad M_\infty(\mu_5, 5^{5^{-\infty}}, 11^{5^{-\infty}}),
\]

\[
M_\infty(E_{5^\infty}, 2^{5^{-\infty}}, 11^{5^{-\infty}}), \quad M_\infty(E_{5^\infty}, 3^{5^{-\infty}}, 11^{5^{-\infty}}), \quad M_\infty(E_{5^\infty}, 5^{5^{-\infty}}, 11^{5^{-\infty}}),
\]

where \( M_\infty \) is any \( \mathbb{Z}_5^\infty \)-extension of \( F \). We should mention that we do not have an answer to the validity of Property CF for the admissible 5-adic extensions in the second line.

(b) Let \( p = 5 \). Let \( E \) be the elliptic curve 21a4 of Cremona’s tables which is given by

\[
y^2 + xy = x^3 + x.
\]

Let \( p = 5 \) and \( F = \mathbb{Q}(\mu_5) \). As discussed in [2 Section 7], \( X(E/F) \) is finite as suggested by its \( p \)-adic \( L \)-function which in turn implies that \( X(E/F_\infty) \) has trivial \( \mu_5 \)-invariant and \( \lambda \)-invariant. We will assume this latter property throughout our discussion here. Let \( A \) be an elliptic curve 66c1 of Cremona’s tables given by

\[
A : y^2 + xy = x^3 - 45x - 81.
\]

Set \( L_\infty = F(A_{5^\infty}) \). Since \( A \) has no complex multiplication and \( A(\mathbb{Q})_{\text{tor}} \cong \mathbb{Z}/2 \times \mathbb{Z}/5 \) (for instance, see [7]), it follows that \( L_\infty \) is a noncommutative pro-\( p \) extension of \( F \). Since \( p \geq 5 \), \( L_\infty \) is in fact a strongly admissible \( p \)-adic Lie extension of \( F \).

Let \( P_0, P_1, P_2 \) be defined as in [2 Definition 1.2]. Then in this situation, we have \( P_0 = \{2, 3, 11\} \). Since \( E \) has split multiplicative reduction at 3 and 3 does not split in \( F/\mathbb{Q} \), we have \( P_1 = \{3\} \). We shall now show that \( P_2 \) is empty. By the discussion in [2 Section 7], we have that \( 2 \) does not lie in \( P_2 \). Therefore, it remains to show that \( 11 \) does not lie in \( P_2 \). Since the prime 11 splits completely over \( F/\mathbb{Q} \), we have \( F_u = \mathbb{Q}_{11} \) for every prime \( u \) of \( F \) above 11. Since \( E \) has good reduction at 5, we have an injection \( E(\mathbb{Q}_{11})[5] \to E(\mathbb{F}_{11}) \) (see [27 Chap. VII., Proposition 3.1(b)]). By inspection, one has \( |E(\mathbb{F}_{11})| = 8 \). In particular, this implies that \( E(\mathbb{Q}_{11})[5] = 0 \), and thus all the primes of \( F \) above 11 do not lie in \( P_2 \). (Alternatively, to see that \( E(\mathbb{Q}_{11})[5] = 0 \), one may give a proof by contradiction. Suppose that \( E(\mathbb{Q}_{11})[5] \neq 0 \). Then since \( |E(\mathbb{Q})| = 4 \), it follows from the injections \( E(\mathbb{Q}) \to E(\mathbb{F}_{11}) \) and \( E(\mathbb{Q}_{11})[5] \to E(\mathbb{F}_{11}) \) that 20 divides \( |E(\mathbb{F}_{11})| \). But by the Hasse bound (cf. [27 Chap. V., Theorem 1.1]), we have

\[
|E(\mathbb{F}_{11})| \leq 11 + 1 + 2\sqrt{11} = 18.633... < 20
\]

and this gives the required contradiction.) We may now apply [2 Corollary 6.3] to conclude that \( X(E/L_\infty) \) is completely faithfully over \( \mathbb{Z}_5[\text{Gal}(L_\infty/F)] \), noting that \( X(E/L_\infty) \) is finitely generated over \( \mathbb{Z}_5[\text{Gal}(L_\infty/F_{\text{cyc}})] \).

Let \( F_\infty \) be the compositum of \( L_\infty \) and \( M_\infty \), where \( M_\infty \) is any \( \mathbb{Z}_5^\infty \)-extension of any finite extension \( L \) of \( F \) contained in \( L_\infty \). All the hypothesis in Theorem 7.2 can be verified easily. We will just make the remark that assumption (iii) follows from [2 Remark 2.6 and Corollary 6.1(on p. 1243)], and assumption
(iv) follows from the fact that $A$ has good ordinary reduction at 5 and [Lemma 2.8(ii)]. Therefore, we have that $X(E/F_\infty)$ is a completely faithful $\mathbb{Z}_5[\text{Gal}(F_\infty/F)]$-module by an iterative application of Theorem 7.2. One can then apply Proposition 5.3 to show that $X_f(E'/F_\infty)$ is also completely faithful over $\mathbb{Z}_5[\text{Gal}(F_\infty/F)]$ for $E' = 21a1, 21a2, 21a3, 21a5, 21a6$. Therefore, Property CF holds for the Selmer groups of $E$ and its isogenous elliptic curves over such $F_\infty$. By Propositions 4.1 and 4.2, Property CT also holds for the Selmer groups of $E$ and its isogenous elliptic curves over such $F_\infty$.

Acknowledgments. The author would like to thank Romyar Sharifi for his comments and for pointing out some grammatical issues in the paper. The author is supported by the National Natural Science Foundation of China under the Research Fund for International Young Scientists (Grant No: 11550110172).
