#### Abstract

We put forward an effective amplification protocol for protecting the single-photon multi-mode W state of the time-bin qubit. The protocol only relies on linear optical elements, such as the 50: 50 beam splitters, variable beam splitters with the transmission of $t$ and the polarizing beam splitters. Only one pair of the single-photon multi-mode W state and some auxiliary single photons are required, and the fidelity of the single-photon multi-mode W state can be increased under $t<\frac{1}{2}$. The encoded time-bin information can be perfectly contained. Our protocol is quite simple and economical, and it can be realized under current experimental condition. Based on above features, it may be useful in current and future quantum information processing.

## I. INTRODUCTION

Quantum entanglement is an importance source in quantum communications [1 8]. For example, in the fields of quantum teleportation [1, 2], quantum key distribution (QKD) [3] 5], quantum state sharing (QSS) [6], quantum secure direct communication (QSDC) [7, [8], the parties all resort to the entanglement to set up the quantum channel. Entanglement is also essential in quantum computations [9-11]. In various entanglement forms, the single photon entanglement (SPE) is the simplest but important one. The typical form of the SPE is

$$
\begin{equation*}
|S P E\rangle=\frac{1}{\sqrt{2}}\left(|10\rangle_{A B}+|01\rangle_{A B}\right) \tag{1}
\end{equation*}
$$

where A and B are two different spatial modes, $|0\rangle$ and $|1\rangle$ mean no photon and one photon, respectively. The SPE between two modes has been proved to be a valuable resource for cryptography [12, 13], state engineering [14], and tomography of states and operations [15, 16]. In the past few years, researchers have extended the two-mode SPE in Eq. (1) to the N -mode W state with the form

$$
\begin{equation*}
|W\rangle=\frac{1}{\sqrt{N}}(|100 \cdots 0\rangle+|010 \cdots 0\rangle+\cdots+|00 \cdots 1\rangle) \tag{2}
\end{equation*}
$$

where the single photon is superpositioned in N spatial modes in different spatial locations $(N>2)$. The single-photon W state displays an effective all-versus nothing nonlocality as the number of N delocalizations of the single particle goes up [17], and it is robust to decoherence in the noisy environment [18 20]. In 2012, Gottesman et al. proposed a protocol for building an interferometric telescope based on the single-photon multi-mode W state [21]. The protocol has the potential to eliminate the baseline length limit, and allows the interferometers with arbitrarily long baselines in principle.

In the paper, we focus on the single-photon W state of the time-bin entangled qubit. The time-bin entanglement is a coherent superposition of single photon state in two or more different temporal modes. Suppose a single-photon pulse enters two channels, where channel length difference (long-short) is much longer than the pulse duration. The output state consists of two well separated pulses with different times of arrival, and the quantum information is

[^0]encoded in the arrival time of the photon, which can be written as $|\operatorname{Long}\rangle(|L\rangle)$ and $\mid$ Short $\rangle(|S\rangle)$, respectively. The time-bin entanglement is a robust form of optical quantum information, especially for the transmission in optical fibers. It has been widely used in the long-distance entanglement distribution [22 24]. For example, in 2002, Thew et al. demonstrated the robust time-bin qubits for distributed quantum communication over 11 km [22]. Later, Marcikic et al. experimentally realized the distribution of time-bin entangled qubits over 50 km of optical fibers 23]. Recently, Inagaki et al. has realized the distribution of time-bin entangled photons over 300 km of optical fiber [24]. By distributing the time-bin entangled qubit to N spatial modes in different spatial locations, we can create a single-photon N -mode W state of the time-bin qubit.

Unfortunately, the photon may be completely lost in the distribution process. The photon loss will make the pure state mix with the vacuum state with some probability. In this way, the entanglement between two distant locations decreases exponentially with the length of the transmission channel. The noiseless linear amplification (NLA) is an effective method to overcome the exponential fidelity decay [25-40]. In 2012, Zhang et al. proposed the NLA to protect the two-mode SPE from photon loss [32]. In 2015, Sheng et al. successfully protect the SPE with the experimentally available parametric down-conversion (SPDC) source [39]. In the same year, Zhou and Sheng proposed a recyclable amplification protocol for the SPE with the weak cross-Kerr nonlinearity. By repeating this amplification, they can effectively increase the fidelity of the output state [40]. Recently, a linear heralded qubit amplification protocol for the time-bin qubit and polarization qubit is proposed by Bruno et al. [41], which can be realized under current experimental conditions. Inspired by this protocol, our group put forward a simple and effective NLA protocol for the SPE of the time-bin qubit [42]. Here, in our paper, we extend this NLA protocol in Ref. [42] to the single-photon multi-mode W state of the time-bin entangled qubit. We will show that our protocol can effectively increase the fidelity of the single-photon multi-mode W state. Our protocol will be useful in the current and future quantum communication field.

The paper is organized as follows, in Sec. 2, we explain our amplification protocol for the single-photon three-mode W state of the time-bin qubit, in Sec. 3, we extend the amplication protocol to the arbitrary single-photon multi-mode W state, in Sec. 4, we calculate the amplification factor, and the success probability of our protocol, and make a discussion and summary.

## II. THE HERALDED AMPLIFICATION FOR THE SINGLE-PHOTON THREE-MODE W STATE OF THE TIME-BIN QUBIT

FIG. 1: The schematic principle of the amplification protocol for the single-photon three-mode W state of the time-bin qubit. Here, BS represents the 50:50 beam splitter, VBS represents the variable beam splitter with the transmission of $t$, and PBS means the polarizing beam splitter.

In this section, we will explain our amplification protocol for the single-photon three-mode W state of the time-bin
qubit. Suppose a time-bin qubit has the form of

$$
\begin{equation*}
|\psi\rangle=\alpha\left|S_{H}\right\rangle+\beta\left|L_{V}\right\rangle, \tag{3}
\end{equation*}
$$

where $|S\rangle(|L\rangle)$ means the short (long) time-bin. The subscript $H$ or $V$ indicates that the photon is in horizontal polarization or vertical polarization. Here, the polarization is used to label and switch the path of the photon. $\alpha$ and $\beta$ are the entanglement coefficients, where $|\alpha|^{2}+|\beta|^{2}=1$. The time-bin qubit $|\psi\rangle$ is distributed to three parties, say, Alice (A), Bob (B) and Charlie (C), which can create a single-photon three-mode W state as

$$
\begin{equation*}
|\Phi\rangle_{A B C}=\frac{1}{\sqrt{3}}\left(|\psi\rangle_{a 1}|0\rangle_{b 1}|0\rangle_{c 1}+|0\rangle_{a 1}|\psi\rangle_{b 1}|0\rangle_{c 1}+|0\rangle_{a 1}|0\rangle_{b 1}|\psi\rangle_{c 1}\right) \tag{4}
\end{equation*}
$$

Due to the environmental noise in the distribution channel, the state in Eq. (4) may be mixed with the vacuum state. We suppose the single-photon can be completely lost with the probability of $1-\eta$. In this way, the three parties share a mixed state as

$$
\begin{equation*}
\rho_{i n}=\eta|\Phi\rangle_{A B C}\langle\Phi|+(1-\eta)|v a c\rangle\langle v a c| \tag{5}
\end{equation*}
$$

The aim of the heralded amplification protocol is to increase the fidelity $\eta$.
The schematic principle of the protocol is shown in Fig. 1. For realizing the amplification, each of the three parties needs to prepare two auxiliary single photons, one in $|H\rangle$ and the other one in $|V\rangle$. All the parties make the auxiliary photons in their hands pass through two polarizing beam splitters (PBSs), say $P B S_{1 a} P B S_{2 a}, P B S_{1 b} P B S_{2 b}$, and $P B S_{1 c} P B S_{2 c}$, respectively. The PBS can totally transmit the photon in $|H\rangle$ but totally reflect the photon in $|V\rangle$. Due to the path-length difference of the photons in $|H\rangle$ and $|V\rangle$, each of they can create an auxiliary photon state as $|\varphi\rangle=\left|S_{H}\right\rangle \otimes\left|L_{V}\right\rangle$.

Then, each of the parties makes the auxiliary photons in his or her hand pass through one variable beam splitter (VBS), say VBS1, VBS2, and VBS3. All the three VBSs have the same transmission of $t$. After the VBSs, they can obtain

$$
\begin{align*}
\left|\varphi_{A B C}\right\rangle & =\left(\sqrt{t}\left|S_{H} 0\right\rangle_{a 2 o u t 1}+\sqrt{1-t}\left|0 S_{H}\right\rangle_{a 2 o u t 1}\right) \otimes\left(\sqrt{t}\left|L_{V} 0\right\rangle_{a 2 o u t 1}+\sqrt{1-t}\left|0 L_{V}\right\rangle_{a 2 o u t 1}\right) \\
& \otimes\left(\sqrt{t}\left|S_{H} 0\right\rangle_{b 2 o u t}+\sqrt{1-t}\left|0 S_{H}\right\rangle_{b 2 o u t 2}\right) \otimes\left(\sqrt{t}\left|L_{V} 0\right\rangle_{b 2 o u t 2}+\sqrt{1-t}\left|0 L_{V}\right\rangle_{b 2 o u t 2}\right) \\
& \otimes\left(\sqrt{t}\left|S_{H} 0\right\rangle_{c 2 o u t}+\sqrt{1-t}\left|0 S_{H}\right\rangle_{c 2 o u t 3}\right) \otimes\left(\sqrt{t}\left|L_{V} 0\right\rangle_{c 2 o u t 3}+\sqrt{1-t}\left|0 L_{V}\right\rangle_{c 2 o u t 3}\right) \\
& =\left[t\left|S_{H} L_{V}\right\rangle_{a 2}+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 1}+\sqrt{t(1-t)}\left(\left|S_{H} L_{V}\right\rangle_{a 2 o u t 1}+\left|L_{V} S_{H}\right\rangle_{a 2 o u t 1}\right)\right] \\
& \otimes\left[t\left|S_{H} L_{V}\right\rangle_{b 2}+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 2}+\sqrt{t(1-t)}\left(\left|S_{H} L_{V}\right\rangle_{b 2 o u t 2}+\left|L_{V} S_{H}\right\rangle_{b 2 o u t 2}\right)\right] \\
& \otimes\left[t\left|S_{H} L_{V}\right\rangle_{c 2}+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 3}+\sqrt{t(1-t)}\left(\left|S_{H} L_{V}\right\rangle_{c 2 o u t 3}+\left|L_{V} S_{H}\right\rangle_{c 2 o u t 3}\right)\right] . \tag{6}
\end{align*}
$$

In this way, the whole state $\rho_{i n} \otimes\left|\varphi_{A B C}\right\rangle$ can be in the state of $|\Phi\rangle_{A B C} \otimes\left|\varphi_{A B C}\right\rangle$ with the probability of $\eta$, or in the state of $|v a c\rangle \otimes\left|\varphi_{A B C}\right\rangle$ with the probability of $1-\eta$. We first discuss the case of $|\Phi\rangle_{A B C} \otimes\left|\varphi_{A B C}\right\rangle$, which can be written as

$$
\begin{align*}
|\Phi\rangle_{A B C} \otimes\left|\varphi_{A B C}\right\rangle= & \frac{1}{\sqrt{3}}\left[\left(\alpha\left|S_{H}\right\rangle_{a 1}+\beta\left|L_{V}\right\rangle_{a 1}\right)|0\rangle_{b 1}|0\rangle_{c 1}+|0\rangle_{a 1}\left(\alpha\left|S_{H}\right\rangle_{b 1}+\beta\left|L_{V}\right\rangle_{b 1}\right)|0\rangle_{c 1}\right. \\
& \left.+|0\rangle_{a 1}|0\rangle_{b 1}\left(\alpha\left|S_{H}\right\rangle_{c 1}+\beta\left|L_{V}\right\rangle_{c 1}\right)\right] \\
\otimes & {\left[t\left|S_{H} L_{V}\right\rangle_{a 2}+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 1}+\sqrt{t(1-t)}\left(\left|S_{H} L_{V}\right\rangle_{a 2 o u t 1}+\left|L_{V} S_{H}\right\rangle_{a 2 o u t 1}\right)\right] } \\
\otimes & {\left[t\left|S_{H} L_{V}\right\rangle_{b 2}+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 2}+\sqrt{t(1-t)}\left(\left|S_{H} L_{V}\right\rangle_{b 2 o u t 2}+\left|L_{V} S_{H}\right\rangle_{b 2 o u t 2}\right)\right] } \\
\otimes & {\left[t\left|S_{H} L_{V}\right\rangle_{c 2}+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 3}+\sqrt{t(1-t)}\left(\left|S_{H} L_{V}\right\rangle_{c 2 o u t 3}+\left|L_{V} S_{H}\right\rangle_{c 2 o u t 3}\right)\right] . } \tag{7}
\end{align*}
$$

The three parties make the photons in the $a_{1} a_{2}, b_{1} b_{2}$, and $c_{1} c_{2}$ modes pass through the $50: 50$ beam splitters (BSs), here named BS1, BS2 and BS3, respectively. The BSs can make

$$
\begin{align*}
|1\rangle_{a 1}=\frac{1}{\sqrt{2}}\left(|1\rangle_{a 3}+|1\rangle_{a 4}\right), & |1\rangle_{a 2}=\frac{1}{\sqrt{2}}\left(|1\rangle_{a 3}-|1\rangle_{a 4}\right), \\
|1\rangle_{b 1}=\frac{1}{\sqrt{2}}\left(|1\rangle_{b 3}+|1\rangle_{b 4}\right), & |1\rangle_{b 2}=\frac{1}{\sqrt{2}}\left(|1\rangle_{b 3}-|1\rangle_{b 4}\right) . \\
|1\rangle_{c 1}=\frac{1}{\sqrt{2}}\left(|1\rangle_{c 3}+|1\rangle_{c 4}\right), & |1\rangle_{c 2}=\frac{1}{\sqrt{2}}\left(|1\rangle_{c 3}-|1\rangle_{c 4}\right) . \tag{8}
\end{align*}
$$

After that, the state in Eq. (7) will evolve to

$$
\begin{align*}
& |\Phi\rangle_{A B C} \otimes\left|\varphi_{A B C}\right\rangle \rightarrow \frac{1}{\sqrt{6}}\left\{\left(\alpha\left|S_{H}\right\rangle_{a 3}+\alpha\left|S_{H}\right\rangle_{a 4}+\beta\left|L_{V}\right\rangle_{a 3}+\beta\left|L_{V}\right\rangle_{a 4}\right)\right. \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H} L_{V}\right\rangle_{a 3}-\left|S_{H} L_{V}\right\rangle_{a 3 a 4}-\left|L_{V} S_{H}\right\rangle_{a 3 a 4}+\left|S_{H} L_{V}\right\rangle_{a 4}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 1}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H} L_{V}\right\rangle_{a 3 o u t 1}-\left|S_{H} L_{V}\right\rangle_{a 4 o u t 1}-\left|L_{V} S_{H}\right\rangle_{a 3 o u t 1}-\left|L_{V} S_{H}\right\rangle_{a 4 o u t 1}\right)\right] \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H} L_{V}\right\rangle_{b 3}-\left|S_{H} L_{V}\right\rangle_{b 3 b 4}-\left|L_{V} S_{H}\right\rangle_{b 3 b 4}+\left|S_{H} L_{V}\right\rangle_{b 4}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 2}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H} L_{V}\right\rangle_{b 3 o u t 2}-\left|S_{H} L_{V}\right\rangle_{b 4 o u t 2}-\left|L_{V} S_{H}\right\rangle_{b 3 \text { out } 2}-\left|L_{V} S_{H}\right\rangle_{b 4 o u t 2}\right)\right] \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H} L_{V}\right\rangle_{c 3}-\left|S_{H} L_{V}\right\rangle_{c 3 c 4}-\left|L_{V} S_{H}\right\rangle_{c 3 c 4}+\left|S_{H} L_{V}\right\rangle_{c 4}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 3}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H} L_{V}\right\rangle_{c 3 o u t 3}-\left|S_{H} L_{V}\right\rangle_{c 4 o u t 3}-\left|L_{V} S_{H}\right\rangle_{c 3 o u t 3}-\left|L_{V} S_{H}\right\rangle_{c 4 o u t 3}\right)\right] \\
& +\left(\alpha\left|S_{H}\right\rangle_{b 3}+\alpha\left|S_{H}\right\rangle_{b 4}+\beta\left|L_{V}\right\rangle_{b 3}+\beta\left|L_{V}\right\rangle_{b 4}\right) \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H} L_{V}\right\rangle_{a 3}-\left|S_{H} L_{V}\right\rangle_{a 3 a 4}-\left|L_{V} S_{H}\right\rangle_{a 3 a 4}+\left|S_{H} L_{V}\right\rangle_{a 4}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 1}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H} L_{V}\right\rangle_{a 3 o u t 1}-\left|S_{H} L_{V}\right\rangle_{a 4 o u t 1}-\left|L_{V} S_{H}\right\rangle_{a 3 o u t 1}-\left|L_{V} S_{H}\right\rangle_{a 4 o u t 11}\right)\right] \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H} L_{V}\right\rangle_{b 3}-\left|S_{H} L_{V}\right\rangle_{b 3 b 4}-\left|L_{V} S_{H}\right\rangle_{b 3 b 4}+\left|S_{H} L_{V}\right\rangle_{b 4}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 2}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H} L_{V}\right\rangle_{b 3 o u t 2}-\left|S_{H} L_{V}\right\rangle_{b 4 o u t 2}-\left|L_{V} S_{H}\right\rangle_{b 3 o u t 2}-\left|L_{V} S_{H}\right\rangle_{b 4 o u t 2}\right)\right] \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H} L_{V}\right\rangle_{c 3}-\left|S_{H} L_{V}\right\rangle_{c 3 c 4}-\left|L_{V} S_{H}\right\rangle_{c 3 c 4}+\left|S_{H} L_{V}\right\rangle_{c 4}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 3}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H} L_{V}\right\rangle_{c 3 o u t 3}-\left|S_{H} L_{V}\right\rangle_{c 4 o u t 3}-\left|L_{V} S_{H}\right\rangle_{c 3 o u t 3}-\left|L_{V} S_{H}\right\rangle_{c 4 o u t 3}\right)\right] \\
& +\left(\alpha\left|S_{H}\right\rangle_{c 3}+\alpha\left|S_{H}\right\rangle_{c 4}+\beta\left|L_{V}\right\rangle_{c 3}+\beta\left|L_{V}\right\rangle_{c 4}\right) \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H} L_{V}\right\rangle_{a 3}-\left|S_{H} L_{V}\right\rangle_{a 3 a 4}-\left|L_{V} S_{H}\right\rangle_{a 3 a 4}+\left|S_{H} L_{V}\right\rangle_{a 4}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 1}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H} L_{V}\right\rangle_{a 3 o u t 1}-\left|S_{H} L_{V}\right\rangle_{a 4 o u t 1}-\left|L_{V} S_{H}\right\rangle_{a 3 o u t 1}-\left|L_{V} S_{H}\right\rangle_{a 4 o u t 1}\right)\right] \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H} L_{V}\right\rangle_{b 3}-\left|S_{H} L_{V}\right\rangle_{b 3 b 4}-\left|L_{V} S_{H}\right\rangle_{b 3 b 4}+\left|S_{H} L_{V}\right\rangle_{b 4}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{\text {out } 2}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H} L_{V}\right\rangle_{b 3 o u t 2}-\left|S_{H} L_{V}\right\rangle_{b 4 o u t 2}-\left|L_{V} S_{H}\right\rangle_{b 3 o u t 2}-\left|L_{V} S_{H}\right\rangle_{b 4 o u t 2}\right)\right] \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H} L_{V}\right\rangle_{c 3}-\left|S_{H} L_{V}\right\rangle_{c 3 c 4}-\left|L_{V} S_{H}\right\rangle_{c 3 c 4}+\left|S_{H} L_{V}\right\rangle_{c 4}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{\text {out } 3}\right. \\
& \left.\left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H} L_{V}\right\rangle_{c 3 o u t 3}-\left|S_{H} L_{V}\right\rangle_{c 4 o u t 3}-\left|L_{V} S_{H}\right\rangle_{c 3 o u t 3}-\left|L_{V} S_{H}\right\rangle_{c 4 o u t 3}\right)\right]\right\} . \tag{9}
\end{align*}
$$

Next, the parties make a Bell-state measurement (BSM) for the output photons. In detail, they make the photons in the $a_{3} a_{4}, b_{3} b_{4}$, and $c_{3} c_{4}$ modes pass through $P B S_{3 a} P B S_{4 a}, P B S_{3 b} P B S_{4 b}$, and $P B S_{3 c} P B S_{4 c}$, respectively, which can make

$$
\begin{align*}
& \left|S_{H}\right\rangle_{i 3} \rightarrow\left|S_{H}\right\rangle_{i 5}, \quad\left|L_{V}\right\rangle_{i 3} \rightarrow\left|L_{V}\right\rangle_{i 6} \\
& \left|S_{H}\right\rangle_{i 4} \rightarrow\left|S_{H}\right\rangle_{i 7}, \quad\left|L_{V}\right\rangle_{i 4} \rightarrow\left|L_{V}\right\rangle_{i 8} \tag{10}
\end{align*}
$$

where $i=a, b, c$.
After the PBSs, the state in Eq. (9) will evolve to

$$
|\Phi\rangle_{A B C} \otimes\left|\varphi_{A B C}\right\rangle \rightarrow \frac{1}{\sqrt{6}}\left\{\left(\alpha\left|S_{H}\right\rangle_{a 5}+\alpha\left|S_{H}\right\rangle_{a 7}+\beta\left|L_{V}\right\rangle_{a 6}+\beta\left|L_{V}\right\rangle_{a 8}\right)\right.
$$

$$
\begin{align*}
& \otimes\left[\frac{t}{2}\left(\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 6}-\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 8}-\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{a 7}+\left|S_{H}\right\rangle_{a 7}\left|L_{V}\right\rangle_{a 8}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{\text {out } 1}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{\text {out } 1}-\left|S_{H}\right\rangle_{a 7}\left|L_{V}\right\rangle_{\text {out } 1}-\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{o u t 1}-\left|L_{V}\right\rangle_{a 8}\left|S_{H}\right\rangle_{o u t 1}\right)\right] \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{b 6}-\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{b 8}-\left|L_{V}\right\rangle_{b 6}\left|S_{H}\right\rangle_{b 7}+\left|S_{H}\right\rangle_{b 7}\left|L_{V}\right\rangle_{b 8}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 2}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{\text {out } 2}-\left|S_{H}\right\rangle_{b 7}\left|L_{V}\right\rangle_{\text {out } 2}-\left|L_{V}\right\rangle_{b 6}\left|S_{H}\right\rangle_{o u t 2}-\left|L_{V}\right\rangle_{b 8}\left|S_{H}\right\rangle_{\text {out } 2}\right)\right] \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{c 6}-\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{c 8}-\left|L_{V}\right\rangle_{c 6}\left|S_{H}\right\rangle_{c 7}+\left|S_{H}\right\rangle_{c 7}\left|L_{V}\right\rangle_{c 8}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 3}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{\text {out } 3}-\left|S_{H}\right\rangle_{c 7}\left|L_{V}\right\rangle_{\text {out } 3}-\left|L_{V}\right\rangle_{c 6}\left|S_{H}\right\rangle_{o u t 3}-\left|L_{V}\right\rangle_{c 8}\left|S_{H}\right\rangle_{o u t 3}\right)\right] \\
& +\left(\alpha\left|S_{H}\right\rangle_{b 5}+\alpha\left|S_{H}\right\rangle_{b 7}+\beta\left|L_{V}\right\rangle_{b 6}+\beta\left|L_{V}\right\rangle_{b 8}\right) \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 6}-\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 8}-\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{a 7}+\left|S_{H}\right\rangle_{a 7}\left|L_{V}\right\rangle_{a 8}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 1}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{o u t 1}-\left|S_{H}\right\rangle_{a 7}\left|L_{V}\right\rangle_{o u t 1}-\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{o u t 1}-\left|L_{V}\right\rangle_{a 8}\left|S_{H}\right\rangle_{o u t 1}\right)\right] \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{b 6}-\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{b 8}-\left|L_{V}\right\rangle_{b 6}\left|S_{H}\right\rangle_{b 7}+\left|S_{H}\right\rangle_{b 7}\left|L_{V}\right\rangle_{b 8}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 2}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{o u t 2}-\left|S_{H}\right\rangle_{b 7}\left|L_{V}\right\rangle_{\text {out } 2}-\left|L_{V}\right\rangle_{b 6}\left|S_{H}\right\rangle_{o u t 2}-\left|L_{V}\right\rangle_{b 8}\left|S_{H}\right\rangle_{o u t 2}\right)\right] \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{c 6}-\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{c 8}-\left|L_{V}\right\rangle_{c 6}\left|S_{H}\right\rangle_{c 7}+\left|S_{H}\right\rangle_{c 7}\left|L_{V}\right\rangle_{c 8}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 3}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{o u t 3}-\left|S_{H}\right\rangle_{c 7}\left|L_{V}\right\rangle_{o u t 3}-\left|L_{V}\right\rangle_{c 6}\left|S_{H}\right\rangle_{o u t 3}-\left|L_{V}\right\rangle_{c 8}\left|S_{H}\right\rangle_{o u t 3}\right)\right] \\
& +\left(\alpha\left|S_{H}\right\rangle_{c 5}+\alpha\left|S_{H}\right\rangle_{c 7}+\beta\left|L_{V}\right\rangle_{c 6}+\beta\left|L_{V}\right\rangle_{c 8}\right) \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 6}-\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 8}-\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{a 7}+\left|S_{H}\right\rangle_{a 7}\left|L_{V}\right\rangle_{a 8}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{\text {out } 1}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{o u t 1}-\left|S_{H}\right\rangle_{a 7}\left|L_{V}\right\rangle_{o u t 1}-\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{o u t 1}-\left|L_{V}\right\rangle_{a 8}\left|S_{H}\right\rangle_{o u t 1}\right)\right] \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{b 6}-\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{b 8}-\left|L_{V}\right\rangle_{b 6}\left|S_{H}\right\rangle_{b 7}+\left|S_{H}\right\rangle_{b 7}\left|L_{V}\right\rangle_{b 8}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 2}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{\text {out } 2}-\left|S_{H}\right\rangle_{b 7}\left|L_{V}\right\rangle_{\text {out } 2}-\left|L_{V}\right\rangle_{b 6}\left|S_{H}\right\rangle_{o u t 2}-\left|L_{V}\right\rangle_{b 8}\left|S_{H}\right\rangle_{\text {out } 2}\right)\right] \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{c 6}-\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{c 8}-\left|L_{V}\right\rangle_{c 6}\left|S_{H}\right\rangle_{c 7}+\left|S_{H}\right\rangle_{c 7}\left|L_{V}\right\rangle_{c 8}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 3}\right. \\
& \left.\left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{\text {out } 3}-\left|S_{H}\right\rangle_{c 7}\left|L_{V}\right\rangle_{\text {out } 3}-\left|L_{V}\right\rangle_{c 6}\left|S_{H}\right\rangle_{o u t 3}-\left|L_{V}\right\rangle_{c 8}\left|S_{H}\right\rangle_{o u t 3}\right)\right]\right\} . \tag{11}
\end{align*}
$$

Then, the photons in all the twelve output modes are detected by the single-photon detectors, say, $D_{1 a}, D_{2 a}$, $D_{3 a}, D_{4 a}, D_{1 b}, D_{2 b}, D_{3 b}, D_{4 b}, D_{1 c}, D_{2 c}, D_{3 c}$, and $D_{4 c}$, respectively. According to the measurement results, we can judge whether the amplification protocol is successful. If each of the three parties obtains one of the following four measurement results, that is, $D_{1 i} D_{2 i}, D_{1 i} D_{4 i}, D_{2 i} D_{3 i}$, or $D_{3 i} D_{4 i}$ each registers one photon, where $i=a, b$, $c$, our protocol is successful. Otherwise, if the parties obtain other measurement results, the protocol fails. Therefore, there are totally sixty-four different measurement results corresponding to the successful cases.

We take the measurement result of $D_{1 a} D_{2 a} D_{1 b} D_{2 b} D_{1 c} D_{2 c}$ for example. In Eq. (11), there are six items which can make the detectors $D_{1 a} D_{2 a} D_{1 b} D_{2 b} D_{1 c} D_{2 c}$ each registers one photon. They are $-\frac{\alpha t^{2} \sqrt{t(1-t)}}{8 \sqrt{3}}\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{b 6}\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{c 6}\left|S_{H}\right\rangle_{\text {out } 1}$, $\frac{\beta t^{2} \sqrt{t(1-t)}}{8 \sqrt{3}}\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{b 6}\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{c 6}\left|L_{V}\right\rangle_{o u t 1},-\frac{\alpha t^{2} \sqrt{t(1-t)}}{8 \sqrt{3}}\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{b 6}\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{c 6}\left|S_{H}\right\rangle_{o u t 2}$, $\frac{\beta t^{2} \sqrt{t(1-t)}}{8 \sqrt{3}}\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{b 6}\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{c 6}\left|L_{V}\right\rangle_{o u t 2},-\frac{\alpha t^{2} \sqrt{t(1-t)}}{8 \sqrt{3}}\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{b 6}\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{c 6}\left|S_{H}\right\rangle_{o u t 3}$,
and $\frac{\beta t^{2} \sqrt{t(1-t)}}{8 \sqrt{3}}\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{b 6}\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{c 6}\left|L_{V}\right\rangle_{o u t 3}$, In this way, if the parties obtain the measurement result of $D_{1 a} D_{2 a} D_{1 b} D_{2 b} D_{1 c} D_{2 c}$, the state in Eq. (11) will finally collapse to

$$
\begin{align*}
\left|\Phi_{1}\right\rangle_{A B C} & =\frac{1}{\sqrt{3}}\left[\left(-\alpha\left|S_{H}\right\rangle_{\text {out } 1}+\beta\left|L_{V}\right\rangle_{\text {out } 1}\right)|0\rangle_{\text {out } 2}|0\rangle_{\text {out } 3}+|0\rangle_{\text {out } 1}\left(-\alpha\left|S_{H}\right\rangle_{\text {out } 2}+\beta\left|L_{V}\right\rangle_{\text {out } 2}\right)|0\rangle_{\text {out } 3}\right. \\
& \left.+|0\rangle_{\text {out } 1}|0\rangle_{\text {out } 2}\left(-\alpha\left|S_{H}\right\rangle_{\text {out } 3}+\beta\left|L_{V}\right\rangle_{\text {out } 3}\right)\right] \tag{12}
\end{align*}
$$

with the probability of $\frac{t^{5}(1-t)}{64} .\left|\Phi_{1}\right\rangle_{A B C}$ can be easily transformed to $|\Phi\rangle_{A B C}$ in Eq. (4) with the phase flip operation. Certainly, if the parties obtain the other sixty-three successful measurement results, they can also finally obtain the same state in Eq. (44). Therefore, the total successful probability is $P_{1}=\frac{t^{5}(1-t)}{64} \times 64=t^{5}(1-t)$.

On the other hand, if the initial photon state is the $|v a c\rangle \otimes\left|\varphi_{A B C}\right\rangle$, when the parties make the photons in the $a_{1} a_{2}$, $b_{1} b_{2}$, and $c_{1} c_{2}$ modes pass through the BSs , they will obtain

$$
\begin{align*}
\left|\varphi_{A B C}\right\rangle & \rightarrow\left[\frac{t}{2}\left(\left|S_{H} L_{V}\right\rangle_{a 3}-\left|S_{H} L_{V}\right\rangle_{a 3 a 4}-\left|L_{V} S_{H}\right\rangle_{a 3 a 4}+\left|S_{H} L_{V}\right\rangle_{a 4}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 1}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H} L_{V}\right\rangle_{a 3 o u t 1}-\left|S_{H} L_{V}\right\rangle_{a 4 o u t 1}-\left|L_{V} S_{H}\right\rangle_{a 3 o u t 1}-\left|L_{V} S_{H}\right\rangle_{a 4 o u t 1}\right)\right] \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H} L_{V}\right\rangle_{b 3}-\left|S_{H} L_{V}\right\rangle_{b 3 b 4}-\left|L_{V} S_{H}\right\rangle_{b 3 b 4}+\left|S_{H} L_{V}\right\rangle_{b 4}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 2}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H} L_{V}\right\rangle_{b 3 o u t 2}-\left|S_{H} L_{V}\right\rangle_{b 4 o u t 2}-\left|L_{V} S_{H}\right\rangle_{b 3 o u t 2}-\left|L_{V} S_{H}\right\rangle_{b 4 o u t 2}\right)\right] \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H} L_{V}\right\rangle_{c 3}-\left|S_{H} L_{V}\right\rangle_{c 3 c 4}-\left|L_{V} S_{H}\right\rangle_{c 3 c 4}+\left|S_{H} L_{V}\right\rangle_{c 4}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 3}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H} L_{V}\right\rangle_{c 3 o u t 3}-\left|S_{H} L_{V}\right\rangle_{c 4 o u t 3}-\left|L_{V} S_{H}\right\rangle_{c 3 o u t 3}-\left|L_{V} S_{H}\right\rangle_{c 4 o u t 3}\right)\right] \tag{13}
\end{align*}
$$

Next, the parties make the photons in the $a_{3} a_{4}, b_{3} b_{4}$, and $c_{3} c_{4}$ modes pass through $P B S_{3 a} P B S_{4 a}, P B S_{3 b} P B S_{4 b}$, and $P B S_{3 c} P B S_{4 c}$, respectively. After the PBSs, the state in Eq. (13) will evolve to

$$
\begin{align*}
\left|\varphi_{A B C}\right\rangle & \rightarrow\left[\frac{t}{2}\left(\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 6}-\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 8}-\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{a 7}+\left|S_{H}\right\rangle_{a 7}\left|L_{V}\right\rangle_{a 8}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 1}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{o u t 1}-\left|S_{H}\right\rangle_{a 7}\left|L_{V}\right\rangle_{o u t 1}-\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{o u t 1}-\left|L_{V}\right\rangle_{a 8}\left|S_{H}\right\rangle_{o u t 1}\right)\right] \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{b 6}-\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{b 8}-\left|L_{V}\right\rangle_{b 6}\left|S_{H}\right\rangle_{b 7}+\left|S_{H}\right\rangle_{b 7}\left|L_{V}\right\rangle_{b 8}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 2}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{o u t 2}-\left|S_{H}\right\rangle_{b 7}\left|L_{V}\right\rangle_{o u t 2}-\left|L_{V}\right\rangle_{b 6}\left|S_{H}\right\rangle_{o u t 2}-\left|L_{V}\right\rangle_{b 8}\left|S_{H}\right\rangle_{o u t 2}\right)\right] \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{c 6}-\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{c 8}-\left|L_{V}\right\rangle_{c 6}\left|S_{H}\right\rangle_{c 7}+\left|S_{H}\right\rangle_{c 7}\left|L_{V}\right\rangle_{c 8}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{o u t 3}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{o u t 3}-\left|S_{H}\right\rangle_{c 7}\left|L_{V}\right\rangle_{o u t 3}-\left|L_{V}\right\rangle_{c 6}\left|S_{H}\right\rangle_{o u t 3}-\left|L_{V}\right\rangle_{c 8}\left|S_{H}\right\rangle_{o u t 3}\right)\right] \tag{14}
\end{align*}
$$

We can prove that if the parties obtain one of the above successful measurement results, the state in Eq. (14) will collapse to the vacuum state. For example, in Eq. (14), only the item $\frac{t^{3}}{8}\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{b 6}\left|S_{H}\right\rangle_{c 5}\left|L_{V}\right\rangle_{c 6}$ can make the detectors $D_{1 a} D_{2 a} D_{1 b} D_{2 b} D_{1 c} D_{2 c}$ each registers one photon. In this way, under the measurement result of $D_{1 a} D_{2 a} D_{1 b} D_{2 b} D_{1 c} D_{2 c}$, the state in Eq. (14) will collapse to the vacuum state with the probability of $\frac{t^{6}}{64}$. Similarly, if the parties obtain the other sixty-three successful measurement results, they can also finally obtain the vacuum state. Therefore, the total successful probability to obtain the vacuum state is $P_{2}=\frac{t^{6}}{64} \times 64=t^{6}$.

According to the description above, if the protocol is successful, the parties can obtain a new mixed state as

$$
\begin{equation*}
\rho_{\text {out }}=\eta^{\prime}|\Phi\rangle_{A B C}\langle\Phi|+\left(1-\eta^{\prime}\right)|v a c\rangle\langle v a c| \tag{15}
\end{equation*}
$$

where the fidelity $\eta^{\prime}$ is

$$
\begin{equation*}
\eta^{\prime}=\frac{\eta P_{1}}{\eta P_{1}+(1-\eta) P_{2}}=\frac{\eta(1-t)}{\eta-2 \eta t+t} \tag{16}
\end{equation*}
$$

The total successful probability for our protocol is

$$
\begin{equation*}
P_{t}=\eta P_{1}+(1-\eta) P_{2}=t^{5}(\eta-2 \eta t+t) \tag{17}
\end{equation*}
$$

It can be found $\rho_{\text {out }}$ has the same form of $\rho_{i n}$. The entanglement coefficients $\alpha$ and $\beta$ do not effect the $P_{t}$ and $\eta^{\prime}$, which are only functions of the initial fidelity $\eta$ and the transmission $t$. We define the amplification factor $g$ as

$$
\begin{equation*}
g \equiv \frac{\eta^{\prime}}{\eta}=\frac{1-t}{\eta(1-t)+(1-\eta) t} \tag{18}
\end{equation*}
$$

For realizing the amplification, we require $g>1$. It can be calculated that $g>1$ under the case of $t<\frac{1}{2}$. In this way, by providing suitable VBSs with $t<\frac{1}{2}$, we can complete the amplification task.

## III. THE HERALDED AMPLIFICATION FOR THE SINGLE-PHOTON N-MODE W STATE OF THE TIME-BIN QUBIT

FIG. 2: (a) The structure of the "Amplifier". (b) The schematic principle of the amplification protocol for the single-photon N -mode W state of the time-bin qubit.

Our protocol can be straightly extended to single-photon N -mode W state of the time-bin qubit, with $N>3$. Suppose a time-bin qubit with the form of $|\psi\rangle$ in Eq. (3) is distributed to N parties, say, Alice (A), Bob (B), Charlie (C), David (D), $\cdot$, which creates a single-photon N -mode W state as

$$
\begin{equation*}
|\Phi\rangle_{N}=\frac{1}{\sqrt{N}}\left(|\psi\rangle_{a 1}|0\rangle_{b 1}|0\rangle_{c 1} \cdots|0\rangle_{n 1}+|0\rangle_{a 1}|\psi\rangle_{b 1}|0\rangle_{c 1} \cdots|0\rangle_{n 1}+\cdots+|0\rangle_{a 1}|0\rangle_{b 1} \cdots|\psi\rangle_{n 1}\right) \tag{19}
\end{equation*}
$$

We consider the single-qubit can be completely lost with the probability of $1-\eta_{N}$. In this way, the three parties share a mixed state as

$$
\begin{equation*}
\rho_{N}=\eta_{N}|\Phi\rangle_{N}\langle\Phi|+\left(1-\eta_{N}\right)|v a c\rangle\langle v a c| . \tag{20}
\end{equation*}
$$

The schematic principle of our protocol is shown in Fig. 2 (b), and the structure of "Amplifier" is shown in Fig. 2 (a), where $i=a, b, c, d, \cdots, n$. Each of the $N$ parties needs to prepare two auxiliary photons with the polarization of $|H\rangle$ and $|V\rangle$, respectively. They each make the two photons pass through two PBSs and create the auxiliary photon state as $|\varphi\rangle=\left|S_{H}\right\rangle \otimes\left|L_{V}\right\rangle$. Then, each of them makes the auxiliary photons in his or her hand pass through one VBS
with the transmission of $t$. After the VBSs, they can obtain

$$
\begin{align*}
\left|\varphi_{N}\right\rangle= & {\left[t\left|S_{H} L_{V}\right\rangle_{a 2}+(1-t)\left|S_{H} L_{V}\right\rangle_{\text {out } 1}+\sqrt{t(1-t)}\left(\left|S_{H} L_{V}\right\rangle_{a 2 \text { out } 1}+\left|L_{V} S_{H}\right\rangle_{a 2 \text { out } 1}\right)\right] } \\
\otimes & {\left[t\left|S_{H} L_{V}\right\rangle_{b 2}+(1-t)\left|S_{H} L_{V}\right\rangle_{\text {out } 2}+\sqrt{t(1-t)}\left(\left|S_{H} L_{V}\right\rangle_{b 2 \text { out } 2}+\left|L_{V} S_{H}\right\rangle_{b 2 \text { out } 2}\right)\right] } \\
\otimes & {\left[t\left|S_{H} L_{V}\right\rangle_{c 2}+(1-t)\left|S_{H} L_{V}\right\rangle_{\text {out } 3}+\sqrt{t(1-t)}\left(\left|S_{H} L_{V}\right\rangle_{c 2 o u t 3}+\left|L_{V} S_{H}\right\rangle_{c 2 \text { out } 3}\right)\right] } \\
& \cdots  \tag{21}\\
\otimes & {\left[t\left|S_{H} L_{V}\right\rangle_{n 2}+(1-t)\left|S_{H} L_{V}\right\rangle_{\text {outn }}+\sqrt{t(1-t)}\left(\left|S_{H} L_{V}\right\rangle_{n 2 \text { outn }}+\left|L_{V} S_{H}\right\rangle_{\text {n2outn }}\right)\right] . }
\end{align*}
$$

Each of the N parties makes the photons in the $i_{1} i_{2}$ modes pass through the BS, and then make all the output photons pass through the PBSs. If the whole photon state is $|\Phi\rangle_{N} \otimes\left|\varphi_{N}\right\rangle$ with the probability of $\eta_{N}$, it will evolve to

$$
\begin{aligned}
& |\Phi\rangle_{N} \otimes\left|\varphi_{N}\right\rangle \rightarrow \frac{1}{\sqrt{2 N}}\left\{\left(\alpha\left|S_{H}\right\rangle_{a 5}+\alpha\left|S_{H}\right\rangle_{a 7}+\beta\left|L_{V}\right\rangle_{a 6}+\beta\left|L_{V}\right\rangle_{a 8}\right)\right. \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 6}-\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 8}-\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{a 7}+\left|S_{H}\right\rangle_{a 7}\left|L_{V}\right\rangle_{a 8}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{\text {out } 1}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{\text {out } 1}-\left|S_{H}\right\rangle_{a 7}\left|L_{V}\right\rangle_{\text {out } 1}-\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{o u t 1}-\left|L_{V}\right\rangle_{a 8}\left|S_{H}\right\rangle_{\text {out } 1}\right)\right] \\

\end{equation*}
$$

Finally, the parties measure the photons in all the $4 N$ output modes by the single-photon detectors. If each of the $N$ parties obtains one of the following four measurement results, say, $D_{1 i} D_{2 i}, D_{1 i} D_{4 i}, D_{2 i} D_{3 i}$, or $D_{3 i} D_{4 i}$ each registers one photon, where $i=a, b, c, \cdots, n$, our protocol is successful. Otherwise, if the parties obtain other measurement results, the protocol fails. Therefore, there are totally $4^{N}$ different successful measurement results. For example, if each of the parties obtain the measurement result of $D_{1 i} D_{2 i}$ each registers one photon, where $i=a, b, c, \cdots, n$, the state in Eq. (22) will collapse to

$$
\begin{align*}
\left|\Phi_{N 1}\right\rangle & =\frac{1}{\sqrt{N}}\left[\left(-\alpha\left|S_{H}\right\rangle_{\text {out } 1}+\beta\left|L_{V}\right\rangle_{\text {out } 1}\right)|0\rangle_{\text {out } 2}|0\rangle_{\text {out } 3} \cdots|0\rangle_{\text {outn }}+|0\rangle_{\text {out } 1}\left(-\alpha\left|S_{H}\right\rangle_{\text {out } 2}+\beta\left|L_{V}\right\rangle_{\text {out } 2}\right)|0\rangle_{\text {out } 3} \cdots|0\rangle_{\text {outn }}\right. \\
& \left.+\cdots+|0\rangle_{\text {out } 1}|0\rangle_{\text {out } 2} \cdots\left(-\alpha\left|S_{H}\right\rangle_{\text {outn }}+\beta\left|L_{V}\right\rangle_{\text {outn }}\right)\right] \tag{23}
\end{align*}
$$

with the probability of $\frac{t^{2 N-1}(1-t)}{4^{N}} .\left|\Phi_{N 1}\right\rangle$ can be converted to $|\Phi\rangle_{N}$ in Eq. (19) with the phase-flip operation. If the parties obtain other successful measurement results, they can also obtain the same state in Eq. (19) with the help of the phase-flip operation. In this way, the total successful probability is $P_{1 N}=\frac{t^{2 N-1}(1-t)}{4^{N}} \times 4^{N}=t^{2 N-1}(1-t)$.

Under the condition that the initial photon state is the vacuum state, when the parties make the photons in the $i_{1} i_{2}(i=a, b, c, \cdots, n)$ modes pass through the BSs and the output photons pass through the PBS, they will obtain

$$
\begin{align*}
\left|\varphi_{N}\right\rangle & \rightarrow\left[\frac{t}{2}\left(\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 6}-\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{a 8}-\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{a 7}+\left|S_{H}\right\rangle_{a 7}\left|L_{V}\right\rangle_{a 8}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{\text {out } 1}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H}\right\rangle_{a 5}\left|L_{V}\right\rangle_{o u t 1}-\left|S_{H}\right\rangle_{a 7}\left|L_{V}\right\rangle_{\text {out } 1}-\left|L_{V}\right\rangle_{a 6}\left|S_{H}\right\rangle_{o u t 1}-\left|L_{V}\right\rangle_{a 8}\left|S_{H}\right\rangle_{o u t 1}\right)\right] \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{b 6}-\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{b 8}-\left|L_{V}\right\rangle_{b 6}\left|S_{H}\right\rangle_{b 7}+\left|S_{H}\right\rangle_{b 7}\left|L_{V}\right\rangle_{b 8}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{\text {out } 2}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H}\right\rangle_{b 5}\left|L_{V}\right\rangle_{o u t 2}-\left|S_{H}\right\rangle_{b 7}\left|L_{V}\right\rangle_{o u t 2}-\left|L_{V}\right\rangle_{b 6}\left|S_{H}\right\rangle_{o u t 2}-\left|L_{V}\right\rangle_{b 8}\left|S_{H}\right\rangle_{o u t 2}\right)\right] \\
& \otimes \ldots \\
& \otimes\left[\frac{t}{2}\left(\left|S_{H}\right\rangle_{n 5}\left|L_{V}\right\rangle_{n 6}-\left|S_{H}\right\rangle_{n 5}\left|L_{V}\right\rangle_{n 8}-\left|L_{V}\right\rangle_{n 6}\left|S_{H}\right\rangle_{n 7}+\left|S_{H}\right\rangle_{n 7}\left|L_{V}\right\rangle_{n 8}\right)+(1-t)\left|S_{H} L_{V}\right\rangle_{\text {outn }}\right. \\
& \left.+\frac{\sqrt{t(1-t)}}{\sqrt{2}}\left(\left|S_{H}\right\rangle_{n 5}\left|L_{V}\right\rangle_{o u t n}-\left|S_{H}\right\rangle_{n 7}\left|L_{V}\right\rangle_{o u t n}-\left|L_{V}\right\rangle_{n 6}\left|S_{H}\right\rangle_{o u t n}-\left|L_{V}\right\rangle_{n 8}\left|S_{H}\right\rangle_{o u t n}\right)\right] \tag{24}
\end{align*}
$$

If the parties obtain one of the above successful measurement results, the state in Eq. (24) will finally collapse to the vacuum state. The total successful probability to obtain the vacuum state is $P_{2 N}=\frac{t^{2 N}}{4^{N}} \times 4^{N}=t^{2 N}$.

Therefore, for the the single-photon N -mode W state, if the protocol is successful, the parties can obtain a new mixed state as

$$
\begin{equation*}
\rho_{\text {out } N}=\eta_{N}^{\prime}|\Phi\rangle_{N}\langle\Phi|+\left(1-\eta_{N}^{\prime}\right)|v a c\rangle\langle v a c|, \tag{25}
\end{equation*}
$$

where the fidelity $\eta_{N}^{\prime}$ is

$$
\begin{equation*}
\eta_{N}^{\prime}=\frac{\eta_{N} P_{1 N}}{\eta P_{1 N}+\left(1-\eta_{N}\right) P_{2 N}}=\frac{\eta_{N}(1-t)}{\eta_{N}-2 \eta_{N} t+t} \tag{26}
\end{equation*}
$$

In this way, the amplification factor $g_{N}$ can be written as

$$
\begin{equation*}
g_{N}=\frac{\eta_{N}^{\prime}}{\eta_{N}}=\frac{1-t}{\eta_{N}(1-t)+\left(1-\eta_{N}\right) t} \tag{27}
\end{equation*}
$$

which has the same form of $g$ in Eq. (18). It indicates that the mode number $N$ would not affect the fidelity of the distilled new mixed state. By providing the VBSs with $t<\frac{1}{2}$, we can obtain $g_{N}>1$ and realize the amplification.

The total successful probability for our protocol is

$$
\begin{equation*}
P_{t N}=\eta_{N} P_{1 N}+\left(1-\eta_{N}\right) P_{2 N}=t^{2 N-1}\left(\eta_{N}-2 \eta_{N} t+t\right) \tag{28}
\end{equation*}
$$

It can be found that the value of $N$ would reduce the success probability of our protocol. As $t<1$, the larger value of $N$ leads to the lower $P_{t N}$.

FIG. 3: The amplification factor $g_{N}$ as a function of the transmission $t$ of the VBSs under the initial fidelity $\eta=0.2,0.6$, and 0.8 , respectively. All three curves pass through the same point with $t=0.5$.

## IV. DISCCUSION AND CONCLUSION

In this paper, we put forward an effective amplification protocol for the arbitrary single-photon N-mode W state of the time-bin qubit. We suppose one time-bin qubit is shared by N parties, which creates a single-photon N-mode W state. Due to the photon loss, the entangled state would be mixed with the vacuum state. For increasing the fidelity of the single-photon N -mode W state, each of the N parties requires to prepare two single photons with the polarization of $|H\rangle$ and $|V\rangle$, respectively. With the help of the PBSs, the polarization modes can accompany two temporal modes, respectively. Then, with the help of the local operation and some linear optical elements, such as the BSs, PBSs, and VBSs with the transmission of $t$, the parties can distill a new mixed state with the similar form of the initial mixed state with some probability. Under the case that $t<\frac{1}{2}$, the amplification factor $g \equiv \frac{\eta_{N}^{\prime}}{\eta_{N}}>1$, which indicates the fidelity of the new mixed state is higher than that of the initial mixed state. Our protocol has three obvious advantages. First, the parties only require one pair of single-photon N -mode W state of the time-bin qubit. As the entanglement source is quite precious, our protocol is quite economical. Second, the information encoded in the time-bin qubit can be well remained after the amplification. Third, the protocol only requires the linear optical elements, which makes it can be realized in current experimental conditions.

Next, we discuss the experimental realization of our protocol. Our protocol relies on three kinds of beam splitters, say VBSs, PBSs and BSs, which are common linear optical elements in current technology. The VBS is the key element of our protocol. In our protocol, for realizing the amplification, we require to use the VBSs with $t<\frac{1}{2}$. The experimental transmission adjustion of the VBS has been reported by Osorio et al. in 2012 [30]. They reported their experimental results about the heralded photon amplification for quantum communication with the help of the VBS . In the experiment, they successfully adjusted the splitting ratio of VBS from $50: 50$ to $90: 10$ to increase the visibility from $46.7 \pm 3.1 \%$ to $96.3 \pm 3.8 \%$. Based on their experimental result, our requirement for the VBS can be easily realized. Meanwhile, we also require the sophisticated single photon detectors to exactly distinguish the single photon in each output modes. The single photon detection has been a challenge under current experimental conditions, for the quantum decoherence effect of the photon detector [43]. Fortunately, the group of Lita once reported their experimental result about the near-infrared single-photon detection. They showed the photon detection efficiency $\eta_{p}$ at 1556 nm can reach $95 \% \pm 2 \%$ [44].

Finally, we numerically calculate the amplification factor $g_{N}$ and the success probability $P_{t N}$ of our protocol. As shown in Eq. (27), the amplification factor $g_{N}$ relies on the value of $t$ and the fidelity $\left(\eta_{N}\right)$ of the initial mixed state. We show the value of $g_{N}$ as a function of $t$ under different values of $\eta_{N}$ in Fig. 3. It can be found that $g_{N}$ reduces with the growth of $t$. All the curves pass through the same point of $t=\frac{1}{2}$. Under $t=\frac{1}{2}$, we can obtain $g_{N}=1$ under any initial fidelity $\eta_{N}$. Actually, under $t=\frac{1}{2}$, the VBS becomes the BS and our protocol is analogous to an entanglement swapping protocol. Under $t<\frac{1}{2}$, we can obtain $g_{N}>1$. Meanwhile, under $t \rightarrow 0, g_{N} \rightarrow \frac{1}{\eta}$, which indicates that we can obtain $\eta_{N}^{\prime} \rightarrow 1$ under the condition of $t \rightarrow 0$. In this way, for obtaining high fidelity, the parties require to choose the VBS with small transmission.

On the other hand, as shown in Eq. (28), the total success probability of our protocol relies on $t, \eta_{N}$ and the mode number $N$. Fig. 4 and Fig. 5 show the value of $P_{t N}$ as a function of $t$ with three different initial $\eta=0.2,0.6$, and 0.8 , under the condition of $N=3$ and $N=4$, respectively. It can be found that the value of $P_{t N}$ mainly depends

FIG. 4: The total success probability $P_{t}$ of our amplification protocol as a function of the transmission $t$ of the VBSs under the mode number $N=3$ and the initial fidelity $\eta=0.2,0.6$, and 0.8 , respectively.

FIG. 5: The total success probability $P_{t}$ of our amplification protocol as a function of the transmission $t$ of the VBSs under the mode number $N=4$ anad the initial fidelity $\eta=0.2,0.6$, and 0.8 , respectively.
on $t$ and $N$, and the value of $\eta_{N}$ affects $P_{t N}$ slightly. $P_{t N}$ increases with the growth of $t$ while decreaases with the growth of $N$. Under $t \in\left[0, \frac{1}{2}\right], P_{t N}$ will get the maximum value of $t^{2 N}$ when $t=\frac{1}{2}$. When $t \rightarrow 0, P_{t N} \rightarrow 0$. In this way, in the practical application, we need to consider both the amplification factor and success probability factor, simultaneously, and choose the VBSs with suitable transmission.

In conclusion, we demonstrate an effective amplification protocol for protecting the single-photon multi-mode W state of the time-bin qubit. In the protocol, only one pair of the single-photon multi-mode W state and some auxiliary single photons are required, which makes our protocol economical. With the help of the auxiliary single photons and the linear optical elements, such as VBSs, BSs, and PBSs, we can successfully distill new mixed state, and the fidelity of the new mixed state can be effectively increased when the transmission $t$ of the VBSs satisfy $t<\frac{1}{2}$. Moreover, the encoded time-bin feature can be well contained. This protocol can be realized under current experimental condition, and it may be useful in current and future quantum information processing.
