The $m$-th root Finsler geometry of the
Bogoslovsky-Goenner metric

Mircea Neagu

Abstract
In this paper we present the $m$-th root Finsler geometries of the
three and four dimensional Bogoslovsky-Goenner metrics (good Finslerian anisotropic models in Special Relativity), in the sense of their Cartan torsion and curvature distinguished tensors or vertical Einstein-like equations.

Mathematics Subject Classification (2010): 53C60, 53C80, 83A05.
Key words and phrases: Bogoslovsky-Goenner metric, $m$-th root metric, Minkowski space, Cartan torsions and curvatures.

1 Introduction
The physical studies of Asanov [1], Bogoslovsky [2] or Minguzzi [4] emphasize the importance of the Finsler geometry in the theory of space-time structure, gravitation and electromagnetism. For this reason, one emphasizes the important role played by the Finsler-Asanov metric (see Miron et al., [5], pp. 54)

$$F : TM \to \mathbb{R}, \quad F(x, y) = (a^1a^2...a^n)^{\frac{1}{m}},$$

where $a^\alpha (\alpha = 1, 2, ..., n)$ are linearly independent 1-forms. The above Finsler metric was initially considered, in diverse particular forms, by Riemann and Berwald-Moór (see Minguzzi [4] or Bogoslovsky and Goenner [3] and references therein). Moreover, considering that $a^\alpha = a_\beta^\gamma y^\beta$, where $a_\beta^\gamma \in \mathbb{R}$, the above Finsler-Asanov metric becomes a Minkowski metric of $n$-th root type. These kind of metrics were intensively studied by Shimada [6].

In such an anisotropic physical context, Bogoslovski and Goenner introduced the locally Minkowski metric of a flat space-time with entirely broken isotropy, which is given by

1. for $n = 3$:

$$L(y) = \sqrt[3]{(y^1 - y^2 - y^3)(y^1 - y^2 + y^3)(y^1 + y^2 - y^3)};$$

2. for $n = 4$:

$$L(y) = \sqrt[4]{(y^1 - y^2 - y^3 - y^4)(y^1 - y^2 + y^3 + y^4)\cdot(y^1 + y^2 - y^3 + y^4)(y^1 + y^2 + y^3 - y^4)}.$$
The Finsler geometry of a locally Minkovski space

Let us consider a locally Minkowski space \((M^n, L = L(y))\), where \(L : TM \to \mathbb{R}\) is a Finsler metric depending only on directional variables \(y^i\), where \(i = 1, 2, ..., n\). Note that, in this Section, the Latin letters \(i, j, k, \ldots\) run from 1 to \(n\), and the Einstein convention of summation is adopted all over this work. It follows that the fundamental metrical d-tensor of the Minkowski space is

\[ g_{ij}(y) = \frac{1}{2} \frac{\partial^2 L^2}{\partial y^i \partial y^j}, \]

whose inverse d-tensor is given by \(g^{jk}(y)\). Taking into account that the Finsler function \(L\) is a locally Minkowski metric, we deduce that the Euler-Lagrange equations of \(L\) produce the canonical nonlinear connection \(N^i_j = 0\), where

\[ N^i_j = \frac{\partial G^i}{\partial y^j} = \frac{\partial}{\partial y^j} \left[ g^{im} \left( \frac{\partial^2 L^2}{\partial x^u \partial y^m} y^u - \frac{\partial L^2}{\partial x^u} + \frac{\partial^2 L^2}{\partial t \partial y^m} \right) \right]. \]

As a consequence, in the Finsler geometrical study of the Minkowski metric are important only the vertical geometrical objects like (see [5]):

1. the Cartan d-torsion:

\[ C_{jkm} = \frac{1}{2} \frac{\partial g_{jk}}{\partial y^m} = \frac{1}{4} \frac{\partial^3 L^2}{\partial y^i \partial y^j \partial y^m} \quad \text{(covariant form)}, \]

\[ C^i_{jk} = g^{im} C_{jkm} = \frac{1}{2} \frac{\partial g^{jk}}{\partial y^m} \quad \text{(contravariant form)}; \]

2. the Cartan d-curvature:

\[ S^i_{jk} = \frac{\partial C^i_{jk}}{\partial y^k} - \frac{\partial C^i_{jk}}{\partial y^j} + C^u_{ij} C^l_{uk} - C^u_{ik} C^l_{uj} \quad \text{(contravariant form)}, \]

\[ S_{lmjk} = g_{lm} S^l_{ijk} = g^{uv} \left( C_{ujm} C_{vik} - C_{ukm} C_{vij} \right) \quad \text{(covariant form)}. \]

3. the vertical Einstein-like equations for \(n > 2\):

\[ S_{ij} - \frac{1}{2} g_{ij} = \frac{1}{2} T_{ij}, \]

where

- \(S_{ij} = S^m_{ijm}\) is the vertical Ricci d-tensor;
- \(S = g^{uv} S_{uv}\) is the scalar curvature;
- \(T_{ij}\) are the new vertical components of the non-isotropic stress-energy d-tensor of matter \(T\);
- \(k\) is the Einstein constant.
3 The 3-rd root Finsler geometry of the three dimensional Bogoslovsky-Goenner metric

In this Section we have \( M = \mathbb{R}^3 \), that is \( n = 3 \), and the Latin indices \( i, j, k, \ldots \) run from 1 to 3. Let us consider the notations \( S_\alpha = (y^1)^\alpha + (y^2)^\alpha + (y^3)^\alpha \), where \( \alpha \in \mathbb{Z} \), \( P_3 = y^i y^j y^k \) and

\[
A = (y^1 - y^2 - y^3)(y^1 - y^2 + y^3)(y^1 + y^2 - y^3).
\]

In such a context, by direct computations, the three dimensional Bogoslovsky-Goenner metric \( L \) takes the 3-rd root metric form

\[
L = \sqrt[3]{A} = \sqrt[3]{(y^1)^3 + (y^2)^3 + (y^3)^3 - y^1(y^2)^2 - y^1(y^3)^2 - y^2(y^1)^2 - y^2(y^3)^2 - y^3(y^1)^2 - y^3(y^2)^2 + 2y^1 y^2 y^3}
\]

working on the domain in which \( 2S_3 - S_1 S_2 + 2P_3 \neq 0 \), the fundamental metrical d-tensor produced by the Bogoslovsky-Goenner metric of order three \( \mathbb{R}^3 \) is given by

\[
g_{ij} = \frac{1}{2} \frac{\partial^2 L^2}{\partial y^i \partial y^j} = \frac{1}{2} \frac{\partial^2 A^{2/3}}{\partial y^i \partial y^j} = \frac{A^{-1/3}}{3} A_{ij} - \frac{A^{-4/3}}{9} A_{ij}, \quad (3)
\]

where

\[
A_i = \frac{\partial A}{\partial y^i} = 6(y^i)^2 - S_2 - 2y^i S_1 + 2 \frac{P_3}{y^i},
\]

\[
A_{ij} = \frac{\partial^2 A}{\partial y^i \partial y^j} = -2y^i - 2y^j + 2 \frac{P_3}{y^i y^j} + \left[ 12y^i - 2S_1 - 2 \frac{P_3}{(y^i)^2} \right] \delta_{ij}.
\]

Putting the coefficients \( A_{ij} \) into a matrix, we get the matrix

\[
(A_{ij})_{i,j=1,3} = \begin{pmatrix}
6y^1 - 2y^2 - 2y^3 & -2y^1 - 2y^2 + 2y^3 & -2y^1 + 2y^2 - 2y^3 \\
-2y^1 - 2y^2 + 2y^3 & -2y^1 + 6y^2 - 2y^3 & 2y^1 - 2y^2 - 2y^3 \\
-2y^1 + 2y^2 - 2y^3 & 2y^1 - 2y^2 - 2y^3 & -2y^1 - 2y^2 + 6y^3
\end{pmatrix},
\]

whose determinant is given by \( \det(A_{ij}) = -8D \), where \( D = -4(y^1)^3 - 4(y^2)^3 - 4(y^3)^3 + 4(y^1)^2 y^2 + 4(y^1)^2 y^3 + 4y^1(y^2)^2 + 4y^1(y^3)^2 + 4(y^2)^2 y^3 + 4y^2(y^3)^2 - 8y^1 y^2 y^3 = -8S_3 + 4S_1 S_2 - 8P_3 \). If we have \( D \neq 0 \), then the inverse matrix of \( (A_{ij}) \) is the matrix \( (A^{ik})_{i,k=1,3} = D^{-1} A^* \), where \( A^* = \)

\[
(2(y^2)^2 - 4y^2 y^3 + 2(y^3)^2) \begin{pmatrix}
S_2 - 2y^1 y^3 - 2y^2 y^3 & S_2 - 2y^1 y^3 - 2y^2 y^3 & S_2 - 2y^1 y^2 - 2y^2 y^3 \\
S_2 - 2y^1 y^3 - 2y^2 y^3 & 2(y^1)^2 - 4y^1 y^3 + 2(y^3)^2 & S_2 - 2y^1 y^2 - 2y^2 y^3 \\
S_2 - 2y^1 y^2 - 2y^2 y^3 & S_2 - 2y^1 y^2 - 2y^2 y^3 & 2(y^1)^2 - 4y^1 y^2 + 2(y^2)^2
\end{pmatrix}.
\]

As a general formula, we have

\[
A^{ik} = \frac{1}{D} \left[ S_2 - 2(y^i + y^k) \frac{P_3}{y^i y^k} - (y^i)^2 \delta_{ij} \right].
\]
Using the above geometrical entities, we deduce that the inverse d-tensor of the fundamental metrical d-tensor has the form

\[ g^{jk} = 3A^{1/3} A^{jk} + \frac{A^{-2/3}}{1 - \frac{A^{-1}}{3} A^{uv} A_{u} A_{v}} A^{ij} A^{k}, \] (4)

where \( A^{i} = A^{iw} A_{w}. \) Moreover, by direct computations, the covariant Cartan d-torsion produced by the three dimensional Bogoslovsky-Goenner metric is given by

\[ C_{jkm} = \frac{A^{-1/3}}{6} A_{jkm} - \frac{A^{-4/3}}{18} (A_{jk} A_{m} + A_{km} A_{j} + A_{mj} A_{k}) - \frac{A^{-7/3}}{18} A_{j} A_{k} A_{m}, \]

where

\[ A_{jkm} = \frac{\partial A_{ik}}{\partial y^{m}} = \frac{\partial^3 A}{\partial y^j \partial y^k \partial y^m} = \begin{cases} 6, & \text{if } j = k = m \\ 2, & \text{if } j \neq k \neq m \neq j \\ -2, & \text{otherwise}. \end{cases} \]

In other words, if we denote by \( A_{(m)} = (A_{jkm})_{j,k=1,m}, \) where \( m \in \{1, 2, 3\}, \) we get

\[ A_{(1)} = \begin{pmatrix} 6 & -2 & -2 \\ -2 & -2 & 2 \\ -2 & 2 & -2 \end{pmatrix}, \quad A_{(2)} = \begin{pmatrix} -2 & -2 & 2 \\ -2 & 6 & -2 \\ 2 & -2 & -2 \end{pmatrix}, \]

\[ A_{(3)} = \begin{pmatrix} -2 & 2 & -2 \\ 2 & -2 & -2 \\ -2 & -2 & 6 \end{pmatrix}. \]

4 The 4-th root Finsler geometry of the four dimensional Bogoslovsky-Goenner metric

In this Section we have \( M = \mathbb{R}^4, \) that is \( n = 4, \) and the Latin indices \( i, j, k, \ldots \) run from 1 to 4. Let us consider the notations \( S_{\alpha} = (y^{1})^{\alpha} + (y^{2})^{\alpha} + (y^{3})^{\alpha} + (y^{4})^{\alpha}, \)

where \( \alpha \in \mathbb{Z}, \) \( P_{4} = y^{1} y^{2} y^{3} y^{4} \) and \( A = (y^{1} - y^{2} - y^{3} - y^{4})(y^{1} - y^{2} + y^{3} + y^{4})(y^{1} + y^{2} - y^{3} + y^{4})(y^{1} + y^{2} + y^{3} - y^{4}). \)

In such a context, by direct computations, the four dimensional Bogoslovsky-Goenner metric takes the 4-th root metric form

\[ L = \sqrt[4]{A} = \sqrt[4]{(y^{1})^{4} + (y^{2})^{4} + (y^{3})^{4} + (y^{4})^{4} - 2 (y^{1})^{2} (y^{2})^{2} - 2 (y^{1})^{2} (y^{3})^{2} - 2 (y^{1})^{2} (y^{4})^{2} - 2 (y^{2})^{2} (y^{3})^{2} - 2 (y^{2})^{2} (y^{4})^{2} - 2 (y^{3})^{2} (y^{4})^{2} - 8 y^{1} y^{2} y^{3} y^{4} = \sqrt[4]{2S_{4} - S_{2}^{2} - 8P_{4}.} \]
Working on the domain in which $2S_4 - S_2^2 - 8P_4 > 0$, the fundamental metrical d-tensor produced by the Bogoslovsky-Goenner metric of order four \(^{(2)}\) is given by

$$g_{ij} = \frac{1}{2} \frac{\partial^2 L^2}{\partial y^i \partial y^j} = \frac{1}{2} \frac{\partial^2 A^{1/2}}{\partial y^i \partial y^j} = \frac{A^{-1/2}}{4} A_{ij} - \frac{A^{-3/2}}{8} A_i A_j,$$  \hspace{1cm} (5)

where

$$A_i = \frac{\partial A}{\partial y^i} = 4(y^i)^3 - 4y^i \left[ S_2 - (y^i)^2 \right] - \frac{P_4}{y^i},$$

$$A_{ij} = \frac{\partial^2 A}{\partial y^i \partial y^j} = -8y^i y^j - 8 \frac{P_4}{y^i y^j} + \left[ 24 (y^i)^2 - 4S_2 + 8 \frac{P_4}{(y^i)^2} \right] \delta_{ij}.$$  

Putting the coefficients $A_{ij}$ into a matrix, we get the matrix

$$(A_{ij})_{i,j=1,4} = \begin{pmatrix} p & a & b & c \\ a & q & c & b \\ b & c & r & a \\ c & b & a & s \end{pmatrix},$$

where

$$p = 12(y^1)^2 - 4(y^2)^2 - 4(y^3)^2 - 4(y^4)^2,$$

$$q = -4(y^1)^2 + 12(y^2)^2 - 4(y^3)^2 - 4(y^4)^2,$$

$$r = -4(y^1)^2 - 4(y^2)^2 + 12(y^3)^2 - 4(y^4)^2,$$

$$s = -4(y^1)^2 - 4(y^2)^2 - 4(y^3)^2 + 12(y^4)^2,$$

$$a = -8y^1 y^2 - 8y^3 y^4,$$

$$b = -8y^1 y^3 - 8y^2 y^4,$$

$$c = -8y^1 y^4 - 8y^2 y^3,$$

whose determinant is given by $D = \det(A_{ij}) = a^4 - 2a^2 c^2 - 2b^2 c^2 - 2a^2 b^2 + b^4 + c^4 - a^2 pq - b^2 pr - a^2 rs - b^2 qs - c^2 p - c^2 qr + 2abc + 2abq + 2acr + 2abf + pqr$. If we have $D \neq 0$, then the inverse matrix of $(A_{ij})$ is the matrix $(A^{jk})_{j,k=1,4} = D^{-1} A^*$, where $A^* =$ 

\[
\begin{pmatrix}
-qa^2 + 2ab - rb^2 - sc^2 + qrs & a^3 - ac^2 - ab^2 + bcr + bcs - ars \\
a^3 - ac^2 - ab^2 + bcr + bcs - ars & -pa^2 + 2abc - sb^2 - rc^2 + prs \\
b^3 - bc^2 - a^2b + acq + acs - bqs & c^3 - b^2c - a^2c + abp + abs - cps \\
c^3 - b^2c - a^2c + abp + abs - cps & b^3 - bc^2 - a^2b + acp + acr - bpr \\
-qa^2 + 2ab - rb^2 - sc^2 + qrs & a^3 - ac^2 - ab^2 + bcr + bcs - ars \\
-qa^2 + 2ab - rb^2 - sc^2 + qrs & a^3 - ac^2 - ab^2 + bcr + bcs - ars \\
-qa^2 + 2ab - rb^2 - sc^2 + qrs & a^3 - ac^2 - ab^2 + bcr + bcs - ars \\
-qa^2 + 2ab - rb^2 - sc^2 + qrs & a^3 - ac^2 - ab^2 + bcr + bcs - ars \\
-qa^2 + 2ab - rb^2 - sc^2 + qrs & a^3 - ac^2 - ab^2 + bcr + bcs - ars
\end{pmatrix}
\]
Using the above geometrical entities, we deduce that the inverse d-tensor of the fundamental metrical d-tensor (5) has the form

\[ g^{jk} = 4A^{1/2}A^{jk} + \frac{A^{-1/2}}{2 - A^{-1}A^{vw}A_{vu}}A^jA^k, \]  

(6)

where \( A^j = A^{jw}A_w \). Moreover, by direct computations, the covariant Cartan d-torsion produced by the four dimensional Bogoslovsky-Goenner metric (2) is given by

\[ C_{jkm} = \frac{A^{-1/2}}{8}A_{jkm} - \frac{A^{-3/2}}{16}(A_{jk,A_m} + A_{km,A_j} + A_{mj,A_k}) + \frac{3A^{-5/2}}{32}A_jA_kA_m, \]

where

\[ A_{jkm} = \frac{\partial A_{jk}}{\partial y^m} = \frac{\partial^3 A}{\partial y^j\partial y^k\partial y^m}. \]

If we denote by \( A_{(m)} = (A_{jkm})_{j,k=1,4} \), where \( m \in \{1, 2, 3, 4\} \), we get

\[ A_{(1)} = \begin{pmatrix} 24y^1 & -8y^2 & -8y^3 & -8y^4 \\ -8y^2 & -8y^1 & -8y^4 & -8y^3 \\ -8y^3 & -8y^4 & -8y^1 & -8y^2 \\ -8y^4 & -8y^3 & -8y^2 & -8y^1 \end{pmatrix}, \]

\[ A_{(2)} = \begin{pmatrix} -8y^2 & -8y^1 & -8y^4 & -8y^3 \\ -8y^1 & 24y^2 & -8y^3 & -8y^4 \\ -8y^3 & -8y^4 & -8y^1 & -8y^2 \\ -8y^4 & -8y^3 & -8y^2 & -8y^1 \end{pmatrix}, \]

\[ A_{(3)} = \begin{pmatrix} -8y^3 & -8y^4 & -8y^1 & -8y^2 \\ -8y^4 & -8y^3 & -8y^2 & -8y^1 \\ -8y^1 & -8y^2 & 24y^3 & -8y^4 \\ -8y^2 & -8y^1 & -8y^4 & -8y^3 \end{pmatrix}, \]

\[ A_{(4)} = \begin{pmatrix} -8y^4 & -8y^3 & -8y^2 & -8y^1 \\ -8y^3 & -8y^4 & -8y^1 & -8y^2 \\ -8y^2 & -8y^1 & -8y^4 & -8y^3 \\ -8y^1 & -8y^2 & -8y^3 & 24y^4 \end{pmatrix}. \]
