

Test the accuracy of the Dubna phenomenological model of the masses of atomic nuclei

Strachimir Cht. Mavrodiev

Institute for Nuclear Research and Nuclear Energy, Sofia, BAS, Bulgaria

ABSTRACT

In this paper is presented the reliability test the numerical generalization of Bethe-Weizsacker mass formula which describes the values of measured **2654** nuclei masses in **AME2012 nuclear database**: <https://www-nds.iaea.org/amdc/>, with accuracy in the interval (-1.90,1.80) MeV, for the nuclear with mass number A=2(1,1) to 294(117,177).

In the analyzed generalization of the Bethe-Weizsacker formula the little correction of proton and neutron magic numbers and boundaries of their influence was derived as a solution of nonlinear inverse problem (Ivanenko shell model!). There was confirmed the existence of ten proton (2,8,14,20,28,50,82,96,108,126) and eleven neutron (2,8,14,20,28,50,82,126,142,152,184) magic numbers.

The test was performed analyzing the new data from **Nuclide ground states**: <https://www-nds.iaea.org/relnsd/NdsEnsdf/QueryForm.html>, containing **3182** data for A=2(1,1) to 294(118,176) and confirmed the above values of proton and neutron magic numbers. The accuracy of masses description is in the interval (-2.80,1.80) MeV. Only fourteen nuclear masses have bigger than **1.90 MeV** residual.

Keywords: *Bethe-Weizsaker mass formula, magic numbers, binding energy, inverse problem*

INTRODUCTION

The history and development of Bethe-Weizsacker mass formula was presented in details in paper [1], where on the basis of inverse problem was discover the explicit form of binding energy $E_B(A, Z, a)$, which describes the nuclei masses values (2564) from most recent evaluation database AME2012 (December 2012 - [2, 3]) with accuracy better or equal to 2.6 MeV. The masses extrapolated from systematics and marked with the symbol # in the error column was not taken into account.

The purpose of the paper [4] was to obtain the improved, compared with [1] explicit form of BW formulae as function of A and Z.

These aim have been reached using Alexandrov dynamic autoregularization method (FORTRAN code REGN-Dubna [5-17]) for solving the overdetermined algebraic systems of equations which is constructive development of Tikhonov regularization method [18-20]. One has to note that the use of procedure LCH permits to discover the explicit form of unknown function [21-26].

The aim of this paper is to perform the accuracy test of the binding energy, the nuclear mass, the atomic mass and the excess energy models from [4] taking into account the 3182 data published in [37].

In Sec.1 the accuracy test is presented with figures of residuals Res=Expt-Th for Binding energies, Nuclear and Atomic masses and Excess energies for A(Z,N) from A=2(1,1) to 294(118,176). The calculated with new 3182 data two proton and neutron drip- lines and their asymptotics are presented in Sec.2. The Fortran source code of the generalized BW mass formula is given in Appendix A. The description of the experimental binding energy, nuclear and atomic mass mass excess values from new database **Nuclide groung state**: <https://www-nds.iaea.org/relnsd/NdsEnsdf/QueryForm.html> is given in Appendix B. In Appendix C are presented the predicted values of the binding energy and nuclear mass for some supper havy nuclei (see [38] and Proceeding of Exon 2016, Kazan [39]). In Appendix D are presented the values total and kinetic decay energy for some superhavy nuclei.

1. The reliability test

The explicit form of the Bethe-Weizsäcker formula for Binding energy as function of mass number A, number of protons presented in paper [4] was

$$E_B(A, Z, a) = Vol(A, Z, a) - Sur(A, Z, a) \frac{1}{A^{P_1(A, Z, a)}} - Cha(A, Z, a) \frac{Z(Z-1)}{A^{P_2(A, Z, a)}} - \\ Sym(A, Z, a) \frac{(N-Z)^2}{A^{P_3(A, Z, a)}} + Wig(A, Z, a) \frac{\delta(A, Z)}{A^{P_4(A, Z, a)}} + K_{MN}(A, Z, a), \quad (1)$$

where the function $K_{MN}(A, Z, a)$ depends from the proton and neutron magic numbers and from the frontier between their influence.

The next two figures present the behaviour of the function $K_{MN}(A, Z, a)$ from proton number Z and neutron N.

Fig.1. The behaviour of the function $K_{MN}(A, Z, a)$ from the proton magic numbers Z and the the frontier between their influence.

Fig.2. The behaviour of the function $K_{MN}(A, Z, a)$ from the neutron numbers N and the the frontier between their influence.

Under definitions

$$\bar{\epsilon}_r = \frac{1}{N} \sum_{i=1}^N \frac{Expt(A_i, Z_i) - Th(A_i, Z_i, a)}{Expt(A_i, Z_i)}, \quad (2)$$

$$\chi^2 = \sum_{k=1}^M \left(\frac{Expt(A_k, Z_k) - Th(A_k, Z_k, a)}{\sigma(A_k, Z_k)} \right)^2, \quad (3)$$

where

$$\sigma(A_k, Z_k) = C \times \sigma_{Stat}(A_k, Z_k) + Percent \times Expt(A_k, Z_k) \quad (4)$$

and

$$\chi_n = \sqrt{\frac{\chi^2}{M-N}}, \quad (5)$$

where $M - N$ is the number of degrees of freedom, the next Table 1 present the comparison between the 2564 and 3182 cases for B_e , M_{Nucl} , M_{At} and M_{Exc} .

Table1

			Percent	$\bar{\epsilon}_r$	χ^2	χ_n
2564	B_e		1.85E-03	5.19E-02	2512	1.042
	M_{Nucl}		1.20E-05	-1.26E-05	2418	1.022

In the next figures are presented the Gaus fits of distribution of residuals $\text{Res} = \text{Expt- Th}$ for the Binding energy and the Nuclear mass for the case 3182..

Fig. 3. The Gaus fits of distribution of residuals $\text{Res} = \text{Be}^{\text{Expt}} - \text{Be}^{\text{Th}}$.

Fig. 3. The Gaus fits of distribution of residuals $\text{Res} = \text{NuclearMass}^{\text{Expt}} - \text{NuclearMass}^{\text{Th}}$.

2. Two proton and neutron drip- lines and their asymptotics

The nuclear drip lines are the boundary delimiting the zone of Z , N in which atomic nuclei lose stability due to the transmutation of neutrons (down one) as well as because of Coulomb repulsion of protons (up). To find where these drip lines are on the nuclear landscape we need to know the values of Z and N , where the separation energy is changed its sign. The coordinates, where separation energies change the sign can be calculated by using the explicit form for binding energy $E_B(A, Z, a)$ (Eq.(4)).

Fig.4 The behavior of calculated proton and neutron drip-lines compared with Z, N coordinates of 3182 measured nucleus.

Fig.5 The asymptotic behavior of calculated proton and neutron drip-lines.

In Table 3 are presented the isotopes which are outside the drip-lines.

Conclusion

The challenge of low energy nuclear physics to describe the dependence of the binding energy, nuclear and atomic mass, mass excess as functions of the number of protons and neutrons is presented.

This result was established by using the experimental data from AME2012 [2,3] and [37] databases, the inverse problem method for discovering the explicit form of unknown theoretical function (model) and the values, based on the REGN (L. Aleksandrov-Regularized Gauss-Newton iteration method) [5 - 17] for solving the overdetermined nonlinear system of equations. One have to note that the LCH-weighting procedure [21-26] of the REGN program permits to choose the better function out of two functions with the same χ^2 .

The essential advantage of the Aleksandrov method [5 - 17] from other similar methods is extremely effective ideology regularization of inverse problem solution, which on each iteration step controls not only the actual decision, but, very importantly, uncertainty of the solution. At the same time, the transition from the mathematical theory of the autoregularized iterative processes, which is based on meaningful theorems of convergence L. Aleksandrov [6] to Fortran codes (REGN-Dubna [8], FXY-Sofia-Dubna [17]) is very complicated, but technically clear work.

The first interesting application of the proposed explicit form of Dubna Nuclear Mass Phenomenological Model seems to be the calculation of two proton and neutron drip-lines and their intercept in Z=250, N=450, A=700.

Proposed formula can be used for calculation of not known nuclear mass, the total and kinetic energy of proton, alpha, cluster decays and spontaneously fissions- see Appendix D.

The used in this paper approach for generalization of BW mass formulae can be applied for the actualization the half-life models (see for example [37] which describes the increasing volume of experimental data in NuDat database. Such actualization can be used for reasurching the problems in super havy nuclei stability islands.

ACKNOWLEDGMENTS: The creation of a phenomenological model of the masses of atomic nuclei began in at JINR, Dubna about 10 years in satrudnichestvos Alexei Sissakyan and Lubomir Aleksandrov. The author is thankful to Svetla Drenskaya and Maksim Deliyergiyev for fruitfull discutions.

APPENDIX D

IF WE DEFINE THE ALPHA DECAY AS FOLLOW

$$M(Z, N) \rightarrow M_d(Z - 2, N - 2) + M_a(2, 2),$$

calculate the masses using formulae (1) and (4), then the total energy of the decay is

$$Q_t^{\text{Th}} = M(Z, N) - M_d(Z - 2, N - 2) - M_a(2, 2)$$

and the kinetic energy of alpha particle is

$$E_k^{Th} = Q_{at}^{Th} \frac{M_d(Z-2,N-2)}{M_d(Z-2,N-2) + M_a(2,2)}$$

IN THE NEXT TABLE 5 ARE PRESENTES THE DATA FROM PAPER [37] AS FOLLOW: Mode, Nomep, Element, A, Z, N, M, M_d, E_k^{Expt}, E_kTh, Q_k^{Expt}, Q_kTh, dE = $\frac{E_k^{Expt} - E_k^{Th}}{E_k^{Th}}$, dQ = $\frac{Q_k^{Expt} - Q_k^{Th}}{Q_k^{Th}}$.
