# DILATION, FUNCTIONAL MODEL AND A COMPLETE UNITARY INVARIANT FOR $C \cdot{ }_{\cdot 0} \Gamma_{n}$-CONTRACTIONS 

SOURAV PAL

#### Abstract

A commuting tuple of operators $\left(S_{1}, \ldots, S_{n-1}, P\right)$, defined on a Hilbert space $\mathscr{H}$, for which the closed symmetrized polydisc $$
\Gamma_{n}=\left\{\left(\sum_{1 \leq i \leq n} z_{i}, \sum_{1 \leq i<j \leq n} z_{i} z_{j}, \ldots, \prod_{i=1}^{n} z_{i}\right):\left|z_{i}\right| \leq 1, i=1, \ldots, n\right\}
$$ is a spectral set, is called a $\Gamma_{n}$-contraction. A $\Gamma_{n}$-contraction is said to be pure or $C_{\cdot 0}$ if $P$ is $C .0$, that is, if $P^{* n} \rightarrow 0$ strongly as $n \rightarrow \infty$. We show that for any $\Gamma_{n}$-contraction $\left(S_{1}, \ldots, S_{n-1}, P\right)$, there is a unique operator tuple $\left(A_{1}, \ldots, A_{n-1}\right)$ that satisfies the operator identities $$
S_{i}-S_{n-i}^{*} P=D_{P} A_{i} D_{P}, \quad i=1, \ldots, n-1 .
$$

This unique tuple is called the fundamental operator tuple or $\mathscr{F}_{O}$-tuple of $\left(S_{1}, \ldots, S_{n-1}, P\right)$. With the help of the $\mathscr{F}_{O}$-tuple, we construct an operator model for a $C .0 \Gamma_{n}$-contraction and show that there exist $n-1$ operators $C_{1}, \ldots, C_{n-1}$ such that each $S_{i}$ can be represented as $S_{i}=C_{i}+P C_{n-i}^{*}$. We find an explicit minimal dilation for a class of $C .0 \Gamma_{n}$-contractions whose $\mathscr{F}_{O}$-tuples satisfy a certain condition. Also we establish that the $\mathscr{F}_{O}$-tuple of $\left(S_{1}^{*}, \ldots, S_{n-1}^{*}, P^{*}\right)$ together with the characteristic function of $P$ constitute a complete unitary invariant for the $C .0 \Gamma_{n}$-contractions. The entire program is an analogue of the Nagy-Foias theory for $C_{\cdot 0}$ contractions.

## 1. Introduction

Throughout the paper all operators are bounded linear operators defined on complex Hilbert spaces. A contraction is an operator whose norm is not greater than 1 . We denote by $\mathbb{C}, \mathbb{N}$ the set of complex numbers and positive integers respectively. The open unit disc and the unit circle with center at the origin in $\mathbb{C}$ are denoted by $\mathbb{D}$ and $\mathbb{T}$ respectively.

For studying an operator, it suffices to consider only contractions because an operator is just a scalar multiple of a contraction. A few decades ago Sz.-Nagy and Foias initiated a program of determining the structure of a contraction and modeling it as a compression of a unitary operator. As a consequence numerous novel results were achieved and their beautiful constructive proofs were witnessed. A keen reader is referred to the classic [7] and references there in. In 1951, von Neumann, [26], introduced the notion of spectral set for an operator and described the contractions as operators having $\overline{\mathbb{D}}$ as a spectral set.
Theorem 1.1 (von Neumann, 1951). An operator $T$ is a contraction if and only if $\overline{\mathbb{D}}$ is a spectral set for $T$.

The notion of spectral set, which was later defined by Arveson (e.g., [6]) for any finite tuple of commuting operators, became more popular and effective in deciphering the interplay between

[^0]the intrinsic properties of an operator tuple and the complex geometry of an underlying compact subset of $\mathbb{C}^{n}$ associated with the tuple (e.g., see [1, 22]). In 1953, Sz.-Nagy published a very influential article, [24], where he established the following dilation theorem whose impact is extraordinary till date.

Theorem 1.2 (Sz.-Nagy, 1953). If $T$ is a contraction acting on a Hilbert space $\mathscr{H}$, then there exists a Hilbert space $\mathscr{K} \supseteq \mathscr{H}$ and a unitary $U$ on $\mathscr{K}$ such that

$$
p(T)=\left.P_{\mathscr{H}} p(U)\right|_{\mathscr{H}} \quad \text { for every polynomial } p \in \mathbb{C}[z]
$$

A major and important class of operators that has been extensively studied by Sz.-Nagy, Foias and many other mathematicians (e.g., [7]), is the $C_{.0}$ class of contractions. A contraction $T$, defined on Hilbert space $\mathscr{H}$, is said to be $C ._{0}$ or pure, if $T^{* n} h \rightarrow 0$ as $n \rightarrow \infty$ for all $h \in \mathscr{H}$. The aim of this article is to study the $C .0$ operator tuples associated with the symmetrized polydisc $\mathbb{G}_{n}$, where

$$
\mathbb{G}_{n}=\left\{\left(\sum_{1 \leq i \leq n} z_{i}, \sum_{1 \leq i<j \leq n} z_{i} z_{j}, \ldots, \prod_{i=1}^{n} z_{i}\right):\left|z_{i}\right|<1, i=1, \ldots, n\right\} .
$$

The symmetrized polydisc $\mathbb{G}_{n}$ and its closure $\Gamma_{n}$, given by

$$
\Gamma_{n}=\left\{\left(\sum_{1 \leq i \leq n} z_{i}, \sum_{1 \leq i<j \leq n} z_{i} z_{j}, \ldots, \prod_{i=1}^{n} z_{i}\right):\left|z_{i}\right| \leq 1, i=1, \ldots, n\right\}
$$

are the images of polydisc $\mathbb{D}^{n}$ and its closure $\overline{\mathbb{D}^{n}}$ respectively under the symmetrization map $\pi_{n}: \mathbb{C}^{n} \rightarrow \mathbb{C}^{n}$ defined by

$$
\pi_{n}\left(z_{1}, \ldots, z_{n}\right)=\left(\sum_{1 \leq i \leq n} z_{i}, \sum_{1 \leq i<j \leq n} z_{i} z_{j}, \ldots, \prod_{i=1}^{n} z_{i}\right)
$$

The family of domains $\left\{\mathbb{G}_{n}: n \in \mathbb{N}\right\}$ was introduced in [11] to study the spectral NevanlinnaPick problem. Indeed, the family of domains $\left\{\mathbb{G}_{n}: n \in \mathbb{N}\right\}$ is naturally associated with spectral interpolation in the following way: if $\mathscr{M}_{n}(\mathbb{C})$ is the space of all $n \times n$ complex matrices and if $\mathscr{B}_{1}$ is its spectral unit ball, then $A \in \mathscr{B}_{1}$ (that is, the spectral radius $r(A)<1$ ) if and only if $\Pi_{n}(A) \in \mathbb{G}_{n}$, where $\Pi_{n}(A)=\pi_{n}(\sigma(A)), \sigma(A)$ being the spectrum of $A$. The domain $\mathbb{G}_{n}$ is of importance because, apart from the derogatory matrices, the $n \times n$ spectral Nevanlinna-Pick problem is equivalent to a similar interpolation problem of $\mathbb{G}_{n}$ (see [3], Theorem 2.1). Note that a bounded domain like $\mathbb{G}_{n}$, which has complex-dimension $n$, is much easier to deal with than an unbounded $n^{2}$-dimensional object like $\mathscr{B}_{1}$. The symmetrized polydisc has attracted considerable attention in past two decades because of its rich function theory, beautiful complex geometry and appealing operator theory (see [11, 14, 2, 4, 8, 9, 10] and references there in).

In this paper, we analyze and develop a Nagy-Foias type operator theory for the commuting operator tuples having $\Gamma_{n}$ as a spectral set.

Definition 1.3. A commuting tuple of operators $\left(S_{1}, \ldots, S_{n-1}, P\right)$ that has $\Gamma_{n}$ as a spectral set is called a $\Gamma_{n}$-contraction, that is, $\left(S_{1}, \ldots, S_{n-1}, P\right)$ is a $\Gamma_{n}$-contraction if the Taylor joint spectrum $\sigma_{T}\left(S_{1}, \ldots, S_{n-1}, P\right) \subseteq \Gamma_{n}$ and von Neumann's inequality

$$
\left\|f\left(S_{1}, \ldots, S_{n-1}, P\right)\right\| \leq \sup _{\mathbf{z} \in \Gamma_{n}}|f(\mathbf{z})|=\|f\|_{\infty, \Gamma_{n}} \quad\left[\mathbf{z}=\left(s_{1}, \ldots, s_{n-1}, p\right)\right]
$$

holds for all rational functions $f=p / q,\left(p, q \in \mathbb{C}\left[z_{1}, \ldots, z_{n}\right]\right)$ such that $f$ does not have any pole in $\Gamma_{n}$. Also, a $\Gamma_{n}$-contraction $\left(S_{1}, \ldots, S_{n-1}, P\right)$ is called pure or $C .0$ if $P$ is a $C .0$ contraction.

Here $f\left(S_{1}, \ldots, S_{n-1}, P\right)=p\left(S_{1}, \ldots, S_{n-1}, P\right) q\left(S_{1}, \ldots, S_{n-1}, P\right)^{-1}$ in order to maintain the standard convention. In Section 2, we shall explain the motivation behind defining $C \cdot{ }_{0} \Gamma_{n}$-contraction in terms of the last component $P$. A Nagy-Foias type operator theoretic program for the pure $\Gamma_{2-}$ contractions was initiated in [8] and was further carried out in [9]. In this paper, we generalize those results for any arbitrary $n \geq 2$ and our methods are also a generalization of the techniques that were used in [8, 9]. Operator theory on $\Gamma_{2}$ was simpler because rational dilation succeeded on $\Gamma_{2}$ (see [8]) and a concrete operator model was obtained as a consequence of dilation, [9]. Since rational dilation fails on $\mathbb{G}_{n}$ for $n \geq 3$ (see [19]), only conditional dilation and functional model can be achieved when $n \geq 3$.

In [7], Nagy and Foias showed that a $C .0$ contraction $T$, defined on a Hilbert space $\mathscr{H}$, can be realized as the compression of the shift operator $M_{z}$ defined on the vectorial Hardy space $H^{2}\left(\mathscr{D}_{T^{*}}\right)$, where $\mathscr{D}_{T^{*}}=\overline{\operatorname{Ran}} D_{P}=\overline{\operatorname{Ran}}\left(I-T T^{*}\right)^{\frac{1}{2}}$. To obtain this representation, they first showed that $M_{z}$ on $H^{2}\left(\mathscr{D}_{P^{*}}\right)$ is the minimal isometric dilation of $T$. In Theorem 4.3, we construct an analogous minimal $\Gamma_{n}$-isometric dilation of a $C .0 \Gamma_{n}$-contraction ( $S_{1}, \ldots, S_{n-1}, P$ ) under certain conditions. The minimal dilation space for $\left(S_{1}, \ldots, S_{n-1}, P\right)$ is no bigger than the Nagy-Foias minimal dilation space for $P$, which is $H^{2}\left(\mathscr{D}_{P^{*}}\right)$. As a consequence of this $\Gamma_{n^{-}}$ isometric dilation, we achieve in Theorem4.9 a concrete functional model for ( $S_{1}, \ldots, S_{n-1}, P$ ). Also in Theorem 4.6, we independently produce an operator model for a $C_{.0} \Gamma_{n}$-contraction without assuming any condition on $\left(S_{1}, \ldots, S_{n-1}, P\right)$. This model may or may not be a commutative one. A unique operator tuple $\left(B_{1}, \ldots, B_{n-1}\right)$ associated with $\left(S_{1}^{*}, \ldots, S_{n-1}^{*}, P^{*}\right)$, which satisfies

$$
S_{i}^{*}-S_{n-i} P^{*}=D_{P^{*}} B_{i} D_{P^{*}} \quad i=1, \ldots, n-1
$$

plays the central role in the constructions of the dilation and the models. The existence and uniqueness of such an $(n-1)$-tuple are proved in Theorem 3.3. Indeed, in Theorem 3.3 we consider the general case, that is, we prove that for every $\Gamma_{n}$-contraction $\left(S_{1}, \ldots, S_{n-1}, P\right)$ there exists a unique tuple $\left(A_{1}, \ldots, A_{n-1}\right)$ such that

$$
S_{i}-S_{n-i}^{*} P=D_{P} A_{i} D_{P} \quad i=1, \ldots, n-1
$$

For its pivotal role in operator theory on $\Gamma_{n},\left(A_{1}, \ldots, A_{n-1}\right)$ is called the fundamental operator tuple or shortly the $\mathscr{F}_{O}$-tuple of $\left(S_{1}, \ldots, S_{n-1}, P\right)$. In [11], Costara showed that for any $\left(s_{1}, \ldots, s_{n-1}, p\right) \in \Gamma_{n}$ there is a unique $\left(\beta_{1}, \ldots, \beta_{n-1}\right) \in \Gamma_{n-1}$ such that $s_{i}=\beta_{i}+p \bar{\beta}_{n-i}$ for $i=1, \ldots, n-1$. With the help of the $\mathscr{F}_{O}$-tuple, we find an operator theoretic analogue of this result for a $C_{.0} \Gamma_{n}$-contraction in Corollaries 4.7, 4.8, In view of the existence and uniqueness of the $\mathscr{F}_{O}$-tuple of a $\Gamma_{n}$-contraction (as in Theorem 3.3), a natural question arises: given $n-1$ operators $A_{1}, \ldots, A_{n-1}$, can we find a $\Gamma_{n}$-contraction for which $\left(A_{1}, \ldots, A_{n-1}\right)$ is the $\mathscr{F}_{O}$-tuple ? We provide a partial answer to this question in Theorem 3.7.

One of the most wonderful discoveries in operator theory is the characteristic function of a contraction due to Nagy and Foias (defined in Subsection 4.2) which is a complete unitary invariant for the completely non-unitary (c.n.u) contractions in the sense that two c.n.u contractions $T_{1}, T_{2}$ are unitarily equivalent if and only if their characteristic functions coincide. In Theorem 5.2, we find a complete unitary invariant for the $C \cdot{ }_{\cdot 0} \Gamma_{n}$-contractions. We show that for a $C .{ }_{.0} \Gamma_{n}$-contraction $\left(S_{1}, \ldots, S_{n-1}, P\right)$, the $\mathscr{F}_{O}$-tuple $\left(B_{1}, \ldots, B_{n-1}\right)$ of $\left(S_{1}^{*}, \ldots, S_{n-1}^{*}, P^{*}\right)$ and the characteristic function $\Theta_{P}$ of $P$ constitute a complete unitary invariant.

In Section 2, we accumulate a few definitions and results from the literature which will be used in sequel.

Note. The present article is an updated version of a part of the author's unpublished paper [20]. We learned that Theorem 3.3 and the preparatory result Proposition 4.2 of this article were independently proved by A. Pal in [16].

Acknowledgement. The author is thankful to Orr Shalit for several fruitful comments on this article.

## 2. A BRIEF LITERATURE AND PRELIMINARIES

Unitary, isometry and co-isometry are special classes of contractions. There are natural analogues of these classes for $\Gamma_{n}$-contractions in the literature (see [4, 10, 19]). It was established in [14] that the distinguished boundary of $\Gamma_{n}$, denoted by $b \Gamma_{n}$, is the symmetrization of the distinguished boundary of the polydisc, which is the $n$-torus $\mathbb{T}^{n}$, and thus $b \Gamma_{n}$ is the set

$$
b \Gamma_{n}=\left\{\left(\sum_{i=1}^{n} z_{i}, \sum_{1 \leq i<j \leq n} z_{i} z_{j}, \ldots, \prod_{i=1}^{n} z_{i}\right):\left|z_{i}\right|=1, i=1, \ldots, n\right\} .
$$

Definition 2.1. Let $S_{1}, \ldots, S_{n-1}, P$ be commuting operators on $\mathscr{H}$. Then $\left(S_{1}, \ldots, S_{n-1}, P\right)$ is called
(i) a $\Gamma_{n}$-unitary if $S_{1}, \ldots, S_{n-1}, P$ are normal operators and $\sigma_{T}\left(S_{1}, \ldots, S_{n-1}, P\right) \subseteq b \Gamma_{n}$;
(ii) a $\Gamma_{n}$-isometry if there exist a Hilbert space $\mathscr{K} \supseteq \mathscr{H}$ and a $\Gamma_{n}$-unitary $\left(T_{1}, \ldots, T_{n-1}, U\right)$ on $\mathscr{K}$ such that $\mathscr{H}$ is a joint invariant subspace of $T_{1}, \ldots, T_{n-1}, U$ and

$$
\left(\left.T_{1}\right|_{\mathscr{H}}, \ldots,\left.T_{n-1}\right|_{\mathscr{H}},\left.U\right|_{\mathscr{H}}\right)=\left(S_{1}, \ldots, S_{n-1}, P\right) ;
$$

(iii) a $\Gamma_{n}$-co-isometry if the adjoint $\left(S_{1}^{*}, \ldots, S_{n-1}^{*}, P^{*}\right)$ is a $\Gamma_{n}$-isometry.

The following theorems from [19] provide clear descriptions of a $\Gamma_{n}$-unitary and a $\Gamma_{n}$-isometry.
Theorem 2.2 ([19], Theorems 4.2 \& 4.4). A commuting tuple of operators $\left(S_{1}, \ldots, S_{n-1}, P\right)$ is a $\Gamma_{n}$-unitary (or, a $\Gamma_{n}$-isometry) if and only if $\left(S_{1}, \ldots, S_{n-1}, P\right)$ is a $\Gamma_{n}$-contraction and $P$ is a unitary (isometry).

Needless to mention that $\left(S_{1}, \ldots, S_{n-1}, P\right)$ is a $\Gamma_{n}$-co-isometry if and only if $\left(S_{1}, \ldots, S_{n-1}, P\right)$ is a $\Gamma_{n}$-contraction and $P$ is a co-isometry. So, it is evident that the nature of a $\Gamma_{n}$-contraction $\left(S_{1}, \ldots, S_{n-1}, P\right)$ is highly influenced by the nature of its last component $P$. In [18], the author of this paper showed that for a given $\Gamma_{n}$-contraction $\left(S_{1}, \ldots, S_{n-1}, P\right)$ on $\mathscr{H}$, if $P=\left.\left.P\right|_{\mathscr{H}_{1}} \oplus P\right|_{\mathscr{H}_{2}}$ is the canonical decomposition of the contraction $P$ with respect to $\mathscr{H}=\mathscr{H}_{1} \oplus \mathscr{H}_{2}$ such that $\left.P\right|_{\mathscr{H}_{1}}$ is a unitary and $\left.P\right|_{\mathscr{H}_{2}}$ is a c.n.u contraction, then both $\mathscr{H}_{1}, \mathscr{H}_{2}$ reduce $S_{1}, \ldots, S_{n-1}$ and $\left(\left.S_{1}\right|_{\mathscr{H}_{1}}, \ldots,\left.S_{n-1}\right|_{\mathscr{H}_{1}},\left.P\right|_{\mathscr{H}_{1}}\right)$ is a $\Gamma_{n}$-unitary whereas $\left(\left.S_{1}\right|_{\mathscr{H}_{2}}, \ldots,\left.S_{n-1}\right|_{\mathscr{H}_{2}},\left.P\right|_{\mathscr{H}_{2}}\right)$ is a $\Gamma_{n}$-contraction for which $\left.P\right|_{\mathscr{H}_{2}}$ is a c.n.u contraction. This unique decomposition was named the "canonical decomposition" of a $\Gamma_{n}$-contraction. This naturally motivated the author to define a c.n.u $\Gamma_{n^{-}}$ contraction to be a $\Gamma_{n}$-contraction $\left(S_{1}, \ldots, S_{n-1}, P\right)$ for which $P$ is a c.n.u contraction and indeed such a definition is justified. Taking cue from such dominant roles of $P$ in determining the special classes of a $\Gamma_{n}$-contraction $\left(S_{1}, \ldots, S_{n-1}, P\right)$ we are led to the following definition.

Definition 2.3. A $\Gamma_{n}$-contraction $\left(S_{1}, \ldots, S_{n-1}, P\right)$ acting on $\mathscr{H}$ is said to be $C .0$ or pure if $P$ is a $C .0$ contraction, that is, if $P^{* n} h \rightarrow 0$ as $n \rightarrow \infty$ for all $h \in \mathscr{H}$.

The following theorem, which provides a characterization for the $\Gamma_{n}$-unitaries, will be used in sequel.

Theorem 2.4 ([10], Theorem 4.2). Let $\left(S_{1}, \ldots, S_{n-1}, P\right)$ be a commuting tuple of bounded operators. Then the following are equivalent.
(1) $\left(S_{1}, \ldots, S_{n-1}, P\right)$ is a $\Gamma_{n}$-unitary,
(2) $P$ is a unitary, $\left(\frac{n-1}{n} S_{1}, \frac{n-2}{n} S_{2}, \ldots, \frac{1}{n} S_{n-1}\right)$ is a $\Gamma_{n-1}$-contraction and $S_{i}=S_{n-i}^{*} P$ for $i=$ $1, \ldots, n-1$.

## 3. THE FUNDAMENTAL OPERATOR TUPLE ( $\mathscr{F}_{O}$-TUPLE) OF A $\Gamma_{n}$-CONTRACTION

In [18], we introduced the following $n-1$ operator pencils $\Phi_{1}, \ldots, \Phi_{n-1}$ in order to determine the structure of a $\Gamma_{n}$-contraction $\left(S_{1}, \ldots, S_{n-1}, P\right)$ :

$$
\begin{align*}
\Phi_{i}\left(S_{1}, \ldots, S_{n-1}, P\right)= & \left(\tilde{n}_{i}-S_{i}\right)^{*}\left(\tilde{n}_{i}-S_{i}\right)-\left(\tilde{n}_{i} P-S_{n-i}\right)^{*}\left(\tilde{n}_{i} P-S_{n-i}\right) \\
= & \tilde{n}_{i}^{2}\left(I-P^{*} P\right)+\left(S_{i}^{*} S_{i}-S_{n-i}^{*} S_{n-i}\right)-\tilde{n}_{i}\left(S_{i}-S_{n-i}^{*} P\right) \\
& -\tilde{n}_{i}\left(S_{i}^{*}-P^{*} S_{n-i}\right), \quad \text { where } \tilde{n}_{i}=\binom{n}{i} . \tag{3.1}
\end{align*}
$$

We mention here to the readers that while defining $\Phi_{i}$ in [18], $\tilde{n}_{i}$ was mistakenly displayed as $n$ and that was a typographical error. From the definition it is clear that in particular when $S_{1}, \ldots, S_{n-1}, P$ are scalars, i.e, points in $\Gamma_{n}$, the above operator pencils take the following form for each $i$ :

$$
\begin{align*}
\Phi_{i}\left(s_{1}, \ldots, s_{n-1}, p\right)= & \tilde{n}_{i}^{2}\left(1-|p|^{2}\right)+\left(\left|s_{i}\right|^{2}-\left|s_{n-i}\right|^{2}\right)-\tilde{n}_{i}\left(s_{i}-\bar{s}_{n-i} p\right) \\
& -\tilde{n}_{i}\left(\bar{s}_{i}-\bar{p} s_{n-i}\right) . \tag{3.2}
\end{align*}
$$

The following result appeared in [18] and is extremely important in the context of this paper.
Proposition 3.1 (Proposition 2.6, [18]). Let $\left(S_{1}, \ldots, S_{n-1}, P\right)$ be a $\Gamma_{n}$-contraction. Then for $i=1, \ldots, n-1, \Phi_{i}\left(\alpha S_{1}, \ldots, \alpha^{n-1} S_{n-1}, \alpha^{n} P\right) \geq 0$ for all $\alpha \in \overline{\mathbb{D}}$.

The positivity of the operator pencils $\Phi_{i}$ will determine a certain and unique operator tuple $\left(A_{1}, \ldots, A_{n-1}\right)$ associated with each $\Gamma_{n}$-contraction $\left(S_{1}, \ldots, S_{n-1}, P\right)$. We shall call $\left(A_{1}, \ldots, A_{n-1}\right)$ the fundamental operator tuple or the $\mathscr{F}_{O}$-tuple of $\left(S_{1}, \ldots, S_{n-1}, P\right)$ and the underlying reason is that it plays the central role in constructing the explicit dilation and operator models and in determining the complete unitary invariant for a $C .0 \Gamma_{n}$-contraction.

Recall that the numerical radius of an operator $A$ on a Hilbert space $\mathscr{H}$ is defined by

$$
\omega(A)=\sup \left\{|\langle A x, x\rangle|:\|x\|_{\mathscr{H}}=1\right\} .
$$

It is well known that

$$
\begin{equation*}
r(A) \leq \omega(A) \leq\|A\| \text { and } \frac{1}{2}\|A\| \leq \omega(A) \leq\|A\| \tag{3.3}
\end{equation*}
$$

where $r(A)$ is the spectral radius of $A$. We state a basic lemma on the numerical radius whose proof is a routine exercise. We shall use this lemma in sequel.

Lemma 3.2. The numerical radius of an operator $A$ is not greater than 1 if and only if Re $(\alpha A) \leq I$ for all complex numbers $\alpha$ of modulus 1 .

Theorem 3.3. (Existence and Uniqueness). Let $\left(S_{1}, \ldots, S_{n-1}, P\right)$ be a $\Gamma_{n}$-contraction on a Hilbert space $\mathscr{H}$. Then there are unique operators $A_{1}, \ldots, A_{n-1} \in \mathscr{B}\left(\mathscr{D}_{P}\right)$ such that

$$
S_{i}-S_{n-i}^{*} P=D_{P} A_{i} D_{P} \text { for } i=1, \ldots, n-1
$$

Moreover, for each $i$ and for all $z \in \mathbb{T}, \omega\left(A_{i}+A_{n-i} z\right) \leq \tilde{n}_{i} .\left[\begin{array}{c}\tilde{n}_{i}\end{array}=\binom{n}{i}\right]$.

Proof. We apply Proposition 3.1 to $\left(S_{1}, \ldots, S_{n-1}, P\right)$ and obtain for each $i=1, \ldots, n-1$,

$$
\begin{equation*}
\Phi_{i}\left(\alpha S_{1}, \ldots, \alpha^{n-1} S_{n-1}, \alpha^{n} P\right) \geq 0 \tag{3.4}
\end{equation*}
$$

for all $\alpha \in \overline{\mathbb{D}}$. Therefore, in particular for $\beta, \gamma \in \mathbb{T}$ we have from (3.4) for $\Phi_{i}$ and $\Phi_{n-i}$ respectively

$$
\begin{align*}
& \tilde{n}_{i}^{2}\left(I-P^{*} P\right)+\left(S_{i}^{*} S_{i}-S_{n-i}^{*} S_{n-i}\right) \geq \tilde{n}_{i} \beta^{i}\left(S_{i}-S_{n-i}^{*} P\right)+\tilde{n}_{i} \bar{\beta}^{i}\left(S_{i}^{*}-P^{*} S_{n-i}\right),  \tag{3.5}\\
& \tilde{n}_{i}^{2}\left(I-P^{*} P\right)+\left(S_{n-i}^{*} S_{n-i}-S_{i}^{*} S_{i}\right) \geq \tilde{n}_{i} \gamma^{n-i}\left(S_{n-i}-S_{i}^{*} P\right)+\tilde{n}_{i} \gamma^{n-i}\left(S_{n-i}^{*}-P^{*} S_{i}\right) \tag{3.6}
\end{align*}
$$

We choose $\beta, \gamma \in \mathbb{T}$ such that $\gamma^{n-i}=\beta^{i}=\eta$ and then by adding we get

$$
\begin{align*}
2 \tilde{n}_{i}\left(I-P^{*} P\right) \geq & \eta\left\{\left(S_{i}-S_{n-i}^{*} P\right)+\left(S_{n-i}-S_{i}^{*} P\right)\right\} \\
& +\bar{\eta}\left\{\left(S_{i}^{*}-P^{*} S_{n-i}\right)+\left(S_{n-i}^{*}-P^{*} S_{i}\right)\right\} . \tag{3.7}
\end{align*}
$$

This shows that the Laurent polynomial

$$
\begin{align*}
\xi(z)= & 2 \tilde{n}_{i}\left(I-P^{*} P\right)-z\left\{\left(S_{i}-S_{n-i}^{*} P\right)+\left(S_{n-i}-S_{i}^{*} P\right)\right\} \\
& -\bar{z}\left\{\left(S_{i}^{*}-P^{*} S_{n-i}\right)+\left(S_{n-i}^{*}-P^{*} S_{i}\right)\right\} \tag{3.8}
\end{align*}
$$

is non-negative for all $z \in \mathbb{T}$. Therefore, by the Operator Fejer-Riesz Theorem (see Theorem 1.2 in [13]) there is a polynomial of degree 1 , say $P(z)=X_{0}+X_{1} z$, such that for all $z \in \mathbb{T}$,

$$
\begin{align*}
\xi(z)=P(z)^{*} P(z) & =\left(X_{0}^{*}+X_{1}^{*} \bar{z}\right)\left(X_{0}+X_{1} z\right) \\
& =\left(X_{0}^{*} X_{0}+X_{1}^{*} X_{1}\right)+\left(X_{0}^{*} X_{1}\right) z+X_{1}^{*} X_{0} \bar{z} . \tag{3.9}
\end{align*}
$$

Comparing (3.8) and (3.9) we obtain

$$
\begin{gather*}
2 \tilde{n}_{i} D_{P}^{2}=X_{0}^{*} X_{0}+X_{1}^{*} X_{1}  \tag{3.10}\\
\left(S_{i}-S_{n-i}^{*} P\right)+\left(S_{n-i}-S_{i}^{*} P\right)=-X_{0}^{*} X_{1} \tag{3.11}
\end{gather*}
$$

Again putting $\gamma=-\beta$ in (3.6) and adding (3.5) and (3.6) we have that

$$
\begin{align*}
2 \tilde{n}_{i}\left(I-P^{*} P\right) \geq & \beta\left\{\left(S_{i}-S_{n-i}^{*} P\right)-\left(S_{n-i}-S_{i}^{*} P\right)\right\} \\
& +\bar{\beta}\left\{\left(S_{i}^{*}-P^{*} S_{n-i}\right)-\left(S_{n-i}^{*}-P^{*} S_{i}\right)\right\} \tag{3.12}
\end{align*}
$$

This shows that the Laurent polynomial

$$
\begin{align*}
\eta(z)= & 2 \tilde{n}_{i}\left(I-P^{*} P\right)-z\left\{\left(S_{i}-S_{n-i}^{*} P\right)-\left(S_{n-i}-S_{i}^{*} P\right)\right\} \\
& -\bar{z}\left\{\left(S_{i}^{*}-P^{*} S_{n-i}\right)-\left(S_{n-i}^{*}-P^{*} S_{i}\right)\right\} \tag{3.13}
\end{align*}
$$

is non-negative for all $z \in \mathbb{T}$. Therefore, applying the Operator Fejer-Riesz Theorem again we have a polynomial of degree 1 , say $Q(z)=Y_{0}+Y_{1} z$, such that for all $z \in \mathbb{T}$,

$$
\begin{align*}
\eta(z)=Q(z)^{*} Q(z) & =\left(Y_{0}^{*}+Y_{1}^{*} \bar{z}\right)\left(Y_{0}+Y_{1} z\right) \\
& =\left(Y_{0}^{*} Y_{0}+Y_{1}^{*} Y_{1}\right)+\left(Y_{0}^{*} Y_{1}\right) z+Y_{1}^{*} Y_{0} \bar{z} \tag{3.14}
\end{align*}
$$

Comparing (3.13) and (3.14) we have

$$
\begin{gather*}
2 \tilde{n}_{i} D_{P}^{2}=Y_{0}^{*} Y_{0}+Y_{1}^{*} Y_{1}  \tag{3.15}\\
\left(S_{i}-S_{n-i}^{*} P\right)-\left(S_{n-i}-S_{i}^{*} P\right)=-Y_{0}^{*} Y_{1} \tag{3.16}
\end{gather*}
$$

Adding (3.10) and (3.15) we have

$$
\begin{equation*}
4 \tilde{n}_{i} D_{P}^{2}=\left(X_{0}^{*} X_{0}+X_{1}^{*} X_{1}\right)+\left(Y_{0}^{*} Y_{0}+Y_{1}^{*} Y_{1}\right) \tag{3.17}
\end{equation*}
$$

Similarly adding (3.11) and (3.16) we have

$$
\begin{equation*}
2\left(S_{i}-S_{n-i}^{*} P\right)=-\left(X_{0}^{*} X_{1}+Y_{0}^{*} Y_{1}\right) \tag{3.18}
\end{equation*}
$$

We obtain from (3.17) that

$$
4 \tilde{n}_{i} D_{P}^{2} \geq X_{0}^{*} X_{0}, 4 \tilde{n}_{i} D_{P}^{2} \geq X_{1}^{*} X_{1}, 4 \tilde{n}_{i} D_{P}^{2} \geq Y_{0}^{*} Y_{0} \text { and } 4 \tilde{n}_{i} D_{P}^{2} \geq Y_{1}^{*} Y_{1}
$$

So, by Douglas's lemma (see Lemma 2.1 in [12]) there are contractions $Z_{0}, Z_{1}, Z_{2}, Z_{3}$ such that

$$
\begin{array}{ll}
X_{0}^{*}=2 \sqrt{\tilde{n}_{i}} D_{P} Z_{0}, & X_{1}^{*}=2 \sqrt{\tilde{n}_{i}} D_{P} Z_{1} \\
Y_{0}^{*}=2 \sqrt{\tilde{n}_{i}} D_{P} Z_{2}, & Y_{1}^{*}=2 \sqrt{\tilde{n}_{i}} D_{P} Z_{3}
\end{array}
$$

Substituting these values in (3.18) we have that

$$
S_{i}-S_{n-i}^{*} P=D_{P}\left[-2 \tilde{n}_{i}\left(Z_{0} Z_{1}^{*}+Z_{2} Z_{3}^{*}\right)\right] D_{P}
$$

Setting $A_{i}=\left.P_{\mathscr{D}_{P}}\left[-2 \tilde{n}_{i}\left(Z_{0} Z_{1}^{*}+Z_{2} Z_{3}^{*}\right)\right]\right|_{\mathscr{D}_{P}}$, we have that

$$
S_{i}-S_{n-i}^{*} P=D_{P} A_{i} D_{P},
$$

which is true for all $i=1, \ldots, n-1$.
Adding (3.7) and (3.12) we have that

$$
4 \tilde{n}_{i} D_{P}^{2} \geq 4 \operatorname{Re} \beta\left(S_{i}-S_{n-i}^{*} P\right)=4 \operatorname{Re} \beta D_{P} A_{i} D_{P}
$$

Therefore,

$$
D_{P}^{2} \geq \operatorname{Re} \beta D_{P}\left(\frac{1}{\tilde{n}_{i}} A_{i}\right) D_{P}
$$

and thus

$$
D_{P}\left[I_{\mathscr{D}_{P}}-\operatorname{Re} \beta\left(\frac{1}{\tilde{n}_{i}} A_{i}\right)\right] D_{P} \geq 0
$$

This implies that

$$
I_{\mathscr{D}_{P}}-\operatorname{Re} \beta\left(\frac{1}{\tilde{n}_{i}} A_{i}\right) \geq 0
$$

because $A_{i}$ is defined on $\mathscr{D}_{P}$. Therefore, by Lemma3.2, we have

$$
\omega\left(A_{i}\right) \leq \tilde{n}_{i}=\binom{n}{i} .
$$

Uniqueness. Let there be two solutions $A_{i}, C_{i}$ of the equation $S_{i}-S_{n-i}^{*} P=D_{P} X_{i} D_{P}$. Then $D_{P}\left(A_{i}-C_{i}\right) D_{P}=0$, which shows that $A_{i}-C_{i}=0$ as $A_{i}-C_{i}$ is defined on $\mathscr{D}_{P}$. Thus $A_{i}$ is unique for each $i=1, \ldots, n-1$.

We shall see in the next subsection a partial converse to the existence-uniqueness of the $\mathscr{F}_{O^{-}}$ tuple. Under a certain condition, an operator tuple $\left(A_{1}, \ldots, A_{n-1}\right)$ becomes the $\mathscr{F}_{O}$-tuple of a $\Gamma_{n}$-contraction (see Theorem 3.7).

Note 3.4. The $\mathscr{F}_{O}$-tuple of a $\Gamma_{n}$-isometry or a $\Gamma_{n}$-unitary $\left(S_{1}, \ldots, S_{n-1}, P\right)$ is defined to be $(0, \ldots, 0)$ because the $\mathscr{F}_{O}$-tuple is defined on the space $\mathscr{D}_{P}$ and in such cases $\mathscr{D}_{P}=\{0\}$.
Proposition 3.5. If two $\Gamma_{n}$-contractions are unitarily equivalent then so are their $\mathscr{F}_{o \text {-tuples. }}$
Proof. Suppose $\left(S_{11}, \ldots, S_{1(n-1)}, P_{1}\right)$ and $\left(S_{21}, \ldots, S_{2(n-1)}, P_{2}\right)$ are two unitarily equivalent $\Gamma_{n^{-}}$ contractions acting on Hilbert spaces $\mathscr{H}_{1}$ and $\mathscr{H}_{2}$ respectively with $\mathscr{F}_{O}$-tuples $\left(F_{1}, \ldots, F_{n-1}\right)$ and $\left(G_{1}, \ldots, G_{n-1}\right)$. Then there is a unitary $U$ from $\mathscr{H}_{1}$ to $\mathscr{H}_{2}$ such that

$$
U S_{11}=S_{21} U, \ldots, U S_{1(n-1)}=S_{2(n-1)} U \text { and } U P_{1}=P_{2} U
$$

Obviously $U P_{1}^{*}=P_{2}^{*} U$ and consequently

$$
U D_{P_{1}}^{2}=U\left(I-P_{1}^{*} P_{1}\right)=U-P_{2}^{*} P_{2} U=D_{P_{2}}^{2} U
$$

Therefore, $U D_{P_{1}}=D_{P_{2}} U$. Let $V=\left.U\right|_{\mathscr{D}_{P_{1}}}$. Then $V \in \mathscr{L}\left(\mathscr{D}_{P_{1}}, \mathscr{D}_{P_{2}}\right)$ and $V D_{P_{1}}=D_{P_{2}} V$. Thus, using the fact that $S_{1 i}-S_{1(n-i)}^{*} P_{1}$ and $S_{2 i}-S_{2(n-i)}^{*} P_{2}$ are equal to 0 on the orthogonal complement of $\mathscr{D}_{P_{1}}$ and $\mathscr{D}_{P_{2}}$ respectively we have

$$
D_{P_{2}} V F_{i} V^{*} D_{P_{2}}=V D_{P_{1}} F_{i} D_{P_{1}} V^{*}=V\left(S_{1 i}-S_{1(n-i)}^{*} P_{1}\right) V^{*}=S_{2 i}-S_{2 n-i}^{*} P_{2}=D_{P_{2}} G_{i} D_{P_{2}} .
$$

So, $F_{i}$ and $G_{i}$ are unitarily equivalent for $i=1, \ldots, n-1$ and the proof is complete.

Remark 3.6. The converse to the above result does not hold, i.e, two non-unitarily equivalent $\Gamma_{n}$-contractions can have unitarily equivalent $\mathscr{F}_{O^{-}}$tuples. For example, if we consider a $\Gamma_{n^{-}}$ isometry on a Hilbert space which is not a $\Gamma_{n}$-unitary, then its $\mathscr{F}_{O}$-tuple is $(0, \ldots, 0)$ which is same as the $\mathscr{F}_{O}$-tuple of any $\Gamma_{n}$-unitary on the same Hilbert space.

A partial converse to the Existence-Uniqueness Theorem for the $\mathscr{F}_{O}$-tuple. The existence and uniqueness of the $\mathscr{F}_{O}$-tuple (Theorem 3.3) is in the center of all results of this article. Here we provide a partial converse to that result.

Theorem 3.7. Let $A_{1}, \ldots, A_{n-1}$ be operators defined on a Hilbert space $E$ such that

$$
\left(\frac{n-1}{n}\left(A_{1}^{*}+A_{n-1} z\right), \frac{n-2}{n}\left(A_{2}^{*}+A_{n-2} z\right), \ldots, \frac{1}{n}\left(A_{n-1}^{*}+A_{1} z\right)\right)
$$

is a $\Gamma_{n-1}$-contraction for all $z \in \mathbb{T}$. Then there is a $\Gamma_{n}$-contraction for which $\left(A_{1}, \ldots, A_{n-1}\right)$ is the $\mathscr{F}_{o}$-tuple.

Proof. Let us consider the vectorial Hardy-Hilbert space $H^{2}(E)$ and the Toeplitz operator tuple $\left(T_{A_{1}^{*}+A_{n-1} z}, \ldots, T_{A_{n-1}^{*}+A_{1} z}, T_{z}\right)$ acting on it. Here $T_{z}$ on $H^{2}(E)$ is the shift operator. We shall show that $\left(T_{A_{1}^{*}+A_{n-1} z}^{*}, \ldots, T_{A_{n-1}^{*}+A_{1} z}^{*}, T_{z}^{*}\right)$ is a $\Gamma_{n}$-co-isometry and $\left(A_{1}, \ldots, A_{n-1}\right)$ is the $\mathscr{F}_{O}$-tuple of it. Since for all $z \in \mathbb{T}$,

$$
\left(\frac{n-1}{n}\left(A_{1}^{*}+A_{n-1} z\right), \frac{n-2}{n}\left(A_{2}^{*}+A_{n-2} z\right), \ldots, \frac{1}{n}\left(A_{n-1}^{*}+A_{1} z\right)\right)
$$

is a $\Gamma_{n-1}$-contraction, so is

$$
\left(\frac{n-1}{n} M_{A_{1}^{*}+A_{n-1} z}, \frac{n-2}{n} M_{A_{2}^{*}+A_{n-2} z}, \ldots, \frac{1}{n} M_{A_{n-1}^{*}+A_{1} z}\right),
$$

where each of the multiplication operators is defined on $L^{2}(E)$. It is evident that for each $z \in \mathbb{T}$, $M_{A_{i}{ }^{*}+A_{n-i} z}=M_{A_{n-i}{ }^{*}+A_{i} z^{\prime}}^{*} M_{z}$ and $M_{z}$ on $L^{2}(E)$ is unitary. So by Theorem 2.4, the multiplication operator tuple $\left(M_{A_{1}^{*}+A_{n-1} z}, \ldots, M_{A_{n-1}^{*}+A_{1} z}, M_{z}\right)$ on $L^{2}(E)$ is a $\Gamma_{n}$-unitary and the Toeplitz operator tuple $\left(T_{A_{1}^{*}+A_{n-1} z}, \ldots, T_{A_{n-1}^{*}+A_{1} z}, T_{z}\right)$, being the restriction of $\left(M_{A_{1}^{*}+A_{n-1} z}, \ldots, M_{A_{n-1}^{*}+A_{1} z}, M_{z}\right)$ to the common invariant subspace $H^{2}(E)$, is a $\Gamma_{n}$-isometry. Therefore, $\left(T_{A_{1}^{*}+A_{n-1} z}^{*}, \ldots, T_{A_{n-1}^{*}+A_{1} z}^{*}, T_{z}^{*}\right)$ is a $\Gamma_{n}$-co-isometry. We now compute the $\mathscr{F} O$-tuple of $\left(T_{A_{1}^{*}+A_{n-1} z}^{*}, \ldots, T_{A_{n-1}^{*}+A_{1} z}^{*}, T_{z}^{*}\right)$. Now for each $i=1, \ldots, n-1$,

$$
T_{A_{i}^{*}+A_{n-i} z}^{*}-T_{A_{n-i}^{*}+A_{i} z} T_{z}^{*}=T_{A_{i}+A_{n-i}^{*} \bar{z}}-T_{A_{n-i}^{*}+A_{i} z} T_{\bar{z}}=T_{A_{i}}=A_{i} .
$$

Again since $I-T_{z} T_{z}^{*}$ is the projection onto the space $\mathscr{D}_{T_{z}^{*}}(=E)$,

$$
\left(I-T_{z} T_{z}^{*}\right)^{\frac{1}{2}} A_{i}\left(I-T_{z} T_{z}^{*}\right)^{\frac{1}{2}}=A_{i}
$$

Therefore, by the uniqueness of the $\mathscr{F}_{0}$-tuple, $\left(A_{1}, \ldots, A_{n-1}\right)$ is the $\mathscr{F}_{O}$-tuple of the $\Gamma_{n}$-coisometry $\left(T_{A_{1}^{*}+A_{n-1} z}^{*}, \ldots, T_{A_{n-1}^{*}+A_{1} z}^{*}, T_{z}^{*}\right)$.

## 4. DILATION AND MODEL THEORY FOR $C .0 \Gamma_{n}$-CONTRACTIONS

4.1. Dilation. We have witnessed in [19] that in general rational dilation fails on the symmetrized polydisc in any dimension greater than 2 . In this subsection, we shall determine a class of $C \cdot{ }_{0} \Gamma_{n}$-contractions that dilate to the distinguished boundary $b \Gamma_{n}$. Indeed, we impose certain conditions on the $\mathscr{F}_{O}$-tuple of a $C .{ }_{0} \Gamma_{n}$-contraction to obtain a $\Gamma_{n}$-isometric dilation and then extend that $\Gamma_{n}$-isometry to a $\Gamma_{n}$-unitary which eventually becomes a $\Gamma_{n}$-unitary dilation.
Definition 4.1. Let $\left(S_{1}, \ldots, S_{n-1}, P\right)$ be a $\Gamma_{n}$-contraction on $\mathscr{H}$. A commuting operator tuple $\left(T_{1}, \ldots, T_{n-1}, V\right)$ defined on $\mathscr{K}$ is said to be a $\Gamma_{n}$-isometric dilation of $\left(S_{1}, \ldots, S_{n-1}, P\right)$ if $\mathscr{H} \subseteq$ $\mathscr{K},\left(T_{1}, \ldots, T_{n-1}, V\right)$ is a $\Gamma_{n}$-isometry and

$$
\left.P_{\mathscr{H}}\left(T_{1}^{m_{1}} \ldots T_{n-1}^{m_{n-1}} V^{n}\right)\right|_{\mathscr{H}}=S_{1}^{m_{1}} \ldots S_{n-1}^{m_{n-1}} P^{n}
$$

for all non-negative integers $m_{1}, \ldots, m_{n-1}, n$. Moreover, the dilation is called minimal if the following holds:

$$
\mathscr{K}=\overline{\operatorname{span}}\left\{T_{1}^{m_{1}} \ldots T_{n-1}^{m_{n-1}} V^{n} h: h \in \mathscr{H} \text { and } m_{1}, \ldots, m_{n-1}, n \in \mathbb{N} \cup\{0\}\right\}
$$

In a similar fashion one can define a $\Gamma_{n}$-unitary dilation of a $\Gamma_{n}$-contraction.
Needless to mention that a $\Gamma_{n}$-unitary dilation of a $\Gamma_{n}$-contraction is a normal dilation to the distinguished boundary $b \Gamma_{n}$. Before going to the explicit dilation, we state and prove the following result which we use in the proof of the dilation theorem.

Proposition 4.2. Let $\left(T_{1}, \ldots, T_{n-1}, V\right)$ on $\mathscr{K}$ be a $\Gamma_{n}$-isometric dilation of a $\Gamma_{n}$-contraction $\left(S_{1}, \ldots, S_{n-1}, P\right)$ on $\mathscr{H}$. If $\left(T_{1}, \ldots, T_{n-1}, V\right)$ is minimal, then $\left(T_{1}^{*}, \ldots, T_{n-1}^{*}, V^{*}\right)$ is a $\Gamma_{n}$-coisometric extension of $\left(S_{1}^{*}, \ldots, S_{n-1}^{*}, P^{*}\right)$. Conversely, the adjoint of a $\Gamma_{n}$-co-isometric extension of $\left(S_{1}, \ldots, S_{n-1}, P\right)$ is a $\Gamma_{n}$-isometric dilation of $\left(S_{1}, \ldots, S_{n-1}, P\right)$.
Proof. We first prove that $S_{i} P_{\mathscr{H}}=P_{\mathscr{H}} T_{i}$ for each $i$ and $P P_{\mathscr{H}}=P_{\mathscr{H}} V$. Clearly

$$
\mathscr{K}=\overline{\operatorname{span}}\left\{T_{1}^{m_{1}} \ldots T_{n-1}^{m_{n-1}} V^{n} h: h \in \mathscr{H} \text { and } m_{1}, \ldots, m_{n-1}, n \in \mathbb{N} \cup\{0\}\right\}
$$

Now for $h \in \mathscr{H}$ we have that

$$
\begin{aligned}
S_{i} P_{\mathscr{H}}\left(T_{1}^{m_{1}} \ldots T_{n-1}^{m_{n-1}} V^{n} h\right) & =S_{i}\left(S_{1}^{m_{1}} \ldots S_{n-1}^{m_{n-1}} P^{n} h\right) \\
& =S_{1}^{m_{1}} \ldots S_{i}^{m_{i}+1} \ldots S_{n-1}^{m_{n-1}} P^{n} h \\
& =P_{\mathscr{H}}\left(T_{1}^{m_{1}} \ldots T_{i}^{m_{i}+1} \ldots T_{n-1}^{m_{n-1}} V^{n} h\right) \\
& =P_{\mathscr{H}} T_{i}\left(T_{1}^{m_{1}} \ldots T_{n-1}^{m_{n-1}} V^{n} h\right) .
\end{aligned}
$$

Thus, $S_{i} P_{\mathscr{H}}=P_{\mathscr{H}} T_{i}$. Similarly we can prove that $P P_{\mathscr{H}}=P_{\mathscr{H}} V$. Also for $h \in \mathscr{H}$ and $k \in \mathscr{K}$ we have that

$$
\left\langle S_{i}^{*} h, k\right\rangle=\left\langle P_{\mathscr{H}} S_{i}^{*} h, k\right\rangle=\left\langle S_{i}^{*} h, P_{\mathscr{H}} k\right\rangle=\left\langle h, S_{i} P_{\mathscr{H}} k\right\rangle=\left\langle h, P_{\mathscr{H}} T_{i} k\right\rangle=\left\langle T_{i}^{*} h, k\right\rangle .
$$

Hence $S_{i}^{*}=\left.T_{i}^{*}\right|_{\mathscr{H}}$ and similarly $P^{*}=\left.V^{*}\right|_{\mathscr{H}}$. Therefore, $\left(T_{1}^{*}, \ldots, T_{n-1}^{*}, V^{*}\right)$ is a $\Gamma_{n}$-co-isometric extension of $\left(S_{1}^{*}, \ldots, S_{n-1}^{*}, P^{*}\right)$. The converse part is obvious.

We are now in a position to present the desired dilation theorem which is one of the main results of this article.
Theorem 4.3. Let $\left(S_{1}, \ldots, S_{n-1}, P\right)$ be a $C .0 \Gamma_{n}$-contraction on a Hilbert space $\mathscr{H}$ and let the $\mathscr{F}_{\text {O-tuple }}\left(B_{1}, \ldots, B_{n-1}\right)$ of $\left(S_{1}^{*}, \ldots, S_{n-1}^{*}, P^{*}\right)$ be such that

$$
\left(\frac{n-1}{n}\left(B_{1}^{*}+B_{n-1} z\right), \frac{n-2}{n}\left(B_{2}^{*}+B_{n-2} z\right), \ldots, \frac{1}{n}\left(B_{n-1}^{*}+B_{1} z\right)\right)
$$

is a $\Gamma_{n-1}$-contraction for all $z \in \mathbb{T}$. Consider the operators $T_{1}, \ldots, T_{n-1}, V$ on $\mathscr{K}=H^{2}(\mathbb{D}) \otimes$ $\mathscr{D}_{P^{*}}$ defined by $T_{i}=I \otimes B_{i}^{*}+M_{z} \otimes B_{n-i}$ for $i=1, \ldots, n-1$ and $V=M_{z} \otimes I$. Then the n-tuple $\left(T_{1}, \ldots, T_{n-1}, V\right)$ is a minimal $C_{.0} \Gamma_{n}$-isometric dilation of $\left(S_{1}, \ldots, S_{n-1}, P\right)$.

Proof. We have from the Sz.-Nagy-Foias theory for $C .0$ contractions [7] that $\mathscr{K}$ is the minimal isometric dilation space and the operator $V$ is the minimal isometric dilation of $P$. So, the minimality of the dilation follows trivially. It suffices to prove that $\left(T_{1}, \ldots, T_{n-1}, V\right)$ is a $\Gamma_{n}$-isometric dilation of $\left(S_{1}, \ldots, S_{n-1}, P\right)$. By virtue of Lemma 4.2, it suffices to show that $\left(T_{1}^{*}, \ldots, T_{n-1}^{*}, V^{*}\right)$ is a $\Gamma_{n}$-co-isometric extension of $\left(S_{1}^{*}, \ldots, S_{n-1}^{*}, P^{*}\right)$. Since

$$
\left(\frac{n-1}{n}\left(B_{1}^{*}+B_{n-1} z\right), \frac{n-2}{n}\left(B_{2}^{*}+B_{n-2} z\right), \ldots, \frac{1}{n}\left(B_{n-1}^{*}+B_{1} z\right)\right)
$$

is a $\Gamma_{n-1}$-contraction for all $z \in \mathbb{T}$, it follows from the proof of Theorem 3.7 that the Toeplitz operator tuple $\left(T_{B_{1}^{*}+B_{n-1} z}, \ldots, T_{B_{n-1}^{*}+B_{1} z}, T_{z}\right)$ on $H^{2}\left(\mathscr{D}_{P^{*}}\right)$ is a $C .0 \Gamma_{n}$-isometry with $\left(B_{1}, \ldots, B_{n-1}\right)$ being the $\mathscr{F}{ }_{O}$-tuple of its adjoint, $\left(T_{B_{1}^{*}+B_{n-1} z}^{*}, \ldots, T_{B_{n-1}^{*}+B_{1 z}}^{*}, T_{z}^{*}\right)$. Also it is a $C \cdot 0 \Gamma_{n}$-isometry as $T_{z}$ is a $C .0$ isometry. Again since the Toeplitz operator tuple $\left(T_{B_{1}^{*}+B_{n-1} z}, \ldots, T_{B_{n-1}^{*}+B_{1} z}, T_{z}\right)$ on $H^{2}\left(\mathscr{D}_{P^{*}}\right)$ is unitarily equivalent to $\left(T_{1}, \ldots, T_{2}, V\right)$ on $\mathscr{K}=H^{2}(\mathbb{D}) \otimes \mathscr{D}_{P^{*}},\left(T_{1}, \ldots, T_{n-1}, V\right)$ is a $C .0 \Gamma_{n}$-isometry. All we have to prove now is that $\left(T_{1}^{*}, \ldots, T_{n-1}^{*}, V^{*}\right)$ is a $\Gamma_{n}$-co-isometric extension of $\left(S_{1}^{*}, \ldots, S_{n-1}^{*}, P^{*}\right)$.

Let us define $W: \mathscr{H} \rightarrow \mathscr{K}$ by $W h=\sum_{n=0}^{\infty} z^{n} \otimes D_{P^{*}} P^{* n} h$. Now

$$
\begin{aligned}
\|W h\|^{2} & =\left\|\sum_{n=0}^{\infty} z^{n} \otimes D_{P^{*}} P^{* n} h\right\|^{2} \\
& =\left\langle\sum_{n=0}^{\infty} z^{n} \otimes D_{P^{*}} P^{* n} h, \sum_{m=0}^{\infty} z^{m} \otimes D_{P^{*}} P^{* m} h\right\rangle \\
& =\sum_{m, n=0}^{\infty}\left\langle z^{n}, z^{m}\right\rangle\left\langle D_{P^{*}} P^{* n} h, D_{P^{*}} P^{* m} h\right\rangle \\
& =\sum_{n=1}^{\infty}\left\langle P^{n} D_{P^{*}}^{2} P^{* n} h, h\right\rangle \\
& =\sum_{n=0}^{\infty}\left\langle P^{n}\left(I-P P^{*}\right) P^{* n} h, h\right\rangle \\
& =\sum_{n=0}^{\infty}\left\{\left\langle P^{n} P^{* n} h, h\right\rangle-\left\langle P^{n+1} P^{* n+1} h, h\right\rangle\right\} \\
& =\|h\|^{2}-\lim _{n \rightarrow \infty}\left\|P^{* n} h\right\|^{2} .
\end{aligned}
$$

Since $P$ is a pure contraction, $\lim _{n \rightarrow \infty}\left\|P^{* n} h\right\|^{2}=0$ and thus $\|W h\|=\|h\|$. Therefore $W$ is an isometry. For a basis vector $z^{n} \otimes \eta$ of $\mathscr{K}$ we have that

$$
\left\langle W^{*}\left(z^{n} \otimes \eta\right), h\right\rangle=\left\langle z^{n} \otimes \eta, \sum_{k=0}^{\infty} z^{k} \otimes D_{P^{*}} P^{* k} h\right\rangle=\left\langle\eta, D_{P^{*}} P^{* n} h\right\rangle=\left\langle P^{n} D_{P^{*}} \xi, h\right\rangle
$$

Therefore,

$$
\begin{equation*}
W^{*}\left(z^{n} \otimes \eta\right)=P^{n} D_{P^{*}} \eta, \quad \text { for } n=0,1,2,3, \ldots \tag{4.1}
\end{equation*}
$$

and hence

$$
P W^{*}\left(z^{n} \otimes \eta\right)=P^{n+1} D_{P^{*}} \eta, \text { for } n=0,1,2,3, \ldots
$$

Again by (4.1),

$$
W^{*} V\left(z^{n} \otimes \eta\right)=W^{*}\left(M_{z} \otimes I\right)\left(z^{n} \otimes \eta\right)=W^{*}\left(z^{n+1} \otimes \eta\right)=P^{n+1} D_{P^{*}} \eta=P W^{*}\left(z^{n} \otimes \eta\right)
$$

Consequently, $W^{*} V=P W^{*}$, i.e, $V^{*} W=W P^{*}$ and hence $\left.V^{*}\right|_{W(\mathscr{H})}=\left.W P^{*} W^{*}\right|_{W(\mathscr{H})}$.
We now show that $W^{*} T_{i}=S_{i} W^{*}$ for each $i=1, \ldots, n-1$;

$$
\begin{aligned}
W^{*} T_{i}\left(z^{n} \otimes \eta\right) & =W^{*}\left(I \otimes B_{i}^{*}+M_{z} \otimes B_{n-i}\right)\left(z^{n} \otimes \eta\right) \\
& =W^{*}\left(z^{n} \otimes B_{i}^{*} \eta\right)+W^{*}\left(z^{n+1} \otimes B_{n-i} \eta\right) \\
& =P^{n} D_{P^{*}} B_{i}^{*} \eta+P^{n+1} D_{P^{*}} B_{n-1} \eta
\end{aligned}
$$

Also for each $i$,

$$
\begin{equation*}
S_{i} W^{*}\left(z^{n} \otimes \eta\right)=S_{i} P^{n} D_{P^{*}} \eta=P^{n} S_{i} D_{P^{*}} \eta \tag{4.2}
\end{equation*}
$$

Claim 1. $S_{i} D_{P^{*}}=D_{P^{*}} B_{i}^{*}+P D_{P^{*}} B_{n-i}$.
Proof of Claim 1. Since $\left(B_{1}, \ldots, B_{n-1}\right)$ is the $\mathscr{F}_{O}$-tuple of $\left(S_{1}^{*}, \ldots, S_{n-1}^{*}, P^{*}\right)$, we have

$$
\left(D_{P^{*}} B_{i}^{*}+P D_{P^{*}} B_{n-i}\right) D_{P^{*}}=\left(S_{i}-P S_{n-i}^{*}\right)+P\left(S_{n-i}^{*}-S_{i} P^{*}\right)=S_{i} D_{P^{*}}^{2} .
$$

Now if $G=S_{i} D_{P^{*}}-D_{P^{*}} B_{i}^{*}-P D_{P^{*}} B_{n-i}$, then $G$ is defined from $\mathscr{D}_{P^{*}}$ to $\mathscr{H}$ and $G D_{P^{*}} h=0$ for every $h \in \mathscr{D}_{P^{*}}$. Thus the claim is proved.

So from (4.2) we have $S_{i} W^{*}\left(z^{n} \otimes \eta\right)=P^{n}\left(D_{P^{*}} B_{i}^{*}+P D_{P^{*}} B_{n-i}\right)$. Therefore, $W^{*} T_{i}=S_{i} W^{*}$ and hence $\left.T_{i}^{*}\right|_{W(\mathscr{H})}=\left.W S_{i}^{*} W^{*}\right|_{W(\mathscr{H})}$ for each $i$. Hence the proof is complete.

Corollary 4.4. Let $\left(S_{1}, \ldots, S_{n-1}, P\right)$ be a $\Gamma_{n}$-contraction which satisfies the hypotheses of Theorem 4.3. Then the multiplication operator tuple $\left(M_{B_{1}^{*}+B_{n-1}}, \ldots, M_{B_{n-1}^{*}+B_{1 z}}, M_{z}\right)$ on $L^{2}\left(\mathscr{D}_{P^{*}}\right)$ is $a \Gamma_{n}$-unitary dilation of $\left(S_{1}, \ldots, S_{n-1}, P\right)$.

Proof. Since the $\Gamma_{n}$-isometric dilation that is obtained in Theorem 4.3 is unitarily equivalent to Toeplitz operator tuple $\left(T_{B_{1}^{*}+B_{n-1} z}, \ldots, T_{B_{n-1}^{*}+B_{1} z}, T_{z}\right)$ on $H^{2}\left(\mathscr{D}_{P^{*}}\right)$ and since the multiplication operator tuple $\left(M_{B_{1}^{*}+B_{n-1} z}, \ldots, M_{B_{n-1}^{*}+B_{1} z}, M_{z}\right)$ on $L^{2}\left(\mathscr{D}_{P^{*}}\right)$ is a natural $\Gamma_{n}$-unitary extension of it, the assertion follows obviously.
4.2. Operator models. We recall from [7] the notion of the characteristic function of a contraction $T$. For a contraction $T$ defined on a Hilbert space $\mathscr{H}$, let $\Lambda_{T}$ be the set of all complex numbers for which the operator $I-z T^{*}$ is invertible. For $z \in \Lambda_{T}$, the characteristic function of $T$ is defined as

$$
\begin{equation*}
\Theta_{T}(z)=\left.\left[-T+z D_{T^{*}}\left(I-z T^{*}\right)^{-1} D_{T}\right]\right|_{\mathscr{D}_{T}} . \tag{4.3}
\end{equation*}
$$

By virtue of the relation $T D_{T}=D_{T^{*}} P$ (section I. 3 of [7]), $\Theta_{T}(z)$ maps $\mathscr{D}_{T}=\overline{\operatorname{Ran}} D_{T}$ into $\mathscr{D}_{T^{*}}=\overline{\operatorname{Ran}} D_{T^{*}}$ for every $z$ in $\Lambda_{T}$. Let us define

$$
\mathscr{H}_{P}=\left(H^{2}(\mathbb{D}) \otimes \mathscr{D}_{P^{*}}\right) \ominus M_{\Theta_{P}}\left(H^{2}(\mathbb{D}) \otimes \mathscr{D}_{P}\right) .
$$

In [7], Sz.-Nagy and Foias showed that every $C_{.0}$ contraction $P$ defined on a Hilbert space $\mathscr{H}$ is unitarily equivalent to the operator $\left.P_{\mathscr{H}_{P}}\left(M_{Z} \otimes I_{\mathscr{D}_{P^{*}}}\right)\right|_{\mathscr{H}_{P}}$ on the Hilbert space $\mathscr{H}_{P}$, where $P_{\mathscr{H}_{P}}$ is the projection of $H^{2}(\mathbb{D}) \otimes \mathscr{D}_{P^{*}}$ onto $\mathscr{H}_{P}$.

In this subsection, we independently find a model, which is not necessarily commutative, for a $C .0 \Gamma_{n}$-contraction $\left(S_{1}, \ldots, S_{n-1}, P\right)$ without assuming any condition on it. On the minimal
dilation space $\mathscr{H}_{P}$ of $P$ let $R_{1}, \ldots, R_{n-1}$ be the compressions of $T_{1}, \ldots, T_{n-1}$ (as in Theorem (4.3) respectively to $\mathscr{H}_{P}$. Evidently $R_{1}, \ldots, R_{n-1}$ do not commute in general, yet we shall see that they are individually unitarily equivalent to $S_{1}, \ldots, S_{n-1}$ respectively. For $P$, we choose the Nagy-Foias model $R=\left.P_{\mathscr{H}_{P}}\left(M_{z} \otimes I_{\mathscr{D}_{P^{*}}}\right)\right|_{\mathscr{H}_{P}}$. We also show that under the hypotheses of Theorem4.3, $\left(R_{1}, \ldots, R_{n-1}, R\right)$ on $\mathscr{H}$ is unitarily equivalent to $\left(S_{1}, \ldots, S_{n-1}, P\right)$ and thus in this case it provides a commutative model. Before going to the main results we state a lemma whose proof could be found in [9] (see Lemma 3.3 in [9]). For the sake of completeness we include the proof here too.

Lemma 4.5. For every contraction $P$, the identity

$$
\begin{equation*}
W W^{*}+M_{\Theta_{P}} M_{\Theta_{P}}^{*}=I_{H^{2}(\mathbb{D}) \otimes \mathscr{D}_{P^{*}}} \tag{4.4}
\end{equation*}
$$

holds, where $W$ is the isometry mentioned in the proof of Theorem 4.3.
Proof. The operator $W^{*}$ satisfies the identity

$$
W^{*}\left(k_{z} \otimes \xi\right)=(I-\bar{z} P)^{-1} D_{P^{*}} \xi \text { for } z \in \mathbb{D} \text { and } \xi \in \mathscr{D}_{P^{*}}
$$

where $k_{z}(w):=(1-\langle w, z\rangle)^{-1}$ for all $w \in \mathbb{D}$. For a proof one can see Theorem 1.2 in [6]. Therefore we have

$$
\begin{aligned}
& \left\langle\left(W W^{*}+M_{\Theta_{P}} M_{\Theta_{P}}^{*}\right)\left(k_{z} \otimes \xi\right),\left(k_{w} \otimes \eta\right)\right\rangle \\
= & \left\langle W^{*}\left(k_{z} \otimes \xi\right), W^{*}\left(k_{w} \otimes \eta\right)\right\rangle+\left\langle M_{\Theta_{P}}^{*}\left(k_{z} \otimes \xi\right), M_{\Theta_{P}}^{*}\left(k_{w} \otimes \eta\right)\right\rangle \\
= & \left\langle(I-\bar{z} P)^{-1} D_{P^{*}} \xi,(I-\bar{w} P)^{-1} D_{P^{*}} \eta\right\rangle+\left\langle k_{z} \otimes \Theta_{P}(z)^{*} \xi, k_{w} \otimes \Theta_{P}(w)^{*} \eta\right\rangle \\
= & \left\langle D_{P^{*}}\left(I-w P^{*}\right)^{-1}(I-\bar{z} P)^{-1} D_{P^{*}} \xi, \eta\right\rangle+\left\langle k_{z}, k_{w}\right\rangle\left\langle\Theta_{P}(w) \Theta_{P}(z)^{*} \xi, \eta\right\rangle \\
= & \left\langle k_{z} \otimes \xi, k_{w} \otimes \eta\right\rangle \text { for all } z, w \in \mathbb{D} \text { and } \xi, \eta \in \mathscr{D}_{P^{*}} .
\end{aligned}
$$

The last equality follows from the following well-known identity

$$
I-\Theta_{P}(w) \Theta_{P}(z)^{*}=(1-w \bar{z}) D_{P^{*}}\left(I-w P^{*}\right)^{-1}(I-\bar{z} P)^{-1} D_{P^{*}} .
$$

Now using the fact that $\left\{k_{z}: z \in \mathbb{D}\right\}$ forms a total set of $H^{2}(\mathbb{D})$, the assertion follows.
Theorem 4.6. Let $\left(S_{1}, \ldots, S_{n-1}, P\right)$ be a $C_{.0} \Gamma_{n}$-contraction on a Hilbert space $\mathscr{H}$. Then the operators $S_{i}$ and $P$ are unitarily equivalent to $\left.P_{\mathscr{H}_{P}}\left(I \otimes B_{i}^{*}+M_{z} \otimes B_{n-i}\right)\right|_{\mathscr{H}_{P}}$ and $\left.P_{\mathscr{H}_{P}}\left(M_{z} \otimes I_{\mathscr{D}_{P^{*}}}\right)\right|_{\mathscr{H}_{P}}$ respectively, where $\left(B_{1}, \ldots, B_{n-1}\right)$ is the $\mathscr{F}_{O}$-tuple of $\left(S_{1}^{*}, \ldots, S_{n-1}^{*}, P^{*}\right)$.
Proof. Since $W$ is an isometry, $W W^{*}$ is the projection onto the range of $W$ and since $P$ is pure, $M_{\Theta_{P}}$ is also an isometry. So by Lemma 4.5, we have that

$$
W\left(\mathscr{H}_{P}\right)=\left(H^{2}(\mathbb{D}) \otimes \mathscr{D}_{P^{*}}\right) \ominus M_{\Theta_{P}}\left(H^{2}(\mathbb{D}) \otimes \mathscr{D}_{P}\right)
$$

So, we have

$$
\begin{aligned}
W^{*}\left(I \otimes B_{i}^{*}+M_{z} \otimes B_{n-i}\right)\left(z^{n} \otimes \xi\right) & =W^{*}\left(z^{n} \otimes B_{i}^{*} \xi\right)+W^{*}\left(z^{n+1} \otimes B_{n-i} \xi\right) \\
& =P^{n} D_{P^{*}} B_{i}^{*} \xi+P^{n+1} D_{P^{*}} B_{n-i} \xi \\
& =P^{n}\left(D_{P^{*}} B_{i}^{*}+P D_{P^{*}} B_{n-i}\right) \xi \\
& =P^{n} S_{i} D_{P^{*}} \xi[\text { by Claim } 1 \text { in Theorem44.3] } \\
& =S_{i} P^{n} D_{P^{*}} \xi=S_{i} W^{*}\left(z^{n} \otimes \xi\right) .
\end{aligned}
$$

So for each $i$, we have $W^{*}\left(I \otimes B_{i}^{*}+M_{z} \otimes B_{n-i}\right)=S_{i} W^{*}$ for the vectors of the form $z^{n} \otimes \xi$, for all $n \geq 0$ and $\xi \in \mathscr{D}_{P^{*}}$ which span $H^{2}(\mathbb{D}) \otimes \mathscr{D}_{P^{*}}$. Hence we have $W^{*}\left(I \otimes B_{i}^{*}+M_{z} \otimes B_{n-i}\right)=S_{i} W^{*}$, which implies that $W^{*}\left(I \otimes B_{i}^{*}+M_{z} \otimes B_{n-i}\right) W=S_{i}$. Therefore, $S_{i}$ is unitarily equivalent to $\left.P_{\mathscr{H}_{P}}\left(I \otimes B_{i}^{*}+M_{z} \otimes B_{n-i}\right)\right|_{\mathscr{H}_{P}}$. Again

$$
W^{*}\left(M_{z} \otimes I\right)\left(z^{n} \otimes \xi\right)=W^{*}\left(z^{n+1} \otimes \xi\right)=P^{n+1} D_{P^{*}} \xi=P W^{*}\left(z^{n} \otimes \xi\right)
$$

Therefore by the same argument as above, $P$ is unitarily equivalent to $\left.P_{\mathscr{H}_{P}}\left(M_{z} \otimes I_{\mathscr{D}_{P^{*}}}\right)\right|_{\mathscr{C}_{P}}$.
Corollary 4.7. For any $C_{.0} \Gamma_{n}$-contraction $\left(S_{1}, \ldots, S_{n-1}, P\right)$, there are operators $C_{1}, \ldots, C_{n-1}$ satisfying $\omega\left(C_{i}+C_{n-i} z\right) \leq\binom{ n}{i}$ for all $z \in \mathbb{T}$ and such that $S_{i}=C_{i}+P C_{n-i}^{*}$ for $i=1, \ldots, n-1$.
Proof. From the previous theorem we have that

$$
\begin{aligned}
& W^{*}\left(I \otimes B_{i}^{*}+M_{z} \otimes B_{n-i}\right)=S_{i} W^{*} \\
& \text { or } W^{*}\left(I \otimes B_{i}^{*}+M_{z} \otimes B_{n-i}\right) W=S_{i} \\
& \text { or } W^{*}\left(I \otimes B_{i}^{*}\right) W+W^{*}\left(M_{z} \otimes I\right)\left(I \otimes B_{n-i}\right) W=S_{i} \\
& \text { or } W^{*}\left(I \otimes B_{i}^{*}\right) W+P W^{*}\left(I \otimes B_{n-i}\right) W=S_{i}, \text { since } W^{*}\left(M_{z} \otimes I\right)=P W^{*} .
\end{aligned}
$$

Taking $C_{i}=W^{*}\left(I \otimes B_{i}^{*}\right) W$ for each $i=1, \ldots, n-1$, we get $S_{i}=C_{i}+P C_{n-i}^{*}$. The fact that $\omega\left(C_{i}+C_{n-i} z\right) \leq\binom{ n}{i}$ for all $z \in \mathbb{T}$ is obvious.

Corollary 4.8. If $\left(S_{1}, \ldots, S_{n-1}, P\right)$ is a $\Gamma_{n}$-contraction with $\|P\|<1$, then there are $n-1$ unique operators $C_{1}, \ldots, C_{n-1}$ such that $S_{i}=C_{i}+P C_{n-i}^{*}$.
Proof. Let there be $C_{1}, \ldots, C_{n-1}$ and $\tilde{C}_{1}, \ldots, \tilde{C}_{n-1}$ such that $S_{i}=C_{i}+P C_{n-i}^{*}$ and $S_{i}=\tilde{C}_{i}+P \tilde{C}_{n-i}^{*}$. Then we have $D_{i}+P D_{n-i}^{*}=0$, where $D_{i}=C_{i}-\tilde{C}_{n-i}$. Now

$$
\left\|D_{i}\right\|=\left\|-P D_{n-i}^{*}\right\| \leq\|P\|\left\|D_{n-i}\right\|<\left\|D_{n-i}\right\| \quad \text { as }\|P\|<1 .
$$

Since this holds for each $i$, replacing $i$ by $n-i$ we get $\left\|D_{n-i}\right\|<\left\|D_{i}\right\|$. This shows that $D_{i}=0$ for each $i$ and consequently $C_{i}=\tilde{C}_{i}$.
Theorem 4.9. Let $\left(S_{1}, \ldots, S_{n-1}, P\right)$ be a $C .0 \Gamma_{n}$-contraction on a Hilbert space $\mathscr{H}$ that satisfies the hypotheses of Theorem 4.3 Then $\left(S_{1}, \ldots, S_{n-1}, P\right)$ is unitarily equivalent to the tuple $\left(R_{1}, \ldots, R_{n-1}, R\right)$ on the Hilbert space $\mathscr{H}_{P}=\left(H^{2}(\mathbb{D}) \otimes \mathscr{D}_{P^{*}}\right) \ominus M_{\Theta_{P}}\left(H^{2}(\mathbb{D}) \otimes \mathscr{D}_{P}\right)$ defined by

$$
\begin{aligned}
& R_{i}=\left.P_{\mathscr{H}_{P}}\left(I \otimes B_{i}^{*}+M_{z} \otimes B_{n-i}\right)\right|_{\mathscr{H}_{P}}, \text { for } i=1, \ldots, n-1 \\
& \text { and } R=\left.P_{\mathscr{H}_{P}}\left(M_{z} \otimes I\right)\right|_{\mathscr{H}_{P}} .
\end{aligned}
$$

Proof. Following the proof of Theorem4.3, it suffices to show that $W(\mathscr{H})=\mathscr{H}_{P}$, which follows from the fact that $W W^{*}+M_{\Theta_{P}} M_{\Theta_{P}}^{*}=I_{H^{2}(\mathbb{D}) \otimes \mathscr{P}_{P^{*}}}$. Hence the proof is complete.

## 5. A COMPLETE UNITARY INVARIANT FOR $C \cdot{ }_{0} \Gamma_{n}$-CONTRACTIONS

A complete unitary invariant for a class of operator tuples, defined on a Hilbert space $\mathscr{H}$, is a necessary and sufficient condition under which any two such operator tuples are unitarily equivalent, that is, there is a unitary on $\mathscr{H}$ that intertwines the corresponding components of the two tuples. For a pair of contractions $P, P^{\prime}$ acting on Hilbert spaces $\mathscr{H}$ and $\mathscr{H}^{\prime}$ respectively, we say that the characteristic functions of $P$ and $P^{\prime}$ coincide if there are unitary operators $u$ : $\mathscr{D}_{P} \rightarrow \mathscr{D}_{P^{\prime}}$ and $u_{*}: \mathscr{D}_{P^{*}} \rightarrow \mathscr{D}_{P^{\prime *}}$ such that the following diagram commutes for all $z \in \mathbb{D}$,

A few decades ago, Sz.-Nagy and Foias proved the following theorem, which asserts that the characteristic function is a complete unitary invariant for the c.n.u contractions.

Theorem 5.1 (Nagy-Foias, [7]). Two completely non-unitary contractions are unitarily equivalent if and only if their characteristic functions coincide.

Here we present a complete unitary invariant for the $C .{ }_{0} \Gamma_{n}$-contractions.
Theorem 5.2. Let $\left(S_{1}, \ldots, S_{n-1}, P\right)$ and $\left(S_{1}^{\prime}, \ldots, S_{n-1}^{\prime}, P^{\prime}\right)$ be two $C_{.0} \Gamma_{n}$-contractions defined on $\mathscr{H}$ and $\mathscr{H}^{\prime}$ respectively. Suppose $\left(B_{1}, \ldots, B_{n-1}\right)$ and $\left(B_{1}^{\prime}, \ldots, B_{n-1}^{\prime}\right)$ are the $\mathscr{F}_{o}$-tuples of $\left(S_{1}^{*}, \ldots, S_{n-1}^{*}, P^{*}\right)$ and $\left(S_{1}^{\prime *}, \ldots, S_{n-1}^{\prime *}, P^{* *}\right)$ respectively. Then $\left(S_{1}, \ldots, S_{n-1}, P\right)$ is unitarily equivalent to $\left(S_{1}^{\prime}, \ldots, S_{n-1}^{\prime}, P^{\prime}\right)$ if and only if $\left(B_{1}, \ldots, B_{n-1}, \Theta_{P}\right)$ and $\left(B_{1}^{\prime}, \ldots, B_{n-1}^{\prime}, \Theta_{P^{\prime}}\right)$ are unitarily equivalent.

Remark 5.3. The sense carried out by the unitary equivalence of

$$
\left(B_{1}, \ldots, B_{n-1}, \Theta_{P}\right) \text { and }\left(B_{1}^{\prime}, \ldots, B_{n-1}^{\prime}, \Theta_{P^{\prime}}\right)
$$

is that the characteristic functions of $P$ and $P^{\prime}$ coincide and $\left(B_{1}, \ldots, B_{n-1}\right)$ is unitarily equivalent to $\left(B_{1}^{\prime}, \ldots, B_{n-1}^{\prime}\right)$ by the unitary $u_{*}: \mathscr{D}_{P^{*}} \rightarrow \mathscr{D}_{P^{\prime *}}$ that is involved in the coincidence of the characteristic functions of $P$ and $P^{\prime}$.

Proof. First let us assume that $\left(S_{1}, \ldots, S_{n-1}, P\right)$ and $\left(S_{1}^{\prime}, \ldots, S_{n-1}^{\prime}, P^{\prime}\right)$ are unitarily equivalent and let $U: \mathscr{H} \rightarrow \mathscr{H}^{\prime}$ be a unitary such that $U S_{i}=S_{i}^{\prime} U$ for each $i$ and $U P=P^{\prime} U$. Since $P$ is a $C .0$ contraction, it is a completely non-unitary contraction and hence by Theorem 5.1, the characteristic functions of $P$ and $P^{\prime}$ coincides. The unitary $u_{*}: \mathscr{D}_{P^{*}} \rightarrow \mathscr{D}_{P^{\prime *}}$ that is involved in the coincidence of the characteristic functions $\Theta_{P}$ and $\Theta_{P^{\prime}}$ is nothing but the restriction of $U$ to $\mathscr{D}_{P^{*}}$ that takes $\mathscr{D}_{P^{*}}$ onto $\mathscr{D}_{P^{\prime *}}$. An interested reader can see Chapter VI of [7] for a proof of this fact. We now prove that the same unitary intertwines the $\mathscr{F}_{O}$-tuples of $\left(S_{1}^{*}, \ldots, S_{n-1}^{*}, P^{*}\right)$ and $\left(S_{1}^{\prime *}, \ldots, S_{n-1}^{\prime}{ }^{*}, P^{\prime *}\right)$. We have

$$
U D_{P^{*}}^{2}=U\left(I-P P^{*}\right)=U-P^{\prime} P^{\prime *} U=D_{P^{*}}^{2} U
$$

which gives $U D_{P^{*}}=D_{P^{* *}} U$. Let $\tilde{U}=\left.U\right|_{\mathscr{P}_{P^{*}}}$. Then note that $\tilde{U} \in \mathscr{B}\left(\mathscr{D}_{P^{*}}, \mathscr{D}_{P^{\prime *}}\right)$ and $\tilde{U} D_{P^{*}}=$ $D_{P^{*}} \tilde{U}$. Now for each $i$,

$$
\begin{aligned}
D_{P^{* *}} \tilde{U} B_{i} \tilde{U}^{*} D_{P^{\prime *}}=\tilde{U} D_{P^{*}} B_{i} D_{P^{*}} \tilde{U}^{*} & =\tilde{U}\left(S_{i}^{*}-S_{n-i} P^{*}\right) \tilde{U}^{*} \\
& =S_{i}^{\prime *}-S_{n-i}^{\prime} P^{\prime *}=D_{P^{\prime *}} B_{i}^{\prime} D_{P^{\prime *}}
\end{aligned}
$$

Therefore we have $\tilde{U} B_{i} \tilde{U}^{*}=B_{i}^{\prime}$ for each $i=1, \ldots, n-1$.
We prove the converse part. Let $u: \mathscr{D}_{P} \rightarrow \mathscr{D}_{P^{\prime}}$ and $u_{*}: \mathscr{D}_{P^{*}} \rightarrow \mathscr{D}_{P^{\prime *}}$ be unitary operators such that for each $i$

$$
u_{*} B_{i}=B_{i}^{\prime} u_{*} \text { and } u_{*} \Theta_{P}(z)=\Theta_{P^{\prime}}(z) u \text { for all } z \in \mathbb{D} .
$$

The unitary operator $u_{*}: \mathscr{D}_{P^{*}} \rightarrow \mathscr{D}_{P^{* *}}$ induces the following unitary operator

$$
\begin{aligned}
U_{*}: & H^{2}(\mathbb{D}) \otimes \mathscr{D}_{P^{*}} \rightarrow H^{2}(\mathbb{D}) \otimes \mathscr{D}_{P^{\prime *}} \\
& \left(z^{n} \otimes \xi\right) \mapsto\left(z^{n} \otimes u_{*} \xi\right) \xi \in \mathscr{D}_{P^{*}}, n \geq 0 .
\end{aligned}
$$

We note here that

$$
U_{*}\left(M_{\Theta_{P}} f(z)\right)=u_{*} \Theta_{P}(z) f(z)=\Theta_{P^{\prime}}(z) u f(z)=M_{\Theta_{P^{\prime}}}(u f(z)),
$$

for all $f \in H^{2}(\mathbb{D}) \otimes \mathscr{D}_{P}$ and $z \in \mathbb{D}$. Hence $U_{*}$ takes $\operatorname{Ran} M_{\Theta_{P}}$ onto $\operatorname{Ran} M_{\Theta_{P^{\prime}}}$. Since $U_{*}$ is unitary, we have

$$
U_{*}\left(\mathscr{H}_{P}\right)=U_{*}\left(\left(\operatorname{Ran} M_{\Theta_{P}}\right)^{\perp}\right)=\left(U_{*} \operatorname{Ran} M_{\Theta_{P}}\right)^{\perp}=\left(\operatorname{Ran} M_{\Theta_{P^{\prime}}}\right)^{\perp}=\mathscr{H}_{P^{\prime}}
$$

Again from the definition of $U_{*}$ we have that

$$
\begin{aligned}
U_{*}\left(I \otimes B_{i}^{*}+M_{z} \otimes B_{n-i}\right)^{*} & =\left(I \otimes u_{*}\right)\left(I \otimes B_{i}+M_{z}^{*} \otimes B_{n-i}^{*}\right) \\
& =I \otimes u_{*} B_{i}+M_{z}^{*} \otimes u_{*} B_{n-i}^{*} \\
& =I \otimes B_{i}^{\prime} u_{*}+M_{z}^{*} \otimes B_{n-i}^{\prime *} u_{*} \\
& =\left(I \otimes B_{i}^{\prime}+M_{z}^{*} \otimes B_{n-i}^{\prime *}\right)\left(I \otimes u_{*}\right) \\
& =\left(I \otimes B_{i}^{\prime *}+M_{z} \otimes B_{n-i}^{\prime}\right)^{*} U_{*} .
\end{aligned}
$$

Therefore, $\mathscr{H}_{P^{\prime}}=U_{*}\left(\mathscr{H}_{P}\right)$ is a joint co-invariant subspace of $\left(I \otimes B_{i}^{* *}+M_{z} \otimes B_{n-i}^{\prime}\right)$ for $i=$ $1, \ldots, n-1$. Hence $\left.P_{\mathscr{H}_{P}}\left(I \otimes B_{i}^{*}+M_{z} \otimes B_{n-i}\right)\right|_{\mathscr{H}_{P}}$ and $\left.P_{\mathscr{H}_{P^{\prime}}}\left(I \otimes B_{i}^{\prime *}+M_{z} \otimes B_{n-i}^{\prime}\right)\right|_{\mathscr{H}_{P^{\prime}}}$ are unitarily equivalent for each $i$. It is evident that the unitary operator that intertwines them is $U_{*} \mid \mathscr{H}_{P}$ : $\mathscr{H}_{P} \rightarrow \mathscr{H}_{P^{\prime}}$. Also we have

$$
U_{*}\left(M_{z} \otimes I_{\mathscr{D}_{P^{*}}}\right)=\left(I \otimes u_{*}\right)\left(M_{z} \otimes I_{\mathscr{D}_{P^{*}}}\right)=\left(M_{z} \otimes I_{\mathscr{D}_{P^{\prime *}}}\right)\left(I \otimes u_{*}\right)=\left(M_{z} \otimes I_{\mathscr{D}_{P^{\prime *}}}\right) U_{*} .
$$

So $\left.P_{\mathscr{H}_{P}}\left(M_{z} \otimes I_{\mathscr{D}_{P^{*}}}\right)\right|_{\mathscr{H}_{P}}$ and $\left.P_{\mathscr{H}_{P^{\prime}}}\left(M_{z} \otimes I_{\mathscr{D}_{P^{\prime *}}}\right)\right|_{\mathscr{H}_{P^{\prime}}}$ are unitarily equivalent by the same unitary $\left.U_{*}\right|_{\mathscr{H}_{P}}$. Therefore $\left(S_{1}, \ldots, S_{n-1}, P\right)$ and $\left(S_{1}^{\prime}, \ldots, S_{n-1}^{\prime}, P^{\prime}\right)$ are unitarily equivalent and the proof is complete.
