# A new expression for the Moore-Penrose inverse of a class of matrices 

Xuefeng Xu<br>LSEC, Institute of Computational Mathematics and Scientific/Engineering Computing, Academy of Mathematics and Systems Science, Chinese Academy of Sciences, Beijing 100190, China.<br>E-mail address: xuxuefeng@lsec.cc.ac.cn

#### Abstract

An expression for the Moore-Penrose inverse of a matrix of the form $M=X N Y$, where $X$ and $Y$ are nonsingular, has been recently established by Castro-González et al. [1, Theorem 2.2]. The expression plays an essential role in developing explicit expressions for the Moore-Penrose inverse of a two-by-two block matrix. In this paper, we present a new expression for the MoorePenrose inverse of this class of matrices, which improves the result in [1].

Keywords: Moore-Penrose inverse; Matrix product; Orthogonal projector

## 1. Introduction

We first introduce some notations and concepts which are frequently used in the subsequent content. Let $\mathbb{N}^{+}$and $\mathbb{C}$ denote the set of all positive integers and the field of complex numbers, respectively. Let $\mathbb{C}^{m \times n}$ be the set of all $m \times n$ complex matrices. The identity matrix of order $n$ is denoted by $I_{n}$ or $I$ when its size is clear in the context. For a matrix $A \in \mathbb{C}^{m \times n}, A^{*}$ denotes the conjugate transpose of $A$. We denote by $\mathcal{R}(A)$ and $\mathcal{N}(A)$ the range and null space of $A$, respectively, namely, $\mathcal{R}(A):=\left\{y \in \mathbb{C}^{m}: y=A x, x \in \mathbb{C}^{n}\right\}$ and $\mathcal{N}(A):=\left\{x \in \mathbb{C}^{n}: A x=0\right\}$. The Moore-Penrose inverse of $A$ is denoted by $A^{\dagger}$, which is defined as the unique matrix $Z \in \mathbb{C}^{n \times m}$ satisfying the following equations:

$$
\text { (a) } A Z A=A, \quad \text { (b) } Z A Z=Z, \quad \text { (c) }(A Z)^{*}=A Z, \quad \text { (d) }(Z A)^{*}=Z A
$$

The symbols $E_{A}:=I-A A^{\dagger}$ and $F_{A}:=I-A^{\dagger} A$ stand for the orthogonal projectors onto $\mathcal{N}\left(A^{*}\right)$ and $\mathcal{N}(A)$, respectively. A matrix $Z \in \mathbb{C}^{n \times m}$ is called an inner inverse of $A$ if it satisfies the equality (a).

For a matrix $M \in \mathbb{C}^{m \times n}$ which can be decomposed as $M=X N Y$, where $X \in \mathbb{C}^{m \times m}$ and $Y \in \mathbb{C}^{n \times n}$ are nonsingular, the equality $M^{\dagger}=Y^{-1} N^{\dagger} X^{-1}$ may fail. Several conditions validating $M^{\dagger}=Y^{-1} N^{\dagger} X^{-1}$ are presented in [2]. Recently, Castro-González et al. [1] obtained an explicit expression for $M^{\dagger}$, provided that $X E_{N}=E_{N}$ and $F_{N} Y=F_{N}$. More concretely, it is proved by Castro-González et al. [1, Theorem 2.2] that

$$
\begin{equation*}
M^{\dagger}=\left(I+L_{0}^{*}\right)\left(I+L_{0} L_{0}^{*}\right)^{-1} Y^{-1} N^{\dagger} X^{-1}\left(I+R_{0}^{*} R_{0}\right)^{-1}\left(I+R_{0}^{*}\right) \tag{1.1}
\end{equation*}
$$

where $R_{0}:=E_{N}\left(I-X^{-1}\right)$ and $L_{0}:=\left(I-Y^{-1}\right) F_{N}$. The expression (1.1) is a crucial result in [1], which can be exploited to establish explicit expressions for the Moore-Penrose inverse of a two-by-two block matrix.

Assume that the singular value decomposition (SVD) of $N \in \mathbb{C}^{m \times n}$ is $N=U\left(\begin{array}{ll}\Sigma & 0 \\ 0 & 0\end{array}\right) V^{*}$, where $\Sigma \in \mathbb{C}^{r \times r}$ is a diagonal matrix with positive diagonal entries, $r$ is the rank of $N$, and both $U \in \mathbb{C}^{m \times m}$ and $V \in \mathbb{C}^{n \times n}$ are unitary. Let $X \in \mathbb{C}^{m \times m}$ and $Y \in \mathbb{C}^{n \times n}$. We now give two assumptions $\mathbf{A}_{1}$ and $\mathbf{A}_{2}$ as follows:

$$
\mathbf{A}_{1}: X=U\left(\begin{array}{cc}
X_{1} & 0 \\
X_{2} & X_{4}
\end{array}\right) U^{*}
$$

where $X_{1} \in \mathbb{C}^{r \times r}, X_{2} \in \mathbb{C}^{(m-r) \times r}$, and $X_{4} \in \mathbb{C}^{(m-r) \times(m-r)}$;

$$
\mathbf{A}_{2}: Y=V\left(\begin{array}{cc}
Y_{1} & Y_{3} \\
0 & Y_{4}
\end{array}\right) V^{*}
$$

where $Y_{1} \in \mathbb{C}^{r \times r}, Y_{3} \in \mathbb{C}^{r \times(n-r)}$, and $Y_{4} \in \mathbb{C}^{(n-r) \times(n-r)}$.
In this paper, we further investigate explicit expressions for the Moore-Penrose inverse of this class of matrices. A new expression under weakened conditions for $M^{\dagger}$ is derived, which has enhanced the expression (1.1). More specifically, if the assumptions $\mathbf{A}_{1}$ and $\mathbf{A}_{2}$ are satisfied, then we have

$$
\begin{equation*}
M^{\dagger}=\left(I+L^{*}\right)\left(I+L L^{*}\right)^{-1} N^{\dagger} N\left(Y^{-1} N^{\dagger} X^{-1}\right) N N^{\dagger}\left(I+R^{*} R\right)^{-1}\left(I+R^{*}\right) \tag{1.2}
\end{equation*}
$$

where $R:=X E_{N} X^{-1}\left(E_{N}-I\right)$ and $L:=\left(F_{N}-I\right) Y^{-1} F_{N} Y$.
The rest of this paper is organized as follows. In Section 2, we first introduce a useful lemma which gives an explicit expression for the Moore-Penrose inverse of a two-by-two block matrix, and then give some specific conditions to validate $\mathbf{A}_{1}$ and $\mathbf{A}_{2}$. In Section 3, we present a new and improved expression (i.e., (1.2)) for $M^{\dagger}$ based on the assumptions $\mathbf{A}_{1}$ and $\mathbf{A}_{2}$.

## 2. Preliminaries

In this section, we first introduce a useful lemma, which provides an explicit expression for the Moore-Penrose inverse of a two-by-two block matrix; see [3]. It is worth mentioning that some improved results of this lemma can be found in [1].
Lemma 2.1. Let $M$ be a two-by-two block matrix as the form $M=\left(\begin{array}{cc}A & C \\ B & D\end{array}\right)$. Assume that $\mathcal{R}\left(B^{*}\right) \subseteq \mathcal{R}\left(A^{*}\right), \mathcal{R}(C) \subseteq \mathcal{R}(A)$, and $D-B A^{\dagger} C=0$. Then $M^{\dagger}$ can be given by

$$
M^{\dagger}=\binom{I}{\left(A^{\dagger} C\right)^{*}} \Psi A^{\dagger} \Phi\left(\begin{array}{ll}
I & \left(B A^{\dagger}\right)^{*}
\end{array}\right)
$$

where $\Phi=\left(I+\left(B A^{\dagger}\right)^{*} B A^{\dagger}\right)^{-1}$ and $\Psi=\left(I+A^{\dagger} C\left(A^{\dagger} C\right)^{*}\right)^{-1}$.
Next, we give several specific conditions to guarantee the assumptions $\mathbf{A}_{1}$ and $\mathbf{A}_{2}$.

Lemma 2.2. Let $N \in \mathbb{C}^{m \times n}$ have the singular value decomposition $N=U\left(\begin{array}{ll}\Sigma & 0 \\ 0 & 0\end{array}\right) V^{*}$, where $\Sigma \in \mathbb{C}^{r \times r}$ is a diagonal matrix with positive diagonal entries, $r$ is the rank of $N$, and both $U \in \mathbb{C}^{m \times m}$ and $V \in \mathbb{C}^{n \times n}$ are unitary. Let $X \in \mathbb{C}^{m \times m}$ be an arbitrary matrix. Suppose that one of the following conditions holds:
$\mathbf{C}_{1}: N N^{*} X$ is normal;
$\mathbf{C}_{2}$ : For any $0 \neq c_{1} \in \mathbb{C}$, there exists $k_{1} \in \mathbb{N}^{+}$such that $\left(N N^{*} X\right)^{k_{1}}=c_{1} N N^{\dagger} ;$
$\mathbf{C}_{3}$ : For any $0 \neq c_{2} \in \mathbb{C}$ and $\ell \in \mathbb{N}^{+}$, there exists $k_{2} \in \mathbb{N}^{+}$such that $\left(N N^{*} X\right)^{k_{2}}=c_{2}\left(N N^{*}\right)^{\ell}$;
$\mathbf{C}_{4}: X E_{N}$ is normal;
$\mathbf{C}_{5}:$ For any $0 \neq c_{3} \in \mathbb{C}$, there exists $k_{3} \in \mathbb{N}^{+}$such that $\left(X E_{N}\right)^{k_{3}}=c_{3} E_{N}$;
$\mathbf{C}_{6}: N N^{\dagger} X E_{N}=0 ;$
$\mathbf{C}_{7}$ : There exists $k_{4} \in \mathbb{N}^{+}$such that $\left(N N^{*}\right)^{k_{4}} X E_{N}=0$.
Then $X$ must be of the form

$$
X=U\left(\begin{array}{cc}
X_{1} & 0 \\
X_{2} & X_{4}
\end{array}\right) U^{*}
$$

where $X_{1} \in \mathbb{C}^{r \times r}, X_{2} \in \mathbb{C}^{(m-r) \times r}$, and $X_{4} \in \mathbb{C}^{(m-r) \times(m-r)}$.
Proof. Based on the SVD of $N$, the expressions of $N^{\dagger}$ and $E_{N}$ can be given by

$$
N^{\dagger}=V\left(\begin{array}{cc}
\Sigma^{-1} & 0 \\
0 & 0
\end{array}\right) U^{*} \quad \text { and } \quad E_{N}=U\left(\begin{array}{ll}
0 & 0 \\
0 & I
\end{array}\right) U^{*}
$$

Partition $U^{*} X U$ as $U^{*} X U=\left(\begin{array}{ll}X_{1} & X_{3} \\ X_{2} & X_{4}\end{array}\right)$, where $X_{1} \in \mathbb{C}^{r \times r}, X_{2} \in \mathbb{C}^{(m-r) \times r}, X_{3} \in \mathbb{C}^{r \times(m-r)}$, and $X_{4} \in \mathbb{C}^{(m-r) \times(m-r)}$. Then $X=U\left(\begin{array}{ll}X_{1} & X_{3} \\ X_{2} & X_{4}\end{array}\right) U^{*}$.
(i) The condition $\mathbf{C}_{1}$ states that

$$
N N^{*} X=U\left(\begin{array}{cc}
\Sigma^{2} X_{1} & \Sigma^{2} X_{3} \\
0 & 0
\end{array}\right) U^{*}
$$

is normal, which yields that $\Sigma^{2} X_{1}$ is normal and $\Sigma^{2} X_{3}=0$. It follows from the non-singularity of $\Sigma$ that $X_{3}=0$.
(ii) We have known that $N N^{*} X=U\left(\begin{array}{cc}\Sigma^{2} X_{1} & \Sigma^{2} X_{3} \\ 0 & 0\end{array}\right) U^{*}$. Then, for any $k_{1} \in \mathbb{N}^{+}$, we have

$$
\left(N N^{*} X\right)^{k_{1}}=U\left(\begin{array}{cc}
\left(\Sigma^{2} X_{1}\right)^{k_{1}} & \left(\Sigma^{2} X_{1}\right)^{k_{1}-1} \Sigma^{2} X_{3} \\
0 & 0
\end{array}\right) U^{*} .
$$

In addition, it is easy to see that

$$
c_{1} N N^{\dagger}=U\left(\begin{array}{cc}
c_{1} I & 0 \\
0 & 0
\end{array}\right) U^{*} .
$$

Hence, $\mathbf{C}_{2}$ implies that $\left(\Sigma^{2} X_{1}\right)^{k_{1}}=c_{1} I$ and $\left(\Sigma^{2} X_{1}\right)^{k_{1}-1} \Sigma^{2} X_{3}=0$. Due to the facts that $c_{1} \neq 0$ and $\Sigma$ is nonsingular, it follows that $X_{1}$ is nonsingular and $X_{3}=0$.
(iii) Direct calculation yields

$$
\begin{aligned}
& \left(N N^{*} X\right)^{k_{2}}=U\left(\begin{array}{cc}
\left(\Sigma^{2} X_{1}\right)^{k_{2}} & \left(\Sigma^{2} X_{1}\right)^{k_{2}-1} \Sigma^{2} X_{3} \\
0 & 0
\end{array}\right) U^{*} \\
& c_{2}\left(N N^{*}\right)^{\ell}=U\left(\begin{array}{cc}
c_{2} \Sigma^{2 \ell} & 0 \\
0 & 0
\end{array}\right) U^{*} .
\end{aligned}
$$

Because $c_{2} \neq 0$ and $\Sigma$ is nonsingular, we deduce from $\mathbf{C}_{3}$ that $\Sigma^{2} X_{1}$ is nonsingular and $\left(\Sigma^{2} X_{1}\right)^{k_{2}-1} \Sigma^{2} X_{3}=0$. Hence, $X_{3}=0$.
(iv) Straightforward calculation shows

$$
X E_{N}=U\left(\begin{array}{ll}
0 & X_{3} \\
0 & X_{4}
\end{array}\right) U^{*}
$$

If $X E_{N}$ is normal, then we get that $X_{4}$ is normal and $X_{3}=0$.
(v) Direct computation yields

$$
\left(X E_{N}\right)^{k_{3}}=U\left(\begin{array}{cc}
0 & X_{3} X_{4}^{k_{3}-1} \\
0 & X_{4}^{k_{3}}
\end{array}\right) U^{*}
$$

It follows from $\mathbf{C}_{5}$ that $X_{4}^{k_{3}}=c_{3} I$ and $X_{3} X_{4}^{k_{3}-1}=0$. By $c_{3} \neq 0$, we derive that $X_{4}$ is nonsingular. Hence, we obtain from $X_{3} X_{4}^{k_{3}-1}=0$ that $X_{3}=0$.
(vi) It is easy to compute that

$$
N N^{\dagger} X E_{N}=U\left(\begin{array}{cc}
0 & X_{3} \\
0 & 0
\end{array}\right) U^{*}
$$

Therefore, $N N^{\dagger} X E_{N}=0$ if and only if $X_{3}=0$.
(vii) Direct calculation yields

$$
\left(N N^{*}\right)^{k_{4}} X E_{N}=U\left(\begin{array}{cc}
0 & \Sigma^{2 k_{4}} X_{3} \\
0 & 0
\end{array}\right) U^{*}
$$

Due to the fact that $\Sigma$ is nonsingular, it follows that $\left(N N^{*}\right)^{k_{4}} X E_{N}=0$ is equivalent to $X_{3}=0$.
Consequently, if one of the conditions $\mathbf{C}_{1}-\mathbf{C}_{7}$ holds, then $X$ must be of the from

$$
X=U\left(\begin{array}{cc}
X_{1} & 0 \\
X_{2} & X_{4}
\end{array}\right) U^{*}
$$

which completes the proof.
Analogously, we can prove the following lemma. Its detailed proof is omitted due to limited space.

Lemma 2.3. Let $Y \in \mathbb{C}^{n \times n}$ and let $N \in \mathbb{C}^{m \times n}$ be the same as in Lemma 2.2. Assume that one of the following conditions holds:
$\mathbf{C}_{1}^{\prime}: Y N^{*} N$ is normal;
$\mathbf{C}_{2}^{\prime}$ : For any $0 \neq c_{1}^{\prime} \in \mathbb{C}$, there exists $k_{1}^{\prime} \in \mathbb{N}^{+}$such that $\left(Y N^{*} N\right)^{k_{1}^{\prime}}=c_{1}^{\prime} N^{\dagger} N$;
$\mathbf{C}_{3}^{\prime}$ : For any $0 \neq c_{2}^{\prime} \in \mathbb{C}$ and $\ell^{\prime} \in \mathbb{N}^{+}$, there exists $k_{2}^{\prime} \in \mathbb{N}^{+}$such that $\left(Y N^{*} N\right)^{k_{2}^{\prime}}=c_{2}^{\prime}\left(N^{*} N\right)^{\ell^{\prime}}$;
$\mathbf{C}_{4}^{\prime}: F_{N} Y$ is normal;
$\mathbf{C}_{5}^{\prime}:$ For any $0 \neq c_{3}^{\prime} \in \mathbb{C}$, there exists $k_{3}^{\prime} \in \mathbb{N}^{+}$such that $\left(F_{N} Y\right)^{k_{3}^{\prime}}=c_{3}^{\prime} F_{N}$;
$\mathrm{C}_{6}^{\prime}: F_{N} Y N^{\dagger} N=0 ;$
$\mathbf{C}_{7}^{\prime}$ : There exists $k_{4}^{\prime} \in \mathbb{N}^{+}$such that $F_{N} Y\left(N^{*} N\right)^{k_{4}^{\prime}}=0$.
Then $Y$ must be of the form

$$
Y=V\left(\begin{array}{cc}
Y_{1} & Y_{3} \\
0 & Y_{4}
\end{array}\right) V^{*}
$$

where $Y_{1} \in \mathbb{C}^{r \times r}, Y_{3} \in \mathbb{C}^{r \times(n-r)}$, and $Y_{4} \in \mathbb{C}^{(n-r) \times(n-r)}$.
Remark 2.4. Notice that Lemma 2.2 (resp., Lemma 2.3) does not need the non-singularity of $X$ (resp., $Y$ ). In addition, the reader can give other conditions to ensure that $\mathbf{A}_{1}$ and $\mathbf{A}_{2}$ hold.

## 3. Main results

In order to prove our main result, we first consider explicit expressions for $(X N)^{\dagger}$ and $(N Y)^{\dagger}$. The following theorem provides two applicable formulas for $M_{1}^{\dagger}$ and $M_{2}^{\dagger}$, where $M_{1}=X N$ and $M_{2}=N Y$.

Theorem 3.1. Let $N \in \mathbb{C}^{m \times n}, X \in \mathbb{C}^{m \times m}, Y \in \mathbb{C}^{n \times n}, M_{1}=X N$, and $M_{2}=N Y$. Suppose that $X$ and $Y$ are nonsingular.
(1) If the assumption $\mathbf{A}_{1}$ holds, then

$$
\begin{equation*}
M_{1}^{\dagger}=N^{\dagger} X^{-1} N N^{\dagger}\left(I+R^{*} R\right)^{-1}\left(I+R^{*}\right), \tag{3.1}
\end{equation*}
$$

where $R=X E_{N} X^{-1}\left(E_{N}-I\right)$.
(2) If the assumption $\mathbf{A}_{2}$ holds, then

$$
M_{2}^{\dagger}=\left(I+L^{*}\right)\left(I+L L^{*}\right)^{-1} N^{\dagger} N Y^{-1} N^{\dagger}
$$

where $L=\left(F_{N}-I\right) Y^{-1} F_{N} Y$.

Proof. (1) The assumption $\mathbf{A}_{1}$ reads $X=U\left(\begin{array}{cc}X_{1} & 0 \\ X_{2} & X_{4}\end{array}\right) U^{*}$, where $X_{1} \in \mathbb{C}^{r \times r}$ and $r$ is the rank of $N$. It follows from the non-singularity of $X$ that both $X_{1} \in \mathbb{C}^{r \times r}$ and $X_{4} \in \mathbb{C}^{(m-r) \times(m-r)}$ are nonsingular. We define $R:=X E_{N} X^{-1}\left(E_{N}-I\right)$. By simple computation, we can get

$$
R=U\left(\begin{array}{cc}
0 & 0 \\
X_{2} X_{1}^{-1} & 0
\end{array}\right) U^{*}=U\left(\begin{array}{cc}
0 & 0 \\
G & 0
\end{array}\right) U^{*},
$$

where $G:=X_{2} X_{1}^{-1}$. Because $U$ and $V$ are unitary matrices and

$$
M_{1}=X N=U\left(\begin{array}{ll}
X_{1} \Sigma & 0 \\
X_{2} \Sigma & 0
\end{array}\right) V^{*},
$$

we obtain

$$
M_{1}^{\dagger}=V\left(\begin{array}{ll}
X_{1} \Sigma & 0 \\
X_{2} \Sigma & 0
\end{array}\right)^{\dagger} U^{*}
$$

Note that $X_{1} \Sigma$ is nonsingular. Using Lemma 2.1, we obtain

$$
\left(\begin{array}{ll}
X_{1} \Sigma & 0 \\
X_{2} \Sigma & 0
\end{array}\right)^{\dagger}=\binom{I}{0} \Sigma^{-1} X_{1}^{-1}\left(I+G^{*} G\right)^{-1}\left(\begin{array}{ll}
I & G^{*}
\end{array}\right)
$$

Hence,

$$
M_{1}^{\dagger}=V\binom{I}{0} \Sigma^{-1} X_{1}^{-1}\left(I+G^{*} G\right)^{-1}\left(\begin{array}{ll}
I & G^{*}
\end{array}\right) U^{*}
$$

Straightforward computation yields

$$
\begin{aligned}
& N^{\dagger} X^{-1}=V\binom{I}{0} \Sigma^{-1} X_{1}^{-1}\left(\begin{array}{ll}
I & 0
\end{array}\right) U^{*}, \\
& N N^{\dagger}\left(I+R^{*} R\right)^{-1}\left(I+R^{*}\right)=U\binom{I}{0}\left(I+G^{*} G\right)^{-1}\left(\begin{array}{ll}
I & G^{*}
\end{array}\right) U^{*} .
\end{aligned}
$$

It can be easily seen that $M_{1}^{\dagger}=N^{\dagger} X^{-1} N N^{\dagger}\left(I+R^{*} R\right)^{-1}\left(I+R^{*}\right)$ holds.
(2) Applying the formula (3.1) to the matrix $Y^{*} N^{*}$, we obtain

$$
\left(M_{2}^{*}\right)^{\dagger}=\left(N^{*}\right)^{\dagger}\left(Y^{*}\right)^{-1} N^{*}\left(N^{*}\right)^{\dagger}\left(I+\widehat{R}^{*} \widehat{R}\right)^{-1}\left(I+\widehat{R}^{*}\right),
$$

where

$$
\widehat{R}=Y^{*} E_{N^{*}}\left(Y^{*}\right)^{-1}\left(E_{N^{*}}-I\right)=Y^{*}\left(F_{N}\right)^{*}\left(Y^{-1}\right)^{*}\left(F_{N}-I\right)^{*} .
$$

We define $L:=\left(F_{N}-I\right) Y^{-1} F_{N} Y$. Then,

$$
\left(M_{2}^{\dagger}\right)^{*}=\left(M_{2}^{*}\right)^{\dagger}=\left(N^{\dagger}\right)^{*}\left(Y^{-1}\right)^{*} N^{*}\left(N^{\dagger}\right)^{*}\left(I+L L^{*}\right)^{-1}(I+L) .
$$

Therefore, we drive that $M_{2}^{\dagger}=\left(I+L^{*}\right)\left(I+L L^{*}\right)^{-1} N^{\dagger} N Y^{-1} N^{\dagger}$.

Using Theorem 3.1, we can easily obtain the following expressions for the orthogonal projectors onto $\mathcal{R}\left(M_{1}\right)$ and $\mathcal{R}\left(M_{2}^{*}\right)$.

Corollary 3.2. Under the same conditions as in Theorem 3.1.
(1) If the assumption $\mathbf{A}_{1}$ is valid, then

$$
\begin{equation*}
M_{1} M_{1}^{\dagger}=(I+R) N N^{\dagger}\left(I+R^{*} R\right)^{-1}\left(I+R^{*}\right) \tag{3.2}
\end{equation*}
$$

(2) If the assumption $\mathbf{A}_{2}$ is valid, then

$$
\begin{equation*}
M_{2}^{\dagger} M_{2}=\left(I+L^{*}\right)\left(I+L L^{*}\right)^{-1} N^{\dagger} N(I+L) . \tag{3.3}
\end{equation*}
$$

Proof. According to the equality (3.1), it follows that

$$
\begin{equation*}
M_{1} M_{1}^{\dagger}=X N N^{\dagger} X^{-1} N N^{\dagger}\left(I+R^{*} R\right)^{-1}\left(I+R^{*}\right) \tag{3.4}
\end{equation*}
$$

Notice that

$$
\begin{equation*}
(I+R) N N^{\dagger}=\left(I-N N^{\dagger}+X N N^{\dagger} X^{-1} N N^{\dagger}\right) N N^{\dagger}=X N N^{\dagger} X^{-1} N N^{\dagger} \tag{3.5}
\end{equation*}
$$

Inserting (3.5) into (3.4) gives $M_{1} M_{1}^{\dagger}=(I+R) N N^{\dagger}\left(I+R^{*} R\right)^{-1}\left(I+R^{*}\right)$. Similarly, we can prove the equality (3.3).

Based on the expressions (3.2) and (3.3) for orthogonal projectors $M_{1} M_{1}^{\dagger}$ and $M_{2}^{\dagger} M_{2}$, we can establish the following main result.

Theorem 3.3. Let $N \in \mathbb{C}^{m \times n}, X \in \mathbb{C}^{m \times m}, Y \in \mathbb{C}^{n \times n}$, and $M=X N Y$. Assume that $X$ and $Y$ are nonsingular. If the assumptions $\mathbf{A}_{1}$ and $\mathbf{A}_{2}$ are satisfied, then

$$
M^{\dagger}=\left(I+L^{*}\right)\left(I+L L^{*}\right)^{-1} N^{\dagger} N\left(Y^{-1} N^{\dagger} X^{-1}\right) N N^{\dagger}\left(I+R^{*} R\right)^{-1}\left(I+R^{*}\right),
$$

where $R=X E_{N} X^{-1}\left(E_{N}-I\right)$ and $L=\left(F_{N}-I\right) Y^{-1} F_{N} Y$.
Proof. Note that $Y^{-1} N^{\dagger} X^{-1}$ is an inner inverse of $M$. Then we have

$$
M^{\dagger}=M^{\dagger} M\left(Y^{-1} N^{\dagger} X^{-1}\right) M M^{\dagger}
$$

Let $M_{1}=X N$ and $M_{2}=N Y$. We claim that $M M^{\dagger}=M_{1} M_{1}^{\dagger}$ and $M^{\dagger} M=M_{2}^{\dagger} M_{2}$. In fact, it is clear that $M M^{\dagger}$ is the orthogonal projector onto $\mathcal{R}(M)$. Because $Y$ is nonsingular and $M=M_{1} Y$, it follows that $\mathcal{R}(M)=\mathcal{R}\left(M_{1}\right)$. Hence, $M M^{\dagger}$ is also an orthogonal projector onto $\mathcal{R}\left(M_{1}\right)$. Using the uniqueness of orthogonal projectors, we get that $M M^{\dagger}=M_{1} M_{1}^{\dagger}$. Similarly, we can verify that $M^{\dagger} M=M_{2}^{\dagger} M_{2}$. Therefore, we have

$$
M^{\dagger}=M_{2}^{\dagger} M_{2}\left(Y^{-1} N^{\dagger} X^{-1}\right) M_{1} M_{1}^{\dagger}
$$

Under the assumptions of this theorem, by Corollary 3.2, we have

$$
M^{\dagger}=\left(I+L^{*}\right)\left(I+L L^{*}\right)^{-1} N^{\dagger} N(I+L) Y^{-1} N^{\dagger} X^{-1}(I+R) N N^{\dagger}\left(I+R^{*} R\right)^{-1}\left(I+R^{*}\right) .
$$

Using $R=X E_{N} X^{-1}\left(E_{N}-I\right)$ and $L=\left(F_{N}-I\right) Y^{-1} F_{N} Y$, we obtain

$$
\begin{aligned}
(I+L) Y^{-1} N^{\dagger} X^{-1}(I+R) & =Y^{-1} N^{\dagger} X^{-1}+Y^{-1} N^{\dagger} X^{-1} R+L Y^{-1} N^{\dagger} X^{-1}+L Y^{-1} N^{\dagger} X^{-1} R \\
& =Y^{-1} N^{\dagger} X^{-1}
\end{aligned}
$$

where we have applied the facts that $N^{\dagger} E_{N}=0$ and $F_{N} N^{\dagger}=0$. Consequently, we infer that

$$
M^{\dagger}=\left(I+L^{*}\right)\left(I+L L^{*}\right)^{-1} N^{\dagger} N\left(Y^{-1} N^{\dagger} X^{-1}\right) N N^{\dagger}\left(I+R^{*} R\right)^{-1}\left(I+R^{*}\right)
$$

This completes the proof.
Corollary 3.4. Under the same conditions as in Theorem 3.3. If both $X E_{N}$ and $F_{N} Y$ are Hermitian, then

$$
\begin{equation*}
M^{\dagger}=\left(I+L^{*}\right)\left(I+L L^{*}\right)^{-1} Y^{-1} N^{\dagger} X^{-1}\left(I+R^{*} R\right)^{-1}\left(I+R^{*}\right) \tag{3.6}
\end{equation*}
$$

Proof. Because $X E_{N}$ and $F_{N} Y$ are Hermitian, by Lemmas 2.2 and 2.3, the assumptions $\mathbf{A}_{1}$ and $\mathbf{A}_{2}$ are clearly satisfied. An application of Theorem 3.3 gives

$$
\begin{equation*}
M^{\dagger}=\left(I+L^{*}\right)\left(I+L L^{*}\right)^{-1} N^{\dagger} N\left(Y^{-1} N^{\dagger} X^{-1}\right) N N^{\dagger}\left(I+R^{*} R\right)^{-1}\left(I+R^{*}\right) . \tag{3.7}
\end{equation*}
$$

Due to both $X E_{N}$ and $F_{N} Y$ are Hermitian, it follows that $X E_{N}=E_{N} X^{*}$ and $F_{N} Y=Y^{*} F_{N}$. Then, $E_{N}\left(X^{*}\right)^{-1}=X^{-1} E_{N}$ and $\left(Y^{*}\right)^{-1} F_{N}=F_{N} Y^{-1}$. Notice that
$N^{\dagger} N\left(Y^{-1} N^{\dagger} X^{-1}\right) N N^{\dagger}=Y^{-1} N^{\dagger} X^{-1}-F_{N} Y^{-1} N^{\dagger} X^{-1}-Y^{-1} N^{\dagger} X^{-1} E_{N}+F_{N} Y^{-1} N^{\dagger} X^{-1} E_{N}$.
Using $\left(Y^{*}\right)^{-1} F_{N}=F_{N} Y^{-1}$ and $F_{N} N^{\dagger}=0$, we can derive that $F_{N} Y^{-1} N^{\dagger} X^{-1}=0$. By $E_{N}\left(X^{*}\right)^{-1}=X^{-1} E_{N}$ and $N^{\dagger} E_{N}=0$, we have $Y^{-1} N^{\dagger} X^{-1} E_{N}=0$. Consequently,

$$
\begin{equation*}
N^{\dagger} N\left(Y^{-1} N^{\dagger} X^{-1}\right) N N^{\dagger}=Y^{-1} N^{\dagger} X^{-1} \tag{3.8}
\end{equation*}
$$

By substituting (3.8) into (3.7), we obtain the formula (3.6).
Remark 3.5. If $X E_{N}=E_{N}$ and $F_{N} Y=F_{N}$, the conditions in Corollary 3.4 are obviously satisfied because $E_{N}$ and $F_{N}$ are orthogonal projectors. In this case,

$$
\begin{aligned}
R & =X E_{N} X^{-1}\left(E_{N}-I\right)=E_{N}\left(X^{-1} E_{N}-X^{-1}\right)=E_{N}\left(E_{N}-X^{-1}\right)=E_{N}\left(I-X^{-1}\right)=R_{0}, \\
L & =\left(F_{N}-I\right) Y^{-1} F_{N} Y=\left(F_{N} Y^{-1}-Y^{-1}\right) F_{N}=\left(F_{N}-Y^{-1}\right) F_{N}=\left(I-Y^{-1}\right) F_{N}=L_{0},
\end{aligned}
$$

where $R_{0}$ and $L_{0}$ are defined as in expression (1.1). Therefore, Corollary 3.4 has extended the expression (1.1).
