STUFFLE PRODUCT FORMULAS OF MULTIPLE ZETA VALUES

ZHONGHUA LI AND CHEN QIN

Abstract. Using the combinatorial descriptions of stuffle product, we obtain recursive formulas for the stuffle product of multiple zeta values and of multiple zeta-star values. Then we apply the formulas to prove several stuffle product formulas with one or two strings of $z_p$'s. We also describe how to use our formulas in general cases.

1. Introduction and statement of main results

For integers $k_1 \geq 2$ and $k_2, \ldots, k_n \geq 1$, the multiple zeta value and the multiple zeta-star value are defined by

$$\zeta(k_1, k_2, \ldots, k_n) = \sum_{m_1 > m_2 > \cdots > m_n > 0} \frac{1}{m_1^{k_1} m_2^{k_2} \cdots m_n^{k_n}};$$

$$\zeta^*(k_1, k_2, \ldots, k_n) = \sum_{m_1 \geq m_2 \geq \cdots \geq m_n \geq 1} \frac{1}{m_1^{k_1} m_2^{k_2} \cdots m_n^{k_n}},$$

respectively. In case of $n = 1$, we get Riemann zeta values in both cases, which are special values of the Riemann zeta function at positive integer arguments.

Using the definitions we can express a product of two multiple zeta values (multiple zeta-star values) as a sum of multiple zeta values (multiple zeta-star values). For example, for multiple zeta values we have

$$\zeta(2)\zeta(3) = \sum_{m > 0} \frac{1}{m^2} \times \sum_{n > 0} \frac{1}{n^3} = \left( \sum_{m > n > 0} + \sum_{n > m > 0} + \sum_{m = n > 0} \right) \frac{1}{m^2 n^3} = \zeta(2, 3) + \zeta(3, 2) + \zeta(5),$$

and for multiple zeta-star values, we have

$$\zeta^*(2)\zeta^*(3) = \sum_{m \geq 1} \frac{1}{m^2} \times \sum_{n \geq 1} \frac{1}{n^3} = \left( \sum_{m \geq n \geq 1} + \sum_{n \geq m \geq 1} - \sum_{m = n \geq 1} \right) \frac{1}{m^2 n^3} = \zeta^*(2, 3) + \zeta^*(3, 2) - \zeta^*(5).$$

Such products are called stuffle products (or harmonic shuffle products).

The algebraic settings are given in [3] for multiple zeta values, and in [6] for multiple zeta-star values. Since we only treat the stuffle product here, we give the following algebraic descriptions. Let $Y = \{ z_k \mid k = 1, 2, \ldots \}$ be an alphabet with...
noncommutative letters, and let \( Y^* \) be the set of all words generated by letters in \( Y \), which contains the empty word \( 1 \). Let \( h^1 = Q(Y) \) be the noncommutative polynomial algebra over the rational number field \( Q \) generated by the alphabet \( Y \), which is spanned by \( Y^* \) as a rational vector space. And let \( h^0 \) be the subalgebra of \( h^1 \) defined by

\[
h^0 = Q + \sum_{k=2}^{\infty} z_k h^1.
\]

Corresponding to stuffle products of multiple zeta values and of multiple zeta-star values, we define two bilinear commutative products \( * \) and \( \bar{*} \) on \( h^1 \) by the rules

\[
1 \ast w = w \ast 1 = w,
\]

\[
z_k w_1 \ast z_l w_2 = z_k (w_1 \ast z_l w_2) + z_l (z_k w_1 \ast w_2) + z_{k+l} (w_1 \ast w_2);
\]

\[
1 \bar{*} w = w \bar{*} 1 = w,
\]

\[
z_k w_1 \bar{*} z_l w_2 = z_k (w_1 \bar{*} z_l w_2) + z_l (z_k w_1 \bar{*} w_2) - z_{k+l} (w_1 \bar{*} w_2),
\]

where \( w, w_1, w_2 \in Y^* \) and \( k, l \) are positive integers. Under each of these two products, \( h^1 \) becomes a commutative algebra, and \( h^0 \) is still a subalgebra of \( h^1 \).

To relate the algebra \( h^0 \) to multiple zeta values and to multiple zeta-star values, we define rational linear maps \( Z : h^0 \to \mathbb{R} \) and \( Z^* : h^0 \to \mathbb{R} \) by \( Z(1) = Z^*(1) = 1 \) and

\[
Z(z_k, z_{k_2} \cdots z_{k_n}) = \zeta(k_1, k_2, \ldots, k_n), \quad Z^*(z_k, z_{k_2} \cdots z_{k_n}) = \zeta^*(k_1, k_2, \ldots, k_n),
\]

where \( n, k_1, k_2, \ldots, k_n \) are positive integers with \( k_1 > 1 \), and \( \mathbb{R} \) is the field of real numbers. Then it was shown in [3] and in [6] that \( Z : (h^0, \ast) \to \mathbb{R} \) and \( Z^* : (h^0, \bar{*}) \to \mathbb{R} \) are algebra homomorphisms, respectively. More precisely, for any \( w_1, w_2 \in h^0 \), we have

\[
Z(w_1 \ast w_2) = Z(w_1)Z(w_2),
\]

\[
Z^*(w_1 \bar{*} w_2) = Z^*(w_1)Z^*(w_2).
\]

Hence to get stuffle product formulas, we can work on \( h^0 \) first. For example, since

\[
z_2 \ast z_3 = z_2 z_3 + z_3 z_2 + z_5,
\]

\[
z_2 \bar{*} z_3 = z_2 z_3 + z_3 z_2 - z_5,
\]

applying the map \( Z \) and \( Z^* \) respectively, we get

\[
\zeta(2)\zeta(3) = \zeta(2, 3) + \zeta(3, 2) + \zeta(5), \quad \zeta^*(2)\zeta^*(3) = \zeta^*(2, 3) + \zeta^*(3, 2) - \zeta(5)
\]

as proved above.

There is another commutative product \( \ast \) among multiple zeta values, which is deduced from the iterated integral representation of multiple zeta values and is called the shuffle product (see [3, 7] for details). During the study of multiple zeta values, several shuffle product formulas were found. For example, as generalizations of Euler’s decomposition formula, Eie and Wei essentially studied the shuffle product \( z_k z_1^{m} \ast z_l z_1^{n} \) in [2]. Lei, Guo and Ma obtained the formula for shuffle product \( z_k z_1^{m} \ast z_l z_1^{n} \) in [4], and we studied the shuffle products of words with more strings of \( z_1 \)'s in [5]. For the shuffle product, Chen obtained a formula for the product \( z_k z_p^m \ast z_l z_p^n \) in [1]. Chen expressed this product by simple products of the
form $z_p^i * z_p^j$. We find that one can treat general products with more strings of $z_p$’s such as

$$z_{k_1}z_{p_1}^m z_{k_2}z_{p_2}^m \cdots z_{k_r}z_{p_r}^m * z_{l_1}z_{p_1}^n z_{l_2}z_{p_2}^n \cdots z_{l_s}z_{p_s}^n \quad (1.1)$$

and

$$z_{k_1}z_{p_1}^m z_{k_2}z_{p_2}^m \cdots z_{k_r}z_{p_r}^m * z_{l_1}z_{p_1}^n z_{l_2}z_{p_2}^n \cdots z_{l_s}z_{p_s}^n. \quad (1.2)$$

In fact, the general products can be expressed by simple products of the forms $z_p^i * z_p^j$ and $z_p^i * z_p^j$, respectively. For the simple products, we have the following result.

**Theorem 1.1.** For a positive integer $p$ and two nonnegative integers $a, b$, we denote by $G^n_b$ the set of all words in $Y^*$ which contains $z_p$ a times and $zzp$ b times. Then for any nonnegative integers $m, n, u$, we have

$$z_p^m * z_p^n = \sum_{i=0}^{\min\{m, n\}} \binom{m + n - 2i}{m - i} \sum_{w \in G_i^{m+n-2i}} w \quad (1.3)$$

and

$$z_p^m \times z_p^n = \sum_{i=0}^{\min\{m, n\}} (-1)^i \binom{m + n - 2i}{m - i} \sum_{w \in G_i^{m+n-2i}} w. \quad (1.4)$$

Note that formula (1.3) is just [1, Lemma 1]. To study the general shuffle products mentioned above, we need the following recursive formulas, which are similar to [4, Lemma 2.1] for shuffle products.

**Theorem 1.2.** Let $m, n, k_1, \ldots, k_m, l_1, \ldots, l_n$ be positive integers. Then for any integer $j$ with $1 \leq j \leq m$, we have

$$z_{k_1}z_{k_2} \cdots z_{k_m} * z_{l_1}z_{l_2} \cdots z_{l_n} = \sum_{i=0}^{n} [(z_{k_1}z_{k_2} \cdots z_{k_{j-1}} * z_{l_1}z_{l_2} \cdots z_{l_i})z_{k_j} + (z_{k_1}z_{k_2} \cdots z_{k_{j-1}} * z_{l_1}z_{l_2} \cdots z_{l_{i+1}})](z_{k_{j+1}} \cdots z_{k_m} * z_{l_{i+1}} \cdots z_{l_n}), \quad (1.5)$$

and

$$z_{k_1}z_{k_2} \cdots z_{k_m} \times z_{l_1}z_{l_2} \cdots z_{l_n} = \sum_{i=0}^{n} [(z_{k_1}z_{k_2} \cdots z_{k_{j-1}} \times z_{l_1}z_{l_2} \cdots z_{l_i})z_{k_j} - (z_{k_1}z_{k_2} \cdots z_{k_{j-1}} \times z_{l_1}z_{l_2} \cdots z_{l_{i-1}})](z_{k_{j+1}} \cdots z_{k_m} \times z_{l_{i+1}} \cdots z_{l_n}). \quad (1.6)$$

Here by convention, we let $z_{k_1} \cdots z_{k_{i-1}} = 1$ and $z_{k_{i+1}} \cdots z_{k_{i-2}} = 0$ for any integer $i$.

Applying the recursive formulas to $z_kz_p^m * z_lz_p^n$ and $z_kz_p^m \times z_lz_p^n$, we get the following shuffle product formulas.

**Corollary 1.3.** Let $k, l, p$ be positive integers and let $m, n$ be nonnegative integers. Then we have

$$z_kz_p^m * z_lz_p^n = \sum_{i=1}^{m} z_k(z_{p_i}z_l + z_{p_{i+1}})z_p^{m-i} * z_p^n)$$

$$+ \sum_{i=1}^{n} z_l(z_{p_i}z_k + z_{p_{i+1}})z_p^{n-i} * z_p^m) + (z_kz_l + z_lz_k + z_kz_l)z_p^m * z_p^n \quad (1.7)$$

3
by simple products of the forms
\[ \text{can be expressed by simple products of the forms} \]
\[ \text{and} \]
\[ \text{of the formula increases quickly when} \]
Here we set

Similarly, one can use the recursive formula
\[ \text{for} k, l_1, l_2, p \text{ be positive integers and let} m, n_1, n_2 \text{ be nonnegative integers. Then we have} \]
\[ z_k z_p^{m} \ast z_l z_p^{n} = \sum_{0 \leq i_1 \leq m, 0 \leq i_2 \leq n} z_k \left( z_p^{i_1} z_l + z_p^{i_1-1} z_p^{l+1} \right) \left( z_p^{m-i_2} \ast z_p^{n_2} \right) z_l \]
\[ + \sum_{0 \leq i_1 \leq n_1, 0 \leq i_2 \leq m} z_l \left( z_p^{i_2} z_k + z_p^{i_2-1} z_p^{k+1} \right) \left( z_p^{m-i_2} \ast z_p^{n_2} \right) z_l \]
\[ \times \left( z_p^{m-i_2} \ast z_p^{n_2} \right) z_l \]
\[ + \sum_{0 \leq i_1 \leq n_2} z_k z_l \left( z_p^{i_1} z_p^{n_2} \right) z_l \]
\[ + \sum_{0 \leq i \leq m} z_k z_l \left( z_p^{i} \ast z_p^{n_2} \right) \]
\[ + \sum_{0 \leq i \leq m} \left( z_p^{i} \ast z_p^{n_2} \right) \]
\[ \text{and} \]
\[ z_k z_p^{m} \ast z_l z_p^{n} = \sum_{0 \leq i_1 \leq m, 0 \leq i_2 \leq n} z_k \left( z_p^{i_1} z_l - z_p^{i_1-1} z_p^{l+1} \right) \left( z_p^{m-i_2} \ast z_p^{n_2} \right) z_l \]
\[ - \sum_{0 \leq i_1 \leq n_1, 0 \leq i_2 \leq m} z_l \left( z_p^{i_2} z_k - z_p^{i_2-1} z_p^{k+1} \right) \left( z_p^{m-i_2} \ast z_p^{n_2} \right) \]
\[ \times \left( z_p^{m-i_2} \ast z_p^{n_2} \right) z_l \]
\[ - z_l \sum_{0 \leq i \leq n_2} z_k z_l \left( z_p^{i} \ast z_p^{n_2} \right) \]
\[ - \sum_{0 \leq i \leq m} z_k z_l \left( z_p^{i} \ast z_p^{n_2} \right) \]
\[ \text{Here we set} \ z_p^{-1} = 0. \]

Similarly, one can use the recursive formula (1.5) to the general product (1.1) and formula (1.6) to the general product (1.2). We find that all these type products can be expressed by simple products of the forms \( z_p^m \ast z_p^n \) for the \( \ast \) product, and by simple products of the forms \( z_p^m \ast z_p^n \) for the \( \# \) product. However the complexity of the formula increases quickly when \( m + n \) is larger. Hence we do not write the explicit formulas here.

After getting the formula of the product (1.1), one can apply the map \( Z \) to get a formula of the stuffle product
\[ \zeta(k_1, \{ p \}^{m_1}, \ldots, k_r, \{ p \}^{m_r}) \zeta(l_1, \{ p \}^{n_1}, \ldots, l_s, \{ p \}^{n_s}), \]
where $k_1, l_1 \geq 2$ and $\{p\}^m$ stands for a string of $m$ $p$’s. Similarly, from the formula of the product (1.2), one can obtain a corresponding formula of the stuffle product of multiple zeta-star values. For example, from Theorem 1.1, Corollary 1.3 and Corollary 1.4, we immediately get the following corollary. Note that (1.11) is just [1, Theorem 1].

**Corollary 1.5.** Let $p$ be a positive integer. For nonnegative integers $a, b$, let $A^a_b$ be the set of all strings containing $a$ times $p$ and $b$ times $2p$. Then for any positive integers $k, l, l_1, l_2$ with $k, l_1 \geq 2$ and any nonnegative integers $m, n, n_1, n_2$, we have

\[
\zeta(k, \{p\}^m) \zeta(l, \{p\}^n) = \sum_{0 \leq i \leq m} \sum_{0 \leq j \leq n} \binom{m + n - i - 2j}{n - j} \left[ \zeta(k, \{p\}^i, l, k) + \zeta(k, \{p\}^{i-1}, p + l, k) \right] \\
+ \sum_{0 \leq i \leq m} \sum_{0 \leq j \leq n} \binom{m + n - i - 2j}{m - j} \left[ \zeta(l, \{p\}^i, k, k) + \zeta(l, \{p\}^{i-1}, p + k, k) \right] \\
+ \sum_{0 \leq j \leq m} \sum_{0 \leq i \leq n} \binom{m + n - 2j}{m - j} \left[ \zeta(k, l, k) + \zeta(l, k, k) + \zeta(k + l, k) \right],
\]

(1.11)

\[
\zeta^*(k, \{p\}^m) \zeta^*(l, \{p\}^n) = \sum_{0 \leq i \leq m} \sum_{0 \leq j \leq n} \binom{m + n - i - 2j}{n - j} \left[ \zeta^*(k, \{p\}^i, l, k) - \zeta^*(k, \{p\}^{i-1}, p + l, k) \right] \\
+ \sum_{0 \leq i \leq m} \sum_{0 \leq j \leq n} \binom{m + n - i - 2j}{m - j} \left[ \zeta^*(l, \{p\}^i, k, k) - \zeta^*(l, \{p\}^{i-1}, p + k, k) \right] \\
+ \sum_{0 \leq j \leq m} \sum_{0 \leq i \leq n} \binom{m + n - 2j}{m - j} \left[ \zeta^*(k, l, k) + \zeta^*(l, k, k) - \zeta^*(k + l, k) \right]
\]

and

\[
\zeta(k, \{p\}^m) \zeta(l_1, \{p\}^{n_1}, l_2, \{p\}^{n_2}) = \sum_{0 \leq i_1 \leq m} \sum_{0 \leq j_1 \leq n_1} \sum_{0 \leq i_2 \leq m} \sum_{0 \leq j_2 \leq n_2} \binom{n_1 + i_2 - i_1 - 2j_1}{n_1 - j_1} \binom{m + n_2 - i_2 - 2j_2}{n_2 - j_2} \\
\times \left[ \zeta(k, \{p\}^{i_1}, l_1, k, l_2, l) + \zeta(k, \{p\}^{i_1-1}, p + l_1, k, l_2, l) \right]
\]
\begin{align*}
+ & \sum_{0 \leq j_1 \leq m} \left( n_1 + i_2 - i_1 - 2j_1 - 1 \right) \left( m + n_2 - i_2 - 2j_2 \right) \\
& \times \left[ \zeta(k, \{p\}^{i_1}, l_1, k, p + l_2, l) + \zeta(k, \{p\}^{i_1-1}, p + l_1, k, p + l_2, l) \right] \\
& + \sum_{0 \leq j_1 \leq m} \sum_{0 \leq l_1 \leq n_j} \left( n_1 + i_2 - i_1 - 2j_1 \right) \left( m + n_2 - i_2 - 2j_2 \right) \\
& \times \left[ \zeta(l_1, \{p\}^{j_1}, k, k, p + l_2, l) + \zeta(l_1, \{p\}^{j_1-1}, p + k, k, p + l_2, l) \right] \\
& + \sum_{0 \leq j_1 \leq m} \sum_{0 \leq j_2 \leq m} \left( m + n_2 - 2j \right) \zeta(l_1, \{p\}^{j_1}, k + l_2, k) \\
& + \sum_{0 \leq j_1 \leq m} \sum_{0 \leq j_2 \leq m} \left( m + n_2 - i - 2j \right) \zeta(l_1, \{p\}^{j_1}, k + l_2, k) \\
& \times \left[ \zeta(l_1, \{p\}^{j_1}, l_2, \{p\}^{j_1}, k, p + l_2, l) + \zeta(l_1, \{p\}^{j_1-1}, l_2, \{p\}^{j_1-1}, p + k, k) \right] \\
& + \sum_{0 \leq j_1 \leq m} \sum_{0 \leq j_2 \leq m} \left( n_1 + i - 2j_1 \right) \left( m + n_2 - i - 2j_2 \right) \zeta(k + l_1, k, l_2, l) \\
& + \sum_{0 \leq j_1 \leq m} \sum_{0 \leq j_2 \leq m} \left( n_1 + i - 2j_1 - 1 \right) \left( m + n_2 - i - 2j_2 \right) \zeta(k + l_1, k, p + l_2, l) \\
\zeta^*(k, \{p\}^m) \zeta^*(l_1, \{p\}^{n_1}, l_2, \{p\}^{n_2}) \\
= & \sum_{0 \leq j_1 \leq m} \sum_{0 \leq j_2 \leq m} \left( n_1 + i_2 - i_1 - 2j_1 \right) \left( m + n_2 - i_2 - 2j_2 \right) \\
& \times \left[ \zeta^*(k, \{p\}^{i_1}, l_1, k, l_2, l) - \zeta^*(k, \{p\}^{i_1-1}, p + l_1, k, l_2, l) \right]
\end{align*}
contains proofs of Theorem 1.4. We can get some double shuffle relations of multiple zeta values for some special types. Here we leave the explicit formulas to the reader.

Section 2 contains proofs of Theorem 1.1, Theorem 1.2, Corollary 1.3 and Corollary 1.4. In Section 3, we describe how to apply our recursive formulas to express...
the products (1.1) and (1.2) by simple products, and take the cases \( r = s = 2 \) as an example.

## 2. Proofs

In this section, we give proofs of the results mentioned in Section 1.

### 2.1. Proof of Theorem 1.1

For the simple product \( z_p^m \ast z_p^n \), Chen used induction on \( m + n \) to prove formula (1.3) in [1]. Here we give another proof, which seems simple and intuitive. We use the combinatorial description of stuffle product \(*\). By the definition of stuffle product \(*\), we have

\[
z_{k_1} \cdots z_{k_n} \ast z_{k_{n+1}} \cdots z_{k_{n+m}} = \sum_{i=0}^{\min\{n,m\}} \sum_{\sigma \in \mathcal{S}_{n,m,i}} z_{\sigma^{-1}(1)} z_{\sigma^{-1}(2)} \cdots z_{\sigma^{-1}(n+m-i)},
\]

where \( \mathcal{S}_{n,m,i} \) is the set of all surjections \( \sigma : \{1, 2, \ldots, n+m\} \rightarrow \{1, 2, \ldots, n+i\} \) with conditions

\[
\sigma(1) < \sigma(2) < \cdots < \sigma(n), \quad \sigma(n+1) < \sigma(n+2) < \cdots < \sigma(n+i),
\]

and for any \( \sigma \in \mathcal{S}_{n,m,i} \) and any \( j \in \{1, 2, \ldots, n+i\} \),

\[
z_{\sigma^{-1}(j)} = \begin{cases} 
  z_k, & \text{if } \sigma^{-1}(j) = \{k\}, \\
  z_{k+l}, & \text{if } \sigma^{-1}(j) = \{k, l\}.
\end{cases}
\]

Now if we write

\[
z_p^m \ast z_p^n = \sum_{w \in \mathcal{Y}} c_w w,
\]

then we only need to determine the coefficients \( c_w \). By the combinatorial description of the product \(*\) described above, it is easy to see that if \( c_w \neq 0 \), then all the letters in the word \( w \) must be \( z_p \) or \( z_{2p} \), and the number of \( z_{2p} \)'s is less than or equal to \( \min\{m, n\} \). Hence we can write

\[
z_p^m \ast z_p^n = \sum_{i=0}^{\min\{m,n\}} \sum_{w \in G_i} c^i_w w.
\]

For any \( w \in G_i^{m+n-2i} \), we look for the possibility to get \( w \). There are \( m + n - 2i \) times \( z_p \) in \( w \), in which \( m - i \) times \( z_p \) are from \( z_p^m \) and others are from \( z_p^n \). Hence the possibility is \( \binom{m+n-2i}{m-i} \). In other words, for any \( w \in G_i^{m+n-2i} \), we have

\[
c^i_w = \binom{m+n-2i}{m-i}.
\]

Then we get (1.3).

Similarly, to prove formula (1.4) for the simple product \( \tilde{z}_p^m \tilde{z}_p^n \), we use the combinatorial description of stuffle product \( \tilde{*} \), we have

\[
z_{k_1} \cdots z_{k_n} \tilde{*} z_{k_{n+1}} \cdots z_{k_{n+m}} = \sum_{i=0}^{\min\{n,m\}} \sum_{\sigma \in \mathcal{S}_{n,m,i}} z_{\sigma^{-1}(1)} z_{\sigma^{-1}(2)} \cdots z_{\sigma^{-1}(n+m-i)},
\]

where for any \( \sigma \in \mathcal{S}_{n,m,i} \) and any \( j \in \{1, 2, \ldots, n+i\} \),

\[
z_{\sigma^{-1}(j)} = \begin{cases} 
  z_k, & \text{if } \sigma^{-1}(j) = \{k\}, \\
  -z_{k+l}, & \text{if } \sigma^{-1}(j) = \{k, l\}.
\end{cases}
\]
By the combinatorial description, we can write
\[ z_p^m * z_p^n = \min\{m,n\} \sum_{i=0}^{\min\{m,n\}} \sum_{w \in G_i^{m+n-2i}} d_i^w w. \]

In this case, for any \( w \in G_i^{m+n-2i} \), the possibility to get \( w \) is also \( \binom{m+n-2i}{m-i} \). While every letter \( z_{2p} \) in \( w \) will bring a negative sign. Hence for any \( w \in G_i^{m+n-2i} \), we have
\[ d_i^w = (-1)^i \binom{m+n-2i}{m-i}. \]

Then we get (1.4).

For more details, see [5], which uses the same idea to deal with shuffle products.

2.2. Proof of Theorem 1.2. We only prove the recursive formula (1.5). The recursive formula (1.6) can be proven in a similar way. To get the result, one can use induction on \( m + n \), while here we use the combinatorial description of the stuffle product.

The left-hand side of (1.5) is a sum over surjections
\[ \sigma : \{1, 2, \ldots, m+n\} \rightarrow \{1, 2, \ldots, m+n-p\}, \]
which are strictly increasing on \( \{1, \ldots, m\} \) and on \( \{m+1, \ldots, m+n\} \) separately, and \( p \) is an integer with the condition \( 0 \leq p \leq \min\{m,n\} \). Now for a fixed \( j \in \{1, 2, \ldots, m\} \), there are two different types of such \( \sigma \)'s, one satisfies the condition \( \sigma(i) < \sigma(j) < \sigma(i+1) \) for some \( i \in \{m, m+1, \ldots, m+n\} \), and the other one satisfies the condition \( \sigma(j) = \sigma(i) \) for some \( i \in \{m+1, m+2, \ldots, m+n\} \). Summing over the first type of \( \sigma \)'s we get the term
\[ \sum_{i=0}^{n} (z_{k_1} z_{k_2} \cdots z_{k_{j-1}} * z_{l_1} z_{l_2} \cdots z_{l_{i}}) z_{k_{j+1}} \cdots z_{k_m} * z_{l_{i+1}} \cdots z_{l_n}. \]

And summing over the second type of \( \sigma \)'s we obtain the term
\[ \sum_{i=1}^{n} (z_{k_1} z_{k_2} \cdots z_{k_{j-1}} * z_{l_1} z_{l_2} \cdots z_{l_{i-1}}) z_{k_{j+1}} \cdots z_{k_m} * z_{l_{i+1}} \cdots z_{l_n}. \]

Then we get the recursive formula (1.5). □

2.3. Proof of Corollary 1.3. Here we prove formula (1.7), and one can prove formula (1.8) in a similar way. We remark that the strategy of our proof is slightly different from that of [1, Theorem 3]. We apply the recursive formula (1.5) with \( j = 1 \) to get
\[ z_k z_p^m * z_l z_p^n = z_k z_l (z_p^m * z_p^n) + z_{k+l} (z_p^m * z_p^n) + \sum_{i=0}^{n} (z_{l_{i+1}} z_{p+k} (z_p^m * z_p^{n-i})), \]
which is just (1.7). □
2.4. **Proof of Corollary 1.4.** Here we prove formula (1.9), and one can prove formula (1.10) in a similar way. Applying the recursive formula (1.5) with \( j = 1 \), we get

\[
\begin{align*}
& z_k z_p^m * z_{l_1} z_{l_2}^{n_1} z_{l_2}^{n_2} = z_k (z_p^m * z_{l_1} z_{l_2}^{n_1} z_{l_2}^{n_2}) + z_k l_1 (z_p^m * z_{l_1} z_{l_2}^{n_2}) \\
& \quad + \sum_{i=0}^{n_1} (z_{l_1} z_p^i z_{l_2}^{n_1-i} z_{l_2}^{n_2}) (z_p^m * z_{l_1} z_{l_2}^{n_2}) + z_{l_1} z_{l_2}^{n_1} z_{l_2}^{n_2} (z_p^m * z_{l_2}^{n_2}) \\
& \quad + \sum_{i=0}^{n_2} (z_{l_1} z_{l_2}^{n_1} z_{l_2}^{n_2} z_{l_2}^{n_2}) + z_{l_1} z_{l_2}^{n_1} z_{l_2}^{n_2} (z_{l_2}^{n_2}) (z_p^m * z_{l_2}^{n_2-i}).
\end{align*}
\]

Then we have to compute the products \( z_p^m * z_{l_1} z_{l_2}^{n_1} z_{l_2}^{n_2} \) and \( z_p^m * z_{l_1} z_{l_2}^{n_1} z_{l_2}^{n_2} \). For the second one, we have the following general result.

**Lemma 2.1.** For positive integers \( l, p \) and nonnegative integers \( m, n_1, n_2 \), we have

\[
z_p^m * z_{l_1} z_{l_2}^{n_1} z_{l_2}^{n_2} = \sum_{i=0}^{m} [(z_p^i * z_{l_1}^{n_1}) z_{l_2}^{n_2} + (z_p^{i-1} * z_{l_1}^{n_1}) z_{l_2}^{n_2}] (z_p^{m-i} * z_{l_2}^{n_2}).
\]

**Proof.** We get (2.2) by applying the recursive formula (1.5) with \( j = n_1 + 1 \).

And for the first one, we have the following result.

**Lemma 2.2.** For positive integers \( p, l_1, l_2 \) and nonnegative integers \( m, n_1, n_2 \), we have

\[
z_p^m * z_{l_1} z_{l_2}^{n_1} z_{l_2}^{n_2} = \sum_{0 \leq i_1 \leq i_2 \leq m} (z_p^{i_1} * z_{l_1}^{n_1} z_{l_2}^{n_2} + (z_p^{i_2} * z_{l_1}^{n_1} z_{l_2}^{n_2}) z_{l_2}^{n_2} * z_{l_2}^{n_2}).
\]

**Proof.** Applying the recursive formula (1.5) with \( j = 1 \), we get

\[
z_p^m * z_{l_1} z_{l_2}^{n_1} z_{l_2}^{n_2} = \sum_{i=0}^{m} (z_p^{i} * z_{l_1}^{n_1} z_{l_2}^{n_2} + (z_p^{i-1} * z_{l_1}^{n_1} z_{l_2}^{n_2}) z_{l_2}^{n_2} * z_{l_2}^{n_2}).
\]

Then using (2.2), we have

\[
z_p^m * z_{l_1} z_{l_2}^{n_1} z_{l_2}^{n_2} = \sum_{i=0}^{m} \sum_{0 \leq i_1 \leq i_2 \leq m} (z_p^{i_1} * z_{l_1}^{n_1} z_{l_2}^{n_2} + (z_p^{i_2} * z_{l_1}^{n_1} z_{l_2}^{n_2}) z_{l_2}^{n_2} * z_{l_2}^{n_2}).
\]

Let \( i_1 = i \) and \( i_2 = i + l \) in the summation of the right-hand side of the above equation, we get the result.

Now formula (1.9) follows from (2.1), (2.2) and (2.3). And we finish the proof of Corollary 1.4.

**2.5. Remark.** In fact, one can get Corollary 1.3 and Corollary 1.4 in the same way as the proofs of Theorem 1.1 and Theorem 1.2 given above. For example, \( z_k z_p^m * z_{l_1} z_{l_2}^{n_1} z_{l_2}^{n_2} \) is a sum over surjections

\[
\sigma : \{1, 2, \ldots, m + n + 2\} \to \{1, 2, \ldots, m + n + 2 - j\},
\]

which are strictly increasing on \( \{1, \ldots, m + 1\} \) and on \( \{m + 2, \ldots, m + n + 2\} \) respectively. We can separate such \( \sigma \)'s into three different types according to

\[
\sigma(1) < \sigma(m + 2),
\]
Applying the recursive formula \((\text{1.7})\), we find \((\text{1.1})\) can be expressed by products
\[
\begin{align*}
(T_1) & \ z \frac{m_1}{p} z \frac{m_2}{p} \ldots z \frac{m_r}{p} \cdot z \frac{n_1}{p} z \frac{n_2}{p} \ldots z \frac{n_s}{p}, \\
(T_2) & \ z \frac{m_1}{p} z \frac{m_2}{p} \ldots z \frac{m_r}{p} \cdot z \frac{n_1}{p} z \frac{n_2}{p} \ldots z \frac{n_s}{p}, \quad (0 \leq i_1 \leq n_1), \\
(T_3) & \ z \frac{m_1}{p} z \frac{m_2}{p} \ldots z \frac{m_r}{p} \cdot z \frac{n_1}{p} z \frac{n_2}{p} \ldots z \frac{n_s}{p}, \quad (0 \leq i_2 \leq n_2), \\
& \vdots \\
(T_s) & \ z \frac{m_1}{p} z \frac{m_2}{p} \ldots z \frac{m_r}{p} \cdot z \frac{n_1}{p} z \frac{n_2}{p} \ldots z \frac{n_s}{p}, \quad (0 \leq i_s-1 \leq n_s-1), \\
(T_{s+1}) & \ z \frac{m_1}{p} z \frac{m_2}{p} \ldots z \frac{m_r}{p} \cdot z \frac{n_1}{p} z \frac{n_2}{p} \ldots z \frac{n_s}{p}, \quad (0 \leq i_s \leq n_s).
\end{align*}
\]

We may assume that \(r > 1\). For \(i = 1, 2, \ldots, s\), using the recursive formula \((\text{1.5})\) with \(j = m_1 + 1\) to the product \((T_i)\), we find that \((T_i)\) can be expressed by products of \((T_{i+1})\), \ldots, \((T_{s+1})\). For the product \((T_{s+1})\), we also apply the recursive formula \((\text{1.5})\) with \(j = m_1 + 1\) to get
\[
\begin{align*}
\sum_{i=0}^{n_s-1} [ & \left(z \frac{m_1}{p} z \frac{s_i}{p} \cdot z \frac{m_2}{p} \ldots z \frac{m_r}{p} \cdot z \frac{m_1}{p} z \frac{s_i-1}{p} \cdot z \frac{m_2}{p} \ldots z \frac{m_r}{p} \right)
\end{align*}
\]
Hence \((T_{s+1})\) can be expressed by products of \((T_{s+1})\) with smaller \(r\). Then we see that we can express the product \((\text{1.1})\) by simple products of the form \(z^i \cdot z^j\), as an example.

Let’s take the case \(r = s = 2\), that is \(z \frac{m_1}{p} z \frac{m_2}{p} \cdot z \frac{n_1}{p} z \frac{n_2}{p}\). Applying the recursive formula \((\text{1.5})\) with \(j = 1\), we get
\[
\begin{align*}
\sum_{i=0}^{n_s-1} [ & \left(z \frac{m_1}{p} z \frac{s_i}{p} \cdot z \frac{m_2}{p} \ldots z \frac{m_r}{p} \cdot z \frac{m_1}{p} z \frac{s_i-1}{p} \cdot z \frac{m_2}{p} \ldots z \frac{m_r}{p} \right)
\end{align*}
\]
Hence we need to compute products of the forms
\[
\begin{align*}
(i) & \ z \frac{m_1}{p} z \frac{m_2}{p} \cdot z \frac{n_1}{p} z \frac{n_2}{p}, \\
(ii) & \ z \frac{m_1}{p} z \frac{m_2}{p} \cdot z \frac{n_1}{p} z \frac{n_2}{p}, \\
(iii) & \ z \frac{m_1}{p} z \frac{m_2}{p} \cdot z \frac{n_1}{p} z \frac{n_2}{p}.
\end{align*}
\]
Applying the recursive formula (1.5) with \( j = 1 \) to the product (i), we get
\[
\sum_{i=0}^{m_1} (z_{p_i}^i z_{l_i} + z_{p_i}^{i-1} z_{p_i+1}^i)(z_{p_i}^{m_1-i} z_{k_p} z_{k_p}^2 z_{l_i}^2 z_{p_i}^2) + z_{p_i}^{m_1-i} z_{k_p+1}^i (z_{p_i}^{m_2} z_{p_i}^{n_1} z_{l_i}^2 z_{p_i}^2)
\]
\[+ \sum_{i=0}^{m_2} (z_{p_i}^{m_2-i} z_{p_i}^i z_{l_i} + z_{p_i}^{m_2-i} z_{p_i}^{n_1} z_{l_i}^2 z_{p_i}^2).
\]
Hence the product (i) can be expressed by products of the forms (ii) and (iii). For the product (ii), applying the recursive formula (1.5) with \( j = m_1 + 1 \), we get
\[
\sum_{i=0}^{n_1} [(z_{p_i}^i z_{l_i} z_{p_i}) + (z_{p_i}^{i-1} z_{p_i+1}^i) z_{p_i}^{m_2} z_{p_i}^{n_1} z_{l_i}^2 z_{p_i}^2]
\]
\[+ \sum_{i=0}^{n_2} [(z_{p_i}^{m_2} z_{p_i}^i z_{l_i}^2 z_{p_i}^2)] z_{p_i}^{m_2} z_{p_i}^{n_2}.
\]
Then the product (ii) can be expressed by products of the form (iii). Finally, applying the recursive formula (1.5) with \( j = m_1 + 1 \) to the product (iii), we get
\[
\sum_{i=0}^{n} [(z_{p_i}^i z_{l_i} z_{p_i}) + (z_{p_i}^{i-1} z_{p_i+1}^i) z_{p_i}^{m_2} z_{p_i}^{n-i}]
\]
which is expressed by simple products.

Putting all these results into (3.1), we can finally obtain a formula which writes the product \( z_{k}^i z_{p}^{n_1} z_{l}^2 z_{p}^{n_2} \) by simple products of the form \( z_{p}^i z_{p}^j \). While there are too many terms to write, so we omit this formula.

REFERENCES
