AN EMBEDDING CONSTANT FOR THE HARDY SPACE OF DIRICHLET SERIES

OLE FREDRIK BREVIG

Abstract. A new and simple proof of the embedding of the Hardy–Hilbert space of Dirichlet series into a conformally invariant Hardy space of the half-plane is presented, and the optimal constant of the embedding is computed.

Let \( H^2 \) denote the Hardy–Hilbert space of Dirichlet series, \( f(s) = \sum_{n=1}^{\infty} a_n n^{-s} \), with square summable coefficients, and set

\[
\|f\|_{H^2} := \left( \sum_{n=1}^{\infty} |a_n|^2 \right)^{\frac{1}{2}}.
\]

Using the Cauchy–Schwarz inequality, we find that a Dirichlet series \( f \in H^2 \) is absolutely convergent in the half-plane \( \mathbb{C}_{1/2} := \{ s : \Re(s) > 1/2 \} \). To see that \( \mathbb{C}_{1/2} \) is the largest half-plane of convergence for \( H^2 \), consider \( f(s) = \zeta(1/2 + \varepsilon + s) \), where \( \zeta \) denotes the Riemann zeta function and \( \varepsilon > 0 \).

When studying function and operator theoretic properties of \( H^2 \), it has proven fruitful to employ the embedding of \( H^2 \) into the conformally invariant Hardy space of \( \mathbb{C}_{1/2} \) (see e.g. [6, Sec. 9]). The embedding inequality takes on the form

\[
\|f\|_{H^2} := \left( \frac{1}{\pi} \int_{-\infty}^{\infty} \left| f(1/2 + it) \right|^2 \frac{dt}{1 + t^2} \right)^{\frac{1}{2}} \leq C \|f\|_{H^2}.
\]

Observe that the embedding inequality (1) implies that Dirichlet series in \( H^2 \) are locally \( L^2 \)-integrable on the line \( \Re(s) = 1/2 \). Indeed, the proofs of (1) in the literature go via the local (but equivalent) formulation

\[
\sup_{\tau \in \mathbb{R}} \left( \int_{\tau}^{\tau+1} \left| f(1/2 + it) \right|^2 dt \right)^{\frac{1}{2}} \leq \tilde{C} \|f\|_{H^2}.
\]

To prove (2), one can use a general Hilbert–type inequality due to Montgomery and Vaughan [3] or a version of the classical Plancherel–Polya inequality [2, Thm. 4.11]. It is also possible to give Fourier analytic proofs of (2), the reader is referred to [4, pp. 36–37] and [5, Sec. 1.4.4]. It should be pointed out that these proofs do not give a precise value for either of the constants \( C \) and \( \tilde{C} \).

This note contains a new and simple proof of (1), which additionally identifies the optimal constant \( C \). The proof is based on the observation that the \( H^2 \)-norm of a Dirichlet series is associated to a Hilbert–type bilinear form which is easy to estimate precisely.

Theorem. Suppose that $f(s) = \sum_{n=1}^{\infty} a_n n^{-s}$ is in $\mathcal{H}^2$. Then

$$
\left( \frac{1}{\pi} \int_{-\infty}^{\infty} |f(1/2 + it)|^2 \frac{dt}{1 + t^2} \right)^{\frac{1}{2}} < \sqrt{2} \Vert f \Vert_{\mathcal{H}^2},
$$

and the constant $\sqrt{2}$ is optimal.

Proof. Let $x$ be a positive real number. We begin by computing

$$
I(x) := \frac{1}{\pi} \int_{-\infty}^{\infty} x^it \frac{dt}{1 + t^2} = \frac{1}{\pi} \int_{-\infty}^{\infty} \cos(|\log x| t) \frac{dt}{1 + t^2} = e^{-|\log x|} = \frac{1}{\max(x, 1/x)}.
$$

Expanding $|f(1/2 + it)|^2$, we find that

$$
|f|^2_{H^2} = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \frac{a_m a_n}{\sqrt{mn}} = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \frac{a_m a_n}{\sqrt{mn}} \sqrt{mn} = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \frac{a_m a_n}{\max(m, n)^2}.
$$

The identity (3) will serve as the starting point for both the proof of the inequality $|f|^2_{H^2} < \sqrt{2} \Vert f \Vert_{\mathcal{H}^2}$, and for the proof that $\sqrt{2}$ cannot be improved.

Let us first consider the Hilbert–type (see [1] Ch. IX) bilinear form associated to (3). Given sequences $a, b \in \ell^2$, we want to estimate

$$
B(a, b) := \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} a_m b_n \frac{\sqrt{mn}}{\max(m, n)^2}.
$$

By the Cauchy–Schwarz inequality, we find that

$$
|B(a, b)| \leq \left( \sum_{m=1}^{\infty} |a_m|^2 \sum_{n=1}^{\infty} \frac{m}{\max(m, n)^2} \right)^{\frac{1}{2}} \left( \sum_{n=1}^{\infty} |b_n|^2 \sum_{m=1}^{\infty} \frac{n}{\max(m, n)^2} \right)^{\frac{1}{2}}.
$$

Then $|B(a, b)| < 2 \Vert a \Vert_{\ell^2} \Vert b \Vert_{\ell^2}$, since

$$
\sum_{m=1}^{\infty} \frac{m}{\max(m, n)^2} = \sum_{m=1}^{n} \frac{m}{m^2} + \sum_{m=n+1}^{\infty} \frac{m}{n^2} < 1 + m \int_{m}^{\infty} \frac{dx}{x^2} = 2.
$$

Setting $b = \overline{a}$, we obtain the desired inequality $\Vert f \Vert_{H^2}^2 < \sqrt{2} \Vert f \Vert_{\mathcal{H}^2}$.

For the optimality of $\sqrt{2}$, we again let $f(s) = \zeta(1/2 + \varepsilon + s)$ for some $\varepsilon > 0$. Clearly, $\Vert f \Vert_{\mathcal{H}^2}^2 = \zeta(1+2\varepsilon)$. We insert $f$ into (3) and estimate the inner sums using integrals, which yields

$$
\Vert f \Vert_{H^2}^2 = \sum_{m=1}^{\infty} m^{-\varepsilon} \left( \frac{1}{m^2} \sum_{n=1}^{m} n^{-\varepsilon} + \sum_{n=m+1}^{\infty} \frac{n^{-\varepsilon}}{n^2} \right) > \sum_{m=1}^{\infty} m^{-\varepsilon} \left( \frac{1}{m^2} \frac{m^{1-\varepsilon} - 1}{1 - \varepsilon} + \frac{m+1)^{-1-\varepsilon}}{1 + \varepsilon} \right) > \frac{\zeta(1+2\varepsilon) - \zeta(2+\varepsilon)}{1 - \varepsilon} + \frac{\zeta(1+2\varepsilon) - 1}{1 + \varepsilon}.
$$

Letting $\varepsilon \to 0^+$, we conclude that if $\Vert f \Vert_{H^2} 

\leadsto \Vert f \Vert_{\mathcal{H}^2}^2 \leq C \Vert f \Vert_{\mathcal{H}^2}$, then $C^2 \geq 2$. \qed
