# A LIOUVILLE THEOREM FOR SOME BESSEL GENERALIZED OPERATORS. 

VANESA GALLI, SANDRA MOLINA, AND ALEJANDRO QUINTERO

#### Abstract

In this paper we establish a Liouville theorem in $\mathcal{H}^{\prime}{ }_{\mu}$ for a wider class of operators in $(0, \infty)^{\mathrm{n}}$ that generalizes the $n$-dimensional Bessel operator. We will present two different proofs, based in two representation theorems for certain distributions "supported in zero".

## 1. Introduction

Liouville type theorems have been studied in many works under different contexts. In analytic theory, Liouville theorems stated that a bounded entire function reduces to a constant. A first version of Liouville theorem in distributional theory is due to L. Schwartz [8], and assert that any bounded harmonic function in $\mathbb{R}^{n}$ is a constant.

Currently, this result has been generalized in many directions. A well known generalization states that:

Let $L=\sum_{|\alpha| \leq m} a_{\alpha} D^{\alpha}$ be a linear differential operator with constant coefficients such that $L=\sum_{|\alpha| \leq m} a_{\alpha}(2 \pi i \xi)^{\alpha} \neq 0$ for all $\xi \in \mathbb{R}^{n}-\{0\}$. If a tempered distribution $u$, solves $L u=0$, then $u$ is a polynomial function. In particular, if $u$ is bounded then it reduces to a constant.

In this work, we established a Liouville type theorem for a large class of operators in $(0, \infty)^{\mathrm{n}}$, that are lineal combinations of operators

$$
\begin{equation*}
S^{k}=S_{\mu_{1}}^{k_{1}} \circ \ldots \circ S_{\mu_{n}}^{k_{n}} \tag{1.1}
\end{equation*}
$$

where $k$ is a multi-index, $k=\left(k_{1}, \ldots, k_{n}\right), \mu_{i} \in \mathbb{R}, \mu_{i} \geq-1 / 2$ and

$$
\begin{equation*}
S_{\mu_{i}}=\frac{\partial^{2}}{\partial x_{i}^{2}}-\frac{4 \mu_{i}-1}{4 x_{i}^{2}} . \tag{1.2}
\end{equation*}
$$

The operators given by linear combination of (1.1) contain as a particular case the $n$-dimensional operator defined in [5] and given by:

$$
\begin{equation*}
S_{\mu}=\Delta-\sum_{i=1}^{n} \frac{4 \mu_{i}^{2}-1}{4 x_{i}^{2}} \tag{1.3}
\end{equation*}
$$

where $\mu=\left(\mu_{1}, \ldots, \mu_{n}\right)$ and $S_{\mu}$ is a $n$-dimensional version of the well know Bessel operator

$$
\begin{equation*}
S_{\alpha}=\frac{d^{2}}{d x^{2}}-\frac{4 \alpha^{2}-1}{4 x^{2}} \tag{1.4}
\end{equation*}
$$

This operators were introduced in relation to the Hankel transform given by

[^0]\[

$$
\begin{equation*}
h_{\alpha} f(y)=\int_{0}^{\infty} f(x) \sqrt{x y} J_{\alpha}(x y) d x \tag{1.5}
\end{equation*}
$$

\]

with $\alpha \geq-1 / 2$, for 1 -dimensional case and the $n$-dimensional case

$$
\begin{equation*}
\left(h_{\mu} \phi\right)(y)=\int_{(0, \infty)^{\mathrm{n}}} \phi\left(x_{1}, \ldots, x_{n}\right) \prod_{i=1}^{n}\left\{\sqrt{x_{i} y_{i}} J_{\mu_{i}}\left(x_{i} y_{i}\right)\right\} d x_{1} \ldots d x_{n} \tag{1.6}
\end{equation*}
$$

with $\mu=\left(\mu_{1}, \ldots, \mu_{n}\right), \mu_{i} \geq-1 / 2, i=1, \ldots, n$. And $J_{\nu}$ represents the Bessel functions of the first kind and order $\nu$.

Bessel operators (1.3) and (1.4) and Hankel Transforms (1.5) and (1.6) were studied on Zemanian spaces $\mathcal{H}_{\mu}$ and $\mathcal{H}^{\prime}{ }_{\mu}$ in [5], [6] and 11].

The space $\mathcal{H}_{\mu}$ is a space of functions $\phi \in C^{\infty}\left((0, \infty)^{\mathrm{n}}\right)$ such that for all $m \in$ $\mathbb{N}_{0}, k \in \mathbb{N}_{0}^{n}$ verifies

$$
\begin{equation*}
\gamma_{m, k}^{\mu}(\phi)=\sup _{x \in(0, \infty)^{\mathrm{n}}}\left|\left(1+\|x\|^{2}\right)^{m} T^{k}\left\{x^{-\mu-1 / 2} \phi(x)\right\}\right|<\infty \tag{1.7}
\end{equation*}
$$

where $-\mu-1 / 2=\left(-\mu_{1}-1 / 2, \ldots,-\mu_{n}-1 / 2\right)$ and the operators $T^{k}$ are given by

$$
T^{k}=T_{n}^{k_{n}} \circ T_{n-1}^{k_{n-1}} \circ \ldots \circ T_{1}^{k_{1}}
$$

where $T_{i}=x_{i}^{-1} \frac{\partial}{\partial x_{i}}$. Thus $\mathcal{H}_{\mu}$ is Frèchet space. The dual space of $\mathcal{H}_{\mu}$ is denoted by $\mathcal{H}^{\prime}{ }_{\mu}$.

In [5] the authors proved that $S_{\mu_{i}}$ is continuous from $\mathcal{H}_{\mu}$ into itself for all $i=$ $1, \ldots, n$ and self-adjoints lineal mappings. Which also implies that the operator $S^{k}=S_{\mu_{n}}^{k_{n}} \ldots S_{\mu_{1}}^{k_{1}}$ is continuous from $\mathcal{H}_{\mu}$ into itself. Then, since they are self-adjoints the generalized operators can be extended to $\mathcal{H}^{\prime}{ }_{\mu}$ by

$$
\begin{equation*}
\left(S_{\mu_{i}} f, \phi\right)=\left(f, S_{\mu_{i}} \phi\right) \quad \text { and } \quad\left(S^{k} f, \phi\right)=\left(f, S^{k} \phi\right), \quad f \in \mathcal{H}_{\mu}^{\prime} \quad \phi \in \mathcal{H}_{\mu} . \tag{1.8}
\end{equation*}
$$

The generalized Hankel transformation $h_{\mu} f$ of $f \in \mathcal{H}^{\prime}{ }_{\mu}$ is defined by

$$
\left(h_{\mu} f, \phi\right)=\left(f, h_{\mu} \phi\right), \quad f \in \mathcal{H}_{\mu}^{\prime}, \quad \phi \in \mathcal{H}_{\mu} .
$$

for $\mu \in[-1 / 2, \infty)^{n}$. Then $h_{\mu}$ is an automorphism onto $\mathcal{H}_{\mu}$ and $\mathcal{H}^{\prime}{ }_{\mu}$ and $h_{\mu}=$ $\left(h_{\mu}\right)^{-1}$.

The Hankel transform and Bessel operator are related by

$$
h_{\mu}\left(S_{\mu}\right)=-\left\|y^{2}\right\| h_{\mu}
$$

in $\mathcal{H}_{\mu}$ and $\mathcal{H}^{\prime}{ }_{\mu}$.
Now we shall describe the main result of this work.
Theorem 1.1. Let $P[x]$ be a polynomial in n-variables such that $\sum_{|\alpha| \leq N} a_{\alpha} x^{\alpha} \neq 0$ for all $x \in \mathbb{R}^{n}-\{0\}$ and all its coefficients have the same sign. Let $L$ be the operator $L=\sum_{|\alpha| \leq N}(-1)^{|\alpha|} a_{\alpha} S^{\alpha}$. If $f \in \mathcal{H}^{\prime}{ }_{\mu}$ and

$$
\begin{equation*}
L f=0 \tag{1.9}
\end{equation*}
$$

then there exist a polynomial in $n$-variables $Q$ such that $f(x)=x^{\mu+1 / 2} Q\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]$.
Corollary 1.2. If $f$ is a classical solution of (1.9) of slow growth then there exist a polynomial in $n$-variables $Q$ such that $f(x)=x^{\mu+1 / 2} Q\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]$.. In particular, if $f$ is bounded then $f$ is a constant.

Remark 1.3. The cases $\mu=\left(\mu_{1}, \ldots, \mu_{n}\right)=(1 / 2, \ldots, 1 / 2)$ or $(-1 / 2, \ldots,-1 / 2)$ produce in (1.3) the Laplacian operator in $(0, \infty)^{\mathrm{n}}$.

This paper is organized as follows. In Section 2, we present some notational conventions that will allow us to simplify the presentation of our results. In Section 3 we propose a characterization of a certain family of functions on the multiplier space $\mathcal{O}$ of the $n$-dimensional space $\mathcal{H}_{\mu}$ that extends the result proved by Zemanian in [11. In Section 4 and 5 we give two different proofs of Theorem 1.1

Throughout this paper, C always will denote a suitable positive constant that may change in each occurrence.

## 2. Preliminaries and notations

In this section we summarize without proof the relevant material on Hankel transforms and the Zemanian spaces studied in [4], [5] and [6].

We now present some notational conventions that will allow us to simplify the presentation of our results. We denote by $x=\left(x_{1}, \ldots, x_{n}\right)$ and $y=\left(y_{1}, \ldots, y_{n}\right)$ elements of $(0, \infty)^{\mathrm{n}}$ or $\mathbb{R}^{n}$. Let $\mathbb{N}$ be the set $\{1,2,3, \ldots\}$ and $\mathbb{N}_{0}=\mathbb{N} \cup\{0\},\|x\|=$ $\left(x_{1}^{2}+\ldots+x_{n}^{2}\right)^{\frac{1}{2}}$. The notations $x<y$ and $x \leq y$ mean, respectively, $x_{i}<y_{i}$ and $x_{i} \leq y_{i}$ for $i=1, \ldots, n$. Moreover, $x=a$ for $x \in \mathbb{R}^{n}, a \in \mathbb{R}$ means $x_{1}=x_{2}=$ $\ldots=x_{n}=a, x^{m}=x_{1}^{m_{1}} \ldots x_{n}^{m_{n}}$ and $e_{j}$ for $j=1, \ldots, n$, denotes the members of the canonical basis of $\mathbb{R}^{n}$. An element $k=\left(k_{1}, \ldots, k_{n}\right) \in \mathbb{N}_{0}^{n}=\mathbb{N}_{0} \times \mathbb{N}_{0} \times \ldots \times \mathbb{N}_{0}$ is called multi-index. For $k, m$ multi-index we set $|k|=k_{1}+\ldots+k_{n}$ the length of the multi-index.

Also we will note

$$
k!=k_{1}!\ldots k_{n}!, \quad\binom{k}{m}=\binom{k_{1}}{m_{1}} \ldots\binom{k_{n}}{m_{n}} \quad \text { for } k, m \in \mathbb{N}_{0}^{n} .
$$

Remark 2.1. Let $k$ be a multi-index, the following equality is valid

$$
\begin{equation*}
T^{k}\{\theta . \varphi\}=\sum_{j=0}^{k}\binom{k}{j} T^{k-j} \theta \cdot T^{j} \varphi, \tag{2.1}
\end{equation*}
$$

where "." denote the usual product of functions, $\binom{k}{j}$ and $\sum_{j=0}^{k}$ must be interpreted as in the previous section for $j=0=(0, \ldots, 0)$.

Remark 2.2. If $e_{i}$ is an element of the canonical base of $\mathbb{R}^{n}$, since $S^{e_{i}}=S_{\mu_{n}}^{0} \ldots \circ$ $S_{\mu_{i}}^{1} \ldots S_{\mu_{1}}^{0}=S_{\mu_{i}}$, then

$$
\sum_{i=1}^{n} S^{e_{i}}=\sum_{i=1}^{n} S_{\mu_{i}}=S_{\mu}
$$

In [1] was defined the generalized function $\delta_{\alpha}$, as

$$
\begin{equation*}
\left(\delta_{\alpha}, \phi\right)=C_{\alpha} \lim _{x \rightarrow 0^{+}} x^{-\alpha-1 / 2} \phi(x) \tag{2.2}
\end{equation*}
$$

where $C_{\alpha}=2^{\alpha} \Gamma(\alpha+1)$. The distribution given by (2.2) can be extended in the same way to the $n$-dimensional case. Moreover we can consider the following distribution

$$
\begin{equation*}
\left(T^{k} \delta_{\mu}, \phi\right)=C_{\mu} \lim _{\substack{x \rightarrow 0 \\ x_{i}>0}} T^{k}\left\{x^{-\mu-1 / 2} \phi(x)\right\} \tag{2.3}
\end{equation*}
$$

where $k$ is a multi-index, $\mu \in \mathbb{R}^{n}$ and $C_{\mu}$ is a constant depending on $\mu$ given by $C_{\mu}=\prod_{i=1}^{n} 2^{\mu_{i}} \Gamma\left(\mu_{i}+1\right)$. The generalized function (2.3) is well defined as it can be seen in the proof of Lemma 3.1

Let $\phi \in \mathcal{H}_{\mu}$, since

$$
\left|\left(T^{k} \delta_{\mu}, \phi\right)\right|=\left|C_{\mu} \lim _{\substack{x \rightarrow 0 \\ x_{i} \gg 0}} T^{k}\left\{x^{-\mu-1 / 2} \phi(x)\right\}\right| \leq C_{\mu} \sup _{x \in(0, \infty)^{n}}\left|T^{k}\left\{x^{-\mu-1 / 2} \phi(x)\right\}\right|=C_{\mu} \gamma_{0, k}^{\mu}(\phi),
$$

so $T^{k} \delta_{\mu}$ lies in $\mathcal{H}^{\prime}{ }_{\mu}$. Moreover,

$$
\begin{equation*}
h_{\mu} T^{k} \delta_{\mu}=C_{k}^{\mu} t^{\mu+2 k+1 / 2} \quad \text { in } \quad \mathcal{H}_{\mu}^{\prime}, \tag{2.4}
\end{equation*}
$$

where $C_{k}^{\mu}=(-1)^{|k|} \frac{C_{\mu}}{C_{\mu+k}}$. Indeed, since the well known formula $\frac{d}{d z}\left(z^{-\alpha} J_{\alpha}\right)=$ $-z^{-\alpha} J_{\alpha+1}$ is valid for $\alpha \neq-1,-2, \ldots$, if we consider $k=e_{j}$, then

$$
\begin{aligned}
& \left(h_{\mu} T_{j} \delta_{\mu}, \phi\right)=\left(T_{j} \delta_{\mu}, h_{\mu} \phi\right)=C_{\mu} \lim _{\substack{x \rightarrow 0 \\
x_{i}>0}} T_{j}\left\{x^{-\mu-1 / 2} h_{\mu} \phi(x)\right\}= \\
& =C_{\mu} \lim _{\substack{x \rightarrow 0 \\
x_{i}>0}} x_{j}^{-1} \partial / \partial x_{j}\left\{x^{-\mu-1 / 2} \int_{(0, \infty)^{n}} \phi\left(t_{1}, \ldots, t_{n}\right) \prod_{i=1}^{n}\left\{\sqrt{x_{i} t_{i}} J_{\mu_{i}}\left(x_{i} t_{i}\right)\right\} d t_{1} \ldots d t_{n}\right\} \\
& =C_{\mu} \lim _{\substack{x \rightarrow 0 \\
x_{i}>0}} x_{j}^{-1} \partial / \partial x_{j}\left\{\int_{(0, \infty)^{n}} t^{\mu+1 / 2} \phi\left(t_{1}, \ldots, t_{n}\right) \prod_{i=1}^{n}\left\{\left(x_{i} t_{i}\right)^{-\mu_{i}} J_{\mu_{i}}\left(x_{i} t_{i}\right)\right\} d t_{1} \ldots d t_{n}\right\} \\
& =C_{\mu} \lim _{\substack{x \rightarrow 0 \\
x_{i}>0}} x_{j}^{-1}\left\{\int_{(0, \infty)^{n}} t^{\mu+1 / 2} \phi\left(t_{1}, \ldots, t_{n}\right) \partial / \partial x_{j}\left\{\prod_{i=1}^{n}\left\{\left(x_{i} t_{i}\right)^{-\mu_{i}} J_{\mu_{i}}\left(x_{i} t_{i}\right)\right\}\right\} d t_{1} \ldots d t_{n}\right\} \\
& =-C_{\mu} \lim _{\substack{x \rightarrow 0 \\
x_{i}>0}} \int_{(0, \infty)^{n}} t^{\mu+2 e_{j}+1 / 2} \phi\left(t_{1}, \ldots, t_{n}\right)\left[\left(x_{j} t_{j}\right)^{-\left(\mu_{j}+1\right)} J_{\mu_{j}+1}\left(x_{j} t_{j}\right)\right] \prod_{\substack{i=1 \\
i \neq j}}^{n}\left\{\left(x_{i} t_{i}\right)^{-\mu_{i}} J_{\mu_{i}}\left(x_{i} t_{i}\right)\right\} d t_{1} \ldots d t_{n} \\
& =-C_{\mu}\left\{C_{\mu_{j}+1} \prod_{\substack{i=1 \\
i \neq j}}^{n} C_{\mu_{i}}\right\}^{-1} \int_{(0, \infty)^{n}} t^{\mu+2 e_{j}+1 / 2} \phi\left(t_{1}, \ldots, t_{n}\right) d t_{1} \ldots d t_{n} \\
& =\left(-\frac{C_{\mu_{j}}}{C_{\mu_{j}+1}} t^{\mu+2 e_{j}+1 / 2}, \phi\right)
\end{aligned}
$$

Therefore the assertion is true for $k=e_{j}$. The general case follows in a similar way. Indeed, let $r \in \mathbb{N}_{0}$ and let us observe that

$$
\begin{align*}
& T_{j}^{r}\left\{t^{\mu+1 / 2} \prod_{i=1}^{n}\left\{\left(x_{i} t_{i}\right)^{-\mu} J_{\mu_{i}}\left(x_{i} t_{i}\right)\right\}\right\}= \\
& =\left(x_{j}^{-1} \partial / \partial x_{j}\right)^{r}\left\{t^{\mu+1 / 2} \prod_{i=1}^{n}\left\{\left(x_{i} t_{i}\right)^{-\mu} J_{\mu_{i}}\left(x_{i} t_{i}\right)\right\}\right\} \\
& =(-1)^{r} t^{\mu+2 r} e_{j}+1 / 2\left(x_{j} t_{j}\right)^{-\left(\mu_{j}+r\right)} J_{\mu_{j}+r}\left(x_{j} t_{j}\right) \prod_{\substack{i=1 \\
i \neq j}}^{n}\left\{\left(x_{i} t_{i}\right)^{-\mu_{i}} J_{\mu_{i}}\left(x_{i} t_{i}\right)\right\}, \tag{2.5}
\end{align*}
$$

then (2.5) yields

$$
\begin{aligned}
& \left(h_{\mu} T_{j}^{r} \delta_{\mu}, \phi\right)=\left(T_{j}^{r} \delta_{\mu}, h_{\mu} \phi\right)=C_{\mu} \lim _{\substack{x \rightarrow 0 \\
x_{i}>0}} T_{j}^{r}\left\{x^{-\mu-1 / 2} h_{\mu} \phi(x)\right\}= \\
& =C_{\mu} \lim _{\substack{x \rightarrow 0 \\
x_{i}>0}}\left(x_{j}^{-1} \partial / \partial x_{j}\right)^{r}\left\{x^{-\mu-1 / 2} \int_{(0, \infty)^{\mathrm{n}}} \phi\left(t_{1}, \ldots, t_{n}\right) \prod_{i=1}^{n}\left\{\sqrt{x_{i} t_{i}} J_{\mu_{i}}\left(x_{i} t_{i}\right)\right\} d t_{1} \ldots d t_{n}\right\} \\
& =C_{\mu} \lim _{\substack{x \rightarrow 0 \\
x_{i}>0}}\left(x_{j}^{-1} \partial / \partial x_{j}\right)^{r}\left\{\int_{(0, \infty)^{\mathrm{n}}} t^{\mu+1 / 2} \phi\left(t_{1}, \ldots, t_{n}\right) \prod_{i=1}^{n}\left\{\left(x_{i} t_{i}\right)^{-\mu_{i}} J_{\mu_{i}}\left(x_{i} t_{i}\right)\right\} d t_{1} \ldots d t_{n}\right\} \\
& =(-1)^{r} C_{\mu} \lim _{\substack{x \rightarrow 0 \\
x_{i}>0}} \int_{(0, \infty)^{\mathrm{n}}} t^{\mu+2 r e_{j}+1 / 2} \phi\left(t_{1}, \ldots, t_{n}\right)\left(x_{j} t_{j}\right)^{-\left(\mu_{j}+r\right)} J_{\mu_{j}+r}\left(x_{j} t_{j}\right) \prod_{\substack{i=1 \\
i \neq j}}^{n}\left\{\left(x_{i} t_{i}\right)^{-\mu_{i}} J_{\mu_{i}}\left(x_{i} t_{i}\right)\right\} d t_{1} \ldots d t_{n} \\
& =(-1)^{r} C_{\mu}\left\{C_{\mu_{j}+r} \prod_{\substack{i=1 \\
i \neq j}}^{n} C_{\mu_{i}}\right\}^{-1} \int_{(0, \infty)^{\mathrm{n}}} t^{\mu+2 r e_{j}+1 / 2} \phi\left(t_{1}, \ldots, t_{n}\right) d t_{1} \ldots d t_{n} \\
& =\left((-1)^{r} \frac{C_{\mu_{j}}}{C_{\mu_{j}+r}} t^{\mu+2 r e_{j}+1 / 2}, \phi\right) .
\end{aligned}
$$

For the general case, if we compute for $j \neq k \in\{1, \ldots, n\}$ and $r, m \in \mathbb{N}_{0}$ we obtain that

$$
\left(h_{\mu} T_{j}^{r} T_{k}^{m} \delta_{\mu}, \phi\right)=\left(T_{j}^{r} T_{k}^{m} \delta_{\mu}, h_{\mu} \phi\right)=\left((-1)^{r+m} \frac{C_{\mu_{j}} C_{\mu_{k}}}{C_{\mu_{j}+r} C_{\mu_{k}+m}} t^{\mu+2 r e_{j}+2 m e_{k}+1 / 2}, \phi\right)
$$

and the result follows.

## 3. Some results about Taylor's expansions and a special family of

 MULTIPLIERS IN $\mathcal{H}_{\mu}$In this section we extend the characterization obtained by Zemanian in 11] related to Taylor's expansions of functions in $\mathcal{H}_{\mu}$. Moreover we give a result which improve the Lemma 3.2 in [4].

Lemma 3.1. Let $\mu \in \mathbb{R}^{n}$. Then $\phi$ is a member of $\mathcal{H}_{\mu}$ if and only if it satisfies the following three conditions:
(i) $\phi(x)$ is a smooth complex valued function on $(0, \infty)^{\mathrm{n}}$.
(ii) For each $r \in \mathbb{N}_{0}$
$x^{-\mu-1 / 2} \phi(x)=a_{0}+\sum_{\left|k_{1}\right|=1} a_{2 k_{1}} x^{2 k_{1}}+\sum_{\left|k_{2}\right|=2} a_{2 k_{2}} x^{2 k_{2}}+\ldots+\sum_{\left|k_{r}\right|=r} a_{2 k_{r}} x^{2 k_{r}}+R_{2 r}(x)$,
where

$$
\begin{equation*}
a_{2 k_{r}}=\frac{1}{2^{r} k_{r}!} \lim _{\substack{x \rightarrow 0 \\ x_{i}>0}} T^{k_{r}}\left\{x^{-\mu-1 / 2} \phi(x)\right\}, \tag{3.2}
\end{equation*}
$$

and the remainder term $R_{2 r}(x)$ satisfies

$$
\begin{equation*}
T^{k} R_{2 r}(x)=o(1) \quad x_{x_{i}>0} \tag{3.3}
\end{equation*}
$$

for $k$ multi-index such that $|k|=r$.
(iii) For each multi-index $k_{r}, D^{k_{r}} \phi(x)$ is of rapid descent as $|x| \rightarrow \infty$.

Proof. Since $\phi(x) \in \mathcal{H}_{\mu}$ condition $(i)$ is satisfied by definition. For $k$ a multi-index let us consider the smooth function in $(0, \infty)^{\mathrm{n}}$ given by

$$
\begin{equation*}
\psi(x)=\psi\left(x_{1}, \ldots, x_{n}\right)=T^{k}\left\{x^{-\mu-1 / 2} \phi(x)\right\} . \tag{3.4}
\end{equation*}
$$

Let us see that the coefficients given by (3.2) are well defined, i.e.,

$$
\begin{equation*}
\lim _{\substack{\left(x_{1}, \ldots, x_{n}\right) \rightarrow(0, \ldots, 0) \\ x_{i}>0}} \psi\left(x_{1}, \ldots, x_{n}\right)<\infty . \tag{3.5}
\end{equation*}
$$

Since

$$
\begin{equation*}
\left|\frac{\partial^{n}}{\partial x_{n} \ldots \partial x_{1}} \psi(x)\right| \leq M\left|x_{1} \ldots x_{n}\right| \tag{3.6}
\end{equation*}
$$

if $\left(a_{1}, \ldots, a_{n}\right)$ in $[0, \infty)^{n}$ such that there exist $1 \leq j \leq n$ and $a_{j}=0$ then

$$
\lim _{\substack{\left(x_{1}, \ldots, x_{n}\right) \rightarrow\left(a_{1}, \ldots, a_{n}\right) \\ x_{i}>0}} \frac{\partial^{n}}{\partial x_{n} \ldots \partial x_{1}} \psi(x)=0
$$

then $\frac{\partial^{n}}{\partial x_{n} \ldots \partial x_{1}} \psi(x)$ is $C^{\infty}$ in $(0, \infty)^{\mathrm{n}}$, continuous in $[0, \infty)^{n}$ and consequently integrable in $[0,1]^{n}$.
Moreover,

$$
\begin{equation*}
\int_{1}^{x_{1}} \ldots \int_{1}^{x_{n}} \frac{\partial^{n}}{\partial y_{n} \ldots \partial y_{1}} \psi\left(y_{1}, \ldots, y_{n}\right) d y_{n} \ldots d y_{1}=\psi\left(x_{1}, \ldots, x_{n}\right)+\sum_{\lambda} a_{\lambda} \psi\left(b_{\lambda}\right) \tag{3.7}
\end{equation*}
$$

with $a_{\lambda}=1$ or -1 and $b_{\lambda}=\left(b_{\lambda_{1}}, \ldots, b_{\lambda_{n}}\right)$ with $b_{\lambda_{i}}=x_{i}$ or $b_{\lambda_{i}}=1$.
Let us see now

$$
\lim _{\substack{\left(x_{1}, \ldots, x_{n}\right) \rightarrow(0, \ldots, 0) \\ x_{i}>0}} \psi\left(b_{\lambda}\right)<\infty .
$$

First, let us consider $b_{\lambda}$ such that $b_{\lambda_{j}}=1$ if $j \neq i$ and $b_{\lambda_{i}}=x_{i}$. Since

$$
\begin{gathered}
\left|\frac{\partial}{\partial y_{i}} \psi\left(y_{1}, \ldots, y_{n}\right)\right| \leq M\left|y_{i}\right| \\
\lim _{x_{i} \rightarrow 0} \int_{1}^{x_{i}} \frac{\partial}{\partial y_{i}} \psi\left(1, \ldots, y_{i}, \ldots, 1\right) d y_{i}<\infty
\end{gathered}
$$

So, $\lim _{x \rightarrow 0} \psi\left(1, \ldots, x_{i}, \ldots, 1\right)<\infty$.
Now let us see that $\lim _{x \rightarrow 0} \psi\left(1, \ldots, x_{i}, 1, \ldots, 1, x_{j} \ldots, 1\right)<\infty$. In fact

$$
\left|\frac{\partial}{\partial x_{i} \partial x_{j}} \psi\left(1, \ldots, 1, x_{i}, 1, \ldots, 1, x_{j}, \ldots, 1\right)\right| \leq M\left|x_{i} x_{j}\right|
$$

Then $\frac{\partial}{\partial x_{i} \partial x_{j}} \psi\left(1, \ldots, 1, x_{i}, 1, \ldots, 1, x_{j}, \ldots, 1\right)$ is integrable in $[0,1]^{2}$ and

$$
\begin{aligned}
& \int_{1}^{x_{j}} \int_{1}^{x_{i}} \frac{\partial}{\partial y_{i} \partial y_{j}} \psi\left(1, \ldots, 1, y_{i}, 1, \ldots, 1, y_{j}, \ldots, 1\right) d y_{i} d y_{j}= \\
& \psi\left(1, \ldots, x_{i}, \ldots, x_{j}, \ldots, 1\right)-\psi\left(1, \ldots, x_{i}, \ldots, 1, \ldots, 1\right)- \\
& \quad-\psi\left(1, \ldots, 1, \ldots, x_{j}, \ldots, 1\right)+\psi(1, \ldots, 1)
\end{aligned}
$$

Then, taking limit when $x \rightarrow 0$ to both sides of the previous formula we obtain that $\lim _{x \rightarrow 0} \psi\left(1, \ldots, x_{i}, \ldots, x_{j}, \ldots, 1\right)<\infty$.
If we continuous this process recursively, in the $(n-1)$ step then we obtain that $\lim _{x \rightarrow 0} \psi(b)$ is finite if $b=\left(1, x_{2}, \ldots x_{n}\right)$, or $\left(x_{1}, 1, \ldots, x_{n}\right)$, etc. Finally from (3.7) we deduce (3.5).

Now let us make the following observation. If $r, p \in \mathbb{N}_{0}$

$$
T_{i}^{r} x_{i}^{2 p}=\left\{\begin{array}{cl}
2^{r} r! & \text { if } r=p  \tag{3.8}\\
2^{r} \frac{p!}{(p-r-1)!} x_{i}^{2(p-r)} & \text { if } r<p \\
0 & \text { if } r>p
\end{array}\right.
$$

Let $m$ and $k$ be multi-index such as $|m|=|k|=r$, then

$$
T^{m}\left\{x^{2 k}\right\}=\left\{\begin{array}{cl}
2^{r} k! & \text { if } m=k  \tag{3.9}\\
0 & \text { if } m \neq k
\end{array} .\right.
$$

Upon choosing $a_{2 k_{r}}$ according to (3.2) and observing that

$$
\begin{aligned}
\lim _{\substack{x \rightarrow 0 \\
x_{i}>0}} T^{k_{r}} R_{2 r}(x) & =\lim _{\substack{x \rightarrow 0 \\
x_{i}>0}} T^{k_{r}}\left\{x^{-\mu-1 / 2} \phi(x)-\sum_{j=0}^{r} \sum_{\left|k_{j}\right|=j} a_{k_{j}} x^{2 k_{j}}\right\}= \\
& =\lim _{\substack{x \rightarrow 0 \\
x_{i}>0}} T^{k_{r}}\left\{x^{-\mu-1 / 2} \phi(x)\right\}-a_{k_{r}} 2^{r} k_{r}!=0,
\end{aligned}
$$

we obtain (3.3). Condition (iii) was already proved in [4, Lemma 2.1]. Conversely, if conditions (i) and (ii) hold, then

$$
\sup _{x \in(0,1]^{n}}\left|\left(1+\|x\|^{2}\right) T^{k}\left\{x^{-\mu-1 / 2} \phi(x)\right\}\right|<\infty .
$$

From (2.1) it can be deduce the formula

$$
T^{k}\left\{x^{-\mu-1 / 2}\right\}=x^{-\mu-1 / 2}\left\{\sum_{j=0}^{k} b_{k, j} \frac{D^{j} \phi}{x^{2 k-j}}\right\}
$$

which implies jointly with conditions (i) and (iii) that

$$
\sup _{x \in(1, \infty)^{n}}\left|\left(1+\|x\|^{2}\right) T^{k}\left\{x^{-\mu-1 / 2} \phi(x)\right\}\right|<\infty
$$

Therefore $\gamma_{m, k}^{\mu}(\phi)$ are finite for all $m \in \mathbb{N}_{0}$ and $k \in \mathbb{N}_{0}^{n}$ which completes the theorem.

Let $\mathcal{O}$ be the space of functions $\theta \in C^{\infty}\left((0, \infty)^{\mathrm{n}}\right)$ with the property that for every $k \in \mathbb{N}_{0}^{n}$ there exists $n_{k} \in \mathbb{Z}$ and $C>0$ such that

$$
\left|\left(1+\|x\|^{2}\right)^{n_{k}} T^{k} \theta\right|<C \quad \forall x \in(0, \infty)^{\mathrm{n}} .
$$

For the next Lemma, we will consider polynomials of $n$-variables of the form

$$
P[x]=P\left[x_{1}, \ldots, x_{n}\right]=\sum_{|\alpha| \leq N} a_{\alpha} x^{\alpha} \quad \text { with } a_{\alpha} \in \mathbb{R}
$$

Lemma 3.2. Let $P[x]$ and $Q[x]$ be polynomials of $n$-variables such that $Q[x]=$ $\sum_{|\alpha| \leq N} b_{\alpha} x^{\alpha} \neq 0$ for all $x \in[0, \infty)^{n}$ and all its coefficients have the same sign then $\frac{P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]}{Q\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]} \in \mathcal{O}$.

Proof. Let us show that $P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right] \in \mathcal{O}$. We want to see that for all $k \in \mathbb{N}_{0}^{n}$ there exists $n_{k} \in \mathbb{Z}$ such that

$$
\begin{equation*}
\left|\left(1+\|x\|^{2}\right)^{n_{k}} T^{k} P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]\right|<\infty . \tag{3.10}
\end{equation*}
$$

If $k=e_{i}$,

$$
\begin{aligned}
T^{e_{i}} P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right] & =x_{i}^{-1} \frac{\partial}{\partial x_{i}} P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]=x_{i}^{-1} \frac{\partial}{\partial x_{i}}\left(\sum_{|\zeta| \leq N^{\prime}} a_{\zeta} x_{1}^{2 \zeta_{1}} \ldots x_{n}^{2 \zeta_{n}}\right) \\
& =x_{i}^{-1} \sum_{|\zeta| \leq N^{\prime}} 2 \zeta_{i} a_{\zeta} x_{1}^{2 \zeta_{1}} \ldots x_{i}^{2 \zeta_{i}-1} \ldots x_{n}^{2 \zeta_{n}}=\tilde{P}\left[x_{1}^{2}, \ldots, x_{n}^{2}\right] .
\end{aligned}
$$

Any polynomial of the form $\sum_{|\beta| \leq N} c_{\beta} x_{1}^{2 \beta_{1}} \ldots x_{n}^{2 \beta_{n}}$ can be bounded in the following way

$$
\left|\sum_{|\beta| \leq N} c_{\beta} x_{1}^{2 \beta_{1}} \ldots x_{n}^{2 \beta_{n}}\right| \leq \sum_{|\beta| \leq N}\left|c_{\beta}\right|\left|x_{1}^{2 \beta_{1}}\right| \ldots\left|x_{n}^{2 \beta_{n}}\right|<C\left(1+\|x\|^{2}\right)^{|\gamma|}
$$

for suitables $C>0$ and a multi-index $\gamma$. So

$$
\left|\left(1+\|x\|^{2}\right)^{-\left|\gamma^{\prime}\right|} \tilde{P}\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]\right|<C
$$

for some multi-index $\gamma^{\prime}$.
Now let us see that $1 / Q\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]$ is also in $\mathcal{O}$. Let $Q[x]=\sum_{|\alpha| \leq N} b_{\alpha} x_{1}^{\alpha_{1}} \ldots x_{n}^{\alpha_{n}}$ and without loss of generality we assume that $b_{\alpha} \geq 0, \quad \forall \alpha:|\alpha| \leq N$, then

$$
\begin{align*}
T^{e_{i}}\left(Q\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]\right)^{-1} & =x_{i}^{-1} \frac{\partial}{\partial x_{i}}\left(Q\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]\right)^{-1} \\
& =x_{i}^{-1}(-1)\left(Q\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]\right)^{-2} \frac{\partial}{\partial x_{i}} Q\left[x_{1}^{2}, \ldots, x_{n}^{2}\right] \\
& =\left(Q\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]\right)^{-2} \tilde{Q}\left[x_{1}^{2}, \ldots, x_{n}^{2}\right] \tag{3.11}
\end{align*}
$$

since $Q[x]$ does not have any zeros in $[0, \infty)^{n}$ then $b_{0} \neq 0$, so

$$
Q\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]=b_{0}+\sum_{0<|\alpha| \leq N} b_{\alpha} x_{1}^{2 \alpha_{1}} \ldots x_{n}^{2 \alpha_{n}} \geq b_{0}
$$

therefore

$$
\begin{equation*}
\left(Q\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]\right)^{-2} \leq \frac{1}{b_{0}^{2}}<\infty \tag{3.12}
\end{equation*}
$$

From (3.11) and (3.12), it follows (3.10) for $k=e_{i}$. The general case follows in a similar way.

## 4. Proofs of Liouville type theorem in $\mathcal{H}^{\prime}{ }_{\mu}$

The following is a representation theorem for distibutions "supported in zero" in $\mathcal{H}^{\prime}{ }_{\mu}$.
Theorem 4.1. Let $T \in \mathcal{H}^{\prime}{ }_{\mu}$ satisfying $(T, \phi)=0$ for all $\phi \in \mathcal{H}_{\mu}$ with $\operatorname{supp}(\phi) \subset$ $\left\{x \in(0, \infty)^{\mathrm{n}}:\|x\| \geq a\right\}$ for some $a \in \mathbb{R}, a>0$. Then there exist $N \in \mathbb{N}_{0}$ and scalars $c_{k},|k| \leq N$ such that

$$
T=\sum_{|k| \leq N} c_{k} S^{k} \delta_{\mu}
$$

where $\delta_{\mu}$ is given by (2.3) for $k=0$.

Proof. The proof will follow directly from [3, Lemma 1.4.1] if we can show that there exist $N_{0}$ such that if $\phi \in \mathcal{H}_{\mu}$ satisfies $\left(S^{k} \delta_{\mu}, \phi\right)=0$ for $|k| \leq N_{0}$, then $(T, \phi)=0$.

Consider the family of seminorms $\left\{\lambda_{m, k}^{\mu}\right\}$ defined by (A.1) which generate the same topology in $\mathcal{H}_{\mu}$ as the family $\left\{\gamma_{m, k}^{\mu}\right\}$ (see Appendix A) and let

$$
\rho_{R}^{\mu}(\phi)=\sum_{\substack{m \leq R \\|k| \leq R}} \lambda_{m, k}^{\mu}(\phi) .
$$

This family of seminorms result to be an increasing and equivalent to $\left\{\lambda_{m, k}^{\mu}\right\}$. So, given $T \in \mathcal{H}^{\prime}{ }_{\mu}$, there exist $c>0$ and $N \in \mathbb{N}_{0}$ such that

$$
|(T, \phi)| \leq C \rho_{N}^{\mu}(\phi), \quad \phi \in \mathcal{H}_{\mu} .
$$

Now, let $\phi \in \mathcal{H}_{\mu}$ satisfying $\left(S^{k} \delta_{\mu}, \phi\right)=0$, for all $|k| \leq N_{0}$, where $N_{0}=2 N$ then:

$$
\lim _{\substack{x \rightarrow 0 \\ x_{i}>0}} x^{-\mu-1 / 2} S^{k} \phi(x)=0 .
$$

Given $\varepsilon>0$ there exists $\eta_{k}>0$ such as $\left|x^{-\mu-1 / 2} S^{k} \phi(x)\right|<\varepsilon$, for all $x \in(0, \infty)^{\mathrm{n}}$, $\|x\|<\eta_{k}$ for all $k$ such that $|k|<N_{0}$.

Set $\eta=\min _{|k| \leq N_{0}}\left\{\eta_{k}\right\}$ and $\eta<1$, then

$$
\left|x^{-\mu-1 / 2} S^{k} \phi(x)\right|<\varepsilon \quad \forall x \in(0, \infty)^{\mathrm{n}}:\|x\|<\eta .
$$

Fix $\eta^{*}$ satisfying $0<\eta^{*}<\eta<1$ and define a smooth function $\psi$ on $(0, \infty)^{\mathrm{n}}$ by $\psi(x)=1$ for $\left\{x \in(0, \infty)^{\mathrm{n}}:\|x\|<\eta^{*}\right\}$ and $\psi(x)=0$ for $\left\{x \in(0, \infty)^{\mathrm{n}}:\|x\| \geq \eta\right\}$.

We claim that $\psi \in \mathcal{O}$. In fact, since $\psi \in C^{\infty}\left((0, \infty)^{\mathrm{n}}\right)$ there exist $M_{k}>0$ such that $\left|T^{k} \psi(x)\right| \leq M_{k}$ then there exist $n_{k} \in \mathbb{N}$ such that

$$
\left|\left(1+\|x\|^{2}\right)^{-n_{k}} T^{k} \psi(x)\right|<\infty .
$$

Since $\operatorname{supp}((1-\psi) \phi) \subset\left\{x \in(0, \infty)^{\mathrm{n}}:\|x\| \geq \eta^{*}\right\}$, then for the hypothesis

$$
((1-\psi) T, \phi)=(T,(1-\psi) \phi)=0 \quad \forall \phi \in \mathcal{H}_{\mu} .
$$

From the above it follows that $T=\psi T$, then

$$
\begin{align*}
|(T, \phi)| & =|(\psi T, \phi)|=|(T, \psi \phi)| \leq C \rho_{N}^{\mu}(\psi \phi)= \\
& =C \sum_{\substack{m \leq N \\
|k| \leq N}} \sup _{x \in(0, \infty)^{\mathrm{n}}}\left|\left(1+\|x\|^{2}\right)^{m} x^{-\mu-1 / 2} S^{k}(\psi \phi)(x)\right| . \tag{4.1}
\end{align*}
$$

Since $\operatorname{supp} \psi \subset\left\{x \in(0, \infty)^{\mathrm{n}}:\|x\| \leq \eta\right\}$, then

$$
\begin{gather*}
\sup _{x \in(0, \infty)^{\mathrm{n}}} \mid\left(1+\|x\|^{2}\right)^{m} x^{-\mu-1 / 2} S^{k}(\psi \phi)(x) \leq \\
\sup _{\|x\|<\eta^{*}}\left|\left(1+\|x\|^{2}\right)^{m} x^{-\mu-1 / 2} S^{k} \phi(x)\right|+\sup _{\eta^{*} \leq\|x\|<\eta}\left|\left(1+\|x\|^{2}\right)^{m} x^{-\mu-1 / 2} S^{k}(\psi \phi)(x)\right| . \tag{4.2}
\end{gather*}
$$

If we consider $\|x\|<\eta^{*}$, then

$$
\begin{equation*}
\sup _{\|x\| \leq \eta^{*}}\left|\left(1+\|x\|^{2}\right)^{m} x^{-\mu-1 / 2} S^{k} \phi(x)\right| \leq 2^{|m|} \varepsilon . \tag{4.3}
\end{equation*}
$$

Now we consider $\eta^{*} \leq\|x\|<\eta$. Applying (A.3) and (2.1) we obtain that

$$
\begin{align*}
x^{-\mu-1 / 2} S^{k}(\psi \phi)(x) & =\sum_{l=0}^{k} b_{l, k} x^{2 l} T^{k+l}\left\{x^{-\mu-1 / 2}(\psi \phi)(x)\right\} \\
& =\sum_{l=0}^{k} b_{l, k} x^{2 l} \sum_{r=0}^{k+l}\binom{k+l}{r} T^{k+l-r} \psi(x) T^{r}\left\{x^{-\mu-1 / 2} \phi(x)\right\} . \tag{4.4}
\end{align*}
$$

Since $\psi \in C^{\infty}\left((0, \infty)^{\mathrm{n}}\right)$, there exist positive constants such that

$$
\begin{equation*}
\left|T^{k+l-r} \psi(x)\right| \leq M_{k, l, r} \tag{4.5}
\end{equation*}
$$

in $\eta^{*} \leq\|x\|<\eta$. Accordingly to (4.4) and (4.5) we now have that

$$
\begin{align*}
& \left|\left(1+\|x\|^{2}\right)^{m} x^{-\mu-1 / 2} S^{k}(\psi \phi)(x)\right|= \\
& =\left|\left(1+\|x\|^{2}\right)^{m} \sum_{l=0}^{k} b_{l, k} x^{2 l} \sum_{r=0}^{k+l}\binom{k+l}{r} T^{k+l-r} \psi(x) T^{r}\left\{x^{-\mu-1 / 2} \phi(x)\right\}\right| \\
& \leq\left(1+\|x\|^{2}\right)^{m} \sum_{l=0}^{k} \sum_{r=0}^{k+l}\left|b_{l, k}\right|\binom{k+l}{r}\left|T^{k+l-r} \psi(x)\right|\left|x^{2 l} T^{r}\left\{x^{-\mu-1 / 2} \phi(x)\right\}\right| \\
& \leq\left(1+\|x\|^{2}\right)^{m} \sum_{l=0}^{k} \sum_{r=0}^{k+l}\left|b_{l, k}\right|\binom{k+l}{r} M_{k, l, r}\left|x^{2 l} T^{r}\left\{x^{-\mu-1 / 2} \phi(x)\right\}\right| \\
& =\sum_{l=0}^{k} \sum_{r=0}^{k+l} M_{k, l, r}^{*}\left(1+\|x\|^{2}\right)^{m} x^{2 l}\left|T^{r}\left\{x^{-\mu-1 / 2} \phi(x)\right\}\right| \\
& \leq \sum_{l=0}^{k} \sum_{r=0}^{k+l} M_{k, l, r}^{*}\left(1+\|x\|^{2}\right)^{m+l}\left|T^{r}\left\{x^{-\mu-1 / 2} \phi(x)\right\}\right| \\
& \leq \sum_{l=0}^{k} \sum_{r=0}^{k+l} B_{k, l, r} \sup _{x \in(0, \infty)^{\mathrm{n}}}\left|\left(1+\|x\|^{2}\right)^{m+l} x^{-\mu-1 / 2} S^{r} \phi(x)\right| . \tag{4.6}
\end{align*}
$$

Since $|r| \leq|2 k| \leq 2 N=N_{0}$ then

$$
\begin{equation*}
\left|\left(1+\|x\|^{2}\right)^{m+l} x^{-\mu-1 / 2} S^{r} \phi(x)\right| \leq 2^{|m+l|}\left|x^{-\mu-1 / 2} S^{r} \phi(x)\right| \leq 2^{|m+l|} \varepsilon \tag{4.7}
\end{equation*}
$$

From (4.1), (4.2), (4.3), (4.6) and (4.7) then:

$$
\begin{aligned}
|(T, \phi)| & \leq C \sum_{\substack{m \leq N \\
|k| \leq N}} \sup _{x \in(0, \infty)^{\mathrm{n}}}\left|\left(1+\|x\|^{2}\right)^{m} x^{-\mu-1 / 2} S^{k}(\psi \phi)(x)\right| \leq \\
& \leq C \sum_{\substack{m \leq N \\
|k| \leq N}}\left(2^{|m|} \varepsilon+\sum_{l=0}^{k} \sum_{r=0}^{k+l} B_{k, l, r} 2^{|m+l|} \varepsilon\right)=C^{\prime} \varepsilon
\end{aligned}
$$

with $C^{\prime}=C \sum_{\substack{m \leq N \\|k| \leq N}}\left(2^{|m|}+\sum_{l=0}^{k} \sum_{r=0}^{k+l} B_{k, l, r} 2^{|m+l|}\right)$. Hence $(T, \phi)=0$ since $\varepsilon>0$ was arbitrarily chosen.

Lemma 4.2. Let $\psi \in C^{\infty}\left((0, \infty)^{\mathrm{n}}\right)$ such that $\psi(x)=1$ if $x_{1}+\ldots+x_{n} \geq a^{2}$, $\psi(x)=0$ if $x_{1}+\ldots+x_{n} \leq b^{2}$ with $0<b^{2} \leq a^{2}$ and $0 \leq \psi \leq 1$. And let $P[x]=\sum_{|\alpha| \leq N} a_{\alpha} x^{\alpha} \neq 0$ for all $x \in \mathbb{R}^{n}-\{0\}$ and all its coefficients have the same sign, therefore

$$
P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]^{-1} \psi\left(x_{1}^{2}, \ldots, x_{n}^{2}\right) \in \mathcal{O}
$$

Proof. Let $P\left[x_{1}, \ldots, x_{n}\right]=\sum_{|\alpha| \leq N} a_{\alpha} x_{1}^{\alpha_{1}} \ldots x_{n}^{\alpha_{n}}$.
The aim of this proof is to verify that for all $k \in \mathbb{N}_{0}^{n}$ there exists $n_{k} \in \mathbb{Z}$ such that

$$
\left|\left(1+\|x\|^{2}\right)^{n_{k}} T^{k}\left\{P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]^{-1} \psi\left(x_{1}^{2}, \ldots, x_{n}^{2}\right)\right\}\right| \leq C \quad \forall x \in(0, \infty)^{\mathrm{n}}
$$

For $b \leq\|x\| \leq a$ it turns out that

$$
\begin{align*}
& T^{e_{i}}\left\{P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]^{-1} \psi\left(x_{1}^{2}, \ldots, x_{n}^{2}\right)\right\}= x_{i}^{-1} \frac{\partial}{\partial x_{i}}\left\{P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]^{-1} \psi\left(x_{1}^{2}, \ldots, x_{n}^{2}\right)\right\}= \\
&=P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]^{-2} \tilde{P}\left[x_{1}^{2}, \ldots, x_{n}^{2}\right] \psi\left(x_{1}^{2}, \ldots, x_{n}^{2}\right)+ \\
&+2 P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]^{-1} \frac{\partial \psi}{\partial x_{i}}\left(x_{1}^{2}, \ldots, x_{n}^{2}\right) . \tag{4.8}
\end{align*}
$$

Since all the functions involved, $\psi$ and its derivatives are all continuous in $b \leq$ $\|x\| \leq a$, it is clear that (4.8) is bounded. On the other hand, if $\|x\| \geq a$, since $\psi(x)=1$ then

$$
\begin{aligned}
T^{e_{i}}\left\{P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]^{-1}\right\} & =x_{i}^{-1} \frac{\partial}{\partial x_{i}}\left\{P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]^{-1}\right\} \\
& =P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]^{-2} \tilde{P}\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]
\end{aligned}
$$

We already shown that $\tilde{P}$ is in $\mathcal{O}$, so, there exist $r \in \mathbb{Z}$ such that $\left|\tilde{P}\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]\right| \leq$ $C\left(1+\|x\|^{2}\right)^{r}$. Without loss of generality suppose that all $a_{\alpha}$ are positives and let us first consider $a_{0} \neq 0$, then $P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]^{-2}$ is bounded as in (3.11).

If now we consider $a_{0}=0$, since $P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]>0$ for $\left(x_{1}, \ldots, x_{n}\right) \neq(0, \ldots, 0)$ then $P$ must attain a minimum in $S^{n-1}$. Let $\delta$ be such that

$$
\begin{equation*}
\delta<P\left[\frac{x_{1}^{2}}{\|x\|^{2}}, \ldots, \frac{x_{n}^{2}}{\|x\|^{2}}\right]=\sum_{1 \leq|\alpha| \leq N} a_{\alpha} \frac{x_{1}^{2 \alpha_{1}} \ldots x_{n}^{2 \alpha_{n}}}{\|x\|^{2|\alpha|}} \tag{4.9}
\end{equation*}
$$

Since $\|x\| \geq a$ and $|\alpha| \geq 1$ then

$$
\begin{equation*}
\|x\|^{2|\alpha|}>a^{2|\alpha|} \tag{4.10}
\end{equation*}
$$

From (4.9) and (4.10) we obtain that

$$
\begin{equation*}
\delta<C \sum_{1 \leq|\alpha| \leq N} a_{\alpha} x_{1}^{2 \alpha_{1}} \ldots x_{n}^{2 \alpha_{n}} \tag{4.11}
\end{equation*}
$$

with $C=\max _{1 \leq|\alpha| \leq N} a^{-2|\alpha|}$, then

$$
P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]^{-2} \leq C^{2} \delta^{-2}
$$

Then,

$$
\begin{equation*}
\sup _{\|x\| \geq a} \mid T^{e_{i}}\left\{P\left[x_{1}^{2}, \ldots, x_{n}^{2}\right]^{-1} \mid \leq C^{\prime}\left(1+\|x\|^{2}\right)^{r}\right. \tag{4.12}
\end{equation*}
$$

From equations (4.8) and (4.12) the Lemma follows for $k=e_{i}$. The general case follows in a similar way.

Now we are ready for the proof of the Theorem 1.1,

Proof of Theorem 1.1. If $L(f)=0$ this means that

$$
\sum_{|\alpha| \leq N}(-1)^{|\alpha|} a_{\alpha} S^{\alpha} f=0
$$

Since $h_{\mu}\left(S_{\mu_{i}} f\right)=-y_{i}^{2} h_{\mu} f$ (see [5]), applying Hankel transform to both sides, we have

$$
\begin{align*}
h_{\mu}\left(\sum_{|\alpha| \leq N}(-1)^{|\alpha|} a_{\alpha} S^{\alpha} f\right) & =\sum_{|\alpha| \leq N}(-1)^{|\alpha|} a_{\alpha}(-1)^{|\alpha|} y_{1}^{2 \alpha_{1}} \ldots y_{n}^{2 \alpha_{n}} h_{\mu} f= \\
& =P\left[y_{1}^{2}, \ldots, y_{n}^{2}\right] h_{\mu} f=0 \tag{4.13}
\end{align*}
$$

Let $\psi$ being as in the previous Lemma. Then $\left[P\left[y_{1}^{2}, \ldots, y_{n}^{2}\right]\right]^{-1} \psi\left(y_{1}^{2}, \ldots, y_{n}^{2}\right) \in \mathcal{O}$. Then multiplying in (4.13) we obtain that

$$
\begin{equation*}
\psi\left(y_{1}^{2}, \ldots, y_{n}^{2}\right) \cdot h_{\mu} f=0 \tag{4.14}
\end{equation*}
$$

Let $\phi \in \mathcal{H}_{\mu}$ with $\operatorname{supp} \phi \subset\left\{x \in(0, \infty)^{\mathrm{n}}:\|x\| \geq a\right\}$ and let us see that

$$
\left(h_{\mu} f, \phi\right)=0
$$

Since $\psi\left(x_{1}^{2}, \ldots, x_{n}^{2}\right) \cdot \phi\left(x_{1}, \ldots x_{n}\right)=\phi\left(x_{1}, \ldots x_{n}\right)$ in $(0, \infty)^{\mathrm{n}}$, then

$$
\begin{equation*}
\left(h_{\mu} f, \phi\right)=\left(h_{\mu} f, \psi \phi\right)=\left(\psi h_{\mu} f, \phi\right)=0, \tag{4.15}
\end{equation*}
$$

where we have used (4.14). Consequently $h_{\mu} f$ is zero for all $\phi$ such that $\operatorname{supp} \phi \subset$ $\left\{x \in(0, \infty)^{\mathrm{n}}:\|x\| \geq a\right\}$. For Theorem 4.1 there exist $N_{1} \in \mathbb{N}_{0}$ and constants $c_{k}$, $|k| \leq N_{1}$ such that

$$
\begin{equation*}
h_{\mu} f=\sum_{|k| \leq N_{1}} c_{k} S^{k} \delta_{\mu} \tag{4.16}
\end{equation*}
$$

Therefore, applying the Hankel transform $h_{\mu}$ to both sides of (4.16) and since $h_{\mu}=\left(h_{\mu}\right)^{-1}$ we obtain that

$$
\begin{aligned}
f & =h_{\mu}\left(h_{\mu} f\right)=\sum_{|k| \leq N_{1}} c_{k} h_{\mu}\left(S^{k} \delta_{\mu}\right)= \\
& =\sum_{|k| \leq N_{1}} c_{k}(-1)^{|k|} y_{1}^{2 k_{1}} \ldots y_{1}^{2 k_{n}} h_{\mu} \delta_{\mu} \\
& =\sum_{|k| \leq N_{1}} c_{k}(-1)^{|k|} y_{1}^{2 k_{1}} \ldots y_{1}^{2 k_{n}} y^{\mu+1 / 2},
\end{aligned}
$$

which completes the proof.

## 5. Another proof of Theorem 1.1

We establish a different representation theorem from the one proved in the previous section.
Theorem 5.1. Let $f \in \mathcal{H}^{\prime}{ }_{\mu}$ satisfying $(f, \phi)=0$ for all $\phi \in \mathcal{H}_{\mu}$ with $\operatorname{supp}(\phi) \subset$ $\left\{x \in(0, \infty)^{\mathrm{n}}:\|x\| \geq a\right\}$ for some $a \in \mathbb{R}, a>0$. Then there exist $N \in \mathbb{N}_{0}$ and scalars $c_{k},|k| \leq N$ such that

$$
f=\sum_{|k| \leq N} c_{k} T^{k} \delta_{\mu},
$$

where $T^{k} \delta_{\mu}$ given by (2.3).

Proof. Let $f \in \mathcal{H}^{\prime}{ }_{\mu}$, such that $f$ verifies the hypothesis of the theorem and $c>0$, $N \in \mathbb{N}_{0}$ such that

$$
\begin{equation*}
|(f, \phi)| \leq C \sum_{\substack{m \leq N \\|k| \leq N}} \gamma_{m, k}^{\mu}(\phi), \quad \phi \in \mathcal{H}_{\mu} \tag{5.1}
\end{equation*}
$$

By the Taylor formula and (2.3), if $\phi \in \mathcal{H}_{\mu}$
$\phi(x)=\frac{x^{\mu+1 / 2}}{C_{\mu}}\left\{\left(\delta_{\mu}, \phi\right)+\sum_{\left|k_{1}\right|=1}\left(T^{k_{1}} \delta_{\mu}, \phi\right) \frac{x^{2 k_{1}}}{2 k_{1}!}+\ldots+\sum_{\left|k_{N}\right|=N}\left(T^{k_{N}} \delta_{\mu}, \phi\right) \frac{x^{2 k_{N}}}{2^{N} k_{N}!}+C_{\mu} R_{2 N}(x)\right\}$
where the remain term satisfies $\lim _{\substack{x \rightarrow 0 \\ x_{i}>0}} T^{k} R_{2 N}(x)=0$ for all $k$ multi-index such that $|k| \leq N$. Then, given $\varepsilon>0$ there exist $\eta_{k}>0$ such that $\left|T^{k} R_{2 N}(x)\right|<\varepsilon$ for $x \in(0, \infty)^{\mathrm{n}}:\|x\|<\eta_{k}$. Set $\eta=\min _{|k| \leq N}\left\{\eta_{k}\right\}$ and $\eta<1$, then

$$
\left|T^{k} R_{2 N}(x)\right|<\varepsilon \quad \forall x \in(0, \infty)^{\mathrm{n}}:\|x\|<\eta, \quad|k| \leq N .
$$

Let $a \in \mathbb{R}$ such that $0<a<\eta$ and define $\psi$ a smooth function on $(0, \infty)^{\mathrm{n}}$ by $\psi(x)=1$ for $\left\{x \in(0, \infty)^{\mathrm{n}}:\|x\|<a / 2\right\}$ and $\psi(x)=0$ for $\left\{x \in(0, \infty)^{\mathrm{n}}:\|x\| \geq a\right\}$ and therefore $\left(f,(1-\psi(x)) \phi(x)=0\right.$ for any $\phi \in \mathcal{H}_{\mu}$. Hence

$$
\begin{equation*}
(f, \phi)=(f, \psi \phi) \tag{5.3}
\end{equation*}
$$

Therefore

$$
\begin{equation*}
(f, \phi)=\sum_{|k| \leq N} c_{k}\left(T^{k} \delta_{\mu}, \phi\right)+\left(f, x^{\mu+1 / 2} \psi(x) R_{2 N}(x)\right) \tag{5.4}
\end{equation*}
$$

where

$$
\begin{equation*}
c_{k}=\frac{1}{C_{\mu} 2^{|k|} k!}\left(f, x^{\mu+1 / 2} x^{2 k} \psi(x)\right) . \tag{5.5}
\end{equation*}
$$

Applying the estimate (5.1) to $x^{\mu+1 / 2} \psi(x) R_{2 N}(x)$, we get

$$
\left|\left(f, x^{\mu+1 / 2} \psi(x) R_{2 N}(x)\right)\right| \leq C \sum_{\substack{m \leq N \\|k| \leq N}} \gamma_{m, k}^{\mu}\left(x^{\mu+1 / 2} \psi(x) R_{2 N}(x)\right)
$$

$\left|\left(1+\|x\|^{2}\right)^{m} T^{k}\left\{x^{-\mu-1 / 2} x^{\mu+1 / 2} \psi(x) R_{2 N}(x)\right\}\right| \leq$ $\sup _{\|x\|<\frac{a}{2}}\left|\left(1+\|x\|^{2}\right)^{m} T^{k}\left\{R_{2 N}(x)\right\}\right|+\sup _{\frac{a}{2} \leq\|x\|<a}\left|\left(1+\|x\|^{2}\right)^{m} T^{k}\left\{\psi(x) R_{2 N}(x)\right\}\right| \leq$
$\sup _{\|x\|<\frac{a}{2}}\left|\left(1+\|x\|^{2}\right)^{m} T^{k}\left\{R_{2 N}(x)\right\}\right|+\sup _{\frac{a}{2} \leq\|x\|<a}\left|\left(1+\|x\|^{2}\right)^{m} \sum_{j=0}^{k} T^{k-j} \psi(x) T^{j} R_{2 N}(x)\right| \leq$
$\sup _{\|x\|<\frac{a}{2}}\left|\left(1+\|x\|^{2}\right)^{m} T^{k}\left\{R_{2 N}(x)\right\}\right|+\sup _{\frac{a}{2} \leq\|x\|<a} \sum_{j=0}^{k} M_{j, k}\left|\left(1+\|x\|^{2}\right)^{m} T^{j} R_{2 N}(x)\right|$
For $\|x\|<\eta$

$$
\left|\left(f, x^{\mu+1 / 2} \psi(x) R_{2 N}(x)\right)\right| \leq C \sum_{\substack{m \leq N \\|k| \leq N}} 2^{m}\left(1+\sum_{j=0}^{k} M_{j, k}\right) \varepsilon=C^{\prime} \varepsilon
$$

Thus $\left(f, x^{\mu+1 / 2} \psi(x) R_{2 N}(x)\right)=0$ since $\varepsilon$ was arbitrarily chosen. Therefore

$$
(f, \phi)=\sum_{|k| \leq N} c_{k}\left(T^{k} \delta_{\mu}, \phi\right)
$$

Now we can sketch a different proof for Theorem 1.1.

Another proof of Theorem 1.1. If $L(f)=0$, then we obtain as in (4.15) that $h_{\mu} f$ is zero for all $\phi$ such that $\operatorname{supp} \phi \subset\left\{x \in(0, \infty)^{\mathrm{n}}:\|x\| \geq a\right\}$ with $a>0, a \in \mathbb{R}$. Then, since Theorem 5.1 holds, there exist $N_{2} \in \mathbb{N}_{0}$ and constants $c_{k},|k| \leq N_{2}$ such that

$$
\begin{equation*}
h_{\mu} f=\sum_{|k| \leq N_{2}} c_{k} T^{k} \delta_{\mu} \tag{5.6}
\end{equation*}
$$

Therefore, applying the Hankel transform $h_{\mu}$ to both sides of (5.6) and since $h_{\mu}=\left(h_{\mu}\right)^{-1}$ we obtain that

$$
\begin{aligned}
f=h_{\mu}\left(h_{\mu} f\right) & =\sum_{|k| \leq N_{2}} c_{k} h_{\mu}\left(T^{k} \delta_{\mu}\right)= \\
& =\sum_{|k| \leq N_{2}} c_{k} M_{k}^{\mu} y^{2 k} y^{\mu+1 / 2} \\
& =\sum_{|k| \leq N_{2}} c_{k} M_{k}^{\mu} y_{1}^{2 k_{1}} \ldots y_{n}^{2 k_{n}} y^{\mu+1 / 2}
\end{aligned}
$$

where we have used (2.4). The proof is this complete.

## Appendix A. Equivalence of the seminorms $\gamma_{m, k}^{\mu}$ and $\lambda_{m, k}^{\mu}$

The main result of this paper needs of the existence of another family of seminorms, different from the family $\gamma_{m, k}^{\mu}$, which is defined as

$$
\begin{equation*}
\lambda_{m, k}^{\mu}(\phi)=\sup _{x \in(0, \infty)^{\mathbf{n}}}\left|\left(1+\|x\|^{2}\right)^{m} x^{-\mu-1 / 2} S^{k} \phi(x)\right|, \quad \phi \in \mathcal{H}_{\mu} \tag{A.1}
\end{equation*}
$$

The construction of the family $\left\{\lambda_{m, k}^{\mu}\right\}_{m \in \mathbb{N}_{0}, k \in \mathbb{N}_{0}^{n}}$ was motivated by the work of [1] , [7] and [10]. This multinorm is important because generates on $\mathcal{H}_{\mu}$ the same topology as the family $\left\{\gamma_{m, k}^{\mu}\right\}$.

Remark A.1. Let $k$ be a multi-index, the following equality is valid

$$
\begin{equation*}
x^{-\mu-1 / 2} S^{k} \phi(x)=\sum_{l=0}^{k} b_{l, k} x^{2 l} T^{k+l}\left\{x^{-\mu-1 / 2} \phi(x)\right\} . \tag{A.2}
\end{equation*}
$$

This formula can be derived from the equation

$$
\begin{equation*}
x_{i}^{-\mu_{i}-1 / 2} S_{\mu_{i}}^{k_{i}} \phi(x)=\sum_{l=0}^{k_{i}} b_{l, k_{i}} x_{i}^{2 l} T_{i}^{k_{i}+l}\left\{x_{i}^{-\mu_{i}-1 / 2} \phi(x)\right\}, \tag{A.3}
\end{equation*}
$$

where the constants $b_{j, k_{i}}, j=0, \ldots, k_{i}$, are suitable real constants, only depending on $\mu_{i}$. The formula (A.3) is due to Koh and Zemanian [10, (9)] and is valid for every $k_{i} \in \mathbb{N}_{0}$. Indeed, if $k \in \mathbb{N}_{0}^{n}, k=\left(k_{1}, \ldots, k_{n}\right)$ then,

$$
\begin{aligned}
\left(x_{i}^{-\mu_{i}-1 / 2} S_{\mu_{i}}^{k_{i}}\right) & \left(x_{j}^{-\mu_{j}-1 / 2} S_{\mu_{j}}^{k_{j}}\right) \phi(x)= \\
& =\sum_{l_{i}=0}^{k_{i}} b_{l_{i}, k_{i}} x_{i}^{2 l_{i}} T_{i}^{k_{i}+l_{i}}\left\{x_{i}^{-\mu_{i}-1 / 2} \sum_{l_{j}=0}^{k_{j}} b_{l_{j}, k_{j}} x_{j}^{2 l_{j}} T_{j}^{k_{j}+l_{j}}\left\{x_{j}^{-\mu_{j}-1 / 2} \phi(x)\right\}\right\} \\
& =\sum_{l_{i}=0}^{k_{i}} \sum_{l_{j}=0}^{k_{j}} b_{l_{i}, k_{i}} b_{l_{j}, k_{j}} x_{i}^{2 l_{i}} x_{j}^{2 l_{j}} T_{i}^{k_{i}+l_{i}} T_{j}^{k_{j}+l_{j}}\left\{x_{i}^{-\mu_{i}-1 / 2} x_{j}^{-\mu_{j}-1 / 2} \phi(x)\right\} .
\end{aligned}
$$

Repeating this process we obtain that
$x^{-\mu-1 / 2} S^{k} \phi(x)=\left(x_{1}^{-\mu_{1}-1 / 2} S_{\mu_{1}}^{k_{1}}\right) \ldots\left(x_{n}^{-\mu_{n}-1 / 2} S_{\mu_{n}}^{k_{n}}\right) \phi(x)=$
$\sum_{l_{1}=0}^{k_{1}} \ldots \sum_{l_{n}=0}^{k_{n}} b_{l_{1}, k_{1}} \ldots b_{l_{n}, k_{n}} x_{1}^{2 l_{1}} \ldots x_{n}^{2 l_{n}} T_{1}^{k_{1}+l_{1}} \ldots T_{n}^{k_{n}+l_{n}}\left\{x_{1}^{-\mu_{1}-1 / 2} \ldots x_{n}^{-\mu_{n}-1 / 2} \phi(x)\right\}=$
$\sum_{l=0}^{k} b_{l, k} x^{2 l} T^{k+l}\left\{x^{-\mu-1 / 2} \phi(x)\right\}$.
On the other hand, from [7, Propositions IV.2.2 and IV.2.4] we have that for all $k_{i} \in \mathbb{N}_{0}, i=1, \ldots, n$

$$
\left|T_{i}^{k_{i}}\left\{x_{i}^{-\mu_{i}-1 / 2} \phi(x)\right\}\right| \leq C_{i} \sup _{x_{i} \in(0, \infty)}\left|x_{i}^{-\mu_{i}-1 / 2} S_{\mu_{i}}^{k_{i}} \phi(x)\right| .
$$

So, we can generalize this inequality and obtain the following result
Remark A.2. Let $k$ be a multi-index, the following inequality is valid

$$
\begin{equation*}
\left|T^{k}\left\{x^{-\mu-1 / 2} \phi(x)\right\}\right| \leq C \sup _{x \in(0, \infty)^{\mathrm{n}}}\left|x^{-\mu-1 / 2} S^{k} \phi(x)\right| . \tag{A.4}
\end{equation*}
$$

Set $i, j \in\{1, \ldots, n\}, i \neq j$ and computing

$$
\begin{aligned}
\mid T_{i}^{k_{i}} T_{j}^{k_{j}} & \left\{x^{-\mu-1 / 2} \phi(x)\right\}\left|=\left|T_{i}^{k_{i}}\left\{x_{i}^{-\mu_{i}-1 / 2} T_{j}^{k_{j}}\left\{x_{j}^{-\mu_{j}-1 / 2} x^{-\mu-1 / 2+\left(\mu_{i} e_{i}+1 / 2\right)+\left(\mu_{j} e_{j}+1 / 2\right)} \phi(x)\right\}\right\}\right| \leq\right. \\
& \leq C_{i} \sup _{x_{i} \in(0, \infty)}\left|x_{i}^{-\mu_{i}-1 / 2} S_{\mu_{i}}^{k_{i}}\left\{T_{j}^{k_{j}}\left\{x_{j}^{-\mu_{j}-1 / 2} x^{-\mu-1 / 2+\left(\mu_{i} e_{i}+1 / 2\right)+\left(\mu_{j} e_{j}+1 / 2\right)} \phi(x)\right\}\right\}\right| \\
& =C_{i} \sup _{x_{i} \in(0, \infty)}\left|T_{j}^{k_{j}}\left\{x_{j}^{-\mu_{j}-1 / 2} x^{-\mu-1 / 2+\left(\mu_{i} e_{i}+1 / 2\right)+\left(\mu_{j} e_{j}+1 / 2\right)}\left(x_{i}^{-\mu_{i}-1 / 2} S_{\mu_{i}}^{k_{i}}\right) \phi(x)\right\}\right| \\
& =C_{i} \sup _{x_{i} \in(0, \infty)}\left|T_{j}^{k_{j}}\left\{x_{j}^{-\mu_{j}-1 / 2}\left(x^{-\mu-1 / 2+\left(\mu_{j} e_{j}+1 / 2\right)} S_{\mu_{i}}^{k_{i}}\right) \phi(x)\right\}\right| \\
& \leq C_{i} C_{j} \sup _{x_{j}, x_{i} \in(0, \infty)}\left|x_{j}^{-\mu_{j}-1 / 2} S_{\mu_{j}}^{k_{j}}\left\{x^{-\mu-1 / 2+\left(\mu_{j} e_{j}+1 / 2\right)} S_{\mu_{i}}^{k_{i}} \phi(x)\right\}\right| \\
& =C_{i} C_{j} \sup _{x_{j}, x_{i} \in(0, \infty)}\left|x^{-\mu-1 / 2+\left(\mu_{j} e_{j}+1 / 2\right)} x_{j}^{-\mu_{j}-1 / 2} S_{\mu_{i}}^{k_{i}} S_{\mu_{j}}^{k_{j}} \phi(x)\right| \\
& =C_{i} C_{j} \sup _{x_{j}, x_{i} \in(0, \infty)}\left|x^{-\mu-1 / 2} S_{\mu_{i}}^{k_{i}} S_{\mu_{j}}^{k_{j}} \phi(x)\right| .
\end{aligned}
$$

The general case follows from an inductive argument.
From (A.2) and (A.4) we obtain that the families of seminorms $\gamma_{m, k}^{\mu}$ and $\lambda_{m, k}^{\mu}$ are equivalents.

$$
\left|\left(1+\|x\|^{2}\right)^{m} T^{k}\left\{x^{-\mu-1 / 2} \phi(x)\right\}\right| \leq C \sup _{x \in(0, \infty)^{\mathbf{n}}}\left|\left(1+\|x\|^{2}\right)^{m} x^{-\mu-1 / 2} S^{k} \phi(x)\right|=C \lambda_{m, k}^{\mu}(\phi)
$$

therefore $\gamma_{m, k}^{\mu} \phi(x) \leq C \lambda_{m, k}^{\mu} \phi(x)$. On the other hand, (A.2) imply that

$$
\begin{aligned}
\left|\left(1+\|x\|^{2}\right)^{m} x^{-\mu-1 / 2} S^{k} \phi(x)\right| & \leq \sum_{l=0}^{k}\left|b_{l, k}\right|\left|\left(1+\|x\|^{2}\right)^{m} x^{2 l} T^{k+l}\left\{x^{-\mu-1 / 2} \phi(x)\right\}\right| \\
& \leq \sum_{l=0}^{k}\left|b_{l, k}\right|\left|\left(1+\|x\|^{2}\right)^{m+|l|} T^{k+l}\left\{x^{-\mu-1 / 2} \phi(x)\right\}\right| \\
& \leq \sum_{l=0}^{k}\left|b_{l, k}\right| \gamma_{m+|l|, k+l}^{\mu} \phi(x)
\end{aligned}
$$

which leads to $\lambda_{m, k}^{\mu} \phi(x) \leq \sum_{l=0}^{k}\left|b_{l, k}\right| \gamma_{m+|l|, k+l}^{\mu} \phi(x)$.
