## Abstract

We study analysis aspects of the sixth order GJMS operator  $P_g^6$ . Under conformal normal coordinates around a point, the expansions of Green's function of  $P_g^6$  with pole at this point are presented. As a starting point of the study of  $P_g^6$ , we manage to give some existence results of prescribed  $Q$ -curvature problem on Einstein manifolds. One among them is that for  $n \geq 10$ , let  $(M^n, g)$  be a closed Einstein manifold of positive scalar curvature and  $f$  a smooth positive function in  $M$ . If the Weyl tensor is nonzero at a maximum point of  $f$  and  $f$  satisfies a vanishing order condition at this maximum point, then there exists a conformal metric  $\tilde{g}$  of  $g$  such that its  $Q$ -curvature  $Q_{\tilde{g}}^6$  equals  $f$ .

**2010 MSC:** Primary 53A30, 58J05, 53C21; Secondary 35J35, 35J08, 35B50.

**Keywords:** Sixth order GJMS operator, Prescribed  $Q$ -curvature problem, Green's function, Mountain pass critical points.

## 1 Introduction

Recently, some remarkable developments have been achieved in the existence theory of positive constant  $Q$ -curvature problem associated to Paneitz-Branson operator. One key ingredient in such works is that a strong maximum principle for the fourth order Paneitz-Branson operator is discovered under a hypothesis on the positivity of some conformal invariants or  $Q$ -curvature of the background metric. The readers are referred to [8, 9, 10, 13] and the references therein. This naturally stimulates us to study GJMS operator of order six and its associated  $Q$ -curvature problem, the analogue to the Yamabe problem and  $Q$ -curvature problem for Paneitz-Branson operator. Except for the aforementioned cases, due to the lack of a maximum principle for higher order elliptic equations in general, the existence theory of such problems needs to be developed. Until an analogue of Aubin's result in [2] for the Yamabe problem is verified in Proposition 3.1 below, by adapting some ideas for Paneitz-Branson operator from [4, 3] we establish some existence results of prescribed  $Q$ -curvature problem on Einstein manifolds, in which case the sixth order GJMS operator is of constant coefficients.

The conformally covariant GJMS operators with principle part  $(-\Delta_g)^k$ ,  $k \in \mathbb{N}$  are discovered by Graham-Jenne-Mason-Sparling [6]. In particular, the GJMS operator of order six and the associated  $Q$ -curvature are given as follows (cf. [11, 17]): on manifolds  $(M^n, g)$  of dimension  $n \geq 3$  and  $n \neq 4$ , denote by  $\sigma_k(A_g)$  the  $k$ -th elementary symmetric function of Schouten

---

\*X. Chen: xuezhangchen@nju.edu.cn; †F. Hou: houfeimath@gmail.com.

tensor  $A_{ij} = \frac{1}{n-2}(R_{ij} - \frac{R_g}{2(n-1)}g_{ij})$ . Denote by

$$C_{ijk} = \nabla_k A_{ij} - \nabla_j A_{ik}, \quad B_{ij} = \Delta_g A_{ij} - \nabla^k \nabla_j A_{ik} - A^{kl} W_{kijl} = \nabla^k C_{ijk} - A^{kl} W_{kijl}$$

the Cotton tensor and Bach tensor, respectively. Let

$$\begin{aligned} T_2 &= (n-2)\sigma_1(A_g)g - 8A_g = -\frac{8}{n-2}\text{Ric}_g + \frac{n^2 - 4n + 12}{2(n-1)(n-2)}R_g g; \\ T_4 &= -\frac{3n^2 - 12n - 4}{4}\sigma_1(A_g)^2 g + 4(n-4)|A|_g^2 g + 8(n-2)\sigma_1(A_g)A_g \\ &\quad + (n-6)\Delta_g\sigma_1(A_g)g - 48A_g^2 - \frac{16}{n-4}B_g; \\ v_6 &= -\frac{1}{8}\sigma_3(A_g) - \frac{1}{24(n-4)}\langle B, A \rangle_g. \end{aligned}$$

Then, the  $Q$ -curvature  $Q_g^6$  is defined by

$$\begin{aligned} Q_g^6 &= -3!2^6 v_6 - \frac{n+2}{2}\Delta_g(\sigma_1(A_g)^2) + 4\Delta_g|A|_g^2 - 8\delta(A_g d\sigma_1(A_g)) + \Delta_g^2\sigma_1(A_g) \\ &\quad - \frac{n-6}{2}\sigma_1(A_g)\Delta_g\sigma_1(A_g) - 4(n-6)\sigma_1(A_g)|A|_g^2 + \frac{(n-6)(n+6)}{4}\sigma_1(A_g)^3 \end{aligned} \quad (1.1)$$

and the GJMS operator of sixth order  $P_g^6$  is given by<sup>1</sup>

$$-P_g^6 = \Delta_g^3 + \Delta_g\delta T_2 d + \delta T_2 d\Delta_g + \frac{n-2}{2}\Delta_g(\sigma_1(A_g)\Delta_g) + \delta T_4 d - \frac{n-6}{2}Q_g^6, \quad (1.2)$$

where  $-\delta d = \Delta_g$ . The operator  $P_g^6$  is conformally covariant in the sense that if  $\tilde{g} = u^{\frac{4}{n-6}}g$ ,  $0 < u \in C^\infty(M)$  with  $n \geq 3$  and  $n \neq 4, 6$ ,

$$u^{\frac{n+6}{n-6}} P_{\tilde{g}}^6 \varphi = P_g^6(u\varphi) \quad (1.3)$$

and in dimension 6,

$$P_{e^{2u}g}^6 \varphi = e^{-6u} P_g^6 \varphi$$

for all  $\varphi \in C^\infty(M)$ . When  $(M, g)$  is Einstein,  $P_g^6$  is of constant coefficients, explicitly,

$$\begin{aligned} Q_g^6 &= \frac{n^4 - 20n^2 + 64}{32n^2(n-1)^3}R_g^3, \\ -P_g^6 &= \Delta_g^3 + \frac{-3n^2 + 6n + 32}{4n(n-1)}R_g\Delta_g^2 + \frac{3n^4 - 12n^3 - 52n^2 + 128n + 192}{16n^2(n-1)^2}R_g^2\Delta_g - \frac{n-6}{2}Q_g^6. \end{aligned}$$

Obviously, when  $n \geq 7$ ,  $Q_g^6$  is a positive constant whenever the scalar curvature  $R_g$  is positive. Through a direct computation, the GJMS operator  $P_g^6$  has the following factorization:

$$P_g^6 = \left(-\Delta_g + \frac{(n-6)(n+4)}{4n(n-1)}R_g\right)\left(-\Delta_g + \frac{(n-4)(n+2)}{4n(n-1)}R_g\right)\left(-\Delta_g + \frac{n-2}{4(n-1)}R_g\right). \quad (1.4)$$

---

<sup>1</sup>The definition of  $P_g^6$  differs from the formula (10.15) in [11] by a minus sign.

In general, as shown in [5] and [7], on Einstein manifolds the GJMS operator of order  $2k$  for all positive integers  $k$  satisfies the above property as

$$P_g^{2k} = \prod_{i=1}^k \left( -\Delta_g + \frac{R_g}{4n(n-1)}(n+2i-2)(n-2i) \right).$$

In particular, choose  $M^n = S^n$ ,  $g = g_{S^n}$ , then

$$\begin{aligned} Q_{S^n}^6 &= \frac{n(n^4-20n^2+64)}{32}, \\ P_{S^n}^6 &= -\Delta_{S^n}^3 - \frac{-3n^2+6n+32}{4}\Delta_{S^n}^2 - \frac{3n^4-12n^3-52n^2+128n+192}{16}\Delta_{S^n} + \frac{n-6}{2}Q_{S^n}^6 \\ &= \left( -\Delta_{S^n} + \frac{(n-6)(n+4)}{4} \right) \left( -\Delta_{S^n} + \frac{(n-4)(n+2)}{4} \right) \left( -\Delta_{S^n} + \frac{n(n-2)}{4} \right). \end{aligned}$$

From now on, we set  $P_g = P_g^6$  and  $Q_g = Q_g^6$  in the whole paper unless stated otherwise. Then, for any  $\varphi \in H^3(M, g)$ , we get

$$\begin{aligned} &\int_M \varphi P_g \varphi d\mu_g \\ &= \int_M \left( |\nabla \Delta \varphi|_g^2 - 2T_2(\nabla \Delta \varphi, \nabla \varphi) - \frac{n-2}{2}\sigma_1(A)(\Delta_g \varphi)^2 - T_4(\nabla \varphi, \nabla \varphi) + \frac{n-6}{2}Q_g \varphi^2 \right) d\mu_g. \end{aligned}$$

As a starting point of the study on the sixth order GJMS operator, we obtain some existence results of conformal metrics with positive  $Q$ -curvature candidates on closed Einstein manifolds under some additional natural assumptions.

**Theorem 1.1.** *Suppose  $(M^n, g)$  is a closed Einstein manifold of dimension  $n \geq 10$  and has positive scalar curvature. Let  $f$  be a smooth positive function in  $M$ . Assume the Weyl tensor  $W_g$  is nonzero at a maximum point  $p$  of  $f$  and  $f$  satisfies the vanishing order condition at  $p$ :*

$$\begin{cases} \Delta_g f(p) = 0, & \text{if } n = 10, \\ \nabla^k f(p) = 0, k = 2, 3, 4, & \text{if } n \geq 11. \end{cases} \quad (1.5)$$

*Then there exists a smooth solution to the  $Q$ -curvature equation*

$$P_g u = f u^{\frac{n+6}{n-6}}, \quad u > 0 \text{ in } M.$$

We remark that the condition (1.5) imposed on the  $Q$ -curvature candidates  $f$  is conformally invariant. The condition that  $(M, g)$  is Einstein is only used to seek a positive solution. Theorem 1.1 is a special case of a generalized Theorem 3.1.

This paper is organized as follows. In section 2, the expansions of Green's function for  $P_g$  when  $n \geq 7$  are presented under conformal normal coordinates around a point. The technique used here is basically inspired by Lee-Parker [12], see also [10]. The complicate computations of the term  $P_g(r^{6-n})$  are left to Appendix A, where  $r$  is the geodesic distant from this point. In section 3, we prove an analogue (cf. Proposition 3.1) of Aubin's result for any closed manifold of dimension  $n \geq 10$ , which is not locally conformal flat. Based on this result, using the Mountain Pass Lemma we state in Theorem 3.1 some results of prescribed  $Q$ -curvature problem associated to the sixth order GJMS operator on Einstein manifolds. Then our main Theorem 1.1 directly follows from Theorem 3.1.

## 2 Expansion of Green's function of $P_g$

Based on the survey paper by Lee-Parker [12] on the Yamabe problem, the method of deriving expansions of Green's function of  $P_g$  is more or less standard except for careful computations on some lower order terms involved in  $P_g$ . One may also refer to [10] for the Paneitz-Branson operator case. Green's functions of conformally covariant operators play an important role in the solvability of the constant curvature problems, for instance, the Yamabe problem (cf. [12] etc.) and the constant  $Q$ -curvature problem for Paneitz-Branson operator (cf. [3, 4, 8, 10], etc.). Especially, F. Hang and P. Yang [10] set up a dual variational method of the minimization for the Paneitz-Branson functional to seek a positive maximizer of the dual functional, such a scheme heavily relies on the positivity and expansion of its Green's function. We expect that the expansion of Green's function for  $P_g^6$  will be useful to some possible future applications.

Throughout the whole paper, we use the following notation:  $2^\sharp = \frac{2n}{n-6}$ ,  $\omega_n = \text{vol}(S^n, g_{S^n})$  and when  $n > 6$ ,  $c_n = \frac{1}{8(n-2)(n-4)(n-6)\omega_{n-1}}$ . For  $m \in \mathbb{Z}_+$ , let

$$\mathcal{P}_m := \{\text{homogeneous polynomials in } \mathbb{R}^n \text{ of degree } m\}$$

and

$$\mathcal{H}_m := \{\text{harmonic polynomials in } \mathbb{R}^n \text{ of degree } m\}.$$

Moreover,  $\mathcal{P}_m$  has the following decomposition (cf. [16], P. 68-70)

$$\mathcal{P}_m = \bigoplus_{k=0}^{\lfloor \frac{m}{2} \rfloor} (r^{2k} \mathcal{H}_{m-2k}).$$

**Proposition 2.1.** Assume  $n > 6$  and  $\ker P_g = 0$ . Let  $G_p(x)$  be the Green's function of sixth order GJMS operator at the pole  $p \in M^n$  with the property that  $P_g G_p = c_n \delta_p$  in the sense of distribution. Then, under the conformal normal coordinates around  $p$  with conformal metric  $g$ ,  $G_p(x)$  has the following expansions:

(a) If  $n$  is odd, then

$$G_p(x) = r^{6-n} \left( 1 + \sum_{k=1}^n \psi_k \right) + A + O(r),$$

where  $A$  is a constant and  $\psi_k \in \mathcal{P}_k$ .

(b) If  $n$  is even, then

$$G_p(x) = r^{6-n} \left( 1 + \sum_{k=1}^n \psi_k \right) + r^{6-n} \left( \sum_{k=n-4}^n \varphi_k \right) \log r + r^{6-n} \left( \sum_{k=n-4}^n \varphi'_k \right) \log^2 r$$

$$+r^{6-n}\left(\sum_{k=n-2}^n\varphi_k''\right)\log^3 r+\varphi_n''' \log^4 r+A+O(r),$$

where  $A$  is a constant and  $\psi_k, \varphi_k, \varphi'_k, \varphi''_k, \varphi'''_k \in \mathcal{P}_k$ .

Moreover, we may restate some of the above results in another way.

(c) If  $n = 7, 8, 9$  or  $M$  is conformally flat near  $p$ , then

$$G_p(x) = c_n r^{6-n} + A + O(r),$$

where  $A$  is a constant.

(d) If  $n = 10$ , then

$$G_p(x) = c_n r^{-4} + \frac{1}{17280} |W(p)|^2 \log r + O(1).$$

(e) If  $n \geq 11$ , then

$$G_p(x) = c_n r^{6-n} + \psi_4 r^{6-n} + O(r^{11-n}),$$

where  $\psi_4 \in \mathcal{P}_4$  and

$$\begin{aligned} \psi_4(x) = & \frac{1}{135(n-2)} \left[ \sum_{k,l} (W_{iklj}(p)x^i x^j)^2 - \frac{r^2}{n+4} \sum_{k,l,s} ((W_{ikls}(p) + W_{ilks}(p))x^i)^2 \right. \\ & + \frac{3}{2(n+4)(n+2)} |W(p)|^2 r^4 \Big] \\ & + \frac{3n-20}{270(n+4)(n-4)(n-8)} r^2 \left[ \sum_{k,l,s} ((W_{ikls}(p) + W_{ilks}(p))x^i)^2 - \frac{3}{n} |W(p)|^2 r^2 \right] \\ & - \frac{5n^2 - 66n + 224}{120(n-8)(n-4)} r^2 \left[ \sigma_1(A)_{,ij}(p)x^i x^j + \frac{|W(p)|^2}{12n(n-1)} r^2 \right] \\ & \left. + \frac{3n^4 - 16n^3 - 164n^2 + 400n + 2432}{576(n+4)(n+2)n(n-1)} |W(p)|^2 r^4 \right]. \end{aligned}$$

Before starting to derive the expansion of Green's function of  $P_g$ , we first need to introduce some notation. For  $\alpha \in \mathbb{R}$ , set

$$\begin{aligned} A_\alpha &= r^2 \Delta_0 + 2\alpha r \partial_r + \alpha(\alpha + n - 2), \\ A_{\alpha,g} &= r^2 \Delta_g + 2\alpha r \partial_r + \alpha(\alpha + n - 2), \end{aligned}$$

where  $\Delta_0$  denotes the Euclidean Laplacian, and

$$B_\alpha = \frac{\partial}{\partial \alpha} A_\alpha = 2r \partial_r + 2\alpha + n - 2.$$

For  $k \in \mathbb{Z}_+$ , a straightforward computation yields (also see [10, Lemma 2.4])

$$A_\alpha(\varphi \log^k r) = A_\alpha \varphi \log^k r + k B_\alpha \varphi \log^{k-1} r + k(k-1) \varphi \log^{k-2} r.$$

From this, for  $\alpha, \beta, \gamma \in \mathbb{R}$  we get

$$\begin{aligned}
& A_\gamma A_\beta A_\alpha (\varphi \log^k r) \\
&= A_\gamma A_\beta A_\alpha \varphi \log^k r \\
&\quad + k(B_\gamma A_\beta A_\alpha + A_\gamma B_\beta A_\alpha + A_\gamma A_\beta B_\alpha) \varphi \log^{k-1} r \\
&\quad + k(k-1)(A_\beta A_\alpha + B_\gamma B_\beta A_\alpha + B_\gamma A_\beta B_\alpha + A_\gamma B_\beta B_\alpha + A_\gamma A_\alpha + A_\gamma A_\beta) \varphi \log^{k-2} r \\
&\quad + k(k-1)(k-2)(B_\beta A_\alpha + A_\beta B_\alpha + B_\gamma A_\alpha + B_\gamma B_\beta B_\alpha + B_\gamma A_\beta + A_\gamma B_\alpha + A_\gamma B_\beta) \varphi \log^{k-3} r \\
&\quad + k(k-1)(k-2)(k-3)(A_\alpha + A_\beta + A_\gamma + B_\gamma B_\beta + B_\gamma B_\alpha + B_\beta B_\alpha) \varphi \log^{k-4} r \\
&\quad + k(k-1)(k-2)(k-3)(k-4)(B_\alpha + B_\beta + B_\gamma) \varphi \log^{k-5} r \\
&\quad + k(k-1)(k-2)(k-3)(k-4)(k-5) \varphi \log^{k-6} r. \tag{2.1}
\end{aligned}$$

A direct computation yields

$$\begin{aligned}
\Delta_0(r^\alpha \varphi) &= r^{\alpha-2} A_\alpha \varphi, \\
\Delta_0^2(r^\alpha \varphi) &= \Delta_0(r^{\alpha-2} A_\alpha \varphi) = r^{\alpha-4} A_{\alpha-2} A_\alpha \varphi, \\
\Delta_0^3(r^\alpha \varphi) &= r^{\alpha-6} A_{\alpha-4} A_{\alpha-2} A_\alpha \varphi.
\end{aligned}$$

In particular,

$$\Delta_0^3(r^{6-n} \varphi) = r^{-n} A_{2-n} A_{4-n} A_{6-n} \varphi.$$

Define

$$M_g := \Delta_g \delta T_2 d + \delta T_2 d \Delta_g + \frac{n-2}{2} \Delta_g(\sigma_1(A) \Delta_g) + \delta T_4 d,$$

then rewrite (1.2) as  $-P_g = (\Delta_g)^3 + M_g - \frac{n-6}{2} Q_g$ . Notice that

$$\begin{aligned}
A_{\alpha,g} &= A_\alpha + r^2(\Delta_g - \Delta_0) = A_\alpha + r^2 \partial_i((g^{ij} - \delta^{ij}) \partial_j), \\
-P_g(r^\alpha \varphi) &= r^{\alpha-6} (A_{\alpha-4} A_{\alpha-2} A_\alpha \varphi + K_\alpha \varphi),
\end{aligned}$$

where

$$\begin{aligned}
K_\alpha \varphi &= r^2(\Delta_g - \Delta_0) A_{\alpha-2} A_\alpha \varphi + A_{\alpha-4}(r^2(\Delta_g - \Delta_0)) A_\alpha \varphi + A_{\alpha-4} A_{\alpha-2}(r^2(\Delta_g - \Delta_0)) \varphi \\
&\quad + r^{6-\alpha} M_g(r^\alpha \varphi) - \frac{n-6}{2} r^6 Q_g \varphi. \tag{2.2}
\end{aligned}$$

We first state the expression of  $P_g(r^{6-n})$  and leave complicate computations to Appendix A.

**Lemma 2.1.** *Under conformal normal coordinates around  $p$  with metric  $g$ , there holds*

$$\begin{aligned}
&- P_g(r^{6-n}) \\
&= -c_n \delta_p + (n-6)r^{-n} \left\{ \frac{64(n-4)}{9} \left[ \sum_{k,l} (W_{iklj}(p) x^i x^j)^2 - \frac{r^2}{n+4} \sum_{k,l,s} ((W_{ikls}(p) + W_{ilks}(p)) x^i)^2 \right] \right. \\
&\quad \left. + \frac{3}{2(n+4)(n+2)} |W(p)|^2 r^4 \right] + \frac{16(3n-20)}{9(n+4)} r^2 \left[ \sum_{k,l,s} ((W_{ikls}(p) + W_{ilks}(p)) x^i)^2 - \frac{3}{n} |W(p)|^2 r^2 \right]
\end{aligned}$$

$$\begin{aligned}
& -4(5n^2 - 66n + 224)r^2 \left[ \sigma_1(A)_{,ij}(p)x^i x^j + \frac{|W(p)|^2}{12n(n-1)} r^2 \right] \\
& + \frac{3n^4 - 16n^3 - 164n^2 + 400n + 2432}{3(n+4)(n+2)n(n-1)} |W(p)|^2 r^4 \Big\} + O(r^{5-n}),
\end{aligned}$$

where  $W_{ijkl}$  is the Weyl tensor of metric  $g$  and each term in square brackets on the right hand side of the identity is harmonic polynomial.

Consequently, we rewrite the above equation in Lemma 2.1 as

$$P_g(r^{6-n}) = c_n \delta_p + r^{-n} f$$

with  $f = O(r^4)$ .

Observe that for  $i = 0, 1, \dots, [\frac{m}{2}]$ ,

$$A_\alpha|_{r^{2i}\mathcal{H}_{m-2i}} = (\alpha + 2i)(2m - 2i + \alpha + n - 2)$$

and

$$B_\alpha|_{r^{2i}\mathcal{H}_{m-2i}} = 2m + 2\alpha + n - 2,$$

then it yields

$$\begin{aligned}
& A_{2-n} A_{4-n} A_{6-n}|_{r^{2i}\mathcal{H}_{m-2i}} \\
& = (6 - n + 2i)(4 - n + 2i)(2 - n + 2i)(2m + 4 - 2i)(2m + 2 - 2i)(2m - 2i). \quad (2.3)
\end{aligned}$$

We start to find a formal asymptotic solution like  $G_p(x) = r^{6-n}(1 + \sum_{k=1}^n \psi_k) + \varphi$  with  $\psi_k \in \mathcal{P}_k$ . If we can find  $\bar{\psi} = \sum_{k=1}^n \psi_k$  such that

$$A_{2-n} A_{4-n} A_{6-n} \bar{\psi} + K_{6-n} \bar{\psi} + f = O(r^{n+1}), \quad (2.4)$$

the regularity theory for elliptic equations gives that there exists a solution  $\varphi \in C_{\text{loc}}^{6,\alpha}$  for any  $0 < \alpha < 1$  to

$$P_g(\varphi) = -r^{-n}(A_{2-n} A_{4-n} A_{6-n} \bar{\psi} + K_{6-n} \bar{\psi} + f) \in C_{\text{loc}}^\alpha.$$

Thus it only remains to seek  $\bar{\psi}$  satisfying (2.4) via induction. For any nonnegative integer  $k$ , it is not hard to see from the definition (2.2) for  $K_{6-n}$  that  $K_{6-n} \varphi \in \mathcal{P}_{k+2}$  when  $\varphi \in \mathcal{P}_k$ . We first set  $\psi_1 = \psi_2 = \psi_3 = 0$  by (2.4) and define

$$f_3 = f = O(r^4).$$

**Case 1.**  $n$  is odd.

If we have found  $\psi_1, \dots, \psi_k$  for  $3 \leq k \leq n-1$  with  $\psi_k \in \mathcal{P}_k$  and

$$f_k = A_{2-n} A_{4-n} A_{6-n} \left( \sum_{i=1}^k \psi_i \right) + K_{6-n} \left( \sum_{i=1}^k \psi_i \right) + f := b_{k+1} + O(r^{k+2}),$$

then it follows from (2.3) that  $A_{2-n}A_{4-n}A_{6-n}$  is invertible on  $\mathcal{P}_{k+1}$  for  $0 \leq k \leq n-1$ . Thus there exists a unique  $\psi_{k+1} \in \mathcal{P}_{k+1}$  such that

$$A_{2-n}A_{4-n}A_{6-n}\psi_{k+1} + b_{k+1} = 0.$$

This implies that

$$\begin{aligned} f_{k+1} &= A_{2-n}A_{4-n}A_{6-n} \left( \sum_{i=1}^{k+1} \psi_i \right) + K_{6-n} \left( \sum_{i=1}^{k+1} \psi_i \right) + f \\ &= f_k + A_{2-n}A_{4-n}A_{6-n}\psi_{k+1} + K_{6-n}\psi_{k+1} \\ &= O(r^{k+2}). \end{aligned}$$

This finishes the induction and assertion (a) follows.

**Case 2.**  $n$  is even and not less than 10.

Since  $A_{2-n}A_{4-n}A_{6-n}$  is invertible on  $\mathcal{P}_k$  for  $0 \leq k \leq n-7$ , by the same induction in Case 1, we may find  $\psi_1, \dots, \psi_{n-7}$  such that

$$\begin{aligned} f_{n-7} &= A_{2-n}A_{4-n}A_{6-n} \left( \sum_{k=1}^{n-7} \psi_k \right) + K_{6-n} \left( \sum_{k=1}^{n-7} \psi_k \right) + f = O(r^{n-6}) \\ &:= b_{n-6} + O(r^{n-5}). \end{aligned}$$

Let  $\psi_{n-6}^{(0)} = \alpha_{n-6}^{(0)}(x) + \beta_{n-6}^{(0)}(x) \log r$ , where  $\alpha_{n-6}^{(0)}(x) \in \mathcal{P}_{n-6} \setminus r^{n-6}\mathcal{H}_0$  and  $\beta_{n-6}^{(0)}(x) \in r^{n-6}\mathcal{H}_0$ , then it yields from (2.1) that

$$\begin{aligned} &A_{2-n}A_{4-n}A_{6-n}\psi_{n-6}^{(0)} \\ &= A_{2-n}A_{4-n}A_{6-n}\alpha_{n-6}^{(0)} + (B_{2-n}A_{4-n}A_{6-n} + A_{2-n}B_{4-n}A_{6-n} + A_{2-n}A_{4-n}B_{6-n})\beta_{n-6}^{(0)}. \end{aligned}$$

Notice that for  $0 \leq i \leq \frac{n-8}{2}$ , there hold

$$A_{2-n}A_{4-n}A_{6-n}|_{r^{2i}\mathcal{H}_{m-2i}} \neq 0$$

by (2.3) and

$$(B_{2-n}A_{4-n}A_{6-n} + A_{2-n}B_{4-n}A_{6-n} + A_{2-n}A_{4-n}B_{6-n})|_{r^{n-6}\mathcal{H}_0} = 8(n-2)(n-4)(n-6) \neq 0.$$

Hence there exists a unique  $\psi_{n-6}^{(0)} \in \mathcal{P}_{n-6} + \mathcal{P}_{n-6} \log r$  to

$$A_{2-n}A_{4-n}A_{6-n}\psi_{n-6}^{(0)} + b_{n-6} = 0.$$

This indicates that

$$\begin{aligned} f_{n-6} &= f_{n-7} + A_{2-n}A_{4-n}A_{6-n}\psi_{n-6}^{(0)} + K_{6-n}\psi_{n-6}^{(0)} \\ &= O(r^{n-5}) + (K_{6-n}\beta_{n-6}^{(0)}) \log r \end{aligned}$$

$$:= b_{n-5} + O(r^{n-4}) \log r + O(r^{n-4}).$$

Let  $\psi_{n-5}^{(0)} = \alpha_{n-5}^{(0)} + \beta_{n-5}^{(0)} \log r$ , where  $\alpha_{n-5}^{(0)} \in \mathcal{P}_{n-5} \setminus r^{n-6}\mathcal{H}_1$  and  $\beta_{n-5}^{(0)} \in r^{n-6}\mathcal{H}_1$ , then it yields

$$\begin{aligned} & A_{2-n}A_{4-n}A_{6-n}\psi_{n-5}^{(0)} \\ &= A_{2-n}A_{4-n}A_{6-n}\alpha_{n-5}^{(0)} + (B_{2-n}A_{4-n}A_{6-n} + A_{2-n}B_{4-n}A_{6-n} + A_{2-n}A_{4-n}B_{6-n})\beta_{n-5}^{(0)}. \end{aligned}$$

By similar arguments, there exists a unique  $\psi_{n-5}^{(0)} \in \mathcal{P}_{n-5} + r^{n-6}\mathcal{H}_1 \log r$  such that

$$A_{2-n}A_{4-n}A_{6-n}\psi_{n-5}^{(0)} + b_{n-5} = 0.$$

This implies that

$$\begin{aligned} f_{n-5} &= f_{n-6} + A_{2-n}A_{4-n}A_{6-n}\psi_{n-5}^{(0)} + K_{6-n}\psi_{n-5}^{(0)} \\ &= O(r^{n-4}) \log r + O(r^{n-4}) := b_{n-4}^{(1)} \log r + O(r^{n-4}) + O(r^{n-3}) \log r. \end{aligned}$$

Choose  $\psi_{n-4}^{(1)} = \alpha_{n-4}^{(1)} \log r + \beta_{n-4}^{(1)} \log^2 r \in \mathcal{P}_{n-4} \log r + (r^{n-6}\mathcal{H}_2 + r^{n-4}\mathcal{H}_0) \log^2 r$ , then (2.1) gives

$$\begin{aligned} & A_{2-n}A_{4-n}A_{6-n}\psi_{n-4}^{(1)} \\ &= \left[ A_{2-n}A_{4-n}A_{6-n}\alpha_{n-4}^{(1)} + 2(B_{6-n}A_{4-n}A_{2-n} + A_{6-n}B_{4-n}A_{2-n} + A_{6-n}A_{4-n}B_{2-n})\beta_{n-4}^{(1)} \right] \log r \\ &+ A_{2-n}A_{4-n}A_{6-n}\beta_{n-4}^{(1)} \log^2 r + O(r^{n-4}). \end{aligned}$$

Since

$$\begin{aligned} (B_{6-n}A_{4-n}A_{2-n} + A_{6-n}B_{4-n}A_{2-n} + A_{6-n}A_{4-n}B_{2-n})|_{r^{n-6}\mathcal{H}_2} &= 8(n+2)n(n-2) \neq 0; \\ (B_{6-n}A_{4-n}A_{2-n} + A_{6-n}B_{4-n}A_{2-n} + A_{6-n}A_{4-n}B_{2-n})|_{r^{n-4}\mathcal{H}_0} &= -4n(n-2)(n-4) \neq 0 \end{aligned}$$

and  $A_{2-n}A_{4-n}A_{6-n}|_{r^{2i}\mathcal{H}_{n-4-2i}} \neq 0$  for  $0 \leq i \leq \frac{n-8}{2}$ , then there exists a unique  $\psi_{n-4}^{(1)}$  such that

$$A_{2-n}A_{4-n}A_{6-n}\alpha_{n-4}^{(1)} + 2(B_{6-n}A_{4-n}A_{2-n} + A_{6-n}B_{4-n}A_{2-n} + A_{6-n}A_{4-n}B_{2-n})\beta_{n-4}^{(1)} + b_{n-4}^{(1)} = 0$$

and

$$\begin{aligned} f_{n-4}^{(1)} &= f_{n-5} + A_{2-n}A_{4-n}A_{6-n}\psi_{n-4}^{(1)} + K_{6-n}\psi_{n-4}^{(1)} \\ &= O(r^{n-4}) + O(r^{n-3}) \log r + O(r^{n-2}) \log^2 r \\ &:= b_{n-4}^{(0)} + O(r^{n-3}) \log r + O(r^{n-3}) + O(r^{n-2}) \log^2 r. \end{aligned}$$

Choose  $\psi_{n-4}^{(0)} \in \mathcal{P}_{n-4} + (r^{n-6}\mathcal{H}_2 + r^{n-4}\mathcal{H}_0) \log r$  to remove the term  $b_{n-4}^{(0)}$  and set

$$\begin{aligned} f_{n-4}^{(0)} &= f_{n-4}^{(1)} + A_{2-n}A_{4-n}A_{6-n}\psi_{n-4}^{(0)} + K_{6-n}\psi_{n-4}^{(0)} \\ &= O(r^{n-3}) \log r + O(r^{n-3}) + O(r^{n-2}) \log^2 r. \end{aligned}$$

By similar arguments and (2.1), we get

$$\begin{aligned}\psi_{n-3}^{(1)} &\in \mathcal{P}_{n-3} \log r + (r^{n-6} \mathcal{H}_3 + r^{n-4} \mathcal{H}_1) \log^2 r; \\ \psi_{n-3}^{(0)} &\in \mathcal{P}_{n-3} + (r^{n-6} \mathcal{H}_3 + r^{n-4} \mathcal{H}_1) \log r; \\ \psi_{n-2}^{(i)} &\in \mathcal{P}_{n-2} \log^i r + (r^{n-6} \mathcal{H}_4 + r^{n-4} \mathcal{H}_2 + r^{n-2} \mathcal{H}_0) \log^{i+1} r, \text{ for } i = 0, 1, 2; \\ \psi_{n-1}^{(i)} &\in \mathcal{P}_{n-1} \log^i r + (r^{n-6} \mathcal{H}_5 + r^{n-4} \mathcal{H}_3 + r^{n-2} \mathcal{H}_1) \log^{i+1} r, \text{ for } i = 0, 1, 2; \\ \psi_n^{(i)} &\in \mathcal{P}_n \log^i r + (r^{n-6} \mathcal{H}_6 + r^{n-4} \mathcal{H}_4 + r^{n-2} \mathcal{H}_2) \log^{i+1} r, \text{ for } i = 0, 1, 2, 3.\end{aligned}$$

Now we set

$$\psi_{n-6} = \psi_{n-6}^{(0)}, \psi_{n-5} = \psi_{n-5}^{(0)}, \psi_{n-4} = \psi_{n-4}^{(0)} + \psi_{n-4}^{(1)}, \psi_{n-3} = \psi_{n-3}^{(0)} + \psi_{n-3}^{(1)}$$

and

$$\psi_{n-2} = \sum_{i=0}^2 \psi_{n-2}^{(i)}, \quad \psi_{n-1} = \sum_{i=0}^2 \psi_{n-1}^{(i)}, \quad \psi_n = \sum_{i=0}^3 \psi_n^{(i)}.$$

Eventually, we obtain

$$\begin{aligned}f_n &= A_{2-n} A_{4-n} A_{6-n} \left( \sum_{k=1}^n \psi_k \right) + K_{6-n} \left( \sum_{k=1}^n \psi_k \right) + f \\ &= O(r^{n+1}) (\log^3 r + \log^2 r + \log r + 1) + O(r^{n+2}) \log^4 r.\end{aligned}$$

Hence,  $r^{-n} f_n \in C^\alpha$  for any  $0 < \alpha < 1$ . This finishes the induction and we obtain assertion (b) as desired.

**Case 3.**  $n = 8$ .

Notice that

$$P_g(G_p(x) - c_n r^{-2}) = O(r^{-4}) \in L^p,$$

for some  $\frac{8}{5} < p < 2$ , then it follows from regularity theory of elliptic equations that  $G_p(x) - c_n r^{-2} \in C_{\text{loc}}^{6-\frac{8}{p}}$ . From this, we have

$$G_p(x) = c_n r^{-2} + A + O(r).$$

**Case 4.**  $M$  is locally conformal flat.

One may choose  $g$  flat near  $p$  and  $P_g = -\Delta_0^3$ . Hence, one has  $P_g(G(x) - c_n r^{6-n}) = 0$  and then  $G_p(x) - c_n r^{6-n}$  is smooth near  $p$ .

Therefore, the assertion (c) follows from cases 1, 3, 4. In some special cases, the leading term  $\psi_4$  can be computed with the help of Lemma 2.1. The proof of Proposition 2.1 is complete.

### 3 $n \geq 10$ and not locally conformally flat

Similar to the Yamabe constant, for  $n \geq 3$  and  $n \neq 4, 6$ , we define

$$Y_6^+(M, g) = \inf_{0 < u \in H^3(M, g)} \frac{\int_M u P_g u d\mu_g}{\left( \int_M u^{\frac{2n}{n-6}} d\mu_g \right)^{\frac{n-6}{n}}}.$$

It follows from (1.3) that  $Y_6^+(M, g)$  is a conformal invariant. However, due to the lack of a maximum principle for higher order elliptic equations in general, we first study another conformally invariant quantity

$$Y_6(M, g) = \inf_{u \in H^3(M, g) \setminus \{0\}} \frac{\int_M u P_g u d\mu_g}{\left( \int_M |u|^{\frac{2n}{n-6}} d\mu_g \right)^{\frac{n-6}{n}}}.$$

In particular, we have  $Y_6(S^n) = Y_6^+(S^n) = \frac{n-6}{2} Q_{S^n} \omega_n^{\frac{6}{n}}$ . For  $w \in C_c^\infty(\mathbb{R}^n)$ , let

$$\|w\|_{\mathcal{D}^{3,2}} := \sum_{|\beta|=3} \|D^\beta w\|_{L^2(\mathbb{R}^n)} \approx \|\nabla \Delta w\|_{L^2(\mathbb{R}^n)}$$

and let  $\mathcal{D}^{3,2}(\mathbb{R}^n)$  denote the completion of  $C_c^\infty(\mathbb{R}^n)$  under this norm. The equivalence of the above last two norms can be easily deduced by the formula (3.4) below. We first recall an optimal Euclidean Sobolev inequality (cf. [15, p.154-165], [14]).

**Lemma 3.1.** *For  $n \geq 7$ , the following sharp Sobolev embedding inequality holds*

$$Y_6(S^n) \left( \int_{\mathbb{R}^n} |w|^{\frac{2n}{n-6}} dy \right)^{\frac{n-6}{n}} \leq \int_{\mathbb{R}^n} |\nabla \Delta w|^2 dy \text{ for all } w \in \mathcal{D}^{3,2}(\mathbb{R}^n).$$

*The equality holds if and only if  $w(y) = (\frac{2}{1+|y|^2})^{\frac{n-6}{2}}$  up to any nonzero constant multiple, as well as all translations and dilations.*

**Proposition 3.1.** *On a closed Riemannian manifold  $(M^n, g)$  of dimension  $n \geq 10$ , if there exists  $p \in M^n$  such that the Weyl tensor  $W_g(p) \neq 0$ , then  $Y_6(M^n) < Y_6(S^n)$ .*

**Proof.** Recall the definition of  $P_g$ :

$$-P_g = \Delta_g^3 + \Delta_g \delta T_2 d + \delta T_2 d \Delta_g + \frac{n-2}{2} \Delta_g (\sigma_1(A) \Delta_g) + \delta T_4 d - \frac{n-6}{2} Q_g,$$

then for all  $\varphi \in H^3(M, g)$ ,

$$\begin{aligned} \int_M \varphi P_g \varphi d\mu_g &= \int_M |\nabla \Delta \varphi|^2 d\mu_g - 2 \int_M T_2(\nabla \varphi, \nabla \Delta \varphi) d\mu_g - \frac{n-2}{2} \int_M \sigma_1(A)(\Delta \varphi)^2 d\mu_g \\ &\quad - \int_M T_4(\nabla \varphi, \nabla \varphi) d\mu_g + \frac{n-6}{2} \int_M Q_g \varphi^2 d\mu_g. \end{aligned}$$

Fix  $\rho > 0$  small and choose test functions

$$\varphi(x) = \eta_\rho(x) u_\epsilon(x), \quad u_\epsilon(x) = \left( \frac{2\epsilon}{\epsilon^2 + |x|^2} \right)^{\frac{n-6}{2}}, \quad \epsilon > 0,$$

where  $r = |x| = d_g(x, p)$  and

$$\eta_\rho \in C_c^\infty, 0 \leq \eta_\rho \leq 1, \quad \eta_\rho \equiv 1 \text{ in } B_\rho \text{ and } \eta_\rho \equiv 0 \text{ in } B_{2\rho}^c.$$

It is known from Lee-Park [12] that up to a conformal factor, under conformal normal coordinates around  $p$  with metric  $g$ , for all  $N \geq 5$  there hold

$$\sigma_1(A_g)(p) = 0, \quad \sigma_1(A_g)_{,i}(p) = 0, \quad \Delta_g \sigma_1(A_g)(p) = -\frac{|W(p)|_g^2}{12(n-1)}$$

and

$$\sqrt{\det g} = 1 + O(r^N).$$

Our purpose is to estimate

$$\int_M \varphi P_g \varphi d\mu_g \text{ and } \int_M \varphi^{\frac{2n}{n-6}} d\mu_g.$$

A direct computation shows

$$u'_\epsilon = -(n-6)u_\epsilon \frac{r}{\epsilon^2 + r^2}, \quad u''_\epsilon = -(n-6)u_\epsilon \frac{\epsilon^2 - (n-5)r^2}{(\epsilon^2 + r^2)^2}$$

and

$$\begin{aligned} \Delta_0 u_\epsilon &= -(n-6) \frac{u_\epsilon}{(\epsilon^2 + r^2)^2} (n\epsilon^2 + 4r^2), \\ (\Delta_0 u_\epsilon)' &= (n-6)(n-4) \frac{u_\epsilon r}{(\epsilon^2 + r^2)^3} [(n+2)\epsilon^2 + 4r^2]. \end{aligned}$$

We start with  $\int_M |\nabla \Delta \varphi|_g^2 d\mu_g$  and divide its integral into two parts  $\int_M = \int_{B_\rho} + \int_{M \setminus \overline{B_\rho}}$ . Compute with

$$\begin{aligned} \int_{B_\rho} |\nabla \Delta \varphi|_g^2 d\mu_g &= \int_{B_\rho} g^{ij} (\Delta \varphi)_{,i} (\Delta \varphi)_{,j} d\mu_g \\ &= \int_{B_\rho} (\delta^{ij} + O(r^2)) (\Delta_0 \varphi + O(r^{N-1}) \varphi')_{,i} (\Delta_0 \varphi + O(r^{N-1}) \varphi')_{,j} (1 + O(r^N)) dx \\ &= \int_{B_\rho} |(\nabla \Delta)_0 \varphi|^2 dx + \int_{B_\rho} (\Delta_0 \varphi)' (O(r^{N-2}) \varphi' + O(r^{N-1}) \varphi'') dx \end{aligned}$$

and

$$\begin{aligned} \int_{\mathbb{R}^n \setminus \overline{B_\rho}} |(\nabla \Delta)_0 \varphi|^2 dx &= (n-6)^2 (n-4)^2 \int_{\mathbb{R}^n \setminus \overline{B_\rho}} \frac{u_\epsilon^2 r^2}{(\epsilon^2 + r^2)^6} [(n+2)\epsilon^2 + 4r^2]^2 dx \\ &\leq C \int_{\rho/\epsilon}^\infty \sigma^{5-n} d\sigma = O(\epsilon^{n-6}). \end{aligned}$$

Similarly, we estimate

$$\int_{M \setminus \overline{B_\rho}} |\nabla \Delta \varphi|_g^2 d\mu_g = O(\epsilon^{n-6}).$$

Thus, we obtain

$$\int_M |\nabla \Delta \varphi|_g^2 d\mu_g = \int_{\mathbb{R}^n} |\nabla \Delta_0 u_\epsilon|^2 dx + O(\epsilon^{n-6}).$$

Secondly, we compute

$$\begin{aligned} & \int_{B_\rho} \sigma_1(A)(\Delta \varphi)^2 d\mu_g \\ &= \int_{B_\rho} \left( \frac{1}{2} \sigma_1(A)_{ij}(p) x^i x^j + O(r^3) \right) (\Delta_0 \varphi + O(r^{N-1}) \varphi')^2 (1 + O(r^N)) dx \\ &= \int_{B_\rho} \frac{1}{2n} \Delta \sigma_1(A)(p) |x|^2 (\Delta_0 \varphi)^2 dx + \int_{B_\rho} O(r^3) \frac{u_\epsilon^2}{(\epsilon^2 + r^2)^4} (n\epsilon^2 + 4r^2)^2 dx \\ &= -\frac{(n-6)^2 |W(p)|^2}{24n(n-1)} \omega_{n-1} \int_0^\rho \frac{(n\epsilon^2 + 4r^2)^2}{(\epsilon^2 + r^2)^4} u_\epsilon^2 r^{n+1} dr + \int_{B_\rho} \frac{O(r^3) u_\epsilon^2}{(\epsilon^2 + r^2)^2} dx \end{aligned}$$

and for some large enough  $N$

$$\begin{aligned} \int_{B_{2\rho} \setminus \overline{B_\rho}} \sigma_1(A)(\Delta \varphi)^2 d\mu_g &\leq C \int_{B_{2\rho} \setminus \overline{B_\rho}} |\Delta_0 \varphi + O(r^{N-1}) \varphi'|^2 (1 + O(r^N)) dx \\ &\leq C \int_{B_{2\rho} \setminus \overline{B_\rho}} [(\Delta_0 \varphi)^2 + O(r^{2(N-1)}) |\varphi'|^2] dx \\ &\leq C \int_{B_{2\rho} \setminus \overline{B_\rho}} \left( u_\epsilon \Delta_0 \eta_\rho + 2 \nabla u_\epsilon \cdot \nabla \eta_\rho + \eta_\rho \Delta_0 u_\epsilon \right)^2 dx + O(\epsilon^{n-6}) \\ &\leq C \int_\rho^{2\rho} \frac{(n\epsilon^2 + 4r^2)^2}{(\epsilon^2 + r^2)^4} u_\epsilon^2 r^{n-1} dr + O(\epsilon^{n-6}) \\ &\stackrel{\sigma=\frac{r}{\epsilon}}{\leq} C \epsilon^2 \int_{\rho/\epsilon}^{2\rho/\epsilon} \frac{(n + 4\sigma^2)^2 \sigma^{n-1}}{(1 + \sigma^2)^{n-2}} d\sigma + O(\epsilon^{n-6}) \\ &\leq C \epsilon^2 \left( \frac{\rho}{\epsilon} \right)^{8-n} + O(\epsilon^{n-6}) = O(\epsilon^{n-6}). \end{aligned}$$

Observe that

$$\int_{B_\rho} \frac{r^3 u_\epsilon^2}{(\epsilon^2 + r^2)^2} dx = \begin{cases} O(\epsilon^4) & \text{if } n = 10, \\ O(\epsilon^5 |\log \epsilon|) & \text{if } n = 11, \\ O(\epsilon^5) & \text{if } n \geq 12. \end{cases} \quad (3.1)$$

Hence,

$$\begin{aligned} & -\frac{n-2}{2} \int_M \sigma_1(A)(\Delta \varphi)^2 d\mu_g \\ &= \frac{(n-6)^2(n-2) |W(p)|^2}{48n(n-1)} \omega_{n-1} \int_0^\rho \frac{(n\epsilon^2 + 4r^2)^2}{(\epsilon^2 + r^2)^4} u_\epsilon^2 r^{n+1} dr + \begin{cases} O(\epsilon^4) & \text{if } n = 10, \\ O(\epsilon^5 |\log \epsilon|) & \text{if } n = 11, \\ O(\epsilon^5) & \text{if } n \geq 12. \end{cases} \end{aligned}$$

Thirdly, we compute  $\int_M T_2(\nabla \varphi, \nabla \Delta \varphi) d\mu_g$ .

$$\int_{B_\rho} T_2(\nabla \varphi, \nabla \Delta \varphi) d\mu_g = \int_{B_\rho} \left[ (n-2) \sigma_1(A) \langle \nabla \varphi, \nabla \Delta \varphi \rangle - 8 A_{ij} \varphi_{,i} (\Delta \varphi)_{,j} \right] d\mu_g.$$

Observe that  $u_{\epsilon,i} = \frac{x^i}{r}u'_\epsilon$  and  $(\Delta_0 u_\epsilon)_{,i} = \frac{x^i}{r}(\Delta_0 u_\epsilon)'$ . Then we get

$$\begin{aligned}
& (n-2) \int_{B_\rho} \sigma_1(A) \langle \nabla \varphi, \nabla \Delta \varphi \rangle d\mu_g \\
&= (n-2) \int_{B_\rho} \left( \frac{1}{2} \sigma_1(A)_{,ij}(p) x^i x^j + O(r^3) \right) g^{kl} \varphi_{,k} (\Delta \varphi)_{,l} d\mu_g \\
&= (n-2) \int_{B_\rho} \left( \frac{1}{2} \sigma_1(A)_{,ij}(p) x^i x^j + O(r^3) \right) (\delta^{kl} + O(r^2)) \varphi_{,k} (\Delta_0 \varphi + O(r^{N-1}) \varphi')_{,l} d\mu_g \\
&= \frac{n-2}{2} \int_{B_\rho} \frac{1}{n} \Delta \sigma_1(A)(p) |x|^2 \varphi_{,i} (\Delta_0 \varphi)_{,i} dx + \int_{B_\rho} O(r^3) |\varphi'| |(\Delta_0 \varphi)'| dx \\
&= -\frac{(n-2)|W(p)|^2}{24n(n-1)} \int_{B_\rho} \left\{ -(n-6)^2(n-4) \frac{u_\epsilon^2 r^4}{(\epsilon^2 + r^2)^4} [(n+2)\epsilon^2 + 4r^2] \right\} dx \\
&\quad + \int_{B_\rho} \frac{O(r^3) u_\epsilon^2}{(\epsilon^2 + r^2)^2} dx \\
&= \frac{(n-2)(n-4)(n-6)^2}{24n(n-1)} |W(p)|^2 \int_{B_\rho} \frac{r^4}{(\epsilon^2 + r^2)^4} u_\epsilon^2 [(n+2)\epsilon^2 + 4r^2] dx \\
&\quad + \int_{B_\rho} \frac{O(r^3) u_\epsilon^2}{(\epsilon^2 + r^2)^2} dx,
\end{aligned}$$

and

$$\begin{aligned}
& -8 \int_{B_\rho} A_{ij} \varphi_{,i} (\Delta \varphi)_{,j} d\mu_g \\
&= -8 \int_{B_\rho} \left( A_{ij,k}(p) x^k + \frac{1}{2} A_{ij,kl}(p) x^k x^l + O(r^3) \right) \varphi_{,i} (\Delta_0 \varphi + O(r^{N-1}) \varphi')_{,j} d\mu_g \\
&= -4 \int_{B_\rho} A_{ij,kl}(p) x^k x^l x^i x^j \left[ -(n-4)(n-6)^2 \frac{u_\epsilon^2}{(\epsilon^2 + r^2)^4} [(n+2)\epsilon^2 + 4r^2] \right] dx \\
&\quad + \int_{B_\rho} O(r^3) |\varphi'| |(\Delta_0 \varphi)'| dx \\
&= 4(n-4)(n-6)^2 \int_{B_\rho} \left[ -\frac{2}{9} \frac{1}{n-2} \sum_{k,l} (W_{iklj}(p) x^i x^j)^2 - \frac{\sigma_1(A)_{,ij}(p) x^i x^j r^2}{n-2} \right] \\
&\quad \times \frac{u_\epsilon^2}{(\epsilon^2 + r^2)^4} [(n+2)\epsilon^2 + 4r^2] dx + \int_{B_\rho} \frac{O(r^3) u_\epsilon^2}{(\epsilon^2 + r^2)^2} dx \\
&= -\frac{8(n-4)(n-6)^2}{9(n-2)} \int_{B_\rho} \left[ \sum_{k,l} (W_{iklj}(p) W_{sklt}(p) x^i x^j x^s x^t) \frac{u_\epsilon^2}{(\epsilon^2 + r^2)^4} [(n+2)\epsilon^2 + 4r^2] dx \right. \\
&\quad \left. - \frac{4(n-4)(n-6)^2}{n(n-2)} \int_{B_\rho} \frac{\Delta \sigma_1(A)(p) r^4}{(\epsilon^2 + r^2)^4} u_\epsilon^2 [(n+2)\epsilon^2 + 4r^2] dx + \int_{B_\rho} \frac{O(r^3) u_\epsilon^2}{(\epsilon^2 + r^2)^2} dx \right] \\
&= -\frac{(n-4)(n-6)^2}{(n-1)n(n+2)} \omega_{n-1} |W(p)|^2 \int_0^\rho \frac{r^{n+3} u_\epsilon^2}{(\epsilon^2 + r^2)^4} [(n+2)\epsilon^2 + 4r^2] dr \\
&\quad + \int_{B_\rho} \frac{O(r^3) u_\epsilon^2}{(\epsilon^2 + r^2)^2} dx,
\end{aligned}$$

where the last identity follows from

$$\begin{aligned}
& \sum_{k,l} W_{iklj}(p) W_{sklt}(p) \int_{B_\rho} x^i x^j x^s x^t \frac{u_\epsilon^2}{(\epsilon^2 + r^2)^4} [(n+2)\epsilon^2 + 4r^2] dx \\
&= \sum_{k,l} W_{iklj}(p) W_{sklt}(p) \int_{\mathbb{S}^{n-1}} \xi^i \xi^j \xi^s \xi^t d\mu_{\mathbb{S}^{n-1}} \int_0^\rho r^{n+3} \frac{u_\epsilon^2}{(\epsilon^2 + r^2)^4} [(n+2)\epsilon^2 + 4r^2] dr \\
&= \frac{\omega_{n-1}}{n(n+2)} \sum_{k,l} W_{iklj}(p) W_{sklt}(p) [\delta_{ij}\delta_{st} + \delta_{is}\delta_{jt} + \delta_{it}\delta_{js}] \int_0^\rho \frac{r^{n+3} u_\epsilon^2}{(\epsilon^2 + r^2)^4} [(n+2)\epsilon^2 + 4r^2] dr \\
&= \frac{\omega_{n-1}}{n(n+2)} \left[ |W(p)|^2 + W_{iklj}(p) W_{jkli}(p) \right] \int_0^\rho r^{n+3} \frac{u_\epsilon^2}{(\epsilon^2 + r^2)^4} [(n+2)\epsilon^2 + 4r^2] dr \\
&= \frac{3}{2} \frac{\omega_{n-1}}{n(n+2)} |W(p)|^2 \int_0^\rho r^{n+3} \frac{u_\epsilon^2}{(\epsilon^2 + r^2)^4} [(n+2)\epsilon^2 + 4r^2] dr.
\end{aligned}$$

Then we have

$$\begin{aligned}
& -2 \int_{B_\rho} T_2(\nabla \varphi, \nabla \Delta \varphi) d\mu_g \\
&= -\frac{(n^2 - 28)(n-4)(n-6)^2}{12n(n-1)(n+2)} |W(p)|^2 \omega_{n-1} \int_0^\rho r^{n+3} \frac{u_\epsilon^2}{(\epsilon^2 + r^2)^4} [(n+2)\epsilon^2 + 4r^2] dr \\
&\quad + \int_{B_\rho} \frac{O(r^3)u_\epsilon^2}{(\epsilon^2 + r^2)^2} dx.
\end{aligned}$$

By a similar argument, one has

$$\begin{aligned}
\left| \int_{B_{2\rho} \setminus \overline{B_\rho}} T_2(\nabla \varphi, \nabla \Delta \varphi) \right| &\leq C \int_{B_{2\rho} \setminus \overline{B_\rho}} |\nabla \varphi| |\nabla \Delta \varphi| d\mu_g \\
&\leq C \int_{B_{2\rho} \setminus \overline{B_\rho}} |u'_\epsilon| |(\Delta u_\epsilon)'| dx + O(\epsilon^{n-6}) = O(\epsilon^{n-6}).
\end{aligned}$$

Fourthly, we compute  $\int_M T_4(\nabla \varphi, \nabla \varphi) d\mu_g$ .

$$\begin{aligned}
& (n-6) \int_{B_\rho} \Delta \sigma_1(A) |\nabla \varphi|_g^2 d\mu_g \\
&= (n-6) \int_{B_\rho} (\Delta \sigma_1(A)(p) + O(r)) (|\varphi'|^2 + O(r^2) |\varphi|^2) dx \\
&= -(n-6)^3 \frac{|W(p)|^2}{12(n-1)} \int_{B_\rho} \frac{u_\epsilon^2 r^2}{(\epsilon^2 + r^2)^2} dx + \int_{B_\rho} \frac{O(r^3)u_\epsilon^2}{(\epsilon^2 + r^2)^2} dx.
\end{aligned}$$

Using (A.5), we get

$$\begin{aligned}
& -\frac{16}{n-4} \int_{B_\rho} B_{ij} \varphi_{,i} \varphi_{,j} d\mu_g = -\frac{16}{n-4} \int_{B_\rho} (n-6)^2 u_\epsilon^2 \frac{B_{ij} x^i x^j}{(\epsilon^2 + r^2)^2} dx \\
&= -\frac{16(n-6)^2}{n-4} \int_{B_\rho} \left[ -\frac{2}{9} \frac{1}{n-2} \sum_{k,l,s} [(W_{ikls}(p) + W_{ilks}(p)) x^i]^2 \right]
\end{aligned}$$

$$\begin{aligned}
& + \frac{1}{12(n-2)(n-1)} |W(p)|^2 r^2 - \frac{7n-8}{n-2} \sigma_1(A)_{,ij}(p) x^i x^j + O(r^3) \Big] \frac{u_\epsilon^2}{(\epsilon^2 + r^2)^2} dx \\
& = -\frac{16(n-6)^2}{n-4} \left[ -\frac{2}{3n(n-2)} + \frac{1}{12(n-2)(n-1)} + \frac{7n-8}{12(n-2)(n-1)n} \right] |W(p)|^2 \int_{B_\rho} \frac{r^2 u_\epsilon^2}{(\epsilon^2 + r^2)^2} dx \\
& \quad + \int_{B_\rho} \frac{O(r^3) u_\epsilon^2}{(\epsilon^2 + r^2)^2} dx \\
& = \int_{B_\rho} \frac{O(r^3) u_\epsilon^2}{(\epsilon^2 + r^2)^2} dx,
\end{aligned}$$

where the second identity follows from

$$\sum_{i,k,l,s} (W_{ikls}(p) + W_{ilks}(p))^2 = 2|W(p)|^2 + 2 \sum_{i,k,l,s} W_{ikls}(p) W_{ilks}(p) = 3|W(p)|^2,$$

in view of

$$\begin{aligned}
0 &= W_{ikls}(W_{ilks} + W_{iksl} + W_{islk}) \\
&= W_{ikls}W_{ilks} + W_{ikls}W_{iksl} + W_{ikls}W_{islk} \\
&= 2W_{ikls}W_{ilks} - |W|^2 \quad \text{at } p.
\end{aligned}$$

Also we have

$$\int_{B_{2\rho} \setminus \overline{B_\rho}} T_4(\nabla \varphi, \nabla \varphi) d\mu_g \leq C \int_{B_{2\rho} \setminus \overline{B_\rho}} |\nabla \varphi|_g^2 d\mu_g = O(\epsilon^{n-6}).$$

Hence, collecting the above terms together with (3.1), we obtain

$$\begin{aligned}
& - \int_M T_4(\nabla \varphi, \nabla \varphi) d\mu_g \\
& = - (n-6) \int_{B_\rho} \Delta \sigma_1(A) |\nabla \varphi|_g^2 d\mu_g + \frac{16}{n-4} \int_{B_\rho} B_{ij} \varphi_{,i} \varphi_{,j} d\mu_g + O(\epsilon^{n-6}) \\
& = (n-6)^3 \frac{|W(p)|^2}{12(n-1)} \int_{B_\rho} \frac{u_\epsilon^2 r^2}{(\epsilon^2 + r^2)^2} dx + \begin{cases} O(\epsilon^4) & \text{if } n = 10, \\ O(\epsilon^5 |\log \epsilon|) & \text{if } n = 11, \\ O(\epsilon^5) & \text{if } n \geq 12. \end{cases}
\end{aligned}$$

Finally, we compute  $\frac{n-6}{2} \int_M Q_g \varphi^2 d\mu_g$ . By the definition (1.1) of  $Q_g$ , integration by parts gives

$$\begin{aligned}
& \frac{n-6}{2} \int_M Q_g \varphi^2 d\mu_g \\
& = \frac{n-6}{2} \int_M \Delta^2 \sigma_1(A) \varphi^2 d\mu_g + \int_{B_\rho} \frac{O(r^3) u_\epsilon^2}{(\epsilon^2 + r^2)^2} dx + O(\epsilon^{n-6}) \\
& = \frac{n-6}{2} \int_M \Delta \sigma_1(A) \Delta \varphi^2 d\mu_g + \int_{B_\rho} \frac{O(r^3) u_\epsilon^2}{(\epsilon^2 + r^2)^2} dx + O(\epsilon^{n-6}) \\
& = -\frac{(n-6)^2 |W(p)|^2}{12(n-1)} \omega_{n-1} \int_0^\rho \frac{u_\epsilon^2 r^{n-1}}{(\epsilon^2 + r^2)^2} [(n-10)r^2 - n\epsilon^2] dr + \begin{cases} O(\epsilon^4) & \text{if } n = 10, \\ O(\epsilon^5 |\log \epsilon|) & \text{if } n = 11, \\ O(\epsilon^5) & \text{if } n \geq 12, \end{cases}
\end{aligned}$$

by (3.1), where the last identity follows from

$$\begin{aligned}
& \frac{n-6}{2} \int_{B_\rho} \Delta \sigma_1(A) \Delta \varphi^2 d\mu_g \\
&= \frac{n-6}{2} \int_{B_\rho} (\Delta \sigma_1(A)(p) + O(r)) (\Delta_0 \varphi^2 + O(r^{N-1}) (\varphi^2)') dx \\
&= \frac{n-6}{2} \Delta \sigma_1(A)(p) \int_{B_\rho} 2(\varphi \Delta_0 \varphi + |\nabla \varphi|_0^2) dx + \int_{B_\rho} \frac{O(r) u_\epsilon^2}{\epsilon^2 + r^2} dx \\
&= -\frac{(n-6)^2 |W(p)|^2}{12(n-1)} \omega_{n-1} \int_0^\rho \frac{u_\epsilon^2 r^{n-1}}{(\epsilon^2 + r^2)^2} [(n-10)r^2 - n\epsilon^2] dr + \int_{B_\rho} \frac{O(r) u_\epsilon^2}{\epsilon^2 + r^2} dx
\end{aligned}$$

and the first identity follows from

$$\left| \int_{B_{2\rho} \setminus \overline{B_\rho}} Q_g \varphi^2 d\mu_g \right| \leq C \int_{B_{2\rho} \setminus \overline{B_\rho}} u_\epsilon^2 dx = O(\epsilon^{n-6}).$$

Therefore collecting all the above terms together, we obtain

$$\int_M \varphi P_g \varphi d\mu_g = \int_{\mathbb{R}^n} |\nabla \Delta_0 u_\epsilon|^2 dx + A_{n,\rho,\epsilon} |W(p)|^2 \omega_{n-1} + O(\epsilon^{\min\{n-6, 5\}}),$$

where  $A_{n,\rho,\epsilon}$  is a constant given by

$$\begin{aligned}
& (n-6)^2 \left\{ \frac{n-2}{48n(n-1)} \int_0^\rho \frac{(n\epsilon^2 + 4r^2)^2}{(\epsilon^2 + r^2)^4} u_\epsilon^2 r^{n+1} dr + \frac{n-6}{12(n-1)} \int_0^\rho \frac{u_\epsilon^2 r^{n+1}}{(\epsilon^2 + r^2)^2} dr \right. \\
& - \frac{1}{12(n-1)} \int_0^\rho \frac{u_\epsilon^2 r^{n-1}}{(\epsilon^2 + r^2)^2} [(n-10)r^2 - n\epsilon^2] dr \\
& - \frac{(n^2 - 28)(n-4)}{12n(n-1)(n+2)} \int_0^\rho r^{n+3} \frac{u_\epsilon^2}{(\epsilon^2 + r^2)^4} [(n+2)\epsilon^2 + 4r^2] dr \Big\} \\
&= 2^{n-6} \frac{(n-6)^2}{12(n-1)} \epsilon^4 \left\{ \frac{n-2}{4n} \int_0^{\rho/\epsilon} \frac{(n+4\sigma^2)^2}{(1+\sigma^2)^4} (1+\sigma^2)^{-(n-6)} \sigma^{n+1} d\sigma \right. \\
& + (n-6) \int_0^{\rho/\epsilon} \frac{1}{(1+\sigma^2)^2} (1+\sigma^2)^{-(n-6)} \sigma^{n+1} d\sigma \\
& - \int_0^{\rho/\epsilon} \frac{1}{(1+\sigma^2)^2} (1+\sigma^2)^{-(n-6)} \sigma^{n-1} [(n-10)\sigma^2 - n] d\sigma \\
& \left. - \frac{(n^2 - 28)(n-4)}{n(n+2)} \int_0^{\rho/\epsilon} \frac{\sigma^{n+3}}{(1+\sigma^2)^4} (1+\sigma^2)^{-(n-6)} [(n+2) + 4\sigma^2] d\sigma \right\},
\end{aligned}$$

where  $r = \epsilon\sigma$ . When  $n = 10$ , we claim that the leading term of the constant in the brace on the right hand side of the above identity:

$$\begin{aligned}
& \frac{1}{5} \int_0^{\rho/\epsilon} \frac{(4\sigma^2 + 10)^2}{(1+\sigma^2)^4} (1+\sigma^2)^{-4} \sigma^{11} d\sigma + \int_0^{\rho/\epsilon} \frac{1}{(1+\sigma^2)^2} (1+\sigma^2)^{-4} (4\sigma^2 + 10) \sigma^9 d\sigma \\
& - \frac{18}{5} \int_0^{\rho/\epsilon} \frac{1}{(1+\sigma^2)^4} (1+\sigma^2)^{-4} (4\sigma^2 + 12) \sigma^{13} d\sigma
\end{aligned}$$

is a negative constant multiple of  $|\log \epsilon|$ . To see this, it is obviously true for the third term and the first two terms equal

$$\begin{aligned} & \frac{1}{5} \int_0^{\rho/\epsilon} \left\{ \sigma^2[(4\sigma^2 + 10)^2 - 18\sigma^2(4\sigma^2 + 12)] + 5(4\sigma^2 + 10)(1 + \sigma^2)^2 \right\} (1 + \sigma^2)^{-8}\sigma^9 d\sigma \\ &= \frac{1}{5} \int_0^{\rho/\epsilon} (-36\sigma^6 - 46\sigma^4 + 220\sigma^2 + 50)(1 + \sigma^2)^{-8}\sigma^9 d\sigma, \end{aligned}$$

whose leading term is also a negative constant multiple of  $|\log \epsilon|$ . For  $n \geq 11$ , let  $t = \sigma^2$ , the limit of the coefficient of  $|W(p)|^2\omega_{n-1}$  as  $\epsilon \rightarrow 0$  is

$$\begin{aligned} & 2^{n-7} \frac{(n-6)^2}{12(n-1)} \epsilon^4 \left\{ \frac{n-2}{4n} \int_0^\infty \frac{(n+4t)^2}{(1+t)^{n-2}} t^{\frac{n}{2}} dt \right. \\ &+ (n-6) \int_0^\infty \frac{1}{(1+t)^{n-4}} t^{\frac{n}{2}} dt - \int_0^\infty \frac{(n-10)t-n}{(1+t)^{n-4}} t^{\frac{n}{2}-1} dt \\ & \left. - \frac{(n^2-28)(n-4)}{n(n+2)} \int_0^\infty \frac{(n+2)+4t}{(1+t)^{n-2}} t^{\frac{n}{2}+1} dt \right\}. \end{aligned}$$

With the help of Beta function:  $\int_0^\infty \frac{x^{\alpha-1}}{(1+x)^{\alpha+\beta}} dx = B(\alpha, \beta) = \frac{\Gamma(\alpha)\Gamma(\beta)}{\Gamma(\alpha+\beta)}$  for  $\text{Re}(\alpha) > 0, \text{Re}(\beta) > 0$ , we have

$$\begin{aligned} & \frac{n-2}{4n} \int_0^\infty \frac{(n+4t)^2}{(1+t)^{n-2}} t^{\frac{n}{2}} dt \\ &= \frac{n-2}{4n} \int_0^\infty \frac{(n-4)^2 + 8(n-4)(1+t) + 16(1+t)^2}{(1+t)^{n-2}} t^{\frac{n}{2}} dt \\ &= \frac{n-2}{4n} \left[ (n-4)^2 B\left(\frac{n}{2} + 1, \frac{n}{2} - 3\right) + 8(n-4)B\left(\frac{n}{2} + 1, \frac{n}{2} - 4\right) + 16B\left(\frac{n}{2} + 1, \frac{n}{2} - 5\right) \right], \\ & (n-6) \int_0^\infty \frac{1}{(1+t)^{n-4}} t^{\frac{n}{2}} dt = (n-6)B\left(\frac{n}{2} + 1, \frac{n}{2} - 5\right), \\ & - \int_0^\infty \frac{(n-10)t-n}{(1+t)^{n-4}} t^{\frac{n}{2}-1} dt = -(n-10)B\left(\frac{n}{2} + 1, \frac{n}{2} - 5\right) + nB\left(\frac{n}{2}, \frac{n}{2} - 4\right), \\ & - \frac{(n^2-28)(n-4)}{n(n+2)} \int_0^\infty \frac{(n+2)+4t}{(1+t)^{n-2}} t^{\frac{n}{2}+1} dt \\ &= - \frac{(n^2-28)(n-4)}{n(n+2)} \int_0^\infty \frac{4(1+t)^2 + (n-6)(1+t) - (n-2)}{(1+t)^{n-2}} t^{\frac{n}{2}} dt \\ &= - \frac{4(n^2-28)(n-4)}{n(n+2)} B\left(\frac{n}{2} + 1, \frac{n}{2} - 5\right) - \frac{(n^2-28)(n-4)(n-6)}{n(n+2)} B\left(\frac{n}{2} + 1, \frac{n}{2} - 4\right) \\ &+ \frac{(n^2-28)(n-4)(n-2)}{n(n+2)} B\left(\frac{n}{2} + 1, \frac{n}{2} - 3\right). \end{aligned}$$

Hence, the above limit of the coefficient of  $|W(p)|^2\omega_{n-1}$  is rewritten as

$$2^{n-7} \frac{(n-6)^2}{12(n-1)} \epsilon^4 \left\{ nB\left(\frac{n}{2}, \frac{n}{2} - 4\right) \right.$$

$$\begin{aligned}
& + B\left(\frac{n}{2} + 1, \frac{n}{2} - 3\right) \left[ \frac{n-2}{4n}(n-4)^2 + \frac{(n^2-28)(n-4)(n-2)}{n(n+2)} \right] \\
& + B\left(\frac{n}{2} + 1, \frac{n}{2} - 4\right) \left[ \frac{2(n-2)(n-4)}{n} - \frac{(n^2-28)(n-4)(n-6)}{n(n+2)} \right] \\
& + B\left(\frac{n}{2} + 1, \frac{n}{2} - 5\right) \left[ \frac{4(n-2)}{n} - n + 10 + n - 6 - \frac{4(n^2-28)(n-4)}{n(n+2)} \right] \} \\
= & 2^{n-7} \frac{(n-6)^2}{12(n-1)} B\left(\frac{n}{2} + 1, \frac{n}{2} - 5\right) \epsilon^4 \left\{ (n-10) \right. \\
& + \frac{(n-2)(\frac{n}{2}-4)(\frac{n}{2}-5)}{4n(n+2)(n-3)} (5n^2 - 2n - 120) + \frac{\frac{n}{2}-5}{n(n+2)} (-n^3 + 8n^2 + 28n - 176) \\
& \left. + \frac{4}{n(n+2)} (-n^3 + 6n^2 + 30n - 116) \right\}, \tag{3.2}
\end{aligned}$$

where we have used some elementary identities

$$\begin{aligned}
B\left(\frac{n}{2} + 1, \frac{n}{2} - 3\right) & = \frac{\Gamma(\frac{n}{2} + 1)\Gamma(\frac{n}{2} - 3)}{\Gamma(n-2)} = \frac{(\frac{n}{2}-4)(\frac{n}{2}-5)}{(n-3)(n-4)} B\left(\frac{n}{2} + 1, \frac{n}{2} - 5\right), \\
B\left(\frac{n}{2} + 1, \frac{n}{2} - 4\right) & = \frac{\frac{n}{2}-5}{n-4} B\left(\frac{n}{2} + 1, \frac{n}{2} - 5\right), \\
B\left(\frac{n}{2}, \frac{n}{2} - 4\right) & = \frac{\Gamma(\frac{n}{2})\Gamma(\frac{n}{2} - 4)}{\Gamma(n-4)} = \frac{n-10}{n} B\left(\frac{n}{2} + 1, \frac{n}{2} - 5\right).
\end{aligned}$$

The constant in the last brace of (3.2) when  $n \geq 11$  is

$$\begin{aligned}
& n-10 + \frac{1}{16n(n+2)(n-3)} \left\{ (n-2)(n-8)(n-10)(5n^2 - 2n - 120) \right. \\
& \left. + 8(n-3)[(n-10)(-n^3 + 8n^2 + 28n - 176) + 8(-n^3 + 6n^2 + 30n - 116)] \right\} \\
= & n-10 + \frac{1}{16n(n+2)(n-3)} \left[ -3n^5 + 2n^4 + 228n^3 - 264n^2 - 1760n - 768 \right] \\
= & \frac{-3n^5 + 18n^4 + 52n^3 - 200n^2 - 800n - 768}{16n(n+2)(n-3)} < 0.
\end{aligned}$$

On the other hand, we have

$$\int_M \varphi^{\frac{2n}{n-6}} d\mu_g = \int_{B_\rho} u_\epsilon^{\frac{2n}{n-6}} d\mu_g + \int_{B_{2\rho} \setminus \overline{B_\rho}} \varphi^{\frac{2n}{n-6}} d\mu_g = \int_{\mathbb{R}^n} u_\epsilon^{\frac{2n}{n-6}} dx + O(\epsilon^n).$$

Therefore, putting these facts together, we conclude by Lemma 3.1 that

$$\begin{aligned}
& \frac{\int_M \varphi P_g \varphi d\mu_g}{\left( \int_M \varphi^{\frac{2n}{n-6}} d\mu_g \right)^{\frac{n-6}{n}}} \\
= & Y_6(S^n) + A_{n,\rho,\epsilon} |W(p)|^2 \omega_{n-1} + \begin{cases} O(\epsilon^4) & \text{if } n = 10, \\ O(\epsilon^5 |\log \epsilon|) & \text{if } n = 11, \\ O(\epsilon^5) & \text{if } n \geq 12, \end{cases}
\end{aligned}$$

$$= \begin{cases} Y_6(S^n) - C_n |W(p)|^2 \epsilon^4 |\log \epsilon| + O(\epsilon^4) & \text{if } n = 10, \\ Y_6(S^n) - C_n |W(p)|^2 \epsilon^4 + o(\epsilon^4) & \text{if } n \geq 11, \end{cases}$$

for some positive constant  $C_n > 0$ . Consequently, choosing  $\epsilon$  sufficiently small, we obtain  $Y_6(M^n) < Y_6(S^n)$ . This finishes the proof.  $\square$

Given a smooth positive function  $f$  in  $M^n$ , we define a “free” energy functional by

$$E_f[u] = \frac{1}{2} \int_M u P_g u d\mu_g - \frac{1}{2^\sharp} \int_M f |u|^{2^\sharp} d\mu_g.$$

Let  $u_{,i}$  or  $\nabla_i u$  denote the covariant derivatives of  $u$  with respect to metric  $g$  and  $R_{ijk}^l$  be Riemannian curvature tensor of metric  $g$ . Notice that

$$\nabla_j \nabla_i \nabla^i u = \nabla_i \nabla_j \nabla^i u + R_{ij}^k \nabla_k u = \nabla_i \nabla^i \nabla_j u - R_j^k \nabla_k u,$$

there holds

$$\int_M |\nabla \Delta u|_g^2 d\mu_g = \int_M |\Delta \nabla_j u - R_j^k \nabla_k u|_g^2 d\mu_g. \quad (3.3)$$

Under  $g$ -normal coordinates around a point, one gets

$$\begin{aligned} & \frac{1}{2} \Delta_g |\nabla^2 u|_g^2 \\ &= |\nabla^3 u|_g^2 + \langle \nabla \Delta \nabla_i u, \nabla \nabla^i u \rangle_g + u_{,ij} (R_{ijk}^l u_{,lk} + R_j^l u_{,il} + R_{ijk,k}^l u_{,l} + R_{ijk}^l u_{,lk}). \end{aligned}$$

Integrating the above identity over  $M$  to show

$$\int_M |\Delta \nabla u|_g^2 d\mu_g = \int_M |\nabla^3 u|_g^2 d\mu_g + \int_M O(|\mathrm{Rm}| |\nabla^2 u|_g + |\nabla \mathrm{Rm}| |\nabla u|_g) |\nabla^2 u|_g d\mu_g. \quad (3.4)$$

From (3.3) and (3.4), it yields that the following two norms are equivalent:

$$\begin{aligned} \|u\|_{H^3} &:= \left( \int_M (|\nabla \Delta u|_g^2 + |\nabla^2 u|_g^2 + |\nabla u|_g^2 + u^2) d\mu_g \right)^{\frac{1}{2}} \\ &\approx \left( \int_M (|\nabla^3 u|_g^2 + |\nabla^2 u|_g^2 + |\nabla u|_g^2 + u^2) d\mu_g \right)^{\frac{1}{2}}, \quad u \in H^3(M, g). \end{aligned}$$

Let  $\|\cdot\|_p$  denote the norm of  $L^p(M, g)$  for  $1 \leq p \leq \infty$ .

A sequence  $\{u_k\}$  in  $H^3(M, g)$  is called a Palais-Smale  $(\mathrm{P}-\mathrm{S})_\beta$  sequence for  $E_f$  if  $E_f[u_k] \rightarrow \beta \in \mathbb{R}$  and  $DE_f[u_k] \rightarrow 0$  as  $k \rightarrow \infty$ . The energy  $E_f$  satisfies  $(\mathrm{P}-\mathrm{S})_\beta$  condition if any Palais-Smale sequence of  $E_f$  has a strongly convergent subsequence. We call that  $P_g$  is coercive if there exists a constant  $\mu(g) > 0$  such that

$$\int_M \psi P_g \psi d\mu_g \geq \mu(g) \int_M \psi^2 d\mu_g, \quad \text{for all } \psi \in H^3(M, g).$$

**Remark 3.1.** If  $(M, g)$  is Einstein and of positive constant scalar curvature, from the factorization (1.4) of  $P_g$ , the coercivity of  $P_g$  is automatically satisfied.

As an application, we adapt some arguments in Esposito-Robert [4] to show some existence results of prescribed  $Q$ -curvature equation, whose solution may change signs due to the lack of maximum principles (in general).

**Theorem 3.1.** *Let  $(M^n, g)$  be a smooth closed manifold of dimension  $n \geq 10$  and  $f$  be a smooth positive function in  $M^n$ . Suppose the Weyl tensor  $W_g$  is nonzero at a maximum point of  $f$  and  $f$  satisfies the vanishing order condition (1.5) at this maximum point. Assume  $P_g$  is coercive, then there exists a nontrivial  $C^{6,\mu}$  ( $0 < \mu < 1$ ) solution to*

$$P_g u = f|u|^{2^\sharp-2}u \text{ in } M. \quad (3.5)$$

In addition, assume  $(M, g)$  is Einstein and of positive scalar curvature, then there exists a smooth solution to the  $Q$ -curvature equation

$$P_g u = f u^{\frac{n+6}{n-6}}, u > 0 \text{ in } M. \quad (3.6)$$

**Proof.** By the assumptions, there exists  $p \in M$  such that  $f(p) = \max_{x \in M^n} f(x)$ ,  $W_g(p) \neq 0$  and the vanishing order condition (1.5) of  $f$  is true at  $p$ . Let

$$\gamma_\epsilon(t) = t \frac{\varphi}{\|f^{\frac{1}{2^\sharp}}\varphi\|_{2^\sharp}},$$

where  $\varphi = \eta_\rho u_\epsilon$  is the test function chosen in Proposition 3.1. By choosing  $t_0$  large enough, we get  $E[\gamma_\epsilon(t_0)] < 0$ . Let

$$\Gamma = \left\{ \gamma(t) \in C([0, t_0], H^3(M, g)); \gamma(0) = 0, \gamma(t_0) = t_0 \frac{\varphi}{\|f^{\frac{1}{2^\sharp}}\varphi\|_{2^\sharp}} \right\}.$$

From the coercivity of  $P_g$  and Sobolev embedding theorem, we have

$$E_f \left[ \frac{\varphi}{\|f^{\frac{1}{2^\sharp}}\varphi\|_{2^\sharp}} \right] = \frac{1}{2} \frac{\int_M \varphi P_g \varphi d\mu_g}{\|f^{\frac{1}{2^\sharp}}\varphi\|_{2^\sharp}^2} - \frac{1}{2^\sharp} \geq \frac{1}{2} C - \frac{1}{2^\sharp}.$$

It only suffices to estimate the term:

$$\begin{aligned} \int_M f \varphi^{\frac{2n}{n-6}} d\mu_g &= \int_{B_p} \left[ f(p) + \sum_{k=2}^4 \frac{1}{k!} \partial_{i_1 \dots i_k} f(p) x^{i_1} \dots x^{i_k} + O(|x|^5) \right] u_\epsilon^{2^\sharp} dx + O(\epsilon^n) \\ &= f(p) \int_{\mathbb{R}^n} u_\epsilon^{\frac{2n}{n-6}} dx + \begin{cases} O(\epsilon^4) & \text{if } n = 10, \\ o(\epsilon^4) & \text{if } n \geq 11, \end{cases} \end{aligned}$$

where the second equality follows from the vanishing order condition (1.5) of  $f$  at  $p$ . From this and some existing estimates in the proof of Proposition 3.1, we conclude that there exist some sufficiently small  $\epsilon > 0$  and a constant  $C'_n > 0$  such that

$$\sup_{t \geq 0} E_f[\gamma_\epsilon(t)] = E_f[\gamma_\epsilon(t^*)] = \frac{3}{n} \left( \frac{\int_M \varphi P_g \varphi d\mu_g}{\|f^{\frac{1}{2^\sharp}}\varphi\|_{2^\sharp}^2} \right)^{\frac{2^\sharp}{2^\sharp-2}}$$

$$\leq \begin{cases} \frac{3}{n}(\max_M f)^{\frac{6-n}{6}}Y_6(S^n)^{\frac{n}{6}} - C'_n|W(p)|^2\epsilon^4|\log\epsilon| + O(\epsilon^4) & \text{if } n = 10, \\ \frac{3}{n}(\max_M f)^{\frac{6-n}{6}}Y_6(S^n)^{\frac{n}{6}} - C'_n|W(p)|^2\epsilon^4 + o(\epsilon^4) & \text{if } n \geq 11, \end{cases}$$

where  $t^* = \left( \frac{\int_M \varphi P_g \varphi d\mu_g}{\|f^{2^\sharp} \varphi\|_{2^\sharp}^2} \right)^{\frac{1}{2^\sharp-2}}$ . Then it follows from Mountain Pass Lemma (cf. [1] or [4, Proposition 1]) that

$$\beta = \inf_{\gamma \in \Gamma} \sup_{0 \leq t \leq t_0} E_f[\gamma(t)] \leq \sup_{t \geq 0} E_f[\gamma_\epsilon(t)] < \frac{3}{n} Y_6(S^n)^{\frac{n}{6}} (\max_M f)^{\frac{6-n}{6}}$$

is a critical value of  $E_f$  and there exists a  $(P\text{-}S)_\beta$  sequence  $\{u_k\}$  of  $E_f$  in  $H^3(M, g)$ .

Next we claim that  $E_f$  satisfies  $(P\text{-}S)_\beta$  condition. For the above  $(P\text{-}S)_\beta$  sequence  $\{u_k\}$  satisfying  $E_f[u_k] \rightarrow \beta$  and  $DE_f[u_k] \rightarrow 0$  as  $k \rightarrow \infty$ , there holds

$$2\beta + o(\|u_k\|_{H^3}) = 2E_f[u_k] - \langle DE_f[u_k], u_k \rangle = \frac{6}{n} \int_M f|u_k|^{2^\sharp} d\mu_g.$$

Together with the coercivity of  $P_g$ , one has

$$\mu(g)\|u_k\|_{H^3} \leq 2E_f[u_k] + \frac{2}{2^\sharp} \int_M f|u_k|^{2^\sharp} d\mu_g \leq C + o(\|u_k\|_{H^3}).$$

From this, we get  $\{u_k\}$  is bounded in  $H^3(M, g)$ . Then up to a subsequence, as  $k \rightarrow \infty$ ,  $u_k \rightharpoonup u$  in  $H^3(M, g)$  and  $u_k \rightarrow u$  in  $L^p(M, g)$  for  $1 \leq p < 2^\sharp$ . It is easy to verify that  $u$  is a weak solution to (3.5), that is, for all  $\psi \in H^3(M, g)$ ,

$$\int_M \psi P_g u d\mu_g = \int_M f|u|^{2^\sharp-2} u \psi d\mu_g.$$

Choosing  $\psi = u$ , one has

$$\int_M u P_g u d\mu_g = \int_M f|u|^{2^\sharp} d\mu_g,$$

whence

$$E_f[u] = \frac{3}{n} \int_M f|u|^{2^\sharp} d\mu_g \geq 0.$$

Applying Brezis-Lieb lemma to

$$\begin{aligned} \int_M |\nabla \Delta u_k|_g^2 d\mu_g &= \int_M |\nabla \Delta u|_g^2 d\mu_g + \int_M |\nabla \Delta(u - u_k)|_g^2 d\mu_g + o(1), \\ \int_M f|u_k|^{2^\sharp} d\mu_g &= \int_M f|u|^{2^\sharp} d\mu_g + \int_M f|u - u_k|^{2^\sharp} d\mu_g + o(1), \end{aligned}$$

we have

$$\begin{aligned} E_f[u_k] - E_f[u] &= \frac{1}{2} \int_M |\nabla \Delta(u - u_k)|_g^2 - \frac{1}{2^\sharp} \int_M f|u - u_k|^{2^\sharp} d\mu_g + o(1) \\ &= E_f[u - u_k] + o(1). \end{aligned}$$

Since  $DE_f[u_k] \rightarrow 0$  in  $(H^3(M, g))'$ , we have

$$\begin{aligned} o(1) &= \langle u_k - u, DE_f[u_k] \rangle = \langle u_k - u, DE_f[u_k] - DE_f[u] \rangle \\ &= \int_M |\nabla \Delta(u - u_k)|_g^2 d\mu_g - \int_M f|u - u_k|^{2^\sharp} d\mu_g + o(1). \end{aligned}$$

Thus, we obtain

$$\frac{3}{n} \int_M |\nabla \Delta(u - u_k)|_g^2 d\mu_g + o(1) = E_f[u_k - u] = E_f[u_k] - E_f[u] + o(1) \leq E_f[u_k] + o(1) \rightarrow \beta,$$

as  $k \rightarrow \infty$ , which yields

$$\int_M |\nabla \Delta(u - u_k)|_g^2 d\mu_g \leq \frac{n}{3} \beta + o(1). \quad (3.7)$$

Mimicking a cut-and-paste argument as in [3], we obtain that given  $\epsilon > 0$ , there exists a constant  $B_\epsilon > 0$  such that

$$\left( \int_M |\psi|^{2^\sharp} d\mu_g \right)^{\frac{2}{2^\sharp}} \leq (1 + \epsilon) Y_6(S^n)^{-1} \int_M (|\nabla \Delta \psi|_g^2 + |\nabla^2 \psi|_g^2 + |\nabla \psi|_g^2) d\mu_g + B_\epsilon \int_M \psi^2 d\mu_g,$$

for all  $\psi \in H^3(M, g)$ . Choosing  $\psi = u_k - u$  and  $k$  sufficiently large to get

$$\left( \int_M |u - u_k|^{2^\sharp} d\mu_g \right)^{\frac{2}{2^\sharp}} \leq (1 + \epsilon) Y_6(S^n)^{-1} \int_M |\nabla \Delta(u - u_k)|_g^2 d\mu_g + o(1).$$

Hence we have

$$\begin{aligned} o(1) &= \int_M |\nabla \Delta(u - u_k)|_g^2 d\mu_g - \int_M f|u - u_k|^{2^\sharp} d\mu_g \\ &\geq \int_M |\nabla \Delta(u - u_k)|_g^2 d\mu_g \left[ 1 - (\max_M f)(1 + \epsilon)^{\frac{2^\sharp}{2}} Y_6(S^n)^{-\frac{2^\sharp}{2}} \left( \int_M |\nabla \Delta(u - u_k)|_g^2 d\mu_g \right)^{\frac{6}{n-6}} \right]. \end{aligned}$$

From (3.7) and  $\beta < \frac{3}{n} Y_6(S^n)^{\frac{n}{6}} (\max_M f)^{\frac{6-n}{6}}$ , choosing  $\epsilon$  sufficiently small, we get

$$o(1) \geq C \int_M |\nabla \Delta(u - u_k)|_g^2 d\mu_g.$$

Combining the above inequality and the coercivity of  $P_g$  to show that  $u_k \rightarrow u$  in  $H^3(M, g)$ . Using the regularity result in Lemma 3.2 below, we know that  $u \in C^{6,\mu}(M)$  for any  $0 < \mu < 1$ .

In addition, assume  $(M, g)$  is Einstein and has positive constant scalar curvature, we define the modified energy in  $H^3(M, g)$  by

$$E_f^+[u] = \frac{1}{2} \int_M u P_g u d\mu_g - \frac{1}{2^\sharp} \int_M f u_+^{2^\sharp} d\mu_g,$$

where  $u_+ = \max\{u, 0\}$ . Using the above similar arguments associated with Mountain Pass Lemma and mimicking what we did in Lemma 3.2 below for  $E_f^+$ , we get that there exists a nontrivial  $C^6$ -solution  $u$  to

$$P_g u = f u_+^{\frac{n+6}{n-6}} \text{ in } M. \quad (3.8)$$

Since  $P_g$  is coercive by Remark 3.1, testing equation (3.8) with  $u_- = \min\{u, 0\}$  we conclude that  $u \geq 0$  in  $M$ . Together with  $R_g$  being a positive constant and the factorization (1.4) of GJMS operator:

$$\left( -\Delta_g + \frac{(n-6)(n+4)}{4n(n-1)} R_g \right) \left( -\Delta_g + \frac{(n-4)(n+2)}{4n(n-1)} R_g \right) \left( -\Delta_g + \frac{n-2}{4(n-1)} R_g \right) u \geq 0$$

and  $u \not\equiv 0$  in  $M$ , we employ the maximum principle twice and strong maximum principle once for elliptic equations of second order to show that  $u$  is a positive solution to the equation (3.6). From this and Schauder estimates for elliptic equations, we conclude that  $u \in C^\infty(M)$ . This completes the proof.  $\square$

We are now concerned with the regularity of mountain pass critical points for  $E$ .

**Lemma 3.2.** *Let  $(M, g)$  be a smooth closed Riemannian manifold of dimension  $n \geq 7$ . Assume  $u \in H^3(M, g)$  is a weak solution of equation (3.5). Then  $u \in C^{6,\mu}(M)$  for any  $0 < \mu < 1$ .*

**Proof.** Rewrite  $P_g = (-\Delta_g)^3 - M_g + \frac{n-6}{2} Q_g$  by (1.2). Let  $u \in H^3(M, g)$  be a weak solution of equation (3.5) and rewrite this equation as

$$\begin{aligned} (-\Delta_g + 1)^3 u &= M_g u + 3\Delta_g^2 u - 3\Delta_g u + (1 - \frac{n-6}{2} Q_g) u + f|u|^{2^\sharp-2} u \\ &:= b + f|u|^{2^\sharp-2} u, \end{aligned} \tag{3.9}$$

where  $b \in H^{-1}(M, g)$ . By the Sobolev embedding theorem we have  $u \in L^{2^\sharp}(M, g)$  and  $|u|^{2^\sharp-2} \in L^{\frac{n}{6}}(M, g)$ . Given  $\epsilon > 0$ , there exist a  $K_\epsilon > 0$  and a decomposition of  $f|u|^{2^\sharp-2} = h_\epsilon + \eta_\epsilon$  with  $\|h_\epsilon\|_{\frac{n}{6}} \leq \epsilon$ ,  $\|\eta_\epsilon\|_\infty \leq K_\epsilon$ . Inspired by the arguments in [4, Proposition 3], for  $s > 1$  we define an operator

$$H_\epsilon : v \in L^s(M, g) \rightarrow (-\Delta_g + 1)^{-3}(h_\epsilon v) \in L^s(M, g).$$

Indeed, from Sobolev embedding theorem, the standard  $W^{2,p}$ -regularity theory of the elliptic operator  $-\Delta_g + 1$  and Hölder's inequality, we have

$$\begin{aligned} \|H_\epsilon v\|_s &\leq C \|(-\Delta_g + 1)^{-3}(h_\epsilon v)\|_{W^{6, \frac{ns}{n+6s}}} \leq C \|h_\epsilon v\|_{\frac{ns}{n+6s}} \\ &\leq C \|h_\epsilon\|_{\frac{n}{6}} \|v\|_s \leq C \epsilon \|v\|_s, \end{aligned}$$

where the constant  $C$  is independent of  $u$ . Choose  $\epsilon > 0$  small enough, then the norm of  $H_\epsilon$  on space  $L^s(M, g)$  satisfies

$$\|H_\epsilon\|_{L^s \rightarrow L^s} \leq C \epsilon \leq \frac{1}{2}.$$

With the help of the operator  $H_\epsilon$ , we rewrite equation (3.9) as

$$(Id - H_\epsilon)u = (-\Delta_g + 1)^{-3}(b + \eta_\epsilon u),$$

then it is easy to show  $Id - H_\epsilon : L^s \rightarrow L^s$  is bounded and invertible. We intend to prove  $u \in H^6(M, g)$ . To see this, notice that  $(-\Delta_g + 1)^{-3}(b + \eta_\epsilon u) \in H^5(M, g)$  since  $b + \eta_\epsilon u \in H^{-1}(M, g)$ . In the following, we first show  $u \in H^4(M, g)$ . Applying the Sobolev embedding

theorem and the  $L^s$  boundedness of the operator  $(Id - H_\varepsilon)^{-1}$  to show that if  $n \leq 10$ ,  $u \in L^p(M, g)$  for all  $p > 1$ , and if  $n > 10$ ,  $u \in L^{\frac{2n}{n-10}}(M, g)$ . In the latter case we have  $|u|^{2^\sharp-2}u \in L^{\frac{2n(n-6)}{(n+6)(n-10)}}(M, g)$ . From equation (3.9), we get

$$(-\Delta_g + 1)^2 u = (-\Delta_g + 1)^{-1} b + (-\Delta_g + 1)^{-1} (f |u|^{2^\sharp-2} u).$$

From  $(-\Delta_g + 1)^{-1}(|u|^{2^\sharp-2}u) \in W^{2,\frac{2n(n-6)}{(n+6)(n-10)}}(M, g) \hookrightarrow L^2(M, g)$  and  $(-\Delta_g + 1)^{-1}b \in L^2(M, g)$ , we have  $u \in H^4(M, g)$  in both cases. Repeat the above step with  $u \in H^4(M, g)$  and  $b \in L^2(M, g)$  in this situation. Notice that  $(-\Delta_g + 1)^{-3}(b + \eta_\varepsilon u) \in H^6(M, g)$ , similar arguments in the above step show that if  $n \leq 12$ ,  $u \in L^p(M, g)$  for all  $p > 1$  and if  $n > 12$ ,  $u \in L^{\frac{2n}{n-12}}(M, g)$ . In the latter case, we get  $|u|^{2^\sharp-2}u \in L^2(M, g)$  due to  $\frac{2n(n-6)}{(n+6)(n-12)} > 2$ . Hence we obtain  $u \in H^6(M, g)$ .

Finally we start with the classical bootstrap. We now construct a non-decreasing sequence  $s_k \in \mathbb{R} \cup \{+\infty\}$  such that  $u \in W^{6,s_k}(M, g)$  for all  $k \in \mathbb{N}$ . Set  $s_0 = 2$ , and find  $k \geq 0$  such that  $u \in W^{6,s_k}(M, g)$ . Next we will define  $s_{k+1}$  by induction. The Sobolev embedding theorem yields

$$b \in L^{\frac{ns_k}{n-2s_k}}(M, g),$$

with the convention that  $\frac{ns_k}{n-2s_k} = +\infty$  if  $s_k \geq \frac{n}{2}$ , and

$$|u|^{2^\sharp-2}u \in L^{\frac{ns_k(n-6)}{(n-6s_k)(n+6)}}(M, g),$$

with the convention that  $\frac{ns_k}{n-6s_k} = +\infty$  if  $s_k \geq \frac{n}{6}$ . In view of equation (3.9), we have  $u \in W^{6,s_{k+1}}(M, g)$  with  $s_{k+1} = \min\{\frac{ns_k}{n-2s_k}, \frac{ns_k(n-6)}{(n-6s_k)(n+6)}\}$ . If  $s_k \in \mathbb{R}$  for all  $k \in \mathbb{N}$ , it must hold that  $s_k \rightarrow +\infty$ . Then we have  $u \in W^{6,p}(M, g)$  for all  $1 \leq p < +\infty$ . If  $s_k = +\infty$  for all  $k \geq k_0 + 1$ , then  $s_{k_0} \geq \frac{n}{6}$ , whence  $b \in L^{\frac{n}{4}}(M, g)$  and  $|u|^{2^\sharp-2}u \in L^q(M, g)$  for all  $1 \leq q < +\infty$ . The equation (3.9) leads to  $u \in W^{6,\frac{n}{4}}(M)$ . Repeating the argument twice, we obtain  $u \in W^{6,p}(M, g)$  for all  $1 \leq p < +\infty$ . From this and the Sobolev embedding theorem, we have  $u \in C^{5,\nu}(M)$  for all  $0 < \nu < 1$ . By the regularity theory for the classical solution of the elliptic operator  $-\Delta_g + 1$ , we get  $u \in C^{6,\mu}(M)$  for some  $0 < \mu < 1$ . This completes the proof.  $\square$

## A Appendix: Proof of Lemma 2.1

As in Proposition 3.1, one may employ all computations under conformal normal coordinates of metric  $g$  around a point in  $M$ . From Lee-Park [12] that up to a conformal factor, under  $g$ -conformal normal coordinates around this point, for all  $N \geq 5$  there hold

$$\sigma_1(A_g) = 0, \quad \sigma_1(A_g)_{,i} = 0, \quad \Delta_g \sigma_1(A_g) = -\frac{|W|_g^2}{12(n-1)}$$

at this point and

$$\sqrt{\det g} = 1 + O(r^N) \text{ near this point.}$$

To simplify the notation, we will omit the subscript  $g$ . Notice that

$$-P_g(r^{6-n}) = \left[ \Delta^3 + \Delta \delta T_2 d + \delta T_2 d \Delta + \frac{n-2}{2} \Delta (\sigma_1(A) \Delta) + \delta T_4 d - \frac{n-6}{2} Q_g \right] (r^{6-n})$$

$$:= \sum_{k=1}^6 I_k.$$

Next, we begin to estimate all terms  $I_1$ - $I_6$ .

For  $I_1$ , let  $u = u(r)$  be a radial function, we have

$$\begin{aligned}\Delta u(r) &= \Delta_0 u(r) + O(r^{N-1})u'; \\ \Delta^2 u(r) &= \Delta_0(\Delta_0 u(r) + O(r^{N-1})u') + O(r^{N-1})(\Delta_0 u(r) + O(r^{N-1})u')' \\ &= \Delta_0^2 u(r) + O(r^{N-1})u''' + O(r^{N-2})u'' + O(r^{N-3})u'; \\ \Delta^3 u(r) &= \Delta_0^3 u(r) + O(r^{N-1})u^{(5)} + O(r^{N-2})u^{(4)} + O(r^{N-3})u''' \\ &\quad + O(r^{N-4})u'' + O(r^{N-5})u'.\end{aligned}$$

Hence we obtain

$$I_1 = \Delta^3(r^{6-n}) = -c_n \delta_p + O(r^{N-n}).$$

To estimate  $I_2$ . Notice that

$$\begin{aligned}I_2 &= \Delta \delta T_2 d(r^{6-n}) \\ &= -\Delta[(T_2)_{ij}(r^{6-n})_{,j}]_{,i} \\ &= -\Delta[(T_2)_{ij,i}(r^{6-n})_{,j} + (T_2)_{ij}(r^{6-n})_{,ji}].\end{aligned}$$

Using

$$\begin{aligned}(r^{6-n})_{,j} &= (6-n)r^{4-n}x^j, \\ (r^{6-n})_{,ji} &= (4-n)(6-n)r^{2-n}x^i x^j + (6-n)r^{4-n}\delta_{ij} + O(r^{6-n}),\end{aligned}\tag{A.1}$$

one has

$$\begin{aligned}(T_2)_{ij,i}(r^{6-n})_{,j} &= (n-10)\sigma_1(A)_{,j}(6-n)r^{4-n}x^j \\ &= (n-10)(6-n)\sigma_1(A)_{,j}x^j r^{4-n}\end{aligned}$$

and

$$\begin{aligned}(T_2)_{ij}(r^{6-n})_{,ji} &= [(n-2)\sigma_1(A)g_{ij} - 8A_{ij}](6-n)[(4-n)r^{2-n}x^i x^j + r^{4-n}\delta_{ij} + O(r^{6-n})] \\ &= (6-n)[4(n-4)\sigma_1(A)r^{4-n} - 8(4-n)A_{ij}x^i x^j r^{2-n}] + O(r^{7-n}).\end{aligned}$$

Hence, we obtain

$$\begin{aligned}I_2 &= -(6-n)\Delta[(n-10)\sigma_1(A)_{,j}x^j r^{4-n} + 4(n-4)\sigma_1(A)r^{4-n} - 8(4-n)A_{ij}x^i x^j r^{2-n}] \\ &= (n-6)\{(n-10)[4(4-n)\sigma_1(A)_{,j}x^j r^{2-n} + 2(4-n)\sigma_1(A)_{,jk}x^j x^k r^{2-n}] \\ &\quad + \sigma_1(A)_{,kk}x^j r^{2-n} + 2\Delta\sigma_1(A)r^{4-n}\} + O(r^{5-n})\end{aligned}$$

$$\begin{aligned}
& + 4(n-4)[\Delta\sigma_1(A)r^{4-n} + 2(4-n)\sigma_1(A)_{,k}x^k r^{2-n} + 2(4-n)\sigma_1(A)r^{2-n}] \\
& + 8(n-4)[4(2-n)A_{ij}x^i x^j r^{-n} + \Delta A_{ij}x^i x^j r^{2-n} + 4\sigma_1(A)_{,i}x^i r^{2-n} + 2\sigma_1(A)r^{2-n}] \\
& = (n-6) \left\{ -4(n-4)(3n-26)\sigma_1(A)_{,j}x^j r^{2-n} + 6(n-6)\Delta\sigma_1(A)r^{4-n} \right. \\
& \quad - 2(n-10)(n-4)\sigma_1(A)_{,jk}x^j x^k r^{2-n} + (n-10)\sigma_1(A)_{,kk}x^j r^{4-n} + O(r^{5-n}) \\
& \quad \left. - 8(n-6)(n-4)\sigma_1(A)r^{2-n} - 32(n-4)(n-2)A_{ij}x^i x^j r^{-n} + 8(n-4)\Delta A_{ij}x^i x^j r^{2-n} \right\} \\
& = (n-6) \left\{ -4(n-4)(3n-26)\sigma_1(A)_{,ij}(p)x^i x^j r^{2-n} - \frac{n-6}{2(n-1)}|W(p)|^2 r^{4-n} \right. \\
& \quad - 2(n-10)(n-4)\sigma_1(A)_{,ij}(p)x^i x^j r^{2-n} - 4(n-6)(n-4)\sigma_1(A)_{,ij}(p)x^i x^j r^{2-n} \\
& \quad \left. - 16(n-4)(n-2)A_{ij,kl}(p)x^i x^j x^k x^l r^{-n} + 8(n-4)\Delta A_{ij}x^i x^j r^{2-n} \right\} + O(r^{5-n}) \\
& = (n-6) \left\{ -2(n-4)(9n-74)\sigma_1(A)_{,ij}(p)x^i x^j r^{2-n} - \frac{n-6}{2(n-1)}|W(p)|^2 r^{4-n} \right. \\
& \quad \left. - 16(n-4)(n-2)A_{ij,kl}(p)x^i x^j x^k x^l r^{-n} + 8(n-4)\Delta A_{ij}x^i x^j r^{2-n} \right\} + O(r^{5-n}).
\end{aligned}$$

To estimate

$$\begin{aligned}
I_3 &= \delta T_2 d \Delta(r^{6-n}) \\
&= -[(T_2)_{ij}(\Delta r^{6-n})_{,j}]_{,i} \\
&= -(T_2)_{ij,i}(\Delta r^{6-n})_{,j} - (T_2)_{ij}(\Delta r^{6-n})_{,ji}.
\end{aligned}$$

Recall that  $T_2 = (n-2)\sigma_1(A)g - 8A$ , then

$$(T_2)_{ij,i} = (n-10)\sigma_1(A)_{,j}.$$

Observe that

$$\begin{aligned}
\Delta r^{6-n} &= 4(6-n)r^{4-n} + O(r^{N+4-n}), \\
(\Delta r^{6-n})_{,j} &= 4(6-n)(4-n)x^j r^{2-n} + O(r^{N+3-n}),
\end{aligned}$$

and

$$(\Delta r^{6-n})_{,ji} = 4(6-n)(4-n)[(2-n)x^i x^j r^{-n} + r^{2-n}\delta_{ij}] + O(r^{4-n}),$$

then it yields

$$\begin{aligned}
& (T_2)_{ij}(\Delta r^{6-n})_{,ji} \\
& = 4(n-6)(n-4)[(n-2)\sigma_1(A)g_{ij} - 8A_{ij}][(2-n)x^i x^j r^{-n} + r^{2-n}\delta_{ij} + O(r^{4-n})] \\
& = 4(n-6)(n-4)[- (n-2)^2\sigma_1(A)r^{2-n} + n(n-2)\sigma_1(A)r^{2-n} \\
& \quad + 8(n-2)r^{-n}A_{ij}x^i x^j - 8\sigma_1(A)r^{2-n}] + O(r^{5-n}) \\
& = 4(n-6)(n-4) \left[ 2(n-6)\sigma_1(A)r^{2-n} + 8(n-2)r^{-n}A_{ij}x^i x^j \right] + O(r^{5-n}) \\
& = 4(n-6)(n-4)[(n-6)\sigma_1(A)_{,ij}(p)x^i x^j r^{2-n} + 4(n-2)r^{-n}(A_{ij,kl}(p)x^i x^j x^k x^l)] + O(r^{5-n}).
\end{aligned}$$

Hence, we obtain

$$\begin{aligned}
I_3 &= -4(n-6)(n-4) \left[ (n-6)\sigma_1(A)_{,ij}(p)x^i x^j r^{2-n} + 4(n-2)r^{-n}(A_{ij,kl}(p)x^i x^j x^k x^l) \right] \\
&\quad - 4(n-6)(n-4)(n-10)r^{2-n}\sigma_1(A)_{,i}x^i + O(r^{5-n}) \\
&= -8(n-8)(n-6)(n-4)\sigma_1(A)_{,ij}(p)x^i x^j r^{2-n} \\
&\quad - 16(n-6)(n-4)(n-2)r^{-n}(A_{ij,kl}(p)x^i x^j x^k x^l) + O(r^{5-n}).
\end{aligned}$$

We now compute

$$\begin{aligned}
I_4 &= \frac{n-2}{2} \Delta(\sigma_1(A)\Delta(r^{6-n})) \\
&= 2(n-2)(6-n)\Delta(\sigma_1(A)r^{4-n}) + O(r^{N+4-n}) \\
&= 2(n-2)(6-n)r^{2-n}[\Delta\sigma_1(A)r^2 + 2(4-n)\sigma_1(A)_{,i}x^i + 2(4-n)\sigma_1(A)] + O(r^{N+2-n}) \\
&= 2(n-2)(n-6)r^{2-n} \left[ \frac{1}{12(n-1)}|W(p)|^2r^2 + 3(n-4)\sigma_1(A)_{,ij}(p)x^i x^j \right] + O(r^{5-n}).
\end{aligned}$$

For  $I_5$ , from (A.1) we have

$$\begin{aligned}
I_5 &= \delta T_4 d(r^{6-n}) \\
&= -((T_4)_{ij}r^{6-n,j})_i \\
&= -(T_4)_{ij,i}(r^{6-n})_j - (T_4)_{ij}(r^{6-n})_{ji} \\
&= (n-6)[r^{4-n}(T_4)_{ij,i}x^j - (n-4)r^{2-n}(T_4)_{ij}x^i x^j + r^{4-n}\text{tr}(T_4)] \\
&:= (n-6)[I_1^{(5)} + I_2^{(5)} + I_3^{(5)}].
\end{aligned}$$

Also from [12], there holds

$$\text{Sym}\left(R_{kl,ij} + \frac{2}{9}R_{nklm}R_{nijm}\right)(p) = 0 \text{ and } R_{ij}(p) = 0,$$

then

$$R_{kl,ij}(p)x^i x^j x^k x^l = -\frac{2}{9}W_{nklm}(p)W_{nijm}(p)x^i x^j x^k x^l.$$

Thus we have

$$A_{kl,ij}(p)x^i x^j x^k x^l = -\frac{2}{9}\frac{1}{n-2}\sum_{k,l}(W_{iklj}(p)x^i x^j)^2 - \frac{\sigma_1(A)_{,ij}(p)x^i x^j r^2}{n-2}. \quad (\text{A.2})$$

To estimate  $I_3^{(5)}$ . From the definition of  $T_4$ , one gets

$$\begin{aligned}
\text{tr}(T_4) &= -\frac{3n^3-12n^2-36n+64}{4}\sigma_1(A)^2 + 4(n^2-4n-12)|A|^2 + n(n-6)\Delta\sigma_1(A) \\
&= -\frac{n(n-6)}{12(n-1)}|W(p)|^2 + O(r).
\end{aligned}$$

Thus one obtains

$$I_3^{(5)} = -\frac{n(n-6)}{12(n-1)}|W(p)|^2r^{4-n} + O(r^{5-n}).$$

For the term  $I_1^{(5)}$ , it is easy to see

$$I_1^{(5)} = r^{4-n} (T_4)_{ij,i} x^j = O(r^{5-n}).$$

It remains to estimate the term  $I_2^{(5)}$ , one has

$$(T_4)_{ij} x^i x^j = (n-6)\Delta\sigma_1(A)r^2 - \frac{16}{n-4} B_{ij} x^i x^j + O(r^4). \quad (\text{A.3})$$

Notice that

$$\begin{aligned} B_{ij} x^i x^j &= [C_{ijk,k} - A_{kl} W_{kijl}] x^i x^j = [(A_{ij,k} - A_{ik,j}),_k - A_{kl} W_{kijl}] x^i x^j \\ &= [\Delta A_{ij} - A_{ik,jk} + O(r)] x^i x^j \end{aligned}$$

and

$$\begin{aligned} \Delta(A_{ij} x^i x^j) &= (A_{ij,k} x^i x^j + A_{ij}(x^i \delta_{jk} + x^j \delta_{ik})),_k \\ &= (\Delta A_{ij}) x^i x^j + 2A_{ij,k} (x^i \delta_{jk} + x^j \delta_{ik}) + 2\sigma_1(A) + O(r^3) \\ &= (\Delta A_{ij}) x^i x^j + 4\sigma_1(A),_i x^i + 2\sigma_1(A) + O(r^3). \end{aligned}$$

By (A.2), one gets

$$\begin{aligned} (\Delta A_{ij}) x^i x^j &= \Delta(A_{ij} x^i x^j) - 4\sigma_1(A),_i x^i - 2\sigma_1(A) + O(r^3) \\ &= \Delta \left[ \frac{1}{2} A_{ij,kl}(p) x^i x^j x^k x^l + O(r^5) \right] - 4[\sigma_1(A),_{ij}(p) x^i x^j + O(r^3)] \\ &\quad - \sigma_1(A),_{ij}(p) x^i x^j + O(r^3) \\ &= \Delta \left[ -\frac{1}{9} \frac{1}{n-2} \sum_{k,l} (W_{iklj}(p) x^i x^j)^2 - \frac{\sigma_1(A),_{ij}(p) x^i x^j r^2}{2(n-2)} \right] \\ &\quad - 5\sigma_1(A),_{ij}(p) x^i x^j + O(r^3) \\ &= -\frac{2}{9} \frac{1}{n-2} \sum_{k,l,s} [(W_{ikls}(p) + W_{ilks}(p)) x^i]^2 + \frac{1}{12(n-2)(n-1)} |W(p)|^2 r^2 \\ &\quad - 6 \frac{n-1}{n-2} \sigma_1(A),_{ij}(p) x^i x^j + O(r^3), \end{aligned} \quad (\text{A.4})$$

where the last identity follows from the following two estimates:

$$\begin{aligned} \Delta(\sigma_1(A),_{ij}(p) x^i x^j r^2) &= \Delta(\sigma_1(A),_{ij}(p) x^i x^j) r^2 + 2\nabla_s (\sigma_1(A),_{ij}(p) x^i x^j) \nabla_s r^2 \\ &\quad + (\sigma_1(A),_{ij}(p) x^i x^j) \Delta r^2 \\ &= 2\Delta\sigma_1(A)(p) r^2 + 8\sigma_1(A),_{ij}(p) x^i x^j + 2n\sigma_1(A),_{ij}(p) x^i x^j + O(r^3) \\ &= -\frac{1}{6(n-1)} |W(p)|^2 r^2 + 2(n+4)\sigma_1(A),_{ij}(p) x^i x^j + O(r^3) \end{aligned}$$

and

$$\Delta \sum_{k,l} (W_{iklj}(p) x^i x^j)^2 = 2 \sum_{k,l,s} [W_{iklj}(p) (x^i \delta_{js} + x^j \delta_{is})]^2 = 2 \sum_{k,l,s} [(W_{ikls}(p) + W_{ilks}(p)) x^i]^2,$$

which follows from

$$\Delta \left[ \sum_{k,l} (W_{iklj}(p)x^i x^j)^2 \right] = 2 \sum_{k,l} [(W_{iklj}(p)x^i x^j) \Delta (W_{sklt}(p)x^s x^t) + |\nabla (W_{iklj}(p)x^i x^j)|^2]$$

and  $\Delta (W_{sklt}(p)x^s x^t) = (W_{sklt}(p)(x^s \delta_{it} + x^t \delta_{is}))_{,i} = 2W_{sklt}(p)\delta_{st} = 0$ . Using  $A_{ik,jk} = A_{ik,kj} + R_{ijk}^l A_{lk} + R_{kjk}^l A_{il} = \sigma_1(A)_{,ij} + R_{lij} A_{lk} + R_{lj} A_{il}$ , one has

$$\begin{aligned} & A_{ik,jk} x^i x^j \\ &= \sigma_1(A)_{,ij} x^i x^j + R_{lij} A_{lk} x^i x^j + R_{lj} A_{il} x^i x^j \\ &= (\sigma_1(A)_{,ij}(p) + O(r)) x^i x^j + (W_{lij}(p) + O(r))(A_{lk,m}(p)x^m + O(r^2)) x^i x^j + O(r^4) \\ &= \sigma_1(A)_{,ij}(p) x^i x^j + O(r^3). \end{aligned}$$

Thus, one obtains

$$\begin{aligned} B_{ij} x^i x^j &= -\frac{2}{9(n-2)} \sum_{k,l,s} [(W_{ikls}(p) + W_{ilks}(p))x^i]^2 + \frac{1}{12(n-2)(n-1)} |W(p)|^2 r^2 \\ &\quad - \frac{7n-8}{n-2} \sigma_1(A)_{,ij}(p) x^i x^j + O(r^3). \end{aligned} \tag{A.5}$$

Inserting the above equations into (A.3), one gets

$$\begin{aligned} & (T_4)_{ij} x^i x^j \\ &= -\frac{n-6}{12(n-1)} |W(p)|^2 r^2 + \frac{32}{9(n-4)(n-2)} \sum_{k,l,s} [(W_{ikls}(p) + W_{ilks}(p))x^i]^2 \\ &\quad - \frac{4}{3(n-4)(n-2)(n-1)} |W(p)|^2 r^2 + \frac{16(7n-8)}{(n-4)(n-2)} \sigma_1(A)_{,ij}(p) x^i x^j + O(r^3), \end{aligned}$$

whence

$$\begin{aligned} I_2^{(5)} &= r^{2-n} \left[ \frac{(n-6)(n-4)}{12(n-1)} |W(p)|^2 r^2 - \frac{32}{9(n-2)} \sum_{k,l,s} ((W_{ikls}(p) + W_{ilks}(p))x^i)^2 \right. \\ &\quad \left. + \frac{4}{3(n-2)(n-1)} |W(p)|^2 r^2 - \frac{16(7n-8)}{n-2} \sigma_1(A)_{,ij}(p) x^i x^j \right] + O(r^{5-n}). \end{aligned}$$

Combining all the terms together, one has

$$\begin{aligned} I_5 &= \left[ -\frac{n^2 - 8n + 8}{3(n-1)(n-2)} |W(p)|^2 r^{4-n} - \frac{32}{9(n-2)} \sum_{k,l,s} ((W_{ikls}(p) + W_{ilks}(p))x^i)^2 r^{2-n} \right. \\ &\quad \left. - \frac{16(7n-8)}{n-2} \sigma_1(A)_{,ij}(p) x^i x^j r^{2-n} \right] (n-6) + O(r^{5-n}). \end{aligned}$$

Finally, from the definition of  $Q_g$  in (1.1), it is not hard to show that

$$I_6 = -\frac{n-6}{2} Q_g r^{6-n} = O(r^{6-n}).$$

Therefore, collecting all the terms  $I_1$ - $I_6$  together with (A.2) and (A.4), we conclude that

$$\begin{aligned}
& -P_g(r^{6-n}) \\
&= -c_n \delta_p + (n-6) \left[ -\frac{16}{9} \sum_{k,l,s} ((W_{ikls}(p) + W_{ilks}(p))x^i)^2 r^{2-n} - \frac{2(n-8)}{3(n-1)} |W(p)|^2 r^{4-n} \right. \\
&\quad \left. + \frac{64(n-4)}{9} \sum_{k,l} (W_{iklj}(p)x^i x^j)^2 r^{-n} - 4(5n^2 - 66n + 224)\sigma_1(A)_{,ij}(p)x^i x^j r^{2-n} \right] + O(r^{5-n}) \\
&= -c_n \delta_p + (n-6)r^{-n} \left\{ \frac{64(n-4)}{9} \left[ \sum_{k,l} (W_{iklj}(p)x^i x^j)^2 - \frac{r^2}{n+4} \sum_{k,l,s} ((W_{ikls}(p) + W_{ilks}(p))x^i)^2 \right. \right. \\
&\quad \left. + \frac{3}{2(n+4)(n+2)} |W(p)|^2 r^4 \right] + \frac{16(3n-20)}{9(n+4)} r^2 \left[ \sum_{k,l,s} ((W_{ikls}(p) + W_{ilks}(p))x^i)^2 - \frac{3}{n} |W(p)|^2 r^2 \right] \\
&\quad - 4(5n^2 - 66n + 224)r^2 \left[ \sigma_1(A)_{,ij}(p)x^i x^j + \frac{|W(p)|^2}{12n(n-1)} r^2 \right] \\
&\quad \left. + \frac{3n^4 - 16n^3 - 164n^2 + 400n + 2432}{3(n+4)(n+2)n(n-1)} |W(p)|^2 r^4 \right\} + O(r^{5-n}),
\end{aligned}$$

where each term in square brackets on the right hand side of the last identity is harmonic polynomial. This finishes the proof of Lemma 2.1.
