

DEFORMATIONS OF LEGENDRIAN CURVES

MARCO SILVA MENDES AND ORLANDO NETO

ABSTRACT. We construct versal and equimultiple versal deformations of the parametrization of a Legendrian curve.

1. CONTACT GEOMETRY

Let $(X, \mathcal{O}_X)$ be a complex manifold of dimension 3. A differential form ω of degree 1 is said to be a *contact form* if $\omega \wedge d\omega$ never vanishes. Let ω be a contact form. By Darboux's theorem for contact forms there is locally a system of coordinates (x, y, p) such that $\omega = dy - p dx$. If ω is a contact form and f is a holomorphic function that never vanishes, $f\omega$ is also a contact form. We say that a locally free subsheaf $\mathcal{L}$ of Ω_X^1 is a *contact structure* on X if $\mathcal{L}$ is locally generated by a contact form. If $\mathcal{L}$ is a contact structure on X the pair $(X, \mathcal{L})$ is called a *contact manifold*. Let $(X_1, \mathcal{L}_1)$ and $(X_2, \mathcal{L}_2)$ be contact manifolds. Let $\chi : X_1 \rightarrow X_2$ be a holomorphic map. We say that χ is a *contact transformation* if $\chi^*\omega$ is a local generator of $\mathcal{L}_1$ whenever ω is a local generator of $\mathcal{L}_2$.

Let $\theta = \xi dx + \eta dy$ denote the canonical 1-form of $T^*\mathbb{C}^2 = \mathbb{C}^2 \times \mathbb{C}^2$. Let $\pi : \mathbb{P}^*\mathbb{C}^2 = \mathbb{C}^2 \times \mathbb{P}^1 \rightarrow \mathbb{C}^2$ be the *projective cotangent bundle* of $\mathbb{C}^2$, where $\pi(x, y; \xi : \eta) = (x, y)$. Let $U[V]$ be the open subset of $\mathbb{P}^*\mathbb{C}^2$ defined by $\eta \neq 0$ [$\xi \neq 0$]. Then θ/η [θ/ξ] defines a contact form $dy - p dx$ [$dx - q dy$] on $U[V]$, where $p = -\xi/\eta$ [$q = -\eta/\xi$]. Moreover, $dy - p dx$ and $dx - q dy$ define a structure of contact manifold on $\mathbb{P}^*\mathbb{C}^2$.

If $\Phi(x, y) = (a(x, y), b(x, y))$ with $a, b \in \mathbb{C}\{x, y\}$ is an automorphism of $(\mathbb{C}^2, (0, 0))$, we associate to Φ the germ of contact transformation

$$\chi : (\mathbb{P}^*\mathbb{C}^2, (0, 0; 0 : 1)) \rightarrow (\mathbb{P}^*\mathbb{C}^2, (0, 0; -\partial_x b(0, 0) : \partial_x a(0, 0)))$$

defined by

$$(1.1) \quad \chi(x, y; \xi : \eta) = (a(x, y), b(x, y); \partial_y b \xi - \partial_x b \eta : -\partial_y a \xi + \partial_x a \eta).$$

If $D\Phi_{(0,0)}$ leaves invariant $\{y = 0\}$, then $\partial_x b(0, 0) = 0$, $\partial_x a(0, 0) \neq 0$ and $\chi(0, 0; 0 : 1) = (0, 0; 0 : 1)$. Moreover,

$$\chi(x, y, p) = (a(x, y), b(x, y), (\partial_y b p + \partial_x b)/(\partial_y a p + \partial_x a)).$$

Let $(X, \mathcal{L})$ be a contact manifold. A curve L in X is called *Legendrian* if $\omega|_L = 0$ for each section ω of $\mathcal{L}$.

Let Z be the germ at $(0, 0)$ of an irreducible plane curve parametrized by

$$(1.2) \quad \varphi(t) = (x(t), y(t)).$$

We define the *conormal* of Z as the curve parametrized by

$$(1.3) \quad \psi(t) = (x(t), y(t); -y'(t) : x'(t)).$$

The conormal of Z is the germ of a Legendrian curve of $\mathbb{P}^*\mathbb{C}^2$.

We will denote the conormal of Z by $\mathbb{P}_Z^*\mathbb{C}^2$ and the parametrization (1.3) by $\text{Con } \varphi$.

Assume that the tangent cone $C(Z)$ is defined by the equation $ax + by = 0$, with $(a, b) \neq (0, 0)$. Then $\mathbb{P}_Z^*\mathbb{C}^2$ is a germ of a Legendrian curve at $(0, 0; a : b)$.

Let $f \in \mathbb{C}\{t\}$. We say the f has order k and write $\text{ord } f = k$ or $\text{ord}_t f = k$ if f/t^k is a unit of $\mathbb{C}\{t\}$.

Remark 1.1. Let Z be the plane curve parametrized by (1.2). Let $L = \mathbb{P}_Z^*\mathbb{C}^2$. Then:

- (i) $C(Z) = \{y = 0\}$ if and only if $\text{ord } y > \text{ord } x$. If $C(Z) = \{y = 0\}$, L admits the parametrization

$$\psi(t) = (x(t), y(t), y'(t)/x'(t))$$

on the chart (x, y, p) .

- (ii) $C(Z) = \{y = 0\}$ and $C(L) = \{x = y = 0\}$ if and only if $\text{ord } x < \text{ord } y < 2\text{ord } x$.
- (iii) $C(Z) = \{y = 0\}$ and $\{x = y = 0\} \not\subset C(L) \subset \{y = 0\}$ if and only if $\text{ord } y \geq 2\text{ord } x$.
- (iv) $C(L) = \{y = p = 0\}$ if and only if $\text{ord } y > 2\text{ord } x$.
- (v) $\text{mult } L \leq \text{mult } Z$. Moreover, $\text{mult } L = \text{mult } Z$ if and only if $\text{ord } y \geq 2\text{ord } x$.

If L is the germ of a Legendrian curve at $(0, 0; a : b)$, $\pi(L)$ is a germ of a plane curve of $(\mathbb{C}^2, (0, 0))$. Notice that all branches of $\pi(L)$ have the same tangent cone.

If Z is the germ of a plane curve with irreducible tangent cone, the union L of the conormal of the branches of Z is a germ of a Legendrian curve. We call L the *conormal* of Z .

If $C(Z)$ has several components, the union of the conormals of the branches of Z is a union of several germs of Legendrian curves.

If L is a germ of Legendrian curve, L is the conormal of $\pi(L)$.

Consider in the vector space $\mathbb{C}^2$, with coordinates x, p , the symplectic form $dp \wedge dx$. We associate to each symplectic linear automorphism

$$(p, x) \mapsto (\alpha p + \beta x, \gamma p + \delta x)$$

of $\mathbb{C}^2$ the contact transformation

$$(1.4) \quad (x, y, p) = (\gamma p + \delta x, y + \frac{1}{2}\alpha\gamma p^2 + \beta\gamma xp + \frac{1}{2}\beta\delta x^2, \alpha p + \beta x).$$

We call (1.4) a *paraboloidal contact transformation*.

In the case $\alpha = \delta = 0$ and $\gamma = -\beta = 1$ we get the so called *Legendre* transformation

$$\Psi(x, y, p) = (p, y - px, -x).$$

We say that a germ of a Legendrian curve L of $(\mathbb{P}^*\mathbb{C}^2, (0, 0; a : b))$ is in *generic position* if $C(L) \not\supset \pi^{-1}(0, 0)$.

Remark 1.2. Let L be the germ of a Legendrian curve on a contact manifold $(X, \mathcal{L})$ at a point o . By the Darboux's theorem for contact forms there is a germ of a contact transformation $\chi : (X, o) \rightarrow (U, (0, 0, 0))$, where $U = \{\eta \neq 0\}$ is the open subset of $\mathbb{P}^*\mathbb{C}^2$ considered above. Hence $C(\pi(\chi(L))) = \{y = 0\}$. Applying a paraboloidal transformation to $\chi(L)$ we can assume that $\chi(L)$ is in generic position. If $C(L)$ is irreducible, we can assume $C(\chi(L)) = \{y = p = 0\}$.

Following the above remark, from now on we will always assume that every Legendrian curve germ is embedded in $(\mathbb{C}_{(x,y,p)}^3, \omega)$, where $\omega = dy - p dx$.

Example 1.3. (1) The plane curve $Z = \{y^2 - x^3 = 0\}$ admits a parametrization $\varphi(t) = (t^2, t^3)$. The conormal L of Z admits the parametrization $\psi(t) = (t^2, t^3, \frac{3}{2}t)$. Hence $C(L) = \pi^{-1}(0, 0)$ and L is not in generic position. If χ is the Legendre transformation, $C(\chi(L)) = \{y = p = 0\}$ and L is in generic position. Moreover, $\pi(\chi(L))$ is a smooth curve.
(2) The plane curve $Z = \{(y^2 - x^3)(y^2 - x^5) = 0\}$ admits a parametrization given by

$$\varphi_1(t_1) = (t_1^2, t_1^3), \quad \varphi_2(t_2) = (t_2^2, t_2^5).$$

The conormal L of Z admits the parametrization given by

$$\psi_1(t_1) = (t_1^2, t_1^3, \frac{3}{2}t_1), \quad \psi_2(t_2) = (t_2^2, t_2^5, \frac{5}{2}t_2^3).$$

Hence $C(L_1) = \pi^{-1}(0, 0)$ and L is not in generic position. If χ is the paraboloidal contact transformation

$$\chi : (x, y, p) \mapsto (x + p, y + \frac{1}{2}p^2, p),$$

then $\chi(L)$ has branches with parametrization given by

$$\begin{aligned} \chi(\psi_1)(t_1) &= (t_1^2 + \frac{3}{2}t_1, t_1^3 + \frac{9}{8}t_1^2, \frac{3}{2}t_1), \\ \chi(\psi_2)(t_2) &= (t_2^2 + \frac{5}{2}t_2^3, t_2^5 + \frac{25}{8}t_2^6, \frac{5}{2}t_2^3). \end{aligned}$$

Then

$$C(\chi(L_1)) = \{y = p - x = 0\}, \quad C(\chi(L_2)) = \{y = p = 0\}$$

and L is in generic position.

2. RELATIVE CONTACT GEOMETRY

Set $\mathbf{x} = (x_1, \dots, x_n)$ and $\mathbf{z} = (z_1, \dots, z_m)$. Let I be an ideal of the ring $\mathbb{C}\{\mathbf{z}\}$. Let $\tilde{I}$ be the ideal of $\mathbb{C}\{\mathbf{x}, \mathbf{z}\}$ generated by I .

Lemma 2.1. (a) Let $f \in \mathbb{C}\{\mathbf{x}, \mathbf{z}\}$, $f = \sum_{\alpha} a_{\alpha} \mathbf{x}^{\alpha}$ with $a_{\alpha} \in \mathbb{C}\{\mathbf{z}\}$. Then $f \in \tilde{I}$ if and only if $a_{\alpha} \in I$ for each α .
(b) If $f \in \tilde{I}$, then $\partial_{x_i} f \in \tilde{I}$ for $1 \leq i \leq n$.
(c) Let $a_1, \dots, a_{n-1} \in \mathbb{C}\{\mathbf{x}, \mathbf{z}\}$. Let $b, \beta_0 \in \tilde{I}$. Assume that $\partial_{x_n} \beta_0 = 0$. If β is the solution of the Cauchy problem

$$(2.1) \quad \partial_{x_n} \beta - \sum_{i=1}^{n-1} a_i \partial_{x_i} \beta = b, \quad \beta - \beta_0 \in \mathbb{C}\{\mathbf{x}, \mathbf{z}\} x_n,$$

then $\beta \in \tilde{I}$.

Proof. There are $g_1, \dots, g_{\ell} \in \mathbb{C}\{\mathbf{z}\}$ such that $I = (g_1, \dots, g_{\ell})$. If $a_{\alpha} \in I$ for each α , there are $h_{i,\alpha} \in \mathbb{C}\{\mathbf{z}\}$ such that $a_{\alpha} = \sum_{i=1}^{\ell} h_{i,\alpha} g_i$. Hence $f = \sum_{i=1}^{\ell} (\sum_{\alpha} h_{i,\alpha} \mathbf{x}^{\alpha}) g_i \in \tilde{I}$.

If $f \in \tilde{I}$, there are $H_i \in \mathbb{C}\{\mathbf{x}, \mathbf{z}\}$ such that $f = \sum_{i=1}^{\ell} H_i g_i$. There are $b_{i,\alpha} \in \mathbb{C}\{\mathbf{z}\}$ such that $H_i = \sum_{\alpha} b_{i,\alpha} \mathbf{x}^{\alpha}$. Therefore $a_{\alpha} = \sum_{i=1}^{\ell} b_{i,\alpha} g_i \in I$.

We can perform a change of variables that rectifies the vector field $\partial_{x_n} - \sum_{i=1}^{n-1} a_i \partial_{x_i}$, reducing the Cauchy problem (2.1) to the Cauchy problem

$$\partial_{x_n} \beta = b, \quad \beta - \beta_0 \in \mathbb{C}\{\mathbf{x}, \mathbf{z}\} x_n.$$

Hence statements (b) and (c) follow from (a). $\square$

Let J be an ideal of $\mathbb{C}\{\mathbf{z}\}$ contained in I . Let X, S and T be analytic spaces with local rings $\mathbb{C}\{\mathbf{x}\}, \mathbb{C}\{\mathbf{z}\}/I$ and $\mathbb{C}\{\mathbf{z}\}/J$. Hence $X \times S$ and $X \times T$ have local rings $\mathcal{O} := \mathbb{C}\{\mathbf{x}, \mathbf{z}\}/\tilde{I}$ and $\tilde{\mathcal{O}} := \mathbb{C}\{\mathbf{x}, \mathbf{z}\}/\tilde{J}$. Let $\mathbf{a}_1, \dots, \mathbf{a}_{n-1}, \mathbf{b} \in \mathcal{O}$ and $\mathbf{g} \in \mathcal{O}/x_n \mathcal{O}$. Let $a_i, b \in \tilde{\mathcal{O}}$ and $g \in \tilde{\mathcal{O}}/x_n \tilde{\mathcal{O}}$ be representatives of $\mathbf{a}_i, \mathbf{b}$ and $\mathbf{g}$. Consider the Cauchy problems

$$(2.2) \quad \partial_{x_n} f + \sum_{i=1}^{n-1} a_i \partial_{x_i} f = b, \quad f + x_n \tilde{\mathcal{O}} = g$$

and

$$(2.3) \quad \partial_{x_n} \mathbf{f} + \sum_{i=1}^{n-1} \mathbf{a}_i \partial_{x_i} \mathbf{f} = \mathbf{b}, \quad \mathbf{f} + x_n \mathcal{O} = \mathbf{g}.$$

Theorem 2.2. (a) There is one and only one solution of the Cauchy problem (2.2).

(b) If f is a solution of (2.2), $\mathbf{f} = f + \tilde{I}$ is a solution of (2.3).

(c) If $\mathbf{f}$ is a solution of (2.3) there is a representative f of $\mathbf{f}$ that is a solution of (2.2).

Proof. By Lemma 2.1, $\partial_{x_i} \tilde{I} = \tilde{I}$. Hence (b) holds.

Assume $J = (0)$. The existence and uniqueness of the solution of (2.2) is a special case of the classical Cauchy-Kowalevski Theorem. There is one and only one formal solution of (2.2). Its convergence follows from the majorant method.

The existence of a solution of (2.3) follows from (b).

Let $\mathbf{f}_1, \mathbf{f}_2$ be two solutions of (2.3). Let f_j be a representative of $\mathbf{f}_j$ for $j = 1, 2$. Then $\partial_{x_n}(f_2 - f_1) + \sum_{i=1}^{n-1} a_i \partial_{x_i}(f_2 - f_1) \in \tilde{I}$ and $f_2 - f_1 + x_n \tilde{\mathcal{O}} \in \tilde{I} + x_n \tilde{\mathcal{O}}$. By Lemma 2.1, $f_2 - f_1 \in \tilde{I}$. Therefore $\mathbf{f}_1 = \mathbf{f}_2$. This ends the proof of statement (a). Statement (c) follows from statements (a) and (b). $\square$

Set $\Omega_{X|S}^1 = \bigoplus_{i=1}^n \mathcal{O} dx_i$. We call the elements of $\Omega_{X|S}^1$ *germs of relative differential forms* on $X \times S$. The map $d : \mathcal{O} \rightarrow \Omega_{X|S}^1$ given by $df = \sum_{i=1}^n \partial_{x_i} f dx_i$ is called the *relative differential* of f .

Assume that $\dim X = 3$ and let $\mathcal{L}$ be a contact structure on X . Let $\rho : X \times S \rightarrow X$ be the first projection. Let ω be a generator of $\mathcal{L}$. We will denote by $\mathcal{L}_S$ the sub $\mathcal{O}$ -module of $\Omega_{X|S}^1$ generated by $\rho^* \omega$. We call $\mathcal{L}_S$ a *relative contact structure* of $X \times S$. We call $(X \times S, \mathcal{L}_S)$ a *relative contact manifold*. We say that an isomorphism of analytic spaces

$$(2.4) \quad \chi : X \times S \rightarrow X \times S$$

is a *relative contact transformation* if $\chi(\mathbf{0}, s) = (\mathbf{0}, s)$, $\chi^* \omega \in \mathcal{L}_S$ for each $\omega \in \mathcal{L}_S$ and the diagram

$$(2.5) \quad \begin{array}{ccc} X & \xrightarrow{id_X} & X \\ \downarrow & & \downarrow \\ X \times S & \xrightarrow{\chi} & X \times S \\ \downarrow & & \downarrow \\ S & \xrightarrow{id_S} & S \end{array}$$

commutes.

The demand of the commutativity of diagram (2.5) is a very restrictive condition but these are the only relative contact transformations we will need. We can and will assume that the local ring of X equals $\mathbb{C}\{x, y, p\}$ and that $\mathcal{L}$ is generated by $dy - p dx$.

Set $\mathcal{O} = \mathbb{C}\{x, y, p, \mathbf{z}\}/\tilde{I}$ and $\tilde{\mathcal{O}} = \mathbb{C}\{x, y, p, \mathbf{z}\}/\tilde{J}$. Let $\mathfrak{m}_X$ be the maximal ideal of $\mathbb{C}\{x, y, p\}$. Let $\mathfrak{m}[\tilde{\mathfrak{m}}]$ be the maximal ideal of $\mathbb{C}\{\mathbf{z}\}/I[\mathbb{C}\{\mathbf{z}\}/J]$. Let $\mathfrak{n}[\tilde{\mathfrak{n}}]$ be the ideal of $\mathcal{O}[\tilde{\mathcal{O}}]$ generated by $\mathfrak{m}_X \mathfrak{m}[\tilde{\mathfrak{m}}]$.

Remark 2.3. If (2.4) is a relative contact transformation, there are $\alpha, \beta, \gamma \in \mathfrak{n}$ such that $\partial_x \beta \in \mathfrak{n}$ and

$$(2.6) \quad \chi(x, y, p, \mathbf{z}) = (x + \alpha, y + \beta, p + \gamma, \mathbf{z}).$$

Theorem 2.4. (a) Let $\chi : X \times S \rightarrow X \times S$ be a relative contact transformation. There is $\beta_0 \in \mathfrak{n}$ such that $\partial_p \beta_0 = 0$, $\partial_x \beta_0 \in \mathfrak{n}$, β is the solution of the Cauchy problem

$$(2.7) \quad \left(1 + \frac{\partial \alpha}{\partial x} + p \frac{\partial \alpha}{\partial y}\right) \frac{\partial \beta}{\partial p} - p \frac{\partial \alpha}{\partial p} \frac{\partial \beta}{\partial y} - \frac{\partial \alpha}{\partial p} \frac{\partial \beta}{\partial x} = p \frac{\partial \alpha}{\partial p}, \quad \beta - \beta_0 \in p\mathcal{O}$$

and

$$(2.8) \quad \gamma = \left(1 + \frac{\partial \alpha}{\partial x} + p \frac{\partial \alpha}{\partial y}\right)^{-1} \left(\frac{\partial \beta}{\partial x} + p \left(\frac{\partial \beta}{\partial y} - \frac{\partial \alpha}{\partial x} - p \frac{\partial \alpha}{\partial y}\right)\right).$$

- (b) Given $\alpha, \beta_0 \in \mathfrak{n}$ such that $\partial_p \beta_0 = 0$ and $\partial_x \beta_0 \in \mathfrak{n}$, there is a unique contact transformation χ verifying the conditions of statement (a). We will denote χ by χ_{α, β_0} .
- (c) Given a relative contact transformation $\tilde{\chi} : X \times T \rightarrow X \times T$ there is one and only one contact transformation $\chi : X \times S \rightarrow X \times S$ such that the diagram

$$(2.9) \quad \begin{array}{ccc} X \times S & \xrightarrow{\chi} & X \times S \\ \downarrow & & \downarrow \\ X \times T & \xrightarrow{\tilde{\chi}} & X \times T \end{array}$$

commutes.

- (d) Given $\alpha, \beta_0 \in \mathfrak{n}$ and $\tilde{\alpha}, \tilde{\beta}_0 \in \tilde{\mathfrak{n}}$ such that $\partial_p \beta_0 = 0$, $\partial_p \tilde{\beta}_0 = 0$, $\partial_x \beta_0 \in \mathfrak{n}$, $\partial_x \tilde{\beta}_0 \in \tilde{\mathfrak{n}}$ and $\tilde{\alpha}, \tilde{\beta}_0$ are representatives of α, β_0 , set $\chi = \chi_{\alpha, \beta_0}$, $\tilde{\chi} = \chi_{\tilde{\alpha}, \tilde{\beta}_0}$. Then diagram (2.9) commutes.

Proof. Statements (a) and (b) are a relative version of Theorem 3.2 of [1]. In [1] we assume $S = \{0\}$. The proof works as long S is smooth. The proof in the singular case depends on the singular variant of the Cauchy-Kowalevski Theorem introduced in 2.2. Statement (c) follows from statement (b) of Theorem 2.2. Statement (d) follows from statement (c) of Theorem 2.2. $\square$

Remark 2.5. (1) The inclusion $S \hookrightarrow T$ is said to be a *small extension* if the surjective map $\mathcal{O}_T \twoheadrightarrow \mathcal{O}_S$ has one dimensional kernel. If the kernel is generated by ε , we have that, as complex vector spaces, $\mathcal{O}_T = \mathcal{O}_S \oplus \varepsilon\mathbb{C}$. Every extension of Artinian local rings factors through small extensions.

Theorem 2.6. Let $S \hookrightarrow T$ be a small extension such that

$$\begin{aligned} \mathcal{O}_S &\cong \mathbb{C}\{\mathbf{z}\}, \\ \mathcal{O}_T &\cong \mathbb{C}\{\mathbf{z}, \varepsilon\}/(\varepsilon^2, \varepsilon z_1, \dots, \varepsilon z_m) = \mathbb{C}\{\mathbf{z}\} \oplus \mathbb{C}\varepsilon. \end{aligned}$$

Assume $\chi : X \times S \rightarrow X \times S$ is a relative contact transformation given at the ring level by

$$(x, y, p) \mapsto (H_1, H_2, H_3),$$

$\alpha, \beta_0 \in \mathfrak{m}_X$, such that $\partial_p \beta_0 = 0$ and $\beta_0 \in (x^2, y)$. Then, there are uniquely determined $\beta, \gamma \in \mathfrak{m}_X$ such that $\beta - \beta_0 \in p\mathcal{O}_X$ and $\tilde{\chi} : X \times T \rightarrow X \times T$, given by

$$\tilde{\chi}(x, y, p, \mathbf{z}, \varepsilon) = (H_1 + \varepsilon\alpha, H_2 + \varepsilon\beta, H_3 + \varepsilon\gamma, \mathbf{z}, \varepsilon),$$

is a relative contact transformation extending χ (diagram (2.9) commutes). Moreover, the Cauchy problem (2.7) for $\tilde{\chi}$ takes the simplified form

$$(2.10) \quad \frac{\partial \beta}{\partial p} = p \frac{\partial \alpha}{\partial p}, \quad \beta - \beta_0 \in \mathbb{C}\{x, y, p\}p$$

and

$$(2.11) \quad \gamma = \frac{\partial \beta}{\partial x} + p\left(\frac{\partial \beta}{\partial y} - \frac{\partial \alpha}{\partial x}\right) - p^2 \frac{\partial \alpha}{\partial y}.$$

Proof. We have that $\tilde{\chi}$ is a relative contact transformation if and only if there is $f := f' + \varepsilon f'' \in \mathcal{O}_T\{x, y, p\}$ with $f \notin (x, y, p)\mathcal{O}_T\{x, y, p\}$, $f' \in \mathcal{O}_S\{x, y, p\}$, $f'' \in \mathbb{C}\{x, y, p\} = \mathcal{O}_X$ such that

$$(2.12) \quad d(H_2 + \varepsilon\beta) - (H_3 + \varepsilon\gamma)d(H_1 + \varepsilon\alpha) = f(dy - p dx).$$

Since χ is a relative contact transformation we can suppose that

$$dH_2 - H_3 dH_1 = f'(dy - p dx).$$

Using the fact that $\varepsilon \mathfrak{m}_{\mathcal{O}_T}$ we see that (2.12) is equivalent to

$$\begin{cases} \frac{\partial \beta}{\partial p} = p \frac{\partial \alpha}{\partial p}, \\ \gamma = \frac{\partial \beta}{\partial x} + p\left(\frac{\partial \beta}{\partial y} - \frac{\partial \alpha}{\partial x}\right) - p^2 \frac{\partial \alpha}{\partial y}, \\ f'' = \frac{\partial \beta}{\partial y} - p \frac{\partial \alpha}{\partial y}. \end{cases}$$

As $\beta - \beta_0 \in (p)\mathbb{C}\{x, y, p\}$ we have that β , and consequently γ , are completely determined by α and β_0 . $\square$

Remark 2.7. Set $\alpha = \sum_k \alpha_k p^k$, $\beta = \sum_k \beta_k p^k$, $\gamma = \sum_k \gamma_k p^k$, where $\alpha_k, \beta_k, \gamma_k \in \mathbb{C}\{x, y\}$ for each $k \geq 0$ and $\beta_0 \in (x^2, y)$. Under the assumptions of Theorem 2.6,

$$(i) \quad \beta_k = \frac{k-1}{k} \alpha_{k-1}, \quad k \geq 1.$$

(ii) Moreover,

$$\gamma_0 = \frac{\partial \beta_0}{\partial x}, \quad \gamma_1 = \frac{\partial \beta_0}{\partial y} - \frac{\partial \alpha_0}{\partial x}, \quad \gamma_k = -\frac{1}{k} \frac{\partial \alpha_{k-1}}{\partial x} - \frac{1}{k-1} \frac{\partial \alpha_{k-2}}{\partial y}, \quad k \geq 2.$$

Since,

$$\frac{\partial}{\partial y} \gamma_0 = \frac{\partial}{\partial x} \left(\frac{\partial \alpha_0}{\partial x} + \gamma_1 \right),$$

β_0 is the solution of the Cauchy problem

$$\frac{\partial \beta_0}{\partial x} = \gamma_0, \quad \frac{\partial \beta_0}{\partial y} = \frac{\partial \alpha_0}{\partial x} + \gamma_1, \quad \beta_0 \in (x^2, y).$$

3. CATEGORIES OF DEFORMATIONS

A category $\mathfrak{C}$ is called a *groupoid* if all morphisms of $\mathfrak{C}$ are isomorphisms.

Let $p : \mathfrak{F} \rightarrow \mathfrak{C}$ be a functor.

Let S be an object of $\mathfrak{C}$. We will denote by $\mathfrak{F}(S)$ the subcategory of $\mathfrak{F}$ given by the following conditions:

- Ψ is an object of $\mathfrak{F}(S)$ if $p(\Psi) = S$.
- χ is a morphism of $\mathfrak{F}(S)$ if $p(\chi) = id_S$.

Let $\chi[\Psi]$ be a morphism [an object] of $\mathfrak{F}$. Let $f[S]$ be a morphism [an object] of $\mathfrak{C}$. We say that $\chi[\Psi]$ is a morphism [an object] of $\mathfrak{F}$ over $f[S]$ if $p(\chi) = f[p(\Psi) = S]$.

A morphism $\chi' : \Psi' \rightarrow \Psi$ of $\mathfrak{F}$ over $f : S' \rightarrow S$ is called *cartesian* if for each morphism $\chi'' : \Psi'' \rightarrow \Psi$ of $\mathfrak{F}$ over f there is exactly one morphism $\chi : \Psi'' \rightarrow \Psi'$ over $id_{S'}$ such that $\chi' \circ \chi = \chi''$.

If the morphism $\chi' : \Psi' \rightarrow \Psi$ over f is cartesian, Ψ' is well defined up to a unique isomorphism. We will denote Ψ' by $f^*\Psi$ or $\Psi \times_S S'$.

We say that $\mathfrak{F}$ is a *fibred category* over $\mathfrak{C}$ if

- (1) For each morphism $f : S' \rightarrow S$ in $\mathfrak{C}$ and each object Ψ of $\mathfrak{F}$ over S there is a morphism $\chi' : \Psi' \rightarrow \Psi$ over f that is cartesian.
- (2) The composition of cartesian morphisms is cartesian.

A fibred groupoid is a fibred category such that $\mathfrak{F}(S)$ is a groupoid for each $S \in \mathfrak{C}$.

Lemma 3.1. *If $p : \mathfrak{F} \rightarrow \mathfrak{C}$ satisfies (1) and $\mathfrak{F}(S)$ is a groupoid for each object S of $\mathfrak{C}$, then $\mathfrak{F}$ is a fibred groupoid over $\mathfrak{C}$.*

Proof. Let $\chi : \Phi \rightarrow \Psi$ be an arbitrary morphism of $\mathfrak{F}$. It is enough to show that χ is cartesian. Set $f = p(\chi)$. Let $\chi' : \Phi' \rightarrow \Psi$ be another morphism over f . Let $f^*\Psi \rightarrow \Psi$ be a cartesian morphism over f . There are morphisms $\alpha : \Phi' \rightarrow f^*\Psi$, $\beta : \Phi \rightarrow f^*\Psi$ such that the solid diagram

$$(3.1) \quad \begin{array}{ccccc} & & \alpha & & \\ & \swarrow & & \searrow & \\ f^*\Psi & \xleftarrow{\beta} & \Phi & \xleftarrow{\dots\dots\dots} & \Phi' \\ & \searrow & \downarrow \chi & \swarrow \chi' & \\ & & \Psi & & \end{array}$$

commutes. Hence $\beta^{-1} \circ \alpha$ is the only morphism over f such that diagram (3.1) commutes.

□

Let $\mathfrak{A}n$ be the category of analytic complex space germs. Let 0 denote the complex vector space of dimension 0. Let $p : \mathfrak{F} \rightarrow \mathfrak{A}n$ be a fibred category.

Definition 3.2. Let T be an analytic complex space germ. Let $\psi[\Psi]$ be an object of $\mathfrak{F}(0)$ [$\mathfrak{F}(T)$]. We say that Ψ is a *versal deformation* of ψ if given

- a closed embedding $f : T'' \hookrightarrow T'$,

- a morphism of complex analytic space germs $g : T'' \rightarrow T$,
- an object Ψ' of $\mathfrak{F}(T')$ such that $f^*\Psi' \cong g^*\Psi$,

there is a morphism of complex analytic space germs $h : T' \rightarrow T$ such that

$$h \circ f = g \quad \text{and} \quad h^*\Psi \cong \Psi'.$$

If Ψ is versal and for each Ψ' the tangent map $T(h) : T_{T'} \rightarrow T_T$ is determined by Ψ' , Ψ is called a *semiuniversal deformation* of ψ .

Let T be a germ of a complex analytic space. Let A be the local ring of T and let $\mathfrak{m}$ be the maximal ideal of A . Let T_n be the complex analytic space with local ring $A/\mathfrak{m}^n$ for each positive integer n . The canonical morphisms

$$A \rightarrow A/\mathfrak{m}^n \quad \text{and} \quad A/\mathfrak{m}^n \rightarrow A/\mathfrak{m}^{n+1}$$

induce morphisms $\alpha_n : T_n \rightarrow T$ and $\beta_n : T_{n+1} \rightarrow T_n$.

A morphism $f : T'' \rightarrow T'$ induces morphisms $f_n : T''_n \rightarrow T'_n$ such that the diagram

$$\begin{array}{ccc} T'' & \xrightarrow{f} & T' \\ \alpha''_n \uparrow & & \uparrow \alpha'_n \\ T''_n & \xrightarrow{f_n} & T'_n \\ \beta''_n \uparrow & & \uparrow \beta'_n \\ T''_{n+1} & \xrightarrow{f_{n+1}} & T'_{n+1} \end{array}$$

commutes.

Definition 3.3. We will follow the terminology of Definition 3.2. Let $g_n = g \circ \alpha''_n$. We say that Ψ is a *formally versal deformation* of ψ if there are morphisms $h_n : T'_n \rightarrow T$ such that

$$h_n \circ f_n = g_n, \quad h_n \circ \beta'_n = h_{n+1} \quad \text{and} \quad h_n^*\Psi \cong \alpha'_n{}^*\Psi'.$$

If Ψ is formally versal and for each Ψ' the tangent maps $T(h_n) : T_{T'_n} \rightarrow T_T$ are determined by $\alpha'_n{}^*\Psi'$, Ψ is called a *formally semiuniversal deformation* of ψ .

Theorem 3.4 ([4], Theorem 5.2). *Let $\mathfrak{F} \rightarrow \mathfrak{C}$ be a fibered groupoid. Let $\psi \in \mathfrak{F}(0)$. If there is a versal deformation of ψ , every formally versal [semiuniversal] deformation of ψ is versal [semiuniversal].*

Let Z be a curve of $\mathbb{C}^n$ with irreducible components $Z_1, \dots, Z_r$. Set $\bar{\mathbb{C}} = \bigsqcup_{i=1}^r \bar{C}_i$ where each $\bar{C}_i$ is a copy of $\mathbb{C}$. Let φ_i be a parametrization of Z_i , $1 \leq i \leq r$. Let $\varphi : \bar{\mathbb{C}} \rightarrow \mathbb{C}^n$ be the map such that $\varphi|_{\bar{C}_i} = \varphi_i$, $1 \leq i \leq r$. We call φ the *parametrization* of Z .

Let T be an analytic space. A morphism of analytic spaces $\Phi : \bar{\mathbb{C}} \times T \rightarrow \mathbb{C}^n \times T$ is called a *deformation of φ over T* if the diagram

$$\begin{array}{ccc} \bar{\mathbb{C}} & \xrightarrow{\varphi} & \mathbb{C}^n \\ \downarrow & & \downarrow \\ \bar{\mathbb{C}} \times T & \xrightarrow{\Phi} & \mathbb{C}^n \times T \\ \downarrow & & \downarrow \\ T & \xrightarrow{id_T} & T \end{array}$$

commutes. The analytic space T is called the *base space* of the deformation.

We will denote by Φ_i the composition

$$\bar{C}_i \times T \hookrightarrow \bar{\mathbb{C}} \times T \xrightarrow{\Phi} \mathbb{C}^n \times T \rightarrow \mathbb{C}^n, \quad 1 \leq i \leq r.$$

The maps Φ_i , $1 \leq i \leq r$, determine Φ .

Let Φ be a deformation of φ over T . Let $f : T' \rightarrow T$ be a morphism of analytic spaces. We will denote by $f^*\Phi$ the deformation of φ over T' given by

$$(f^*\Phi)_i = \Phi_i \circ (id_{\bar{C}_i} \times f).$$

We call $f^*\Phi$ the *pullback* of Φ by f .

Let $\Phi' : \bar{\mathbb{C}} \times T \rightarrow \mathbb{C}^n \times T$ be another deformation of φ over T . A morphism from Φ' into Φ is a pair (χ, ξ) where $\chi : \mathbb{C}^n \times T \rightarrow \mathbb{C}^n \times T$ and $\xi : \bar{\mathbb{C}} \times T \rightarrow \bar{\mathbb{C}} \times T$ are isomorphisms of analytic spaces such that the diagram

$$\begin{array}{ccccccc} T & \longleftarrow & \bar{\mathbb{C}} \times T & \xrightarrow{\Phi} & \mathbb{C}^n \times T & \longrightarrow & T \\ & \uparrow & \nearrow \xi & \uparrow & \uparrow & \nwarrow \chi & \uparrow \\ & id_T & \bar{\mathbb{C}} & \xrightarrow{\varphi} & \mathbb{C}^n \times \{0\} & & id_T \\ & & \downarrow & & \downarrow & & \\ T & \longleftarrow & \bar{\mathbb{C}} \times T & \xrightarrow{\Phi'} & \mathbb{C}^n \times T & \longrightarrow & T \end{array}$$

commutes.

Let Φ' be a deformation of φ over S and $f : S \rightarrow T$ a morphism of analytic spaces. A *morphism of Φ' into Φ over f* is a morphism from Φ' into $f^*\Phi$. There is a functor p that associates T to a deformation Ψ over T and f to a morphism of deformations over f .

Given $t \in T$ let Z_t be the curve parametrized by the composition

$$\bar{\mathbb{C}} \times \{t\} \hookrightarrow \bar{\mathbb{C}} \times T \xrightarrow{\Phi} \mathbb{C}^n \times T \rightarrow \mathbb{C}^n.$$

We call Z_t the *fiber of the deformation Φ at the point t* .

Let $\varphi : \bar{\mathbb{C}} \rightarrow \mathbb{C}^2$ be the parametrization of a plane curve Z . We will denote by $\mathcal{Def}_\varphi[\mathcal{Def}_\varphi^{em}]$ the category of deformations [equimultiple deformations] Φ of (the parametrization φ of) the plane curve Z .

Consider in $\mathbb{C}^3$ the contact structure given by the differential form $dy - p dx$. Let $\psi : \bar{\mathbb{C}} \rightarrow \mathbb{C}^3$ be the parametrization of a Legendrian curve L . We say that a deformation Ψ of ψ is a *Legendrian deformation of ψ* if all of its fibers are Legendrian. We say that (χ, ξ) is an isomorphism of Legendrian deformations if $\chi : X \times T \rightarrow X \times T$ is a relative contact transformation. We will denote by $\widehat{\mathcal{Def}}_\psi[\widehat{\mathcal{Def}}_\psi^{em}]$ the category of Legendrian [equimultiple Legendrian] deformations of ψ . All deformations are assumed to have trivial sections (see [3]).

Assume that $\psi = \text{Con } \varphi$ parametrizes a germ of a Legendrian curve L , in generic position, in $(\mathbb{C}_{(x,y,p)}^3, \omega)$. If $\Phi \in \mathcal{Def}_\varphi$ is given by

$$(3.2) \quad \Phi_i(t_i, \mathbf{s}) = (X_i(t_i, \mathbf{s}), Y_i(t_i, \mathbf{s})), \quad 1 \leq i \leq r,$$

such that $P_i(t_i, \mathbf{s}) := \partial_t Y_i(t_i, \mathbf{s}) / \partial_t X_i(t_i, \mathbf{s}) \in \mathbb{C}\{t_i, \mathbf{s}\}$ for $1 \leq i \leq r$, then

$$(3.3) \quad \Psi_i(t_i, \mathbf{s}) = (X_i(t_i, \mathbf{s}), Y_i(t_i, \mathbf{s}), P_i(t_i, \mathbf{s})).$$

defines a deformation Ψ of ψ which we call *conormal of Φ* . Notice that in this case all fibers of Φ have the same tangent space $\{y = 0\}$. We will denote Ψ by $\text{Con } \Phi$. If $\Psi \in \widehat{\mathcal{Def}}_\psi$ is given by (3.3), we call *plane projection of Ψ* to the deformation Φ of φ given by (3.2). We will denote Φ by Ψ^π .

Let us consider the full subcategory $\xrightarrow{\text{Con}} \mathcal{Def}_\varphi$ of the deformations $\Phi \in \mathcal{Def}_\varphi^{em}$ such that all fibers of Φ have the same tangent space $\{y = 0\}$.

Remark 3.5. We see immediately that if $\Phi \in \xrightarrow{\text{Con}} \mathcal{Def}_\varphi$ then $\text{Con } \Phi$ exists. However, it should be noted that there are more deformations for which the conormal is defined:

Let Φ be the deformation of $\varphi = (t^3, t^{10})$ given by

$$X(t, s) = st + t^3; \quad Y(t, s) = \frac{5}{12}st^8 + t^{10}.$$

Then $\text{Con } \Phi$ exists, but Φ is not equimultiple.

We define in this way the functors

$$\text{Con} : \xrightarrow{\text{Con}} \mathcal{Def}_\varphi \rightarrow \widehat{\mathcal{Def}}_\psi, \quad \pi : \widehat{\mathcal{Def}}_\psi \rightarrow \mathcal{Def}_\varphi.$$

Notice that the conormal of the plane projection of a Legendrian deformation always exists and we have that $\text{Con}(\Psi^\pi) = \Psi$ for each $\Psi \in \widehat{\mathcal{Def}}_\psi$ and $(\text{Con } \Phi)^\pi = \Phi$ where $\Phi \in \xrightarrow{\text{Con}} \mathcal{Def}_\varphi$.

Let us denote by $\xrightarrow{\text{Con}} \mathcal{Def}_\varphi$ the subcategory of equimultiple deformations Φ of φ such that all fibres of Φ have fixed tangent space $\{y = 0\}$ with conormal in generic position. Then $\xrightarrow{\text{Con}} \mathcal{Def}_\varphi \subset \xrightarrow{\text{Con}} \mathcal{Def}_\varphi$ and if $\Phi \in \xrightarrow{\text{Con}} \mathcal{Def}_\varphi$ is given by 3.2,

then $\Phi \in \overrightarrow{\mathcal{D}ef}_\varphi$ iff

$$(3.4) \quad \text{ord}_{t_i} Y_i \geq 2 \text{ord}_{t_i} X_i, \quad 1 \leq i \leq r.$$

Because we demand that Φ is equimultiple and all branches have tangent space $\{y = 0\}$, 3.4 is equivalent to

$$(3.5) \quad \text{ord}_{t_i} Y_i \geq 2m_i, \quad 1 \leq i \leq r,$$

where m_i is the multiplicity of the component Z_i of Z .

Lemma 3.6. *Under the assumptions above,*

$$\text{Con}(\overrightarrow{\mathcal{D}ef}_\varphi) \subset \widehat{\mathcal{D}ef}_\psi^{em} \quad \text{and} \quad (\widehat{\mathcal{D}ef}_\psi^{em})^\pi \subset \overrightarrow{\mathcal{D}ef}_\varphi.$$

Proof. Let m_i be the multiplicity of the component Z_i of Z . Let $Z_{i,s}[L_{i,s}]$ be the fiber of $\Phi[\Psi]$ (given by 3.2 [3.3]) at s . If $\Phi \in \overrightarrow{\mathcal{D}ef}_\varphi$, $C(L_{i,s}) \not\subset \pi^{-1}(0,0)$ for each s , so $\text{ord}_{t_i} Y_i \geq 2 \text{ord}_{t_i} X_i = 2m_i$. Hence $\text{ord}_{t_i} P_i \geq m_i$ and Ψ is equimultiple.

If $\Psi \in \widehat{\mathcal{D}ef}_\psi^{em}$, $\text{ord}_{t_i} P_i \geq \text{ord}_{t_i} X_i$ and we get that $C(L_{i,s}) \not\subset \pi^{-1}(0,0)$ for each s . Each component $L_{i,s}$ has multiplicity m_i for each s . Hence $\text{mult } Z_{i,s} \geq m_i$ for each s . Since multiplicity is semicontinuous, $\text{mult } Z_{i,s} = m_i$ for each s and Φ is equimultiple. $\square$

Lemma 3.7. *If $\mathfrak{C}$ is one of the categories $\widehat{\mathcal{D}ef}_\psi$, $\widehat{\mathcal{D}ef}_\psi^{em}$, $p : \mathfrak{C} \rightarrow \mathfrak{A}n$ is a fibered groupoid.*

Proof. Let $f : S \rightarrow T$ be a morphism of $\mathfrak{A}n$. Let Ψ be a deformation over T . Then, $(\tilde{\chi}, \tilde{\xi}) : f^*\Psi \rightarrow \Psi$ is cartesian, with

$$\tilde{\xi}(t_i, \mathbf{s}) = (t_i, \mathbf{s}), \quad \tilde{\chi}(x, y, p, \mathbf{s}) = (x, y, p, \mathbf{s}).$$

This is because if $(\chi, \xi) : \Psi' \rightarrow \Psi$ is a morphism over f , then by definition of morphism of deformations over different base spaces, (χ, ξ) is a morphism from Ψ' into $f^*\Psi$ over id_S . $\square$

4. EQUIMULTIPLE VERSAL DEFORMATIONS

For Sophus Lie a contact transformation was a transformation that takes curves into curves, instead of points into points. We can recover the initial point of view. Given a plane curve Z at the origin, with tangent cone $\{y = 0\}$, and a contact transformation χ from a neighbourhood of $(0; dy)$ into itself, χ acts on Z in the following way: $\chi \cdot Z$ is the plane projection of the image by χ of the conormal of Z . We can define in a similar way the action of a relative contact transformation on a deformation of a plane curve Z , obtaining another deformation of Z .

We say that $\Phi \in \overrightarrow{\mathcal{D}ef}_\varphi(T)$ is *trivial* (relative to the action of the group of relative contact transformations over T) if there is χ such that $\chi \cdot \Phi := \pi \circ \chi \circ \text{Con } \Phi$ is the constant deformation of ϕ over T , given by

$$(t_i, \mathbf{s}) \mapsto \varphi_i(t_i), \quad i = 1, \dots, r.$$

Let Z be the germ of a plane curve parametrized by $\varphi : \bar{\mathbb{C}} \rightarrow \mathbb{C}^2$. In the following we will identify each ideal of $\mathcal{O}_Z$ with its image by $\varphi^* : \mathcal{O}_Z \rightarrow \mathcal{O}_{\bar{\mathbb{C}}}$. Hence

$$\mathcal{O}_Z = \mathbb{C} \left\{ \begin{bmatrix} x_1 \\ \vdots \\ x_r \end{bmatrix}, \begin{bmatrix} y_1 \\ \vdots \\ y_r \end{bmatrix} \right\} \subset \bigoplus_{i=1}^r \mathbb{C}\{t_i\} = \mathcal{O}_{\bar{\mathbb{C}}}.$$

Set $\dot{\mathbf{x}} = [\dot{x}_1, \dots, \dot{x}_r]^t$, where $\dot{x}_i$ is the derivative of x_i in order to t_i , $1 \leq i \leq r$. Let

$$\dot{\varphi} := \dot{\mathbf{x}} \frac{\partial}{\partial x} + \dot{\mathbf{y}} \frac{\partial}{\partial y}$$

be an element of the free $\mathcal{O}_{\bar{\mathbb{C}}}$ -module

$$(4.1) \quad \mathcal{O}_{\bar{\mathbb{C}}} \frac{\partial}{\partial x} \oplus \mathcal{O}_{\bar{\mathbb{C}}} \frac{\partial}{\partial y}.$$

Notice that (4.1) has a structure of $\mathcal{O}_Z$ -module induced by φ^* .

Let m_i be the multiplicity of Z_i , $1 \leq i \leq r$. Consider the $\mathcal{O}_{\bar{\mathbb{C}}}$ -module

$$(4.2) \quad \left(\bigoplus_{i=1}^r t_i^{m_i} \mathbb{C}\{t_i\} \frac{\partial}{\partial x} \right) \oplus \left(\bigoplus_{i=1}^r t_i^{2m_i} \mathbb{C}\{t_i\} \frac{\partial}{\partial y} \right).$$

Let $\mathfrak{m}_{\bar{\mathbb{C}}} \dot{\varphi}$ be the sub $\mathcal{O}_{\bar{\mathbb{C}}}$ -module of (4.2) generated by

$$(a_1, \dots, a_r) \left(\dot{\mathbf{x}} \frac{\partial}{\partial x} + \dot{\mathbf{y}} \frac{\partial}{\partial y} \right),$$

where $a_i \in t_i \mathbb{C}\{t_i\}$, $1 \leq i \leq r$. For $i = 1, \dots, r$ set $p_i = \dot{y}_i / \dot{x}_i$. For each $k \geq 0$ set

$$\mathbf{p}^k = [p_1^k, \dots, p_r^k]^t.$$

Let $\widehat{I}$ be the sub $\mathcal{O}_Z$ -module of (4.2) generated by

$$\mathbf{p}^k \frac{\partial}{\partial x} + \frac{k}{k+1} \mathbf{p}^{k+1} \frac{\partial}{\partial y}, \quad k \geq 1.$$

Set

$$\widehat{M}_{\varphi} = \frac{\left(\bigoplus_{i=1}^r t_i^{m_i} \mathbb{C}\{t_i\} \frac{\partial}{\partial x} \right) \oplus \left(\bigoplus_{i=1}^r t_i^{2m_i} \mathbb{C}\{t_i\} \frac{\partial}{\partial y} \right)}{\mathfrak{m}_{\bar{\mathbb{C}}} \dot{\varphi} + (x, y) \frac{\partial}{\partial x} \oplus (x^2, y) \frac{\partial}{\partial y} + \widehat{I}}.$$

Given a category $\mathfrak{C}$ we will denote by $\underline{\mathfrak{C}}$ the set of isomorphism classes of elements of $\mathfrak{C}$.

Theorem 4.1. *Let ψ be the parametrization of a germ of a Legendrian curve L of a contact manifold X . Let $\chi : X \rightarrow \mathbb{C}^3$ be a contact transformation such that $\chi(L)$ is in generic position. Let φ be the plane projection of $\chi \circ \psi$. Then there is a canonical isomorphism*

$$\widehat{\mathcal{D}ef}_{\psi}^{em}(T_{\varepsilon}) \xrightarrow{\sim} \widehat{M}_{\varphi}.$$

Proof. Let $\Psi \in \widehat{\mathcal{Def}}_\psi^{em}(T_\varepsilon)$. By Lemma 3.6, Ψ is the conormal of its projection $\Phi \in \overrightarrow{\mathcal{Def}}_\varphi(T_\varepsilon)$. Moreover, Ψ is given by

$$\Psi_i(t_i, \varepsilon) = (x_i + \varepsilon a_i, y_i + \varepsilon b_i, p_i + \varepsilon c_i),$$

where $a_i, b_i, c_i \in \mathbb{C}\{t_i\}$, $\text{ord } a_i \geq m_i$, $\text{ord } b_i \geq 2m_i$, $i = 1, \dots, r$. The deformation Ψ is trivial if and only if Φ is trivial for the action of the relative contact transformations. Φ is trivial if and only if there are

$$\begin{aligned} \xi_i(t_i) &= \tilde{t}_i = t_i + \varepsilon h_i, \\ \chi(x, y, p, \varepsilon) &= (x + \varepsilon \alpha, y + \varepsilon \beta, p + \varepsilon \gamma, \varepsilon), \end{aligned}$$

such that χ is a relative contact transformation, ξ_i is an isomorphism, $\alpha, \beta, \gamma \in (x, y, p)\mathbb{C}\{x, y, p\}$, $h_i \in t_i\mathbb{C}\{t_i\}$, $1 \leq i \leq r$, and

$$\begin{aligned} x_i(t_i) + \varepsilon a_i(t_i) &= x_i(\tilde{t}_i) + \varepsilon \alpha(x_i(\tilde{t}_i), y_i(\tilde{t}_i), p_i(\tilde{t}_i)), \\ y_i(t_i) + \varepsilon b_i(t_i) &= y_i(\tilde{t}_i) + \varepsilon \beta(x_i(\tilde{t}_i), y_i(\tilde{t}_i), p_i(\tilde{t}_i)), \end{aligned}$$

for $i = 1, \dots, r$. By Taylor's formula $x_i(\tilde{t}_i) = x_i(t_i) + \varepsilon \dot{x}_i(t_i) h_i(t_i)$, $y_i(\tilde{t}_i) = y_i(t_i) + \varepsilon \dot{y}_i(t_i) h_i(t_i)$ and

$$\begin{aligned} \varepsilon \alpha(x_i(\tilde{t}_i), y_i(\tilde{t}_i), p_i(\tilde{t}_i)) &= \varepsilon \alpha(x_i(t_i), y_i(t_i), p_i(t_i)), \\ \varepsilon \beta(x_i(\tilde{t}_i), y_i(\tilde{t}_i), p_i(\tilde{t}_i)) &= \varepsilon \beta(x_i(t_i), y_i(t_i), p_i(t_i)), \end{aligned}$$

for $i = 1, \dots, r$. Hence Φ is trivialized by χ if and only if

$$(4.3) \quad a_i(t_i) = \dot{x}_i(t_i) h_i(t_i) + \alpha(x_i(t_i), y_i(t_i), p_i(t_i)),$$

$$(4.4) \quad b_i(t_i) = \dot{y}_i(t_i) h_i(t_i) + \beta(x_i(t_i), y_i(t_i), p_i(t_i)),$$

for $i = 1, \dots, r$. By Remark 2.7 (i), (4.3) and (4.4) are equivalent to the condition

$$\mathbf{a} \frac{\partial}{\partial x} + \mathbf{b} \frac{\partial}{\partial y} \in \mathfrak{m}_{\mathbb{C}} \dot{\varphi} + (x, y) \frac{\partial}{\partial x} \oplus (x^2, y) \frac{\partial}{\partial y} + \widehat{I}.$$

□

Set

$$\begin{aligned} M_\varphi &= \frac{(\oplus_{i=1}^r t_i^{m_i} \mathbb{C}\{t_i\} \frac{\partial}{\partial x}) \oplus (\oplus_{i=1}^r t_i^{m_i} \mathbb{C}\{t_i\} \frac{\partial}{\partial y})}{\mathfrak{m}_{\mathbb{C}} \dot{\varphi} + (x, y) \frac{\partial}{\partial x} \oplus (x, y) \frac{\partial}{\partial y}}, \\ \overrightarrow{M}_\varphi &= \frac{(\oplus_{i=1}^r t_i^{m_i} \mathbb{C}\{t_i\} \frac{\partial}{\partial x}) \oplus (\oplus_{i=1}^r t_i^{2m_i} \mathbb{C}\{t_i\} \frac{\partial}{\partial y})}{\mathfrak{m}_{\mathbb{C}} \dot{\varphi} + (x, y) \frac{\partial}{\partial x} \oplus (x^2, y) \frac{\partial}{\partial y}}. \end{aligned}$$

By Proposition 2.27 of [3],

$$\underline{\mathcal{Def}}_\varphi^{em}(T_\varepsilon) \cong M_\varphi.$$

A similar argument shows that

$$\overrightarrow{\mathcal{Def}}_\varphi(T_\varepsilon) \cong \overrightarrow{M}_\varphi.$$

We have linear maps

$$(4.5) \quad M_\varphi \xrightarrow{\iota} \overrightarrow{M}_\varphi \twoheadrightarrow \widehat{M}_\varphi.$$

Theorem 4.2 ([3], II Theorem 2.38 (3)). *Set $k = \dim M_\varphi$. Let $\mathbf{a}^j, \mathbf{b}^j \in \bigoplus_{i=1}^r t_i^{m_i} \mathbb{C}\{t_i\}$, $1 \leq j \leq k$. If*

$$(4.6) \quad \mathbf{a}^j \frac{\partial}{\partial x} + \mathbf{b}^j \frac{\partial}{\partial y} = \begin{bmatrix} a_1^j \\ \vdots \\ a_r^j \end{bmatrix} \frac{\partial}{\partial x} + \begin{bmatrix} b_1^j \\ \vdots \\ b_r^j \end{bmatrix} \frac{\partial}{\partial y},$$

$1 \leq j \leq k$, represents a basis of M_φ , the deformation $\Phi : \bar{\mathbb{C}} \times \mathbb{C}^k \rightarrow \mathbb{C}^2 \times \mathbb{C}^k$ given by

$$(4.7) \quad X_i(t_i, \mathbf{s}) = x_i(t_i) + \sum_{j=1}^k a_i^j(t_i) s_j, \quad Y_i(t_i, \mathbf{s}) = y_i(t_i) + \sum_{j=1}^k b_i^j(t_i) s_j,$$

$i = 1, \dots, r$, is a semiuniversal deformation of φ in $\mathcal{D}ef_\varphi^{em}$.

Lemma 4.3. *Set $\overrightarrow{k} = \dim \overrightarrow{M}_\varphi$. Let $\mathbf{a}^j \in \bigoplus_{i=1}^r t_i^{m_i} \mathbb{C}\{t_i\}$, $\mathbf{b}^j \in \bigoplus_{i=1}^r t_i^{2m_i} \mathbb{C}\{t_i\}$, $1 \leq j \leq \overrightarrow{k}$. If (4.6) represents a basis of $\overrightarrow{M}_\varphi$, the deformation $\overrightarrow{\Phi}$ given by (4.7), $1 \leq i \leq r$, is a semiuniversal deformation of φ in $\overrightarrow{\mathcal{D}ef}_\varphi$. Moreover, $\text{Con } \overrightarrow{\Phi}$ is a versal deformation of ψ in $\widehat{\mathcal{D}ef}_\psi^{em}$.*

Proof. We will only show the completeness of $\overrightarrow{\Phi}$ and $\text{Con } \overrightarrow{\Phi}$. Since the linear inclusion map ι referred in (4.5) is injective, the deformation $\overrightarrow{\Phi}$ is the restriction to $\overrightarrow{M}_\varphi$ of the deformation Φ introduced in Theorem 4.2. Let $\Phi_0 \in \overrightarrow{\mathcal{D}ef}_\varphi(T)$. Since $\Phi_0 \in \mathcal{D}ef_\varphi^{em}(T)$, there is a morphism of analytic spaces $f : T \rightarrow M_\varphi$ such that $\Phi_0 \cong f^* \Phi$. Since $\Phi_0 \in \overrightarrow{\mathcal{D}ef}_\varphi(T)$, $f(T) \subset \overrightarrow{M}_\varphi$. Hence $f^* \overrightarrow{\Phi} = f^* \Phi$.

If $\Psi \in \widehat{\mathcal{D}ef}_\psi^{em}(T)$, $\Psi^\pi \in \overrightarrow{\mathcal{D}ef}_\varphi(T)$. Hence there is $f : T \rightarrow \overrightarrow{M}_\varphi$ such that $\Psi^\pi \cong f^* \overrightarrow{\Phi}$. Therefore $\Psi = \text{Con } \Psi^\pi \cong \text{Con } f^* \overrightarrow{\Phi} = f^* \text{Con } \overrightarrow{\Phi}$. $\square$

Theorem 4.4. *Let $\mathbf{a}^j \in \bigoplus_{i=1}^r t_i^{m_i} \mathbb{C}\{t_i\}$, $\mathbf{b}^j \in \bigoplus_{i=1}^r t_i^{2m_i} \mathbb{C}\{t_i\}$, $1 \leq j \leq \ell$. Assume that (4.6) represents a basis [a system of generators] of $\widehat{M}_\varphi$. Let Φ be the deformation given by (4.7), $1 \leq i \leq r$. Then $\text{Con } \Phi$ is a semiuniversal [versal] deformation of ψ in $\widehat{\mathcal{D}ef}_\psi^{em}$.*

Proof. By Theorem 3.4 and Lemma 4.3 it is enough to show that $\text{Con } \Phi$ is formally semiuniversal [versal].

Let $\iota : T' \hookrightarrow T$ be a small extension. Let $\Psi \in \widehat{\mathcal{D}ef}_\psi^{em}(T)$. Set $\Psi' = \iota^* \Psi$. Let $\eta' : T' \rightarrow \mathbb{C}^\ell$ be a morphism of complex analytic spaces. Assume that

(χ', ξ') define an isomorphism

$$\eta'^* \text{Con } \Phi \cong \Psi'.$$

We need to find $\eta : T \rightarrow \mathbb{C}^\ell$ and χ, ξ such that $\eta' = \eta \circ \iota$ and χ, ξ define an isomorphism

$$\eta^* \text{Con } \Phi \cong \Psi$$

that extends (χ', ξ') . Let $A[A']$ be the local ring of $T[T']$. Let δ be the generator of $\text{Ker}(A \twoheadrightarrow A')$. We can assume $A' \cong \mathbb{C}\{\mathbf{z}\}/I$, where $\mathbf{z} = (z_1, \dots, z_m)$. Set

$$\tilde{A}' = \mathbb{C}\{\mathbf{z}\} \quad \text{and} \quad \tilde{A} = \mathbb{C}\{\mathbf{z}, \varepsilon\}/(\varepsilon^2, \varepsilon z_1, \dots, \varepsilon z_m).$$

Let $\mathfrak{m}_A$ be the maximal ideal of A . Since $\mathfrak{m}_A \delta = 0$ and $\delta \in \mathfrak{m}_A$, there is a morphism of local analytic algebras from $\tilde{A}$ onto A that takes ε into δ such that the diagram

$$(4.8) \quad \begin{array}{ccc} \tilde{A} & \longrightarrow & \tilde{A}' \\ \downarrow & & \downarrow \\ A & \longrightarrow & A' \end{array}$$

commutes. Assume $\tilde{T}[\tilde{T}']$ has local ring $\tilde{A}[\tilde{A}']$. We also denote by ι the morphism $\tilde{T}' \hookrightarrow \tilde{T}$. We denote by κ the morphisms $T \hookrightarrow \tilde{T}$ and $T' \hookrightarrow \tilde{T}'$. Let $\tilde{\Psi} \in \widehat{\mathcal{D}ef}_\psi^{em}(\tilde{T})$ be a lifting of Ψ .

We fix a linear map $\sigma : A' \hookrightarrow \tilde{A}'$ such that $\kappa^* \sigma = id_{A'}$. Set $\tilde{\chi}' = \chi_{\sigma(\alpha), \sigma(\beta_0)}$, where $\chi' = \chi_{\alpha, \beta_0}$. Define $\tilde{\eta}'$ by $\tilde{\eta}'^* s_i = \sigma(\eta'^* s_i)$, $i = 1, \dots, l$. Let $\tilde{\xi}'$ be the lifting of ξ' determined by σ . Then

$$\tilde{\Psi}' := \tilde{\chi}'^{-1} \circ \tilde{\eta}'^* \text{Con } \Phi \circ \tilde{\xi}'^{-1}$$

is a lifting of Ψ' and

$$(4.9) \quad \tilde{\chi}' \circ \tilde{\Psi}' \circ \tilde{\xi}' = \tilde{\eta}'^* \text{Con } \Phi.$$

By Theorem 2.4 it is enough to find liftings $\tilde{\chi}, \tilde{\xi}, \tilde{\eta}$ of $\tilde{\chi}', \tilde{\xi}', \tilde{\eta}'$ such that

$$\tilde{\chi} \cdot \tilde{\Psi}^\pi \circ \tilde{\xi} = \tilde{\eta}^* \Phi$$

in order to prove the theorem.

Consider the following commutative diagram

$$\begin{array}{ccccc}
\bar{\mathbb{C}} \times \tilde{T}' & \hookrightarrow & \bar{\mathbb{C}} \times \tilde{T} & \cdots \rightarrow & \bar{\mathbb{C}} \times \mathbb{C}^\ell \\
\downarrow \tilde{\Psi}' & & \downarrow \tilde{\Psi} & & \downarrow \text{Con } \Phi \\
\mathbb{C}^3 \times \tilde{T}' & \hookrightarrow & \mathbb{C}^3 \times \tilde{T} & \cdots \rightarrow & \mathbb{C}^3 \times \mathbb{C}^\ell \\
\downarrow pr & & \downarrow pr & & \downarrow \\
\tilde{T}' & \hookrightarrow & \tilde{T} & \xrightarrow{\tilde{\eta}} & \mathbb{C}^\ell. \\
& \searrow \tilde{\eta}' & & &
\end{array}$$

If $\text{Con } \Phi$ is given by

$$X_i(t_i, \mathbf{s}), Y_i(t_i, \mathbf{s}), P_i(t_i, \mathbf{s}) \in \mathbb{C}\{\mathbf{s}, t_i\},$$

then $\tilde{\eta}'^* \text{Con } \Phi$ is given by

$$X_i(t_i, \tilde{\eta}'(\mathbf{z})), Y_i(t_i, \tilde{\eta}'(\mathbf{z})), P_i(t_i, \tilde{\eta}'(\mathbf{z})) \in \tilde{A}'\{t_i\} = \mathbb{C}\{\mathbf{z}, t_i\}$$

for $i = 1, \dots, r$. Suppose that $\tilde{\Psi}'$ is given by

$$U'_i(t_i, \mathbf{z}), V'_i(t_i, \mathbf{z}), W'_i(t_i, \mathbf{z}) \in \mathbb{C}\{\mathbf{z}, t_i\}.$$

Then, $\tilde{\Psi}$ must be given by

$$U_i = U'_i + \varepsilon u_i, V_i = V'_i + \varepsilon v_i, W_i = W'_i + \varepsilon w_i \in \tilde{A}\{t_i\} = \mathbb{C}\{\mathbf{z}, t_i\} \oplus \varepsilon \mathbb{C}\{t_i\}$$

with $u_i, v_i, w_i \in \mathbb{C}\{t_i\}$ and $i = 1, \dots, r$. By definition of deformation we have that, for each i ,

$$(U_i, V_i, W_i) = (x_i(t_i), y_i(t_i), p_i(t_i)) \bmod \mathfrak{m}_{\tilde{A}}.$$

Suppose $\tilde{\eta}' : \tilde{T}' \rightarrow \mathbb{C}^\ell$ is given by $(\tilde{\eta}'_1, \dots, \tilde{\eta}'_\ell)$, with $\tilde{\eta}'_i \in \mathbb{C}\{\mathbf{z}\}$. Then $\tilde{\eta}$ must be given by $\tilde{\eta} = \tilde{\eta}' + \varepsilon \tilde{\eta}^0$ for some $\tilde{\eta}^0 = (\tilde{\eta}^0_1, \dots, \tilde{\eta}^0_\ell) \in \mathbb{C}^\ell$. Suppose that $\tilde{\chi}' : \mathbb{C}^3 \times \tilde{T}' \rightarrow \mathbb{C}^3 \times \tilde{T}'$ is given at the ring level by

$$(x, y, p) \mapsto (H'_1, H'_2, H'_3),$$

such that $H' = id \bmod \mathfrak{m}_{\tilde{A}'}$ with $H'_i \in (x, y, p)A'\{x, y, p\}$. Let the automorphism $\tilde{\xi}' : \bar{\mathbb{C}} \times \tilde{T}' \rightarrow \bar{\mathbb{C}} \times \tilde{T}'$ be given at the ring level by

$$t_i \mapsto h'_i$$

such that $h' = id \bmod \mathfrak{m}_{\tilde{A}'}$ with $h'_i \in (t_i)\mathbb{C}\{\mathbf{z}, t_i\}$.

Then, from 4.9 follows that

$$\begin{aligned}
(4.10) \quad X_i(t_i, \tilde{\eta}') &= H'_1(U'_i(h'_i), V'_i(h'_i), W'_i(h'_i)), \\
Y_i(t_i, \tilde{\eta}') &= H'_2(U'_i(h'_i), V'_i(h'_i), W'_i(h'_i)), \\
P_i(t_i, \tilde{\eta}') &= H'_3(U'_i(h'_i), V'_i(h'_i), W'_i(h'_i)).
\end{aligned}$$

Now, $\tilde{\eta}'$ must be extended to $\tilde{\eta}$ such that the first two previous equations extend as well. That is, we must have

$$(4.11) \quad \begin{aligned} X_i(t_i, \tilde{\eta}) &= (H'_1 + \varepsilon\alpha)(U_i(h'_i + \varepsilon h_i^0), V_i(h'_i + \varepsilon h_i^0), W_i(h'_i + \varepsilon h_i^0)), \\ Y_i(t_i, \tilde{\eta}) &= (H'_2 + \varepsilon\beta)(U_i(h'_i + \varepsilon h_i^0), V_i(h'_i + \varepsilon h_i^0), W_i(h'_i + \varepsilon h_i^0)). \end{aligned}$$

with $\alpha, \beta \in (x, y, p)\mathbb{C}\{x, y, p\}$, $h_i^0 \in (t_i)\mathbb{C}\{t_i\}$ such that

$$(x, y, p) \mapsto (H'_1 + \varepsilon\alpha, H'_2 + \varepsilon\beta, H'_3 + \varepsilon\gamma)$$

gives a relative contact transformation over $\tilde{T}$ for some $\gamma \in (x, y, p)\mathbb{C}\{x, y, p\}$. The existence of this extended relative contact transformation is guaranteed by Theorem 2.6. Moreover, again by Theorem 2.6 this extension depends only on the choices of α and β_0 . So, we need only to find α , β_0 , $\tilde{\eta}^0$ and h_i^0 such that (4.11) holds. Using Taylor's formula and $\varepsilon^2 = 0$ we see that

$$(4.12) \quad \begin{aligned} X_i(t_i, \tilde{\eta}' + \varepsilon\tilde{\eta}^0) &= X_i(t_i, \tilde{\eta}') + \varepsilon \sum_{j=1}^{\ell} \frac{\partial X_i}{\partial s_j}(t_i, \tilde{\eta}') \tilde{\eta}_j^0 \\ (\varepsilon \mathbf{m}_{\tilde{A}} = 0) &= X_i(t_i, \tilde{\eta}') + \varepsilon \sum_{j=1}^{\ell} \frac{\partial X_i}{\partial s_j}(t_i, 0) \tilde{\eta}_j^0, \\ Y_i(t_i, \tilde{\eta}' + \varepsilon\tilde{\eta}^0) &= Y_i(t_i, \tilde{\eta}') + \varepsilon \sum_{j=1}^{\ell} \frac{\partial Y_i}{\partial s_j}(t_i, 0) \tilde{\eta}_j^0. \end{aligned}$$

Again by Taylor's formula and noticing that $\varepsilon \mathbf{m}_{\tilde{A}} = 0$, $\varepsilon \mathbf{m}_{\tilde{A}'} = 0$ in $\tilde{A}$, $h' = id \bmod \mathbf{m}_{\tilde{A}'}$ and $(U_i, V_i) = (x_i(t_i), y_i(t_i)) \bmod \mathbf{m}_{\tilde{A}}$ we see that

$$(4.13) \quad \begin{aligned} U_i(h'_i + \varepsilon h_i^0) &= U_i(h'_i) + \varepsilon \dot{U}_i(h'_i) h_i^0 \\ &= U'_i(h'_i) + \varepsilon(\dot{x}_i h_i^0 + u_i), \\ V_i(h'_i + \varepsilon h_i^0) &= V'_i(h'_i) + \varepsilon(\dot{y}_i h_i^0 + v_i). \end{aligned}$$

Now, $H' = id \bmod \mathbf{m}_{\tilde{A}'}$, so

$$\frac{\partial H'_1}{\partial x} = 1 \bmod \mathbf{m}_{\tilde{A}'}, \quad \frac{\partial H'_1}{\partial y}, \frac{\partial H'_1}{\partial p} \in \mathbf{m}_{\tilde{A}'} \tilde{A}'\{x, y, p\}.$$

In particular,

$$\varepsilon \frac{\partial H'_1}{\partial y} = \varepsilon \frac{\partial H'_1}{\partial p} = 0.$$

By this and arguing as in (4.12) and (4.13) we see that

$$\begin{aligned} &(H'_1 + \varepsilon\alpha)(U'_i(h'_i) + \varepsilon(\dot{x}_i h_i^0 + u_i), V'_i(h'_i) + \varepsilon(\dot{y}_i h_i^0 + v_i), W'_i(h'_i) + \varepsilon(\dot{p}_i h_i^0 + w_i)) \\ &= H'_1(U'_i(h'_i), V'_i(h'_i), W'_i(h'_i)) + \varepsilon(\alpha(U'_i(h'_i), V'_i(h'_i), W'_i(h'_i)) + 1(\dot{x}_i h_i^0 + u_i)) \\ &= H'_1(U'_i(h'_i), V'_i(h'_i), W'_i(h'_i)) + \varepsilon(\alpha(x_i, y_i, p_i) + \dot{x}_i h_i^0 + u_i), \\ &(H'_2 + \varepsilon\beta)(U'_i(h'_i) + \varepsilon(\dot{x}_i h_i^0 + u_i), V'_i(h'_i) + \varepsilon(\dot{y}_i h_i^0 + v_i), W'_i(h'_i) + \varepsilon(\dot{p}_i h_i^0 + w_i)) \\ &= H'_2(U'_i(h'_i), V'_i(h'_i), W'_i(h'_i)) + \varepsilon(\beta(x_i, y_i, p_i) + \dot{y}_i h_i^0 + v_i) \end{aligned}$$

Substituting this in (4.11) and using (4.10) and (4.12) we see that we have to find $\tilde{\eta}^0 = (\tilde{\eta}_1^0, \dots, \tilde{\eta}_\ell^0) \in \mathbb{C}^\ell$, h_i^0 such that

$$(4.14) \quad (u_i(t_i), v_i(t_i)) = \sum_{j=1}^{\ell} \tilde{\eta}_j^0 \left(\frac{\partial X_i}{\partial s_j}(t_i, 0), \frac{\partial Y_i}{\partial s_j}(t_i, 0) \right) - h_i^0(t_i)((\dot{x}_i(t_i), \dot{y}_i(t_i)) - (\alpha(x_i(t_i), y_i(t_i), p_i(t_i)), \beta(x_i(t_i), y_i(t_i), p_i(t_i)))).$$

Note that, because of Remark 2.7 (i), $(\alpha(x_i(t_i), y_i(t_i), p_i(t_i)), \beta(x_i(t_i), y_i(t_i), p_i(t_i))) \in \widehat{I}$ for each i . Also note that $\tilde{\Psi} \in \widehat{\mathcal{Def}}_\psi^{em}(\tilde{T})$ means that $u_i \in t_i^{m_i} \mathbb{C}\{t_i\}$, $v_i \in t_i^{2m_i} \mathbb{C}\{t_i\}$. Then, if the vectors

$$\begin{aligned} & \left(\frac{\partial X_1}{\partial s_j}(t_1, 0), \dots, \frac{\partial X_r}{\partial s_j}(t_r, 0) \right) \frac{\partial}{\partial x} + \left(\frac{\partial Y_1}{\partial s_j}(t_1, 0), \dots, \frac{\partial Y_r}{\partial s_j}(t_r, 0) \right) \frac{\partial}{\partial y} \\ &= (a_1^j(t_1), \dots, a_r^j(t_r)) \frac{\partial}{\partial x} + (b_1^j(t_1), \dots, b_r^j(t_r)) \frac{\partial}{\partial y}, \quad j = 1, \dots, \ell \end{aligned}$$

form a basis of [generate] $\widehat{M}_\varphi$, we can solve (4.14) with unique $\tilde{\eta}_1^0, \dots, \tilde{\eta}_\ell^0$ [respectively, solve] for all $i = 1, \dots, r$. This implies that the conormal of Φ is a formally semiuniversal [respectively, versal] equimultiple deformation of ψ over $\mathbb{C}^\ell$. $\square$

5. VERSAL DEFORMATIONS

Let $f \in \mathbb{C}\{x_1, \dots, x_n\}$. We will denote by $\int f dx_i$ the solution of the Cauchy problem

$$\frac{\partial g}{\partial x_i} = f, \quad g \in (x_i).$$

Let ψ be a Legendrian curve with parametrization given by

$$(5.1) \quad t_i \mapsto (x_i(t_i), y_i(t_i), p_i(t_i)) \quad i = 1, \dots, r.$$

We will call *fake plane projection* of (5.1) to the plane curve σ with parametrization given by

$$(5.2) \quad t_i \mapsto (x_i(t_i), p_i(t_i)) \quad i = 1, \dots, r.$$

We will denote σ by ψ^{π_f} .

Given a plane curve σ with parametrization (5.2), we will call *fake conormal* of σ to the Legendrian curve ψ with parametrization (5.1), where

$$y_i(t_i) = \int p_i(t_i) \dot{x}_i(t_i) dt_i.$$

We will denote ψ by $\mathcal{Con}_f \sigma$. Applying the construction above to each fibre of a deformation we obtain functors

$$\pi_f : \widehat{\mathcal{Def}}_\psi \rightarrow \mathcal{Def}_\sigma, \quad \mathcal{Con}_f : \mathcal{Def}_\sigma \rightarrow \widehat{\mathcal{Def}}_\psi.$$

Notice that

$$(5.3) \quad \mathcal{Con}_f(\Psi^{\pi_f}) = \Psi, \quad (\mathcal{Con}_f(\Sigma))^{\pi_f} = \Sigma$$

for each $\Psi \in \widehat{\mathcal{Def}}_\psi$ and each $\Sigma \in \mathcal{Def}_\sigma$.

Let ψ be the parametrization of a Legendrian curve given by (5.1). Let σ be the fake plane projection of ψ . Set $\dot{\sigma} := \dot{\mathbf{x}} \frac{\partial}{\partial x} + \dot{\mathbf{p}} \frac{\partial}{\partial p}$. Let I^f be the linear subspace of

$$\mathfrak{m}_{\mathbb{C}} \frac{\partial}{\partial x} \oplus \mathfrak{m}_{\mathbb{C}} \frac{\partial}{\partial p} = \left(\bigoplus_{i=1}^r t_i \mathbb{C} \{t_i\} \frac{\partial}{\partial x} \right) \oplus \left(\bigoplus_{i=1}^r t_i \mathbb{C} \{t_i\} \frac{\partial}{\partial p} \right)$$

generated by

$$\alpha_0 \frac{\partial}{\partial x} - \left(\frac{\partial \alpha_0}{\partial x} + \frac{\partial \alpha_0}{\partial y} \mathbf{p} \right) \mathbf{p} \frac{\partial}{\partial p}, \quad \left(\frac{\partial \beta_0}{\partial x} + \frac{\partial \beta_0}{\partial y} \mathbf{p} \right) \frac{\partial}{\partial p},$$

and

$$\alpha_k \mathbf{p}^k \frac{\partial}{\partial x} - \frac{1}{k+1} \left(\frac{\partial \alpha_k}{\partial x} \mathbf{p}^{k+1} + \frac{\partial \alpha_k}{\partial y} \mathbf{p}^{k+2} \right) \frac{\partial}{\partial p}, \quad k \geq 1,$$

where $\alpha_k \in (x, y), \beta_0 \in (x^2, y)$ for each $k \geq 0$. Set

$$M_\sigma^f = \frac{\mathfrak{m}_{\mathbb{C}} \frac{\partial}{\partial x} \oplus \mathfrak{m}_{\mathbb{C}} \frac{\partial}{\partial p}}{\mathfrak{m}_{\mathbb{C}} \dot{\sigma} + I^f}.$$

Theorem 5.1. *Assuming the notations above, $\widehat{\mathcal{Def}}_\psi(T_\varepsilon) \cong M_\sigma^f$.*

Proof. Let $\Psi \in \widehat{\mathcal{Def}}_\psi(T_\varepsilon)$ be given by

$$\Psi_i(t_i, \varepsilon) = (X_i, Y_i, P_i) = (x_i + \varepsilon a_i, y_i + \varepsilon b_i, p_i + \varepsilon c_i),$$

where $a_i, b_i, c_i \in \mathbb{C} \{t_i\} t_i$ and $Y_i = \int P_i \partial_{t_i} X_i dt_i$, $i = 1, \dots, r$. Hence

$$b_i = \int (\dot{x}_i c_i + \dot{a}_i p_i) dt_i, \quad i = 1, \dots, r.$$

By (5.3) Ψ is trivial if and only if there an isomorphism $\xi : \bar{\mathbb{C}} \times T_\varepsilon \rightarrow \bar{\mathbb{C}} \times T_\varepsilon$ given by

$$t_i \rightarrow \tilde{t}_i = t_i + \varepsilon h_i, \quad h_i \in \mathbb{C} \{t_i\} t_i, \quad i = 1, \dots, r,$$

and a relative contact transformation $\chi : \mathbb{C}^3 \times T_\varepsilon \rightarrow \mathbb{C}^3 \times T_\varepsilon$ given by

$$(x, y, p, \varepsilon) \mapsto (x + \varepsilon \alpha, y + \varepsilon \beta, p + \varepsilon \gamma, \varepsilon)$$

such that

$$X_i = x_i(\tilde{t}_i) + \varepsilon \alpha(x_i(\tilde{t}_i), y_i(\tilde{t}_i), p_i(\tilde{t}_i)),$$

$$P_i = p_i(\tilde{t}_i) + \varepsilon \gamma(x_i(\tilde{t}_i), y_i(\tilde{t}_i), p_i(\tilde{t}_i)),$$

$i = 1, \dots, r$. Following the argument of the proof of Theorem 4.1, Ψ^{π_f} is trivial if and only if

$$a_i(t_i) = \dot{x}_i(t_i) h_i(t_i) + \alpha(x_i(t_i), y_i(t_i), p_i(t_i)),$$

$$c_i(t_i) = \dot{p}_i(t_i) h_i(t_i) + \gamma(x_i(t_i), y_i(t_i), p_i(t_i)),$$

$i = 1, \dots, r$. The result follows from Remark 2.7 (ii). $\square$

Lemma 5.2. *Let ψ be the parametrization of a Legendrian curve. Let Φ be the semiuniversal deformation in Def_σ of the fake plane projection σ of ψ . Then $\text{Conf}_f \Phi$ is a versal deformation of ψ in $\widehat{\text{Def}}_\psi$.*

Proof. It follows the argument of Lemma 4.3. $\square$

Theorem 5.3. *Let $\mathbf{a}^j, \mathbf{c}^j \in \mathfrak{m}_{\mathbb{C}}$ such that*

$$(5.4) \quad \mathbf{a}^j \frac{\partial}{\partial x} + \mathbf{c}^j \frac{\partial}{\partial p} = \begin{bmatrix} a_1^j \\ \vdots \\ a_r^j \end{bmatrix} \frac{\partial}{\partial x} + \begin{bmatrix} c_1^j \\ \vdots \\ c_r^j \end{bmatrix} \frac{\partial}{\partial p},$$

$1 \leq j \leq \ell$, represents a basis [a system of generators] of M_σ^f . Let $\Phi \in \text{Def}_\sigma$ be given by

$$(5.5) \quad X_i(t_i, \mathbf{s}) = x_i(t_i) + \sum_{j=1}^{\ell} a_i^j(t_i) s_j, \quad P_i(t_i, \mathbf{s}) = p_i(t_i) + \sum_{j=1}^{\ell} c_i^j(t_i) s_j,$$

$i = 1, \dots, r$. Then $\text{Conf}_f \Phi$ is a semiuniversal [versal] deformation of ψ in $\widehat{\text{Def}}_\psi$.

Proof. It follows the argument of Theorem 4.4, using Remark 2.7 (ii). $\square$

6. EXAMPLES

Example 6.1. Let $\varphi(t) = (t^3, t^{10})$, $\psi(t) = (t^3, t^{10}, \frac{10}{3}t^7)$, $\sigma(t) = (t^3, \frac{10}{3}t^7)$. The deformations given by

- $X(t, \mathbf{s}) = t^3$, $Y(t, \mathbf{s}) = s_1 t^4 + s_2 t^5 + s_3 t^7 + s_4 t^8 + t^{10} + s_5 t^{11} + s_6 t^{14}$;
- $X(t, \mathbf{s}) = s_1 t + s_2 t^2 + t^3$, $Y(t, \mathbf{s}) = s_3 t + s_4 t^2 + s_5 t^4 + s_6 t^5 + s_7 t^7 + s_8 t^8 + t^{10} + s_9 t^{11} + s_{10} t^{14}$;

are respectively

- an equimultiple semiuniversal deformation;
- a semiuniversal deformation

of φ . The conormal of the deformation given by

$$X(t, \mathbf{s}) = t^3, \quad Y(t, \mathbf{s}) = s_1 t^7 + s_2 t^8 + t^{10} + s_3 t^{11};$$

is an equimultiple semiuniversal deformation of ψ . The fake conormal of the deformation given by

$$X(t, \mathbf{s}) = s_1 t + s_2 t^2 + t^3, \quad P(t, \mathbf{s}) = s_3 t + s_4 t^2 + s_5 t^4 + s_6 t^5 + \frac{10}{3} t^7 + s_7 t^8;$$

is a semiuniversal deformation of the fake conormal of σ . The conormal of the deformation given by

$$X(t, \mathbf{s}) = s_1 t + s_2 t^2 + t^3, \quad Y(t, \mathbf{s}) = \alpha_2 t^2 + \alpha_3 t^3 + \alpha_4 t^4 + \alpha_5 t^5 + \alpha_6 t^6 + \alpha_7 t^7 + \alpha_8 t^8 + \alpha_9 t^9 + \alpha_{10} t^{10} + \alpha_{11} t^{11};$$

with

$$\begin{aligned}\alpha_2 &= \frac{s_1 s_3}{2}, & \alpha_3 &= \frac{s_1 s_4 + 2s_2 s_3}{3}, & \alpha_4 &= \frac{3s_3 + 2s_2 s_4}{4}, \\ \alpha_5 &= \frac{3s_4 + s_1 s_5}{5}, & \alpha_6 &= \frac{2s_2 s_5 + s_1 s_6}{6}, & \alpha_7 &= \frac{3s_5 + 2s_2 s_6}{7}, \\ \alpha_8 &= \frac{10s_1 + 9s_6}{24}, & \alpha_9 &= \frac{3s_1 s_7 + 20s_2}{27}, & \alpha_{10} &= 1 + \frac{s_2 s_7}{5}, \\ \alpha_{11} &= \frac{3s_7}{11},\end{aligned}$$

is a semiuniversal deformation of ψ .

Example 6.2. Let $Z = \{(x, y) \in \mathbb{C}^2 : (y^2 - x^5)(y^2 - x^7) = 0\}$. Consider the parametrization φ of Z given by

$$x_1(t_1) = t_1^2, \quad y_1(t_1) = t_1^5 \quad x_2(t_2) = t_2^2, \quad y_2(t_2) = t_2^7.$$

Let σ be the fake projection of the conormal of φ given by

$$x_1(t_1) = t_1^2, \quad p_1(t_1) = \frac{5}{2}t_1^3 \quad x_2(t_2) = t_2^2, \quad p_2(t_2) = \frac{7}{2}t_2^5.$$

The deformations given by

- $X_1(t_1, \mathbf{s}) = t_1^2, \quad Y_1(t_1, \mathbf{s}) = s_1 t_1^3 + t_1^5,$
 $X_2(t_2, \mathbf{s}) = t_2^2, \quad Y_2(t_2, \mathbf{s}) = s_2 t_2^2 + s_3 t_2^3 + s_4 t_2^4 + s_5 t_2^5 + s_6 t_2^6 + t_2^7 +$
 $+ s_7 t_2^8 + s_8 t_2^{10} + s_9 t_2^{12};$
- $X_1(t_1, \mathbf{s}) = s_1 t_1 + t_1^2, \quad Y_1(t_1, \mathbf{s}) = s_3 t_1 + s_4 t_1^3 + t_1^5,$
 $X_2(t_2, \mathbf{s}) = s_2 t_2 + t_2^2, \quad Y_2(t_2, \mathbf{s}) = s_5 t_2 + s_6 t_2^2 + s_7 t_2^3 + s_8 t_2^4 + s_9 t_2^5 + s_{10} t_2^6 +$
 $+ t_2^7 + s_{11} t_2^8 + s_{12} t_2^{10} + s_{13} t_2^{12};$

are respectively

- an equimultiple semiuniversal deformation;
- a semiuniversal deformation

of φ . The conormal of the deformation given by

$$\begin{aligned}X_1(t_1, \mathbf{s}) &= t_1^2, & Y_1(t_1, \mathbf{s}) &= t_1^5, \\ X_2(t_2, \mathbf{s}) &= t_2^2, & Y_2(t_2, \mathbf{s}) &= s_1 t_2^4 + s_2 t_2^5 + s_3 t_2^6 + t_2^7 + s_4 t_2^8;\end{aligned}$$

is an equimultiple semiuniversal deformation of the conormal of φ . The fake conormal of the deformation given by

$$\begin{aligned}X_1(t_1, \mathbf{s}) &= s_1 t_1 + t_1^2, & P_1(t_1, \mathbf{s}) &= s_3 t_1 + \frac{5}{2}t_1^3, \\ X_2(t_2, \mathbf{s}) &= s_2 t_2 + t_2^2, & P_2(t_2, \mathbf{s}) &= s_4 t_2 + s_5 t_2^2 + s_6 t_2^3 + s_7 t_2^4 + \frac{7}{2}t_2^5 + s_8 t_2^6;\end{aligned}$$

is a semiuniversal deformation of the fake conormal of σ . The conormal of the deformation given by

$$\begin{aligned} X_1(t_1, \mathbf{s}) &= s_1 t_1 + t_1^2, & Y_1(t_1, \mathbf{s}) &= \alpha_2 t_1^2 + \alpha_3 t_1^3 + \alpha_4 t_1^4 + t_1^5, \\ X_2(t_2, \mathbf{s}) &= s_2 t_2 + t_2^2, & Y_2(t_2, \mathbf{s}) &= \beta_2 t_2^2 + \beta_3 t_2^3 + \beta_4 t_2^4 + \beta_5 t_2^5 + \beta_6 t_2^6 + \\ & & & + \beta_7 t_2^7 + \beta_8 t_2^8; \end{aligned}$$

with

$$\begin{aligned} \alpha_2 &= \frac{s_1 s_3}{2}, & \alpha_3 &= \frac{2s_3}{3}, & \alpha_4 &= \frac{5s_1}{8}, \\ \beta_2 &= \frac{s_2 s_4}{2}, & \beta_3 &= \frac{2s_4 + s_2 s_5}{3}, & \beta_4 &= \frac{2s_5 + s_2 s_6}{4}, \\ \beta_5 &= \frac{2s_6 + s_2 s_7}{5}, & \beta_6 &= \frac{4s_7 + 7s_2}{12}, & \beta_7 &= 1 + \frac{s_2 s_8}{7}, \\ \beta_8 &= \frac{2s_8}{8}, \end{aligned}$$

is a semiuniversal deformation of the conormal of φ .
