LOCAL ASYMPTOTIC PROPERTIES FOR COX-INGERSOLL-ROSS PROCESS WITH DISCRETE OBSERVATIONS

MOHAMED BEN ALAYA, AHMED KEBAIER AND NGOC KHUE TRAN

Abstract. In this paper, we consider a one-dimensional Cox-Ingersoll-Ross (CIR) process whose drift coefficient depends on unknown parameters. Considering the process discretely observed at high frequency, we prove the local asymptotic normality property in the sub-critical case, the local asymptotic quadraticity in the critical case, and the local asymptotic mixed normality property in the supercritical case. To obtain these results, we use the Malliavin calculus techniques developed recently for CIR process by Al{ò}s et al. [2] and Altmayer et al. [3] together with the \( L^p \)-norm estimation for positive and negative moments of the CIR process obtained by Bossy et al. [11] and Ben Alaya et al. [7, 8]. In this study, we require the same conditions of high frequency \( \Delta_n \to 0 \) and infinite horizon \( n \Delta_n \to \infty \) as in the case of ergodic diffusions with globally Lipschitz coefficients studied earlier by Gobet [20]. However, in the non-ergodic cases, additional assumptions on the decreasing rate of \( \Delta_n \) are required due to the fact that the square root diffusion coefficient of the CIR process is not regular enough. Indeed, we assume \( n \Delta_n^3 \to 0 \) for the critical case and \( \Delta_n^2 e^{-b_0 n \Delta_n} \to 0 \) for the supercritical case.

1. Introduction

On a complete probability space \((\hat{\Omega}, \hat{\mathcal{F}}, \hat{\mathbb{P}})\), we consider a Cox-Ingersoll-Ross (CIR) process \(X_{a,b}^t = (X_{a,b}^t)_{t \geq 0} \) in \( \mathbb{R} \) defined by
\[
X_{a,b}^t = x_0 + \int_0^t (a - b X_{s}^{a,b}) ds + \int_0^t \sqrt{2 \sigma X_{s}^{a,b}} dB_s,
\]
where \( X_0^{a,b} = x_0 > 0 \) is a given initial condition and we assume that \( a \geq \sigma > 0 \). Here, \( B = (B_t)_{t \geq 0} \) is a standard Brownian motion. The parameters \((a, b) \in \Theta \times \Sigma\) are unknown to be estimated, and \( \Theta \) and \( \Sigma \) are closed intervals of \( \mathbb{R}^* \) and \( \mathbb{R} \), respectively, where \( \mathbb{R}^* = \mathbb{R} \setminus \{0\} \). Let \( \{\mathcal{F}_t\}_{t \geq 0} \) denote the natural filtration generated by \( B \). We denote by \( \hat{\mathbb{P}}^{a,b} \) the probability measure induced by the CIR process \( X_{a,b}^t \) on the canonical space \((C(\mathbb{R}^+, \mathbb{R}), \mathcal{B}(C(\mathbb{R}^+, \mathbb{R})))\) endowed with the natural filtration \( \{\mathcal{F}_t\}_{t \geq 0} \). Here \( C(\mathbb{R}^+, \mathbb{R}) \) denotes the set of \( \mathbb{R} \)-valued continuous functions defined on \( \mathbb{R}^+ \), and \( \mathcal{B}(C(\mathbb{R}^+, \mathbb{R})) \) is its Borel \( \sigma \)-algebra. We denote by

Lemma 1.1. [8, Proposition 3]

(i) For all $p < \frac{a}{\sigma}$ and $b > 0$, we have $\sup_{t \geq 0} \hat{E}^{a,b}[\frac{1}{(X_t^{a,b})^p}] < \infty$.

(ii) For all $p < \frac{a}{\sigma}$ and $b = 0$, we have

$$\sup_{0 \leq t \leq 1} \hat{E}^{a,0}[\frac{1}{(X_t^{a,0})^p}] < \infty \quad \text{and} \quad \sup_{t \geq 1} \frac{\hat{E}^{a,0}[\frac{1}{(X_t^{a,0})^p}]}{t^{-p}} < \infty.$$  

(iii) For all $0 < p < \frac{a}{\sigma}$ and $b < 0$, we have

$$\sup_{0 \leq t \leq 1} \hat{E}^{a,b}[\frac{1}{(X_t^{a,b})^p}] < \infty \quad \text{and} \quad \sup_{t \geq 1} \frac{\hat{E}^{a,b}[\frac{1}{(X_t^{a,b})^p}]}{t^{-p}} < \infty.$$  

Recall that (i) and (ii) of Lemma 1.1 are taken from [8, Proposition 3]. The statement (iii) of Lemma 1.1 is due to the Comparison Theorem giving that $X_t^{a,0} \leq X_t^{a,b}$ a.s. for all $t \geq 0$ when $b < 0$ as their corresponding drift coefficients satisfy $a - 0x < a - bx$.

Lemma 1.2. [8, Proposition 4 and 5] Let $t > s \geq 0$ satisfying that $0 \leq t - s < 1$.

(i) Assume that $b > 0$. Then for any $q \geq 1$, there exists a constant $C > 0$ such that

$$\hat{E}^{a,b}[|X_t^{a,b} - X_s^{a,b}|^q] \leq C (t - s)^{\frac{q}{2}}.$$  

(ii) Assume that $b = 0$. Then there exists a constant $C > 0$ such that

$$\hat{E}^{a,0}[|X_t^{a,0} - X_s^{a,0}|^q] \leq \begin{cases} C (t - s)^{\frac{q}{2}} \sup_{u \in [s,t]} \hat{E}^{a,0}[(X_u^{a,0})^\frac{q}{2}], & \text{for any } q \geq 2, \\ C (at + x_0)^{\frac{q}{2}} (t - s)^{\frac{q}{2}}, & \text{for any } q \in [1,2]. \end{cases}$$  

Recall that the CIR process is extensively used in mathematical finance to model the evolution of short-term interest rates or to describe the dynamic of the stochastic volatility in the Heston model. The CIR process appears in the financial literature also as part of the class of affine processes, and a lot of interesting material can be found in this way, e.g. in the work of Teichmann et al. [15], Duffie, Filipović and Schachermayer [18], Kallsen [28], Keller-Ressel and Mijatović [30] and other authors.

A fundamental concept in asymptotic theory of statistics is the local asymptotic normality (LAN) property introduced by Le Cam [35] and then extended by Jeganathan [26] to the local asymptotic mixed normality (LAMN) property. The local asymptotic quadraticity

$$\hat{E}^{a,b}$$ the expectation with respect to (w.r.t.) $\hat{P}^{a,b}$. Let $\hat{P}^{a,b} \rightarrow \hat{L}(\hat{P}^{a,b})$, $\hat{P}^{a,b}$-a.s., and $\hat{L}$ denote the convergence in $\hat{P}^{a,b}$-probability, in $\hat{P}^{a,b}$-law, in $\hat{P}^{a,b}$-almost surely, and equality in law, respectively. $\ast$ denotes the transpose.

By applying Itô’s formula to (1.1), the unique strong solution of the equation (1.1) which is non-negative is given by

$$X_t^{a,b} = x_0 e^{-bt} + a \int_0^t e^{-b(t-s)} ds + \int_0^t e^{-b(t-s)} \sqrt{2\sigma X_s^{a,b}} dB_s,$$  

for all $t \geq 0$. Notice that condition $a \geq \sigma > 0$ guarantees that the process $X_t^{a,b}$ is always positive, i.e., $P(X_t^{a,b} > 0, \forall t \geq 0) = 1$. Let us now recall the following useful results taken from [8].

$$\hat{E}^{a,0}$$ and $\hat{L}$$
(LAQ) property was introduced by e.g. \cite{24,36}. Initiated by Gobet \cite{19}, the techniques of Malliavin calculus can be used to analyze the log-likelihood ratio of the discrete observation of continuous diffusion processes. Concretely, Gobet \cite{19,20} obtained the LAN and LAN properties respectively for multidimensional elliptic diffusions and ergodic diffusions on the basis of discrete observations at high frequency. In the presence of jumps, several cases have been largely investigated, see e.g. Aït-Sahalia and Jacod \cite{1}, Kawai \cite{29}, Clément et al. \cite{12,13}, Kohatsu-Higa et al. \cite{31,32}, and Tran \cite{45}. However, all these results deal with the stochastic differential equations whose coefficients are continuously differentiable and satisfy a global Lipschitz condition. The case where the coefficient functions of the model do not satisfy these standard assumptions, for instance the square root diffusion function in the CIR model which is neither differentiable at 0 nor globally Lipschitz, still remains an open problem when the model is discretely observed at high frequency.

On the other hand, notice that most existing research works on statistics for CIR process and more generally for affine diffusions mainly focus on parameter estimation based on continuous observations. More precisely, Overbeck \cite{39} showed the asymptotic properties of maximum likelihood estimator (MLE) as well as the LAN, LAMN and LAQ properties for CIR process in the subcritical (ergodic), critical, and supercritical (non-ergodic) submodels. Later, Ben Alaya and Kebaier \cite{7,8} show various asymptotic properties of MLE associated to the partial and global drift parameters of the CIR process in both ergodic and non-ergodic cases. Recently, Barczy and Pap \cite{6} have studied the asymptotic properties of MLE for Heston models. Later on, Benke and Pap \cite{9} have proved the LAN, LAMN and LAQ properties for Heston models. More recently, Barczy et al. \cite{41,42} have studied the asymptotic properties of MLE for jump-type Heston models and jump-type CIR process. Some results on parameter estimation based on discrete observations of CIR process can be found e.g. in \cite{40,8}. In \cite{40}, Overbeck and Rydén proved the LAN property for the ergodic CIR process based on discrete observations at low frequency and did one-step-improvement in the sense of Le Cam \cite{35}.

However, as mentioned just above, it seems that the validity of the LAN, LAMN and LAQ properties for CIR process in ergodic and non-ergodic cases on the basis of discrete observations in a high frequency context has never been addressed in the literature. One difficulty comes from the fact that its diffusion coefficient is the square root function. Motivated by this fact, the main objective of this paper is to derive the LAN property in the subcritical case, the LAQ property in the critical case, and the LAMN property in the supercritical case for $X^{a,b}$ based on discrete observations.

Let us now recall the notion of the LAQ, LAMN and LAN properties in our setting. Given the process $X^{a,b} = (X^{a,b}_t)_{t \geq 0}$ and $n \geq 1$, we consider a discrete observation at equidistant and deterministic times $t_k = k\Delta_n$, $k \in \{0, \ldots, n\}$ of the process $X^{a,b}$, which is denoted by $X^{n,a,b} = (X^{a,b}_{t_0}, X^{a,b}_{t_1}, \ldots, X^{a,b}_{t_n})$, where $\Delta_n \leq 1$ for all $n \geq 1$. We suppose that the high-frequency and infinite horizon conditions satisfy: $\Delta_n \to 0$ and $n\Delta_n \to \infty$ as $n \to \infty$. We denote by $P^{a,b}_n$ and $p_n(\cdot; (a,b))$ the probability law and the density of the random vector $X^{n,a,b}$, respectively.

For fixed $(a_0, b_0) \in \Theta \times \Sigma$, we consider a discrete observation of the process $X^{a_0,b_0}$ given by $X^{n,a_0,b_0} = (X^{a_0,b_0}_{t_0}, X^{a_0,b_0}_{t_1}, \ldots, X^{a_0,b_0}_{t_n})$. For $(u, v) \in \mathbb{R}^2$, we set $a_n := a_0 + u\varphi_{1,n}(a_0, b_0)$ and $b_n := b_0 + v\varphi_{2,n}(a_0, b_0)$, where we assume that $\varphi_{1,n}(a_0, b_0)$ and $\varphi_{2,n}(a_0, b_0)$ tend to zero as $n \to \infty$. Suppose that there exist a $\mathbb{R}^2$-valued random vector $U(a_0, b_0)$ and a (random)
matrix $I(a_0, b_0)$ such that for all $z = (u, v)^* \in \mathbb{R}^2$, as $n \to \infty$,
\begin{equation}
\log \frac{dP_{n,a,b_n}}{dP_{n,a,b_0}}(X_{n,a_0,b_0}) \xrightarrow{L^1} z^* U(a_0, b_0) - \frac{1}{2} z^* I(a_0, b_0) z.
\end{equation}

Then, we say that

(a) The LAQ property holds at $(a_0, b_0)$ with rates of convergence $(\varphi_{1,n}^{-1}(a_0, b_0), \varphi_{2,n}^{-1}(a_0, b_0))$ and random matrix $I(a_0, b_0)$ if further for all $z = (u, v)^* \in \mathbb{R}^2$, we have
\begin{equation}
\mathbb{E}_{a_0, b_0} \left[ e^{z^* U(a_0, b_0) - \frac{1}{2} z^* I(a_0, b_0) z} \right] = 1.
\end{equation}

(b) The LAMN property holds at $(a_0, b_0)$ with rates of convergence $(\varphi_{1,n}^{-1}(a_0, b_0), \varphi_{2,n}^{-1}(a_0, b_0))$ and asymptotic random Fisher information matrix $I(a_0, b_0)$ if further we can write $U(a_0, b_0) = I(a_0, b_0)^\frac{1}{2} N(0, I_2)$, where $N(0, I_2)$ denotes a centered $\mathbb{R}^2$-valued Gaussian random vector with identity covariance matrix $I_2$, which is independent of the conditional covariance matrix $I(a_0, b_0)$.

In particular, when $I(a_0, b_0)$ is deterministic, i.e., $U(a_0, b_0) = N(0, I(a_0, b_0))$, we say that the LAN property holds at $(a_0, b_0)$ with rates of convergence $(\varphi_{1,n}^{-1}(a_0, b_0), \varphi_{2,n}^{-1}(a_0, b_0))$ and asymptotic Fisher information matrix $I(a_0, b_0)$.

For the full power of the LAN, LAMN or LAQ property, one should consider arbitrary bounded sequences $(u_n, v_n)_{n \geq 1}$ in $\mathbb{R}^2$ when the local scale at $(a_0, b_0)$ is denoted by $(\varphi_n(a_0, b_0))_{n \geq 1} = (\varphi_{1,n}(a_0, b_0), \varphi_{2,n}(a_0, b_0))_{n \geq 1}$, that is, $u_n := a_0 + u_n \varphi_{1,n}(a_0, b_0)$ and $v_n := b_0 + v_n \varphi_{2,n}(a_0, b_0)$. For details, we refer the reader to Subsection 7.1 of Höpfner [22] or Le Cam and Lo Yang [36].

As we will see, the rates of convergence for LAQ, LAMN and LAN properties for CIR process depend strongly on the drift parameter $b$. Indeed, the value of the drift parameter $b > 0$, $b = 0$ and $b < 0$ determines respectively the subcritical, critical and supercritical cases.

To show the convergence [13], one needs to derive an appropriate stochastic expansion of the log-likelihood ratio. For any $t > s$, the law of $X_{t,a,b}^s$ conditioned on $X_{s,a,b}^s = x$ admits a positive explicit transition density $p_{a,b}^{(t - s, x, y)}$. From the explicit expression [15] and [16] below, the transition density $p_{a,b}^{(t - s, x, y)}$ is differentiable w.r.t. $a$ and $b$. Then using Markov property and the mean value theorem, the log-likelihood ratio can be decomposed as
\begin{equation}
\log \frac{dP_{n,a,b_n}}{dP_{n,a,b_0}}(X_{n,a_0,b_0}) = \log p_n(X_{n,a_0,b_0}; (a_n, b_n)) - \log p_n(X_{n,a_0,b_0}; (a_0, b_0))
\begin{align*}
&= \log p_n(X_{n,a_0,b_0}; (a_n, b_n)) + \log p_n(X_{n,a_0,b_0}; (a_n, b_n))
&\quad + \sum_{k=0}^{n-1} \log \frac{p_{a,b_n}}{p_{a,b_0}}(\Delta_n, X_{t_k}^{a_0,b_0}, X_{t_{k+1}}^{a_0,b_0}) + \sum_{k=0}^{n-1} \log \frac{p_{a,b_n}}{p_{a,b_0}}(\Delta_n, X_{t_k}^{a_0,b_0}, X_{t_{k+1}}^{a_0,b_0})
&\quad + \sum_{k=0}^{n-1} u_{\varphi_{1,n}}(a_0, b_0) \int_0^1 \frac{\partial p_{a,b_n}(\ell)}{\partial p_{a,b_0}(\ell)}(\Delta_n, X_{t_k}^{a_0,b_0}, X_{t_{k+1}}^{a_0,b_0}) d\ell \\
&\quad + \sum_{k=0}^{n-1} v_{\varphi_{2,n}}(a_0, b_0) \int_0^1 \frac{\partial p_{a,b_n}(\ell)}{\partial p_{a,b_0}(\ell)}(\Delta_n, X_{t_k}^{a_0,b_0}, X_{t_{k+1}}^{a_0,b_0}) d\ell,
\end{align*}
\end{equation}
where \( a_n = a_0 + \varphi_{1,n}(a_0, b_0), b_n = b_0 + \varphi_{2,n}(a_0, b_0) \), \( a(\ell) := a_0 + \ell \varphi_{1,n}(a_0, b_0) \) and \( b(\ell) := b_0 + \ell \varphi_{2,n}(a_0, b_0) \).

Since we are dealing with the CIR process, one way to proceed could be to use an explicit expression for the transition density function which is characterized in terms of a non-central chi-squared distribution (see e.g. [14]). That is, for any \( t > 0 \) and \( b \neq 0 \),

\[
p^{a,b}(t, x, y) = \frac{-be^{bt}}{\sigma(1 - e^{bt})} \left( \frac{y}{xe^{-bt}} \right)^{\frac{\nu}{2}} \exp \left\{ \frac{b}{\sigma} \frac{x + e^{bt}y}{1 - e^{bt}} \right\} I_\nu \left( \frac{-2b \sqrt{xy} e^{\frac{bt}{2}}}{\sigma(1 - e^{bt})} \right),
\]

and \( b = 0 \),

\[
p^{a,0}(t, x, y) = \frac{1}{\sigma t} \left( \frac{y}{x} \right)^{\frac{\nu}{2}} \exp \left\{ - \frac{x + y}{\sigma t} \right\} I_\nu \left( \frac{2 \sqrt{xy}}{\sigma t} \right),
\]

where \( \nu = \frac{a}{\sigma} - 1 \), and \( I_\nu \) is the modified Bessel function of the first kind of order \( \nu > 0 \) defined by

\[
I_\nu(x) = \sum_{n=0}^{\infty} \frac{1}{n! \Gamma(\nu + n + 1)} \left( \frac{x}{2} \right)^{2n+\nu},
\]

for any \( x \in \mathbb{R} \). Here \( \Gamma(\cdot) \) is the Gamma function defined by \( \Gamma(z) = \int_0^\infty x^{z-1}e^{-x}dx \) for \( z \in \mathbb{R}_+ \). To use this approach, one needs to well understand the behavior of the logarithm derivatives of the transition density w.r.t. the parameters \( a \) and \( b \). However, it is not clear if using \([1.5]\) and \([1.6]\) would help especially since the parameter \( a \) appears in the index \( \nu \) of the modified Bessel function and we have at least to find appropriate estimates of several types of increments involving the parameter \( a \).

In this paper, for our purpose, we use an alternative strategy based on the Malliavin calculus approach initiated by Gobet [19, 20] in order to derive an explicit expression for the logarithm derivatives of the transition density in terms of a conditional expectation of a Skorohod integral. Let us mention here that Malliavin calculus for CIR process is established by Alós and Ewald [2] and then Malliavin calculus for constant elasticity of variance (CEV) process is developed by Altmayer and Neuenkirch [3]. Furthermore, these articles give an explicit expression for the Malliavin derivative of the CIR process which will be useful for our purpose. Later on, the Malliavin differentiability of Heston stochastic volatility have recently used e.g. in [3, 16, 33, 42].

The main results of this paper are the LAN property in the subcritical case, the LAQ property in the critical case, and the LAMN property in the supercritical case for CIR process. For this, let us formulate the following assumption on the ratio of the coefficients of equation \((1.1)\) we shall work with

\[(A) \quad \frac{a}{\sigma} > \frac{21 + \sqrt{321}}{4}.\]

Under condition \((A)\) and \( b_0 > 0 \), we obtain in Theorem 2.2 the LAN property for subcritical case with rates of convergence \( (\varphi_{1,n}(a_0, b_0), \varphi_{2,n}(a_0, b_0)) = (\sqrt{n \Delta_n}, \sqrt{n \Delta_n}) \). In the critical case, assuming condition \((A)\), \( b_0 = 0 \) and that \( n \Delta_n^3 \to 0 \) as \( n \to \infty \), we prove in Theorem 2.3 the LAQ property holds with rates of convergence \( (\varphi_{1,n}(a_0, b_0), \varphi_{2,n}(a_0, b_0)) = (\sqrt{\log(n \Delta_n)}), \sqrt{n \Delta_n}) \). Finally, in the supercritical case, assuming condition \((A)\), \( b_0 < 0 \) and that \( \Delta_n^2 e^{-b_0 n \Delta_n} \to 0 \) as \( n \to \infty \), we obtain in Theorem 2.5 the convergence in law of the
log-likelihood ratio with \((\varphi_{1,n}^{-1}(a_0, b_0), \varphi_{2,n}^{-1}(a_0, b_0)) = (1, e^{-b_0 n^{1/2}})\). In Corollary 2.4 when \(a\) is known and \(b\) is only unknown parameter, assuming condition (A) and \(\Delta_n^2 e^{-b_0 n^{1/2}} \rightarrow 0\), we derive the validity of the LAMN property for the likelihood at \(b_0\) with rate of convergence \(\varphi_{2,n}^{-1}(b_0) = e^{-b_0 n^{1/2}}\).

When the LAN property holds at \((a_0, b_0)\) with rates of convergence \((\varphi_{1,n}^{-1}(a_0, b_0), \varphi_{2,n}^{-1}(a_0, b_0))\) and asymptotic Fisher information matrix \(I(a_0, b_0)\), a sequence of estimators \(\{(\hat{a}_n, \hat{b}_n)\}_{n \in \mathbb{N}^*}\) of \((a_0, b_0)\) is said to be asymptotically efficient at \((a_0, b_0)\) in the sense of Hájek-Le Cam convolution theorem if as \(n \rightarrow \infty\),

\[
\varphi_n^{-1}(a_0, b_0) \left( (\hat{a}_n, \hat{b}_n) - (a_0, b_0) \right)^* \mathcal{L}(\hat{\pi}^{a_0, b_0}) \xrightarrow{\mathcal{D}} \mathcal{N}(0, I(a_0, b_0)^{-1}),
\]

where \(\varphi_n^{-1}(a_0, b_0) := \text{diag}(\varphi_{1,n}^{-1}(a_0, b_0), \varphi_{2,n}^{-1}(a_0, b_0))\) is the diagonal matrix. Notice that a sequence of estimators which is asymptotically efficient in the sense of Hájek-Le Cam convolution theorem achieves asymptotically the Cramér-Rao lower bound \(I(a_0, b_0)^{-1}\) for the estimation variance.

When the LAMN property holds for the likelihood at \((a_0, b_0)\) with rates of convergence \((\varphi_{1,n}^{-1}(a_0, b_0), \varphi_{2,n}^{-1}(a_0, b_0))\) and asymptotic random Fisher information matrix \(I(a_0, b_0)\), convolution and minimax theorems can be applied. On the one hand, the convolution theorem [26 Corollary 1] suggests the notion of asymptotically efficient estimators. That is, a sequence of estimators \(\{(\hat{a}_n, \hat{b}_n)\}_{n \in \mathbb{N}^*}\) of the parameter \((a_0, b_0)\) is said to be asymptotically efficient at \((a_0, b_0)\) in the sense of Hájek-Le Cam convolution theorem if as \(n \rightarrow \infty\),

\[
\varphi_n^{-1}(a_0, b_0) \left( (\hat{a}_n, \hat{b}_n) - (a_0, b_0) \right)^* \mathcal{L}(\hat{\pi}^{a_0, b_0}) \xrightarrow{\mathcal{D}} I(a_0, b_0)^{-1/2} \mathcal{N}(0, I_2),
\]

where \(I(a_0, b_0)\) and \(\mathcal{N}(0, I_2)\) are independent. On the other hand, as a consequence of the minimax theorem [26 Proposition 2], the lower bound for the asymptotic variance of any estimators is given by \(I(a_0, b_0)^{-1}\). For details, we refer the reader to e.g. [26, 36]. It is worth noticing that the estimators constructed from a discretization of the time-continuous MLE given in [3] Theorem 8 and 9 are asymptotically efficient in the subcritical and critical cases since their variance attains the lower bound for the asymptotic variance of estimators with the optimal rate of convergence (see Remark 2.8).

To obtain the aforementioned results, our Malliavin calculus approach allows to obtain an appropriate stochastic expansion of the log-likelihood ratio (see Proposition 4.1). To treat the main term in the asymptotic behavior of the expansion, in the subcritical case, we apply a central limit theorem for triangular arrays of random variables together with the ergodic property whereas in the critical and supercritical cases, the corresponding convergence results [2.6]-[2.9] and [2.10]-[2.12] on the CIR process are essentially used. The difficult part of the proof is to deal with the negligible terms of the expansion. In [19, 20], a change of transition density functions of the diffusion processes is performed in order to be able to use the upper and lower bounds of Gaussian type of the transition density functions. This allows to measure the deviation of the change of transition density functions when the parameters change. For the CIR process, the transition density estimates of Gaussian type may not exist since the diffusion coefficient and its derivative are not bounded. To overcome these difficulties, instead of changing transition density functions, change of measures is essentially used (see Lemma
Then a technical Lemma 5.2 is established in order to measure the deviation of the change of measures when the drift parameters change.

Furthermore, some $L^p$-norm estimation for positive and negative polynomial moments and exponential moment estimates of the CIR process taken from [8, 11] are needed in order to show the convergence of the negligible terms (see Lemma 1.1, 1.2 and Lemma 4.1, 1.2). For this, condition (A) above turns out to be crucial (see Remark 2.7).

When using our strategy, we do not require some additional assumptions on the decreasing rate of $\Delta_n$ such as $n\Delta_n^p \to 0$ for some $p > 1$ in the subcritical (ergodic) case. However, in the non-ergodic cases, we require $n\Delta_n^3 \to 0$ for the critical case and $\Delta_n^2 e^{-b_0 n \Delta_n} \to 0$ for the supercritical case.

This paper is organized as follows. In Section 2, we state our main results in Theorem 2.2, 2.3 and 2.5 which correspond respectively to the subcritical, critical and supercritical cases. Section 3 is devoted to the proof of the main results, which follows the aforementioned strategy. Using techniques of Malliavin calculus, Section 4 introduces technical results needed for the proof of the main results, which are related to an explicit expression for the score functions in terms of a conditional expectation of a Skorohod integral, and a decomposition of the Skorohod integral. The proofs of these technical results are postponed to Appendix A in order to maintain the flow of the exposition. Section 5 focuses on studying the convergence of the remainder terms in the expansion (2.1) of the log-likelihood ratio. Finally, some useful results are presented in Appendix B.

2. Main results

In this section, we give a statement of our main results in this paper which is divided into three cases: subcritical, critical and supercritical cases. Recall that our sampling scheme satisfies the high-frequency and infinite horizon conditions. That is, $\Delta_n \to 0$ and $n\Delta_n \to \infty$ as $n \to \infty$. From (1.4), the log-likelihood ratio can be written as follows

$$
\log \frac{d\mathbb{P}^n_{a_n,b_n}}{d\mathbb{P}^a_{a_0,b_0}}(X^{n,a_0,b_0}) = \sum_{k=0}^{n-1} u_k \varphi_{1,n}(a_0, b_0) \int_0^1 \frac{\partial_a \mathbb{P}^a(x, b_0)}{p^a(x, b_0)}(\Delta_n, X_{t_k}^{a_0,b_0}, X_{t_{k+1}}^{a_0,b_0}) d\ell \\
+ \sum_{k=0}^{n-1} v_k \varphi_{2,n}(a_0, b_0) \int_0^1 \frac{\partial_b \mathbb{P}^b(x, b_0)}{p^b(x, b_0)}(\Delta_n, X_{t_k}^{a_0,b_0}, X_{t_{k+1}}^{a_0,b_0}) d\ell
$$

(2.1)

where $\xi_{k,n}$ and $\eta_{k,n}$ are the main terms whereas $R_{k,n}$ and $H_{k,n}$ are the remainder terms in the expansion. Two couples $(\xi_{k,n}, R_{k,n})$ and $(\eta_{k,n}, H_{k,n})$ will appear from the analysis of two corresponding score functions $\frac{\partial_a \mathbb{P}^a(x, b_0)}{p^a(x, b_0)}(\Delta_n, X_{t_k}^{a_0,b_0}, X_{t_{k+1}}^{a_0,b_0})$ and $\frac{\partial_b \mathbb{P}^b(x, b_0)}{p^b(x, b_0)}(\Delta_n, X_{t_k}^{a_0,b_0}, X_{t_{k+1}}^{a_0,b_0})$. 
The main terms are given by
\[\xi_{k,n} = u\varphi_{1,n}(a_0, b_0) \frac{1}{2\sigma X_{t_k}^{a_0,b_0}} \left( \sqrt{2\sigma X_{t_k}^{a_0,b_0}} (B_{t_{k+1}} - B_{t_k}) - \frac{1}{2} u\varphi_{1,n}(a_0, b_0) \Delta_n \right),\]

\[\eta_{k,n} = -u \varphi_{2,n}(a_0, b_0) \left( \sqrt{2\sigma X_{t_k}^{a_0,b_0}} (B_{t_{k+1}} - B_{t_k}) \right.\]
\[\left. - \Delta_n \left( u\varphi_{1,n}(a_0, b_0) - \frac{1}{2} u\varphi_{2,n}(a_0, b_0) X_{t_k}^{a_0,b_0} \right) \right),\]  

(2.2)

with in the subcritical case \((b_0 > 0)\) \((\varphi_{1,n}(a_0, b_0), \varphi_{2,n}(a_0, b_0)) = (\frac{1}{\sqrt{n\Delta_n}}, \frac{1}{\sqrt{n\Delta_n}})\), in the critical case \((b_0 = 0)\) \((\varphi_{1,n}(a_0, 0), \varphi_{2,n}(a_0, 0)) = \left(\frac{1}{\sqrt{\log(n\Delta_n)}}, \frac{1}{n\Delta_n}\right)\), and in the supercritical case \((b_0 < 0)\) \((\varphi_{1,n}(a_0, b_0), \varphi_{2,n}(a_0, b_0)) = (1, e^{b_0 a/2})\). The remainder terms \(R_{k,n}, H_{k,n}\) are implicitly defined by the decomposition \(2.1\) and they will be explicitly determined in the proof of Lemma 2.1. Then, our aim will be to study the asymptotic of the main terms \(\sum_{k=0}^{n-1}(\xi_{k,n} + \eta_{k,n})\). Note that the convergence of this sum requires a weaker condition than \((A)\), that is \(\frac{a}{\sigma} > 4\). However, the convergence of the remainder terms \(\sum_{k=0}^{n-1}(R_{k,n} + H_{k,n})\) given in the following lemma will require condition \((A)\).

Lemma 2.1. Assume condition \((A)\) and our setting \(\Delta_n \rightarrow 0\) and \(n\Delta_n \rightarrow \infty\) as \(n \rightarrow \infty\).

Then, for the subcritical case, as \(n \rightarrow \infty\),

\[\sum_{k=0}^{n-1} (R_{k,n} + H_{k,n}) \overset{\text{P}}{\longrightarrow} 0.\]  

(2.3)

Furthermore, if we assume the additional condition \(n\Delta_n^2 \rightarrow 0\) for the critical case and \(\Delta_n^2 e^{-b_0 n\Delta_n} \rightarrow 0\) for the supercritical case, then (2.3) remains valid for both cases.

The proof of this lemma will be given in Section 5.

2.1. Subcritical case. Assume that \(b > 0\). In this case, \(X^{a,b}\) is ergodic (see e.g. [27]) and its unique stationary distribution which we denote by \(\pi_{a,b}(dx)\) is a Gamma law with shape parameter \(\frac{a}{\sigma}\) and scale parameter \(\frac{b}{\sigma}\) (see [3]). That is,

\[\pi_{a,b}(dx) = \left(\frac{b}{\sigma}\right)^{\frac{a}{\sigma}} \frac{1}{\Gamma\left(\frac{a}{\sigma}\right)} x^{\frac{a}{\sigma} - 1} e^{-\frac{b}{\sigma} x} dx.\]  

(2.4)

Furthermore, \(X_t^{a,b}\) converges in law as \(t \rightarrow \infty\) towards a random variable \(X_{\infty}^{a,b}\) whose distribution is given by \(\pi_{a,b}(dx)\) (see, e.g., [7, Proposition 3 and 4] or [9, Theorem 5.3]). Moreover, for any \(\pi_{a,b}(dx)\)-integrable function \(h, X^{a,b}\) has the ergodic property in the sense that as \(t \rightarrow \infty\),

\[\frac{1}{t} \int_0^t h(X_s^{a,b}) ds \rightarrow \mathbb{E}^{a,b}[h(X_{\infty}^{a,b})] = \int_0^{\infty} h(x) \pi_{a,b}(dx), \quad \mathbb{P}^{a,b}\text{-a.s.}\]  

(2.5)

Now, for fixed \((a_0, b_0) \in \Theta \times \Sigma_+\) where \(\Sigma_+\) is a closed interval of \(\mathbb{R}_+\), we consider a discrete observation \(X^n_{n, a_0 b_0} = (X_{t_0}^{a_0,b_0}, X_{t_1}^{a_0,b_0}, \ldots, X_{t_n}^{a_0,b_0})\) of the process \(X_{a_0 b_0}\). The first result of this paper is the LAN property.

Theorem 2.2. Assume condition \((A)\) and \(b_0 > 0\). Then, the LAN property holds for the likelihood at \((a_0, b_0)\) with rate of convergence \((\sqrt{n\Delta_n}, \sqrt{n\Delta_n})\) and asymptotic Fisher information
matrix $I(a_0, b_0)$. That is, for all $z = (u, v)^* \in \mathbb{R}^2$, as $n \to \infty$,
\[
\log \frac{dP^n_{a_0, b_0}}{dP^n_{a_0, b_0}}(X^{n, a_0, b_0}) \overset{L(\hat{\nu}^{a_0, b_0})}{\to} z^* N(0, I(a_0, b_0)) - \frac{1}{2} z^* I(a_0, b_0) z,
\]
where $a_n := a_0 + \frac{u}{\sqrt{n \Delta_n}}, \ b_n := b_0 + \frac{v}{\sqrt{n \Delta_n}}$, and $N(0, I(a_0, b_0))$ is a centered $\mathbb{R}^2$-valued Gaussian vector with covariance matrix
\[
I(a_0, b_0) := \frac{1}{2\sigma} \begin{pmatrix}
\frac{b_0}{a_0 - \sigma} & -1 \\
-1 & a_0 \end{pmatrix}.
\]

2.2. Critical case. Assume that $b = 0$. In this case, from [7 Proposition 1], as $t \to \infty$,
\[
\frac{X_t^{a,0}}{t} \overset{L(\hat{\nu}^{a,0})}{\to} R_t^{a,0}, \quad (2.6)
\]
\[
\frac{1}{t^2} \int_0^t X_s^{a,0} ds \overset{L(\hat{\nu}^{a,0})}{\to} \int_0^1 R_s^{a,0} ds. \quad (2.7)
\]
Here, $R_t^{a,0} = (R_t^{a,0})_{t \geq 0}$ is the CIR process starting from 0, solution to
\[
dR_t^{a,0} = adt + \sqrt{2\sigma R_t^{a,0}} dB_t, \quad (2.8)
\]
where $R_0^{a,0} = 0$. Moreover, from [7 Proposition 2], as $t \to \infty$,
\[
\frac{1}{\log t} \int_0^t ds \overset{L(\hat{\nu}^{a,0})}{\to} \frac{1}{a - \sigma}. \quad (2.9)
\]
It is worth noticing that both formulae (2.6) and (2.7) can be obtained by a scaling argument. See Remark on page 614 of Ben Alaya and Kebaier [7].

For fixed $(a_0, 0) \in \Theta \times \Sigma$, consider a discrete observation $X^{n, a_0, 0} = (X^{a_0, 0}_{t_0}, X^{a_0, 0}_{t_1}, \ldots, X^{a_0, 0}_{t_n})$ of the process $X^{a_0, 0}$. The second result of this paper is the following LAQ property.

**Theorem 2.3.** Assume condition (A), $b_0 = 0$ and that $n \Delta_n^3 \to 0$ as $n \to \infty$. Then, the LAQ property holds for the likelihood at $(a_0, 0)$ with rates of convergence $(\sqrt{\log(n \Delta_n)}, n \Delta_n)$ and random matrix $I(a_0, 0)$. That is, for all $z = (u, v)^* \in \mathbb{R}^2$, as $n \to \infty$,
\[
\log \frac{dP^n_{a_0, b_0}}{dP^n_{a_0, b_0}}(X^{n, a_0, 0}) \overset{L(\hat{\nu}^{a_0, b_0})}{\to} z^* U(a_0, 0) - \frac{1}{2} z^* I(a_0, 0) z,
\]
and
\[
\mathbb{E}^{a_0, 0}\left[ e^{z^* U(a_0, 0) - \frac{1}{2} z^* I(a_0, 0) z} \right] = 1,
\]
where $a_n := a_0 + \frac{u}{\sqrt{\log(n \Delta_n)}}, \ b_n := b_0 + \frac{v}{n \Delta_n}$, and $U(a_0, 0)$ is a $\mathbb{R}^2$-valued random vector given by
\[
U(a_0, 0) := \left( \frac{1}{\sqrt{2\sigma(a_0 - \sigma)}}, a_0 - \frac{R_1^{a_0, 0}}{2\sigma} \right)^* G,
\]
with covariance matrix
\[
I(a_0, 0) := \frac{1}{2\sigma} \begin{pmatrix}
\frac{a_0 - \sigma}{2\sigma} & 0 \\
0 & \int_0^1 R_s^{a_0, 0} ds
\end{pmatrix}.
\]
Here, $G$ is a standard normal random variable independent of $(R^0_1, \int_0^1 R^0_s ds)$, where $(R^0_t)_{t \geq 0}$ is the CIR process starting from 0 defined by \((2.8)\).

We notice that Theorem 2.3 solves the problem left open in the last three lines in Subsection 3.2 of Overbeck [39] for time-continuous observations.

Next, we state the result in the case where there is only one unknown parameter.

**Corollary 2.4.** (i) Let $b = 0$ be known and let $a$ be unknown parameter. Assume condition (A). Then, the LAN property holds for the likelihood at $a_0$ with rate of convergence $\sqrt{\log(n\Delta_n)}$ and asymptotic Fisher information $I(a_0) = \frac{1}{2\sigma(a_0 - \sigma)}$. That is, for all $u \in \mathbb{R}$, as $n \to \infty$,

$$
\frac{1}{n} \log \frac{dP_{n,a_0}^{a_n,0}}{dP_{n,a_0}^{a_n,0}}(X^n_{a_0,0}) \xrightarrow{L(\hat{P}_{a_0,0})} uN(0, I(a_0)) - \frac{u^2}{2}I(a_0).
$$

(ii) Let $a$ be known and let $b = 0$ be unknown parameter. Assume condition (A) and that $n\Delta_n^3 \to 0$ as $n \to \infty$. Then, the LAQ property holds for the likelihood at $b_0 = 0$ with rate of convergence $n\Delta_n$ and random variable $U(0) = \frac{a - R^3_t}{2\sigma}$ whose conditional variance is given by $\bar{I}(0) = \frac{1}{2\sigma} \int_0^1 R^3_s ds$. That is, for all $v \in \mathbb{R}$, as $n \to \infty$,

$$
\frac{1}{n} \log \frac{dP_{n,a_0}^{a_n,0,b_n}}{dP_{n,a_0}^{a_n,0}}(X^n_{a_0,0}) \xrightarrow{L(\hat{P}_{a_0,0,b})} vU(0) - \frac{v^2}{2}I(0),
$$

and

$$
\mathbb{E}_{a_0,0}[e^{vU(0)} - \frac{v^2}{2}I(0)] = 1.
$$

2.3. **Supercritical case.** Assume that $b < 0$. In this case, from [7] Proposition 3 and 4], as $t \to \infty$,

$$
e^{bt}X^n_{t,b} \xrightarrow{L(\hat{P}_{a,b})} R^n_{\frac{a}{b}},
$$

$$
e^{bt} \int_0^t X^n_{s,b} ds \xrightarrow{L(\hat{P}_{a,b})} - \frac{R^n_{\frac{a}{b}}}{b},
$$

$$
\int_0^t \frac{ds}{X^n_{s,b}} \xrightarrow{L(\hat{P}_{a,b})} \int_0^t \frac{1}{R^n_s} ds.
$$

Here, $(R^n_t)_{t \geq 0}$ is the CIR process starting from $x_0$, solution to

$$
dR^n_t = adt + \sqrt{2\sigma R^n_t} dB_t,
$$

where $R^n_0 = x_0$. The right hand side in \((2.10)\) specifies the limit variable called $W$ in the last line of Theorem 3 (i) of Overbeck [39]. This limit is also immediate from the formula (8.10) on page 236 of Ikeda-Watanabe [23] combined with the formula (1.1) of Pinsky [43].

For fixed $(a_0, b_0) \in \Theta \times \Sigma_-$ where $\Sigma_- \equiv \Sigma \setminus \{0\}$, we consider a discrete observation $X^n_{a_0,b_0} = (X^n_{t_0,b_0}, X^n_{t_1,b_0}, \ldots, X^n_{t_n,b_0})$ of the process $X^n_{a_0,b_0}$. The last result of this paper is the following convergence in law of the log-likelihood ratio.
Remark 2.7. Let us mention that condition \( z = (u, v)^* \in \mathbb{R}^2 \), as \( n \to \infty \),
\[
\log \frac{dP^{a_n, b_n}_n}{dP^{a_0, b_0}_n}(X^n, a_0, b_0) \xrightarrow{\mathcal{L}(\hat{P}^{a_0, b_0})} z^* U(a_0, b_0) - \frac{1}{2} z^* I(a_0, b_0) z,
\]
where \( a_n := a_0 + u, b_n := b_0 + \frac{v}{e^{-b_0 n} n^2} \), and \( U(a_0, b_0) \) is a \( \mathbb{R}^2 \)-valued random vector given by
\[
U(a_0, b_0) = \left( \frac{V}{2\sigma}, \frac{1}{\sqrt{2\sigma}} (- \frac{1}{b_0} R_{a_0}^n + \frac{i}{\sqrt{b_0}} Z_1) \right)^*\]
with random covariance matrix
\[
I(a_0, b_0) := \frac{1}{2\sigma} \left( \begin{array}{cc} \int_0^{b_0} R_{a_0}^n ds & 0 \\ 0 & -\frac{1}{b_0} R_{a_0}^n \end{array} \right).
\]
Here, \( (R_t^a)_{t \geq 0} \) is the CIR process starting from \( x_0 \) defined by \( (2.13) \) and \( V := \log R_{a_0}^{b_0} - \log x_0 - (a_0 - \sigma) \int_0^{b_0} R_{a_0}^n ds \), and \( Z_1 \) is a standard normal random variable independent of \( (R_{a_0}^{b_0}, \int_0^{b_0} R_{a_0}^n ds) \).

We notice that Theorem 2.5 improves the result obtained by Overbeck [39] in Subsection 3.3 for time-continuous observations.

Next, we state the result in the case where \( b \) is the only one unknown parameter.

Corollary 2.6. Let \( a \) be known and let \( b < 0 \) be unknown parameter. Assume condition (A) and that \( \Delta_n^2 e^{-b_0 \Delta_n} \to 0 \) as \( n \to \infty \). Then, the LAMN property holds for the likelihood at \( b_0 < 0 \) with rate of convergence \( e^{-b_0 \Delta_n} \) and asymptotic random Fisher information \( I(b_0) := -\frac{1}{2\sigma b_0} R_{a_0}^{b_0} \). That is, for all \( v \in \mathbb{R} \), as \( n \to \infty \),
\[
\log \frac{dP_{n,a_0,b_0}}{dP_{n}^a}(X^n, a_0, b_0) \xrightarrow{\mathbb{L}(\hat{P}_{a_0,b_0})} v \sqrt{I(b_0)} \mathcal{N}(0, 1) - \frac{v^2}{2} I(b_0),
\]
where \( \mathcal{N}(0, 1) \) is a centered standard Gaussian random variable which is independent of \( I(b_0) \).

Remark 2.7. Let us mention that condition (A) on the ratio of the coefficients \( \frac{a}{\sigma} \) required in Theorem 2.2, 2.3 and 2.5 is similar to condition (10) in [10] Theorem 2.2] which is used to prove the strong convergence of the symmetrized Euler scheme applied to CIR process. In fact, this technical condition comes from our techniques used in this paper and it is needed to treat Lemma 5.3 and 5.6. It is worth noticing that the lower bound \( \frac{21 + \sqrt{321}}{4} \) appearing in condition (A) is fixed in an optimal way to get minimal restrictions on the ratio \( \frac{a}{\sigma} \) (see Subsection 6.5 and Remark 6.2).

Remark 2.8. The asymptotic efficiency of MLE based on continuous observations in the subcritical and critical cases can be obtained using [3] Theorem 5 and 6. Indeed, combining our main results Theorem 2.2 and Theorem 2.3 together with Theorem 8 and Theorem 9 in [3], the discrete MLE estimator given by (15) in [3] achieves the lower bound given by the inverse of the asymptotic Fisher information matrix \( I(a_0, b_0) \) and \( I(a_0, 0) \) in the subcritical
and critical cases, respectively. Note that, in the supercritical case, the MLE estimator is not consistent (see Theorem 7 in [3]).

**Remark 2.9.** From Section 3 of [39] and Theorem 2.4, 2.5 and 2.7, it is worth noticing that in the subcritical, critical and supercritical cases, no information is lost with respect to the continuous case under the high-frequency discrete observation scheme since the rates of convergence and the limit information coincide in both continuous and discrete cases.

As usual, positive constants will be denoted by $C$. They may change of value from one line to the next.

### 3. Proof of main results

In this section, we give the proof of Theorem 2.2, 2.3 and 2.5. From (2.1) and Lemma 2.1, it is worth noticing that in the subcritical, critical and supercritical cases, no information is lost with respect to the continuous case under the high-frequency discrete observation scheme since the rates of convergence and the limit information coincide in both continuous and discrete cases.

**Lemma 3.1.** Let $b_0 > 0$. Then, for all $p < \frac{1}{2}(\frac{d}{2} - 1)$, as $n \to \infty$,

$$\frac{1}{n} \sum_{k=0}^{n-1} \frac{1}{(X_{a_0,b_0})^p} \to \int_0^\infty \frac{1}{x^p} \pi_{a_0,b_0}(dx).$$

**Proof.** First, using Itô’s formula, (i) of Lemma 1.1 and Burkholder-Davis-Gundy’s (BDG’s) inequality, for any $t_k \leq s \leq t_{k+1}$ we get that

$$\hat{E}_{a_0,b_0} \left[ \frac{1}{(X_{a_0,b_0})^p} \right] = \hat{E}_{a_0,b_0} \left[ \int_t^s \frac{b_0 p}{(X_{a_0,b_0})^p} + ((p+1)\sigma - a_0) \frac{p}{(X_{a_0,b_0})^p} + dB_u \right]$$

$$\leq C(s - t_k) \left( \sup_{u \in [t_k,s]} \hat{E}_{a_0,b_0} \left[ \frac{1}{(X_{a_0,b_0})^p} \right] + \sup_{u \in [t_k,s]} \hat{E}_{a_0,b_0} \left[ \frac{1}{(X_{a_0,b_0})^{p+1}} \right] \right)$$

$$+ C \left( \hat{E}_{a_0,b_0} \left[ \int_{t_k}^s \frac{dB_u}{(X_{a_0,b_0})^{p+\frac{1}{2}}} \right]^2 \right)^{\frac{1}{2}} \leq C \Delta_n + C \left( \int_{t_k}^s \hat{E}_{a_0,b_0} \left[ \frac{1}{(X_{a_0,b_0})^{2p+1}} \right] \right)^{\frac{1}{2}}$$

$$\leq C \Delta_n + C \left( (s - t_k) \sup_{u \in [t_k,s]} \hat{E}_{a_0,b_0} \left[ \frac{1}{(X_{a_0,b_0})^{2p+1}} \right] \right)^{\frac{1}{2}} \leq C \Delta_n,$$

for some constant $C > 0$ which is independent of $t_k$ and $s$, where the moments above are bounded thanks to $p < \frac{1}{2}(\frac{d}{2} - 1)$. This shows that

$$\hat{E}_{a_0,b_0} \left[ \frac{1}{n \Delta_n} \int_0^{n \Delta_n} \frac{ds}{(X_{a_0,b_0})^p} - \frac{1}{n} \sum_{k=0}^{n-1} \frac{1}{(X_{a_0,b_0})^p} \right]$$

$$\leq \frac{1}{n \Delta_n} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \hat{E}_{a_0,b_0} \left[ \frac{1}{(X_{a_0,b_0})^p} - \frac{1}{(X_{a_0,b_0})^p} \right] ds \leq C \sqrt{\Delta_n}, \quad (3.1)$$
which tends to zero as \( n \to \infty \). On the other hand, from (2.5), as \( n \to \infty \),

\[
\frac{1}{n\Delta_n} \int_0^{n\Delta_n} ds \frac{1}{(X_s^{a_0,b_0})^p} \to \int_0^\infty \frac{1}{x^p} \pi_{a_0,b_0}(dx), \quad \tilde{\pi}_{a_0,b_0} \text{-a.s.,}
\]

where the limit above is finite. Thus, the result follows from (3.1) and (3.2).

**Lemma 3.2.** Let \( b_0 > 0 \) and \( (\varepsilon_n)_{n \geq 1} \) be a positive sequence converging to 0 as \( n \to \infty \). Then, for all \( p < \frac{a}{\sigma} \), as \( n \to \infty \),

\[
\frac{\varepsilon_n}{n} \sum_{k=0}^{n-1} \frac{1}{(X_{t_k}^{a_0,b_0})^p} \to 0.
\]

**Proof.** Using \( p < \frac{a}{\sigma} \) and (i) of Lemma 1.1, we have that

\[
\tilde{E}_{a_0,b_0}^{\varepsilon_n} \left[ \frac{\varepsilon_n}{n} \sum_{k=0}^{n-1} \frac{1}{(X_{t_k}^{a_0,b_0})^p} \right] = \frac{\varepsilon_n}{n} \sum_{k=0}^{n-1} \tilde{E}_{a_0,b_0}^{\varepsilon_n} \left[ \frac{1}{(X_{t_k}^{a_0,b_0})^p} \right] \leq C \varepsilon_n,
\]

for some constant \( C > 0 \), which tends to zero. Thus, the result follows.

\( \blacksquare \)

### 3.1. Proof of Theorem 2.2

**Proof.** From Lemma 2.1 with \((\varphi_{1,n}(a_0, b_0), \varphi_{2,n}(a_0, b_0)) = \left( \frac{1}{\sqrt{n\Delta_n}}, \frac{1}{\sqrt{n\Delta_n}} \right)\), we need only to prove that as \( n \to \infty \),

\[
\sum_{k=0}^{n-1} (\xi_{k,n} + \eta_{k,n}) \mathcal{L}(\tilde{\pi}_{a_0,b_0}) \xrightarrow{\mathcal{L}} z^* \mathcal{N}(0, I(a_0, b_0)) - \frac{1}{2} z^* I(a_0, b_0) z,
\]

where \( \xi_{k,n} \) and \( \eta_{k,n} \) are given by (2.2). To do so, we will use Theorem 7.2. At first, let us recall that in the subcritical case \((b > 0)\) the stationary distribution \( \pi_{a,b}(dx) \) (see (2.4)) satisfies

\[
\int_0^\infty x \pi_{a,b}(dx) = \frac{a}{b}, \quad \int_0^\infty \frac{1}{x} \pi_{a,b}(dx) = \frac{b}{a - \sigma}.
\]

Then, by Lemma 3.1, it is easy to check that as \( n \to \infty \),

\[
\sum_{k=0}^{n-1} \tilde{E}_{a_0,b_0}^{\xi_{k,n}} \mathbb{P}(\tilde{F}_{t_k}) = - \frac{u^2}{4\sigma} n \sum_{k=0}^{n-1} \frac{1}{X_{t_k}^{a_0,b_0}} \tilde{\pi}_{a_0,b_0} \to - \frac{u^2}{4\sigma} \int_0^\infty \frac{1}{x} \pi_{a_0,b_0}(dx) = - \frac{u^2}{2\sigma} \frac{b_0}{(a_0 - \sigma)},
\]

under condition \( \frac{a}{\sigma} > 3 \), and

\[
\sum_{k=0}^{n-1} \tilde{E}_{a_0,b_0}^{\eta_{k,n}} \mathbb{P}(\tilde{F}_{t_k}) = \frac{uv}{2\sigma} - \frac{u^2}{4\sigma} n \sum_{k=0}^{n-1} \frac{1}{X_{t_k}^{a_0,b_0}} \tilde{\pi}_{a_0,b_0} \to \frac{uv}{2\sigma} - \frac{u^2}{4\sigma} \int_0^\infty x \pi_{a_0,b_0}(dx) = \frac{uv}{2\sigma} - \frac{u^2}{2} \frac{a_0}{2\sigma b_0},
\]

which gives condition (i) of Theorem 7.2.

Next, we check condition (ii) of Theorem 7.2 similarly by using the same arguments. We get

\[
\sum_{k=0}^{n-1} \left( \tilde{E}_{a_0,b_0}^{\xi_{k,n}^2} \mathbb{P}(\tilde{F}_{t_k}) - \tilde{E}_{a_0,b_0}^{\xi_{k,n}} \mathbb{P}(\tilde{F}_{t_k})^2 \right) = \frac{u^2}{2\sigma} n \sum_{k=0}^{n-1} \frac{1}{X_{t_k}^{a_0,b_0}} \tilde{\pi}_{a_0,b_0} \to \frac{u^2}{2\sigma} \frac{b_0}{(a_0 - \sigma)},
\]

where the limit above is finite. Thus, the result follows from (3.1) and (3.2).
Indeed, there exists $c > \frac{1}{\sigma}$ such that

\[
\sum_{k=0}^{n-1} \left( \hat{E}_{a_0,b_0}^0 \left[ \xi_{k,n} \hat{F}_{t_k} \right] - \hat{E}_{a_0,b_0}^0 \left[ \xi_{k,n} \hat{F}_{t_k} \right] \right)^2 = \frac{\nu^2}{2\sigma^2} n \sum_{k=0}^{n-1} X_{t_k}^{a_0,b_0} \rightarrow \nu^2 \frac{a_0}{2\sigma b_0},
\]

where the first convergence holds under condition $\frac{a}{b} > 3$. Finally, it remains to check condition (iii) of Theorem 7.2. Indeed, there exists $c > 0$ such that

\[
\sum_{k=0}^{n-1} \hat{E}_{a_0,b_0}^0 \left[ \xi_{k,n}^4 \hat{F}_{t_k} \right] \leq \frac{c n^2}{2} \sum_{k=0}^{n-1} \left( X_{t_k}^{a_0,b_0} \right)^2 + \frac{c n^4}{2} \sum_{k=0}^{n-1} \left( X_{t_k}^{a_0,b_0} \right)^4,
\]

which converges to zero in $\hat{P}_{a_0,b_0}$ probability under condition $\frac{a}{b} > 4$ by applying Lemma 3.2 with $\varepsilon_n \in \left( \frac{1}{n}, \frac{1}{n} \right)$. Clearly, this condition is satisfied under (A). Thus, the result follows. □

To control the negligible terms in the critical case, the following lemma will be needed.

**Lemma 3.3.** Let $b_0 = 0$. Then, for $n$ large enough there exist two constants $C_1, C_2$ such that

\[
\Delta_n \sum_{k=0}^{n-1} \hat{E}_{a_0}^0 \left[ \frac{1}{(X_{t_k}^{a_0,b_0})^p} \right] \leq \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \sup_{u \in [t_k, s]} \hat{E}_{a_0}^0 \left[ \frac{1}{(X_{a_0}^{a_0,b_0})^p} \right] ds \leq C_1 + C_2 f(n\Delta_n),
\]

where $f(x) = \log x$ if $p = 1$ and $f(x) = \frac{1}{x^{p-1}}$ if $p \neq 1$ and $p < \frac{a}{\sigma}$.

**Proof.** The first inequality is straightforward. Next, we write

\[
\sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \sup_{u \in [t_k, s]} \hat{E}_{a_0}^0 \left[ \frac{1}{(X_{a_0}^{a_0,b_0})^p} \right] ds = \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \sup_{u \in [t_k, s]} \hat{E}_{a_0}^0 \left[ \frac{1}{(X_{a_0}^{a_0,b_0})^p} \right] ds + \sum_{k=\frac{1}{\Delta_n}}^{n-1} \int_{t_k}^{t_{k+1}} \sup_{u \in [t_k, s]} \hat{E}_{a_0}^0 \left[ \frac{1}{(X_{a_0}^{a_0,b_0})^p} \right] ds.
\]

We obtain the result using that $p < \frac{a}{\sigma}$ and (ii) of Lemma 1.1 □

3.2. Proof of Theorem 2.3.

**Proof.** From [21], Lemma 2.1, with $(\varphi_{1,n}(a_0,0), \varphi_{2,n}(a_0,0)) = \left( \frac{1}{\sqrt{\log(n\Delta_n)}}, \frac{1}{n\Delta_n} \right)$, we need only to prove that as $n \to \infty$,

\[
\sum_{k=0}^{n-1} (\xi_{k,n} + \eta_{k,n}) \mathcal{L}(\hat{E}_{a_0}^{a_0,0}) \rightarrow z^* U(a_0,0) - \frac{1}{2} z^* I(a_0,0) z,
\]

and

\[
\hat{E}_{a_0}^{a_0,0} \left[ e^{z^* U(a_0,0) - \frac{1}{2} z^* I(a_0,0) z} \right] = 1.
\]
To do this, we rewrite
\[ \sum_{k=0}^{n-1} (\xi_{k,n} + \eta_{k,n}) = z^* U_n(a_0, 0) - \frac{1}{2} z^* I_n(a_0, 0) z + R_{n,1}^{a_0,0} + R_{n,2}^{a_0,0} + \frac{uv}{2\sigma \sqrt{\log(n\Delta_n)}} \]  
where \( t_n = n\Delta_n \) and
\[
U_n(a_0, 0) = \frac{1}{\sqrt{2\sigma}} \left( \frac{1}{\sqrt{\log(t_n)}} \int_0^{t_n} \frac{dB_s}{X_{a_0,0}^s} \right),
\]
\[
I_n(a_0, 0) = \frac{1}{2\sigma} \left( \frac{1}{\log(t_n)} \int_0^{t_n} \frac{ds}{X_{a_0,0}^s} + \frac{1}{t_n^2} \int_0^{t_n} X_{a_0,0}^s ds \right),
\]
\[
R_{n,1}^{a_0,0} = \frac{u^2}{4\sigma \log(t_n)} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \left( \frac{1}{X_{a_0,0}^s} - \frac{1}{X_{t_k,0}^s} \right) ds + \frac{v^2}{4\sigma t_n^2} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} (X_{a_0,0}^s - X_{t_k,0}^s) ds,
\]
\[
R_{n,2}^{a_0,0} = -\frac{u}{\sqrt{2\sigma \log(t_n)}} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \left( \frac{1}{\sqrt{X_{a_0,0}^s}} - \frac{1}{\sqrt{X_{t_k,0}^s}} \right) dB_s
\]
\[+ \frac{v}{\sqrt{2\sigma t_n}} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \left( \frac{1}{\sqrt{X_{a_0,0}^s}} - \frac{1}{\sqrt{X_{t_k,0}^s}} \right) dB_s.\]

First, using Itô’s formula and equation (1.1), we get that
\[
U_n(a_0, 0) = \frac{1}{\sqrt{2\sigma}} \left( \frac{1}{\sqrt{\log(t_n)}} \left( \log X_{a_0,0}^{t_n} - \log x_0 + (\sigma - a_0) \int_0^{t_n} \frac{ds}{X_{a_0,0}^s} \right) \right),
\]
Moreover, it follows from the proof of [8, Theorem 6] and (2.9) that as \( n \to \infty \),
\[
\left( \frac{1}{\sqrt{\log(t_n)}} \int_0^{t_n} \frac{ds}{X_{a_0,0}^s}, \frac{1}{t_n^2} \int_0^{t_n} X_{a_0,0}^s ds, \frac{X_{a_0,0}^{t_n}}{t_n} \right)
\]
\[\mathcal{L}(\hat{P}^{a_0,0}) \longrightarrow \left( \sqrt{\frac{2\sigma}{a_0 - \sigma}} G, \int_0^1 R_{a_0,0}^s ds, R_{1,a_0,0}^{a_0,0}, \frac{1}{a_0 - \sigma} \right),\]

where \( G \) is a standard normal random variable independent of \( (R_{1,a_0,0}^s, \int_0^1 R_{a_0,0}^s ds) \). This implies that as \( n \to \infty \),
\[
(U_n(a_0, 0), I_n(a_0, 0)) \xrightarrow{\mathcal{L}(\hat{P}^{a_0,0})} (U(a_0, 0), I(a_0, 0)).
\]
Next, thanks to the proof of \cite{8} Theorem 9, under condition $\frac{2}{\sigma} > 2$, we have that $R_{a,0}^{a,0}$ $\overset{a,0}{\rightarrow}$ 0 as $n \to \infty$. Now, we treat $R_{a,0}^{a,0}$ $\overset{a,0}{\rightarrow}$ 0. For this, we write $R_{a,0}^{a,0} = \sum_{k=1}^{n-1} (\zeta_{k,n,1} + \zeta_{k,n,2})$, where

$$\zeta_{k,n,1} = -\frac{u}{\sqrt{2\sigma}\sqrt{\log t_n}} \int_{t_k}^{t_{k+1}} \left( \frac{1}{\sqrt{X_s^{a,0}}} - \frac{1}{\sqrt{X_{t_k}^{a,0}}} \right) dB_s,$$

$$\zeta_{k,n,2} = \frac{v}{\sqrt{2\sigma}t_n} \int_{t_k}^{t_{k+1}} \left( \sqrt{X_s^{a,0}} - \sqrt{X_{t_k}^{a,0}} \right) dB_s.$$ 

We apply Lemma \ref{lemma3.3} to $\zeta_{k,n,1}$ and $\zeta_{k,n,2}$. As it is obvious that $\sum_{k=0}^{n-1} \hat{E}_{a,0}^{a,0}[\zeta_{k,n,1}] = 0$, we only need to check that $\sum_{k=0}^{n-1} \hat{E}_{a,0}^{a,0}[\zeta_{k,n,2}] = 0$. To do so, we use Itô’s formula to get

$$\hat{E}_{a,0}^{a,0} \left[ \sum_{k=0}^{n-1} \hat{E}_{a,0}^{a,0}[\zeta_{k,n,2}] \right] = \sum_{k=0}^{n-1} \hat{E}_{a,0}^{a,0}[\zeta_{k,n,2}].$$

$$= \frac{v^2}{2\sigma \log t_n} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \hat{E}_{a,0}^{a,0} \left[ \left( \int_{t_k}^{s} \frac{\sigma_a}{2} \frac{du}{(X_u^{a,0})^2} + \int_{t_k}^{s} \sqrt{\frac{\sigma}{2} dB_u} \right) \right] ds$$

$$\leq C \frac{u^2}{\log t_n} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \left( (s-t_k)^2 \sup_{u \in [t_k,s]} \hat{E}_{a,0}^{a,0}[\frac{1}{(X_u^{a,0})^2}] + (s-t_k)^2 \sup_{u \in [t_k,s]} \hat{E}_{a,0}^{a,0}[\frac{1}{(X_u^{a,0})^2}] \right) ds$$

$$\leq C \frac{u^2}{\log (n\Delta_n)} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \left( \sup_{u \in [t_k,s]} \hat{E}_{a,0}^{a,0}[\frac{1}{(X_u^{a,0})^2}] + \sup_{u \in [t_k,s]} \hat{E}_{a,0}^{a,0}[\frac{1}{(X_u^{a,0})^2}] \right) ds$$

$$\leq C \frac{u^2}{\log (n\Delta_n)} \left( C_1 + C_2 \left( \frac{1}{(n\Delta_n)^2} + \frac{1}{n\Delta_n} \right) \right),$$

where $C_1, C_2$ are constants. We have

$$\sum_{k=0}^{n-1} \hat{E}_{a,0}^{a,0}[\zeta_{k,n,2}] = 0.$$
which tends to zero. Thus, \( \sum_{k=0}^{n-1} \tilde{E}^{\alpha_0,0} \zeta_{k,n} \tilde{P}^{\alpha_0,0} \to 0 \). Then, we have \( \sum_{k=0}^{n-1} \zeta_{k,n} \tilde{P}^{\alpha_0,0} \to 0 \).

Consequently, under condition \( \frac{a}{\sigma} > 3 \), we have that \( R^{\alpha_0,0} \to 0 \) as \( n \to \infty \). Therefore, under \( \frac{a}{\sigma} > 3 \), \( R^{\alpha_0,0}, R^{\alpha_0,0} \to 0 \) as \( n \to \infty \). This combined with [3.5]-[3.6] gives [3.3].

Finally, we treat [3.4]. For this, let us consider the CIR process \( R^{a,b} = (R^{a,b}_t)_{t \geq 0} \) starting from 0 defined by

\[
dR^{a,b}_t = (a - bR^{a,b}_t)dt + \sqrt{2\sigma R^{a,b}_t}dB_t,
\]

where \( R^{a,b}_0 = 0 \), \((a, b) \in \mathbb{R}^+ \times \mathbb{R} \). We denote by \( P^{a,b}_R \) the probability measure induced by the CIR process \( R^{a,b} \) on the measurable space \((C(\mathbb{R}^+, \mathbb{R}), \mathcal{B}(C(\mathbb{R}^+, \mathbb{R})))\). Let \( T > 0 \). For any \( t > 0 \), let \( P^{a,b}_{R,t} \) be the restriction of \( P^{a,b}_R \) on \( \tilde{F}_t \). As a consequence of [6, Lemma 3.1], for any \( a > \sigma, b \in \mathbb{R} \), the probability measures \( P^{a,b}_{R,t} \) and \( P^{a,b}_{R,t} \) are absolutely continuous with respect to each other and its Radon-Nikodym derivative is given by

\[
\frac{dP^{a,b}_{R,t}}{dP^{a,b}_R}((R^{a,b}_s)_{s \in [0,t]} = \exp \left\{ \frac{b}{\sqrt{2\sigma}} \int_0^t \sqrt{R^{a,0}_{s-}}dB_s - \frac{b^2}{4\sigma} \int_0^t R^{a,0}_{s-}ds \right\}.
\]

(3.7)

On the other hand, as a consequence of Theorem 3.4 in Chapter III of Jacod and Shiryaev [25], the Radon-Nikodym derivative process \( \frac{dP^{a,b}_{R,t}}{dP^{a,b}_R}((R^{a,0}_s)_{s \in [0,t]}))_{t \in [0,T]} \) is a martingale w.r.t. the filtration \( \tilde{F}_t \).

Now, using the independence between \( G \) and \( (R^{a,0}_1, \int_0^1 R^{a,0}_s ds) \), we have

\[
\tilde{E}^{a,0,0} \left[ e^{s^*U((a,0),0)z} - \frac{1}{2} s^*T((a,0),0)z \right] = E_1E_2,
\]

where

\[
E_1 = \tilde{E}^{a,0,0} \left[ e^{u \sqrt{\sigma(a-\sigma)}} G - \frac{u^2}{4\sigma(a-\sigma)} \right], \quad E_2 = \tilde{E}^{a,0,0} \left[ e^{u \sqrt{\sigma(a-\sigma)} - \frac{u^2}{4\sigma} \int_0^1 R^{a,0}_s ds} \right].
\]

Clearly, \( E_1 = 1 \) since \( G \) is the standard normal random variable. Using equation [2.8] and [3.7], we have that

\[
E_2 = \tilde{E}^{a,0,0} \left[ e^{u \sqrt{\sigma(a-\sigma)} \int_0^1 \sqrt{R^{a,0}_s}dB_s - \frac{2}{4\sigma} \int_0^1 R^{a,0}_s ds} \right] = \tilde{E}^{a,0,0} \left[ \frac{dP^{a,v}_{R,1}}{dP^{a,0}_{R,1}} ((R^{a,0}_s)_{s \in [0,1]}) \right].
\]

Using the fact that the Radon-Nikodym derivative process \( \frac{dP^{a,v}_{R,t}}{dP^{a,0}_{R,t}}((R^{a,0}_s)_{s \in [0,t]}))_{t \in [0,T]} \) is a martingale w.r.t. the filtration \( \tilde{F}_t \), we get that

\[
\tilde{E}^{a,0,0} \left[ \frac{dP^{a,v}_{R,1}}{dP^{a,0}_{R,1}} ((R^{a,0}_s)_{s \in [0,1]}) \right] = \tilde{E}^{a,0,0} \left[ \frac{dP^{a,v}_{R,0}}{dP^{a,0}_{R,0}} (R^{a,0}_0) \right] = 1,
\]

which implies that \( E_2 = 1 \). This concludes [3.4]. Thus, the result follows. \( \square \)
3.3. Proof of Corollary 2.3

Proof. (i) When \( b = 0 \) is known and \( a \) is unknown parameter, the result is obtained as a consequence of Theorem 2.3 by taking \( v = 0 \). This is reason why the condition \( n\Delta_n^3 \to 0 \) as \( n \to \infty \) is removed.

(ii) When \( a \) is known and \( b = 0 \) is unknown parameter, the result is obtained as a consequence of Theorem 2.3 by taking \( u = 0 \). \( \square \)

To control the negligible terms in the supercritical case, the following lemma will be needed.

**Lemma 3.4.** Let \( b_0 < 0 \). Then, for \( n \) large enough there exist two constants \( C_1, C_2 \) such that

\[
\Delta_n \sum_{k=0}^{n-1} \hat{E}_{a_0,b_0}^n \left[ \frac{1}{(X_{a_0,b_0}^n)^p} \right] \leq \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \sup_{u \in [t_k,s]} \hat{E}_{a_0,b_0}^n \left[ \frac{1}{(X_{a_0,b_0}^n)^p} \right] ds \leq C_1 + C_2 f(n\Delta_n),
\]

where \( f(x) = \log x \) if \( p = 1 \), \( f(x) = \frac{1}{x^{p-1}} \) if \( p \neq 1 \) and \( 0 < p < \frac{4}{3} \) and \( f(x) = e^{b_0 x} \) if \( p < 0 \).

Proof. For the two first cases, we proceed as in the proof of Lemma 3.3 where we use (iii) instead of (ii) of Lemma 1.1. For \( p < 0 \), we use (2.10) combined with the uniform integrability property to get that there exists \( C_1 > 0 \) such that for all \( t > 0 \),

\[
\hat{E}_{a_0,b_0}^n [(X_{a_0,b_0}^n)^{−p}] \leq C e^{b_0 t}.
\]

We complete the proof by using the same arguments as in the proof of Lemma 3.3. \( \square \)

3.4. Proof of Theorem 2.5

Proof. From (2.1), Lemma 2.1 with \((\varphi_{1,n}(a_0,b_0),\varphi_{2,n}(a_0,b_0)) = (1,e^{b_0\frac{\Delta_n}{2}})\), we need only to prove that as \( n \to \infty \),

\[
\sum_{k=0}^{n-1} (\xi_{k,n} + \eta_{k,n}) \xrightarrow{L} z^* U(a_0,b_0) - \frac{1}{2} z^* I(a_0,b_0) z.
\]

(3.8)

To do this, we rewrite

\[
\sum_{k=0}^{n-1} (\xi_{k,n} + \eta_{k,n}) = z^* U_n(a_0,b_0) - \frac{1}{2} z^* I_n(a_0,b_0) z + R_{a_0}^{n,b_0} + R_{n;4}^{a_0,b_0} + \frac{uv n \Delta_n}{2\sigma e^{-b_0 \frac{\Delta_n}{2}}},
\]

(3.9)

where

\[
U_n(a_0,b_0) = \frac{1}{\sqrt{2\sigma}} \begin{pmatrix}
\int_0^{t_n} dB_s \\
- e^{b_0 \frac{t_n}{2}} \int_0^{t_n} X_{a_0,b_0}^s dB_s
\end{pmatrix},
\]

\[
I_n(a_0,b_0) = \frac{1}{2\sigma} \begin{pmatrix}
\int_0^{t_n} ds \\
0
\end{pmatrix},
\]

\[
R_{n;3}^{a_0,b_0} = \frac{u^2}{4\sigma} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \left( \frac{1}{X_{a_0,b_0}^s} - \frac{1}{X_{a_0,b_0}^{t_k}} \right) ds + \frac{v^2}{4\sigma e^{-b_0 \frac{\Delta_n}{2}}} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} (X_{a_0,b_0}^s - X_{a_0,b_0}^{t_k}) ds,
\]

\[
(3.9)
\]
Next, applying Itô’s formula and Lemma 3.4, we get

\[
R_{n,A}^{a_0,b_0} = -\frac{u}{\sqrt{2\sigma}} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \left( \frac{1}{\sqrt{X_s^{a_0,b_0}}} - \frac{1}{\sqrt{X_{t_k}^{a_0,b_0}}} \right) dB_s \\
+ \frac{v}{\sqrt{2\sigma} e^{-b_0 n \Delta u / 2}} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} (\sqrt{X_s^{a_0,b_0}} - \sqrt{X_{t_k}^{a_0,b_0}}) dB_s.
\]

First, using Itô’s formula, we get that

\[
U_n(a_0, b_0) = \frac{1}{\sqrt{2\sigma}} \left( \frac{1}{\sqrt{2\sigma}} \left( \log(\varepsilon^{b_0 t_n} X_n^{a_0,b_0}) - \log x_0 + (\sigma - a_0) \int_0^{t_n} ds \frac{ds}{X_s^{a_0,b_0}} \right) - e^{b_0 t_n} \int_0^{t_n} \sqrt{X_s^{a_0,b_0}} dB_s \right).
\]

Moreover, it follows from the proof of [6, Theorem 7.1] that as \( n \to \infty \),

\[
\left( e^{b_0 t_n} \int_0^{t_n} \sqrt{X_s^{a_0,b_0}} dB_s, e^{b_0 t_n} X_n^{a_0,b_0}, e^{b_0 t_n} \int_0^{t_n} \sqrt{X_s^{a_0,b_0}} ds, \int_0^{t_n} ds \frac{ds}{X_s^{a_0,b_0}} \right) \xrightarrow{L(\varepsilon^{a_0,b_0})} \left( (-\frac{1}{b_0} R_n^{a_0} + \frac{1}{b_0})^\frac{1}{2} Z_1, R_n^{a_0}, \frac{1}{b_0} R_n^{a_0}, \int_0^{t_n} \sqrt{X_s^{a_0,b_0}} dB_s \right),
\]

where \( Z_1 \) is a standard normal random variable independent of \( (R_n^{a_0}, \int_0^{t_n} \sqrt{X_s^{a_0,b_0}} dB_s) \). This implies that as \( n \to \infty \),

\[
(U_n(a_0,b_0), I_n(a_0,b_0)) \xrightarrow{L(\varepsilon^{a_0,b_0})} (U(a_0,b_0), I(a_0,b_0)).
\]

Next, applying Itô’s formula and Lemma 3.4, we get

\[
\hat{E}^{a_0,b_0}[R_{n,A}^{a_0,b_0}] \leq \frac{u^2}{4\sigma} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \hat{E}^{a_0,b_0}\left[ \frac{1}{X_s^{a_0,b_0}} - \frac{1}{X_{t_k}^{a_0,b_0}} \right] ds \\
+ \frac{v^2}{4\sigma e^{-b_0 n \Delta u}} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \hat{E}^{a_0,b_0}\left[ |X_s^{a_0,b_0} - X_{t_k}^{a_0,b_0}| \right] ds
\]

\[
\leq \frac{u^2}{4\sigma} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \hat{E}^{a_0,b_0}\left[ \left| \int_{t_k}^s \left( \frac{b_0}{X_u^{a_0,b_0}} + \frac{2\sigma - a_0}{(X_u^{a_0,b_0})^2} \right) du - \sqrt{2\sigma} \int_{t_k}^s du \frac{dU_u^{a_0,b_0}}{X_u^{a_0,b_0}} \right| \right] ds \\
+ \frac{v^2}{4\sigma e^{-b_0 n \Delta u}} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \hat{E}^{a_0,b_0}\left[ \left| \int_{t_k}^s (a_0 - b_0 X_u^{a_0,b_0}) du + \sqrt{2\sigma} \int_{t_k}^s dU_u^{a_0,b_0} \right| \right] ds \\
\leq \frac{u^2}{4\sigma} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \left( (s - t_k) \left( \sup_{u \in [t_k,s]} \hat{E}^{a_0,b_0}\left[ \frac{1}{X_u^{a_0,b_0}} \right] \right) + \sup_{u \in [t_k,s]} \hat{E}^{a_0,b_0}\left[ \frac{1}{(X_u^{a_0,b_0})^2} \right] \right) ds \\
+ \left( (s - t_k) \sup_{u \in [t_k,s]} \hat{E}^{a_0,b_0}\left[ X_u^{a_0,b_0} \right] \right) ds + \frac{v^2}{4\sigma e^{-b_0 n \Delta u}} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \left( (s - t_k) \sup_{u \in [t_k,s]} \hat{E}^{a_0,b_0}\left[ X_u^{a_0,b_0} \right] \right) ds
\]
\[
\leq C \left( \sqrt{\Delta_n} + \Delta_n \log(n\Delta_n) + \frac{1}{\sqrt{n}} + n\Delta_n^2 e^{b_0 n \Delta_n} + \sqrt{\Delta_n} e^{\frac{1}{2} b_0 n \Delta_n} \right),
\]
which tends to zero under condition \( \frac{a}{\sigma} > 3 \). Thus, \( R_{n,3}^{a_0,b_0} \xrightarrow{P} 0 \).

Finally, we treat \( R_{n,4}^{a_0,b_0} \). For this, we write \( R_{n,4}^{a_0,b_0} = \sum_{k=0}^{n-1} (\zeta_{k,n,3} + \zeta_{k,n,4}) \), where
\[
\zeta_{k,n,3} = -\frac{u}{\sqrt{2\sigma}} \int_{t_k}^{t_{k+1}} \left( \frac{1}{\sqrt{X_s^{a_0,b_0}}} - \frac{1}{\sqrt{X_{t_k}^{a_0,b_0}}} \right) dB_s,
\]
\[
\zeta_{k,n,4} = \frac{v}{\sqrt{2\sigma} e^{-b_0 n (\Delta_n)^2/2}} \int_{t_k}^{t_{k+1}} (\sqrt{X_s^{a_0,b_0}} - \sqrt{X_{t_k}^{a_0,b_0}}) dB_s.
\]

We apply Lemma 3.4 to \( \zeta_{k,n,3} \) and \( \zeta_{k,n,4} \). First, we have \( \sum_{k=0}^{n-1} \hat{E}^{a_0,b_0} [\zeta_{k,n,3} \hat{F}_{t_k}] = 0 \). Next, applying Itô’s formula and Lemma 3.4 we get
\[
\hat{E}^{a_0,b_0} \left[ \sum_{k=0}^{n-1} \hat{E}^{a_0,b_0} [\zeta_{k,n,3}^2 \hat{F}_{t_k}] \right] = \sum_{k=0}^{n-1} \hat{E}^{a_0,b_0} [\zeta_{k,n,3}^2]
\]
\[
= \frac{u^2}{2\sigma} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \hat{E}^{a_0,b_0} \left[ \left( \frac{1}{\sqrt{X_s^{a_0,b_0}}} - \frac{1}{\sqrt{X_{t_k}^{a_0,b_0}}} \right)^2 \right] ds
\]
\[
= \frac{u^2}{2\sigma} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \hat{E}^{a_0,b_0} \left[ \left( \int_{t_k}^{s} \left( \frac{X_u^{a_0,b_0}}{\frac{X_u^{a_0,b_0}}{a_0}} \right)^2 + \frac{b_0}{2} \right) du + \int_{t_k}^{s} \sqrt{\frac{\sigma}{2}} dB_u \right]^2 ds
\]
\[
\leq C u^2 \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \left( s - t_k \right)^2 \left( \sup_{u \in [t_k,s]} \hat{E}^{a_0,b_0} \left[ \frac{1}{(X_u^{a_0,b_0})^2} \right] + \sup_{u \in [t_k,s]} \hat{E}^{a_0,b_0} \left[ \frac{1}{X_u^{a_0,b_0}} \right] \right)
\]
\[
+ \left( s - t_k \right) \sup_{u \in [t_k,s]} \hat{E}^{a_0,b_0} \left[ \frac{1}{X_u^{a_0,b_0}} \right] ds \leq C \left( \Delta_n + \frac{1}{n^2} + \Delta_n + \Delta_n \log(n\Delta_n) \right),
\]
which tends to zero under condition \( \frac{a}{\sigma} > 3 \). Thus, \( \sum_{k=0}^{n-1} \hat{E}^{a_0,b_0} [\zeta_{k,n,3}^2 \hat{F}_{t_k}] \xrightarrow{P} 0 \). Then, we have \( \sum_{k=0}^{n-1} \zeta_{k,n,3} \xrightarrow{P} 0 \).

Similarly, we have \( \sum_{k=0}^{n-1} \hat{E}^{a_0,b_0} [\zeta_{k,n,4}^2 \hat{F}_{t_k}] = 0 \). Next, applying Itô’s formula and Lemma 3.4 we get
\[
\hat{E}^{a_0,b_0} \left[ \sum_{k=0}^{n-1} \hat{E}^{a_0,b_0} [\zeta_{k,n,4}^2 \hat{F}_{t_k}] \right] = \sum_{k=0}^{n-1} \hat{E}^{a_0,b_0} [\zeta_{k,n,4}^2]
\]
\[
= \frac{v^2}{2\sigma e^{-b_0 n \Delta_n}} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \hat{E}^{a_0,b_0} \left[ \left( \sqrt{X_s^{a_0,b_0}} - \sqrt{X_{t_k}^{a_0,b_0}} \right)^2 \right] ds
\]
\[
= \frac{v^2}{2\sigma e^{-b_0 n \Delta_n}} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \hat{E}^{a_0,b_0} \left[ \left( \int_{t_k}^{s} \left( \frac{a_0}{2} - \frac{\sigma}{4} \right) \frac{1}{X_u^{a_0,b_0}} du + \frac{b_0}{2} \sqrt{X_u^{a_0,b_0}} \right) dB_u + \int_{t_k}^{s} \sqrt{\frac{\sigma}{2}} dB_u \right]^2 ds
\]
\[
\leq C \frac{v^2}{e^{-b_0 n \Delta_n}} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \left( s - t_k \right)^2 \left( \sup_{u \in [t_k,s]} \hat{E}^{a_0,b_0} \left[ \frac{1}{X_u^{a_0,b_0}} \right] + \sup_{u \in [t_k,s]} \hat{E}^{a_0,b_0} \left[ X_u^{a_0,b_0} \right] \right) + \left( s - t_k \right) ds
\]
which tends to zero under condition \( \frac{a}{\sigma} > 1 \). Thus, \( \sum_{k=0}^{n-1} \tilde{P}_{\sigma k, n, 4} \tilde{\Omega}_{\tau_k, 0} \rightarrow 0 \). Then, we have \( \sum_{k=0}^{n-1} \zeta_{k, n, 4} \tilde{\Omega}_{\tau_k, 0} \rightarrow 0 \). Consequently, under condition \( \frac{a}{\sigma} > 3 \), we have that \( R_{n, 4}^{a, b} \tilde{P}_{\sigma 0} \rightarrow 0 \) as \( n \rightarrow \infty \). Therefore, under \( \frac{a}{\sigma} > 3 \) as \( n \rightarrow \infty \)

\[
R_{n, 3}^{a, b} + R_{n, 4}^{a, b} \tilde{P}_{\sigma 0} \rightarrow 0.
\]

Therefore, from (3.9)–(3.11), we conclude (3.8). □

3.5. Proof of Corollary 2.6

Proof. When \( a \) is known and \( b < 0 \) is unknown parameter, the result is obtained as a consequence of Theorem 2.5 by taking \( u = 0 \). □

4. Technical results

The aim of this section is to use techniques of Malliavin calculus in order to represent the remainder terms in Lemma 2.1 as a conditional expectation of Skorohod integral (see Proposition 4.4) that will be analyzed in Section 5. To be more precise, we first consider on a new representation of score functions. We refer the reader to Nualart [38] for a detailed exposition of the Malliavin calculus and the notations therein. We denote by the Malliavin derivative and the Skorohod integral w.r.t. \( W \in \mathbb{R}^* \) on the time interval \([s, \infty)\) and with initial condition \( Y^a,b_s(s, x) = x \) satisfying

\[
Y^a,b_t(s, x) = x + \int_s^t (a - bY^a,b_u(s, x)) du + \int_s^t \sqrt{2\sigma Y^a,b_u(s, x)} dW_u,
\]

for any \( t \geq s \), where \( W = (W_t)_{t \geq 0} \) is a standard Brownian motion. Let \( \{\tilde{F}_t\}_{t \geq 0} \) denote the natural filtration generated by \( W \). For all \( t \geq 0 \) we denote \( Y^a,b_t \equiv Y^a,b_t(0, x_0) \) which is defined by

\[
Y^a,b_t = x_0 + \int_0^t (a - bY^a,b_s) ds + \int_0^t \sqrt{2\sigma Y^a,b_s} dW_s.
\]

Then, the Malliavin calculus on the Wiener space induced by \( W \) will be applied to obtain a new representation of score functions. We refer the reader to Nualart [38] for a detailed exposition of the Malliavin calculus and the notations therein. We denote by \( D \) and \( \delta \) the Malliavin derivative and the Skorohod integral w.r.t. \( W \) on \([tk, tk+1]\). In what follows, let \( \mathbb{D}^{1,2} \) denote the Sobolev space of random variables that are differentiable w.r.t. \( W \) in the sense of Malliavin, and Dom \( \delta \) denote the domain of \( \delta \). The Malliavin calculus for CIR process is developed e.g. in [2], [3].

For any \( k \in \{0, ..., n - 1\} \), the process \( (Y^a,b_t(tk, x), t \in [tk, tk+1]) \) is defined by

\[
Y^a,b_t(tk, x) = x + \int_{tk}^t (a - bY^a,b_u(tk, x)) du + \int_{tk}^t \sqrt{2\sigma Y^a,b_u(tk, x)} dW_u.
\]

Recall that condition \( a \geq \sigma \) ensures that the CIR process \( Y^a,b \) remains almost surely strictly positive. Then, by [44, Theorem V.39], the process \( (Y^a,b_t(tk, x), t \in [tk, tk+1]) \) is differentiable w.r.t. \( x \) that we denote by \( (\partial_x Y^a,b_t(tk, x), t \in [tk, tk+1]) \). Furthermore, this process admits derivatives w.r.t. \( a \) and \( b \) that we denote by \( (\partial_a Y^a,b_t(tk, x), t \in [tk, tk+1]) \) and \( (\partial_b Y^a,b_t(tk, x), t \in [tk, tk+1]) \), respectively, since this problem is similar to the derivative w.r.t.
the initial condition (see e.g. [31] pages 294-295). Under condition \( a \geq \sigma \), these processes are solutions to the following equations

\[
\begin{align*}
\partial_x Y_{t}^{a,b}(t, x) &= 1 - b \int_{t}^{t_k} \partial_x Y_{u}^{a,b}(t, x)du + \int_{t}^{t_k} \frac{\sqrt{\sigma}}{\sqrt{2Y_{u}^{a,b}(t, x)}} \partial_x Y_{u}^{a,b}(t, x)dW_u, \\
\partial_y Y_{t}^{a,b}(t, x) &= \int_{t}^{t_k} (1 - b \partial_a Y_{u}^{a,b}(t, x))du + \int_{t}^{t_k} \frac{\sqrt{\sigma}}{\sqrt{2Y_{u}^{a,b}(t, x)}} \partial_a Y_{u}^{a,b}(t, x)dW_u, \\
\partial_y Y_{t}^{a,b}(t, x) &= -\int_{t}^{t_k} (Y_{u}^{a,b}(t, x) + b \partial_b Y_{u}^{a,b}(t, x))du + \int_{t}^{t_k} \frac{\sqrt{\sigma \partial_b Y_{u}^{a,b}(t, x)}}{\sqrt{2Y_{u}^{a,b}(t, x)}}dW_u.
\end{align*}
\]

Therefore, their explicit solutions are respectively given by

\[
\begin{align*}
\partial_x Y_{t}^{a,b}(t, x) &= \exp \left\{ -b(t - t_k) - \frac{\sigma}{4} \int_{t}^{t_k} \frac{du}{Y_{u}^{a,b}(t, x)} + \frac{\sqrt{\sigma}}{2} \int_{t}^{t_k} \frac{dW_u}{Y_{u}^{a,b}(t, x)} \right\}, \\
\partial_y Y_{t}^{a,b}(t, x) &= \int_{t}^{t_k} \exp \left\{ -b(t - r) - \frac{\sigma}{4} \int_{r}^{t} \frac{dr}{Y_{r}^{a,b}(t, x)} + \frac{\sqrt{\sigma}}{2} \int_{r}^{t} \frac{dW_u}{Y_{r}^{a,b}(t, x)} \right\} dr, \\
\partial_y Y_{t}^{a,b}(t, x) &= -\int_{t}^{t_k} Y_{r}^{a,b}(t, x) \exp \left\{ -b(t - r) - \frac{\sigma}{4} \int_{r}^{t} \frac{dr}{Y_{r}^{a,b}(t, x)} + \frac{\sqrt{\sigma}}{2} \int_{r}^{t} \frac{dW_u}{Y_{r}^{a,b}(t, x)} \right\} dr.
\end{align*}
\]

Observe that from (4.7), (4.8) and (4.9), we can write

\[
\begin{align*}
\partial_a Y_{t}^{a,b}(t, x) &= \int_{t}^{t_k} \partial_x Y_{t}^{a,b}(t, x)(\partial_x Y_{r}^{a,b}(t, x))^{-1}dr, \\
\partial_b Y_{t}^{a,b}(t, x) &= -\int_{t}^{t_k} Y_{r}^{a,b}(t, x)\partial_x Y_{t}^{a,b}(t, x)(\partial_x Y_{r}^{a,b}(t, x))^{-1}dr.
\end{align*}
\]

To analyze the score functions, some notations are introduced. Let \( \widehat{P}_{t_k}^{a,b} \) denote the probability measure induced by \( Y_{t_k}^{a,b} = (Y_{t_k}^{a,b})_{t \geq 0} \) on the canonical space \( (C(\mathbb{R}_+, \mathbb{R}), \mathcal{B}(C(\mathbb{R}_+, \mathbb{R}))) \) endowed with the natural filtration \( \{\widehat{F}_t\}_{t \geq 0} \), and \( \widehat{E}_{a,b}^{a,b} \) denote the expectation w.r.t. \( \widehat{P}_{t_k}^{a,b} \). For all \( k \in \{0, ..., n - 1\} \) and \( x \in \mathbb{R}_+ \), we denote by \( \widehat{P}_{t_k,x}^{a,b} \) and \( \widehat{E}_{t_k,x}^{a,b} \) respectively the probability law of \( Y_{t_k}^{a,b} \) starting at \( x \) at time \( t_k \) and the expectation w.r.t. \( \widehat{P}_{t_k,x}^{a,b} \), i.e., \( \widehat{P}_{t_k,x}^{a,b}(A) = \widehat{E}[1_A | Y_{t_k}^{a,b} = x] \) for all \( A \in \mathcal{F} \) and \( \widehat{E}_{t_k,x}^{a,b}[V] = \widehat{E}[V | Y_{t_k}^{a,b} = x] \) for all \( \mathcal{F} \)-measurable random variables \( V \). Thus, \( \widehat{E}_{t_k,x}^{a,b} \) is the expectation under the probability law of \( Y_{t_k}^{a,b} \) starting at \( x \) at time \( t_k \).

Next, we recall the following exponential moment estimate taken from [31].

Lemma 4.1. [31] Lemma 3.1 Assume that \( \frac{a}{\sigma} > 2 \). For any \( \mu \leq (\frac{a}{\sigma} - 1)^2 \frac{\sigma}{2} \), there exists a constant \( C > 0 \) such that for any \( k \in \{0, ..., n - 1\} \), \( x \in \mathbb{R}_+ \) and \( t \in [t_k, t_{k+1}] \),

\[
\widehat{E}_{t_k,x}^{a,b} \left[ \exp \left\{ \mu \int_{t_k}^{t} \frac{dr}{Y_{r}^{a,b}(t, x)} \right\} \right] \leq C \left( 1 + \frac{1}{x^{\frac{2}{\sigma - 1}}} \right).
\]
As mentioned before, our techniques are based on the Malliavin calculus, which will require some $L^p$-norm estimation for positive and negative polynomial moments of the flow process as well as the Malliavin derivative of the flow process and its inverse.

**Lemma 4.2.** Assume condition $a \geq \sigma$. For all $p \geq 1$, there exists $C > 0$ such that
\[
E_{t_k,x}^a \left[ \left| Y_t^{a,b}(t_k, x) \right|^p \right] \leq C (1 + x^p).
\]
(4.12)

For all $p \in [0, \frac{\sigma}{\sigma + 1} - 1)$, there exists $C > 0$ such that
\[
E_{t_k,x}^a \left[ \frac{1}{\left| Y_t^{a,b}(t_k, x) \right|^p} \right] \leq \frac{C}{x^p}.
\]
(4.13)

For all $p \geq -\frac{(\frac{\sigma}{\sigma + 1} - 1)^2}{2(\frac{\sigma}{\sigma + 1} - \frac{1}{2})}$, there exists $C > 0$ such that
\[
E_{t_k,x}^a \left[ \left| \partial_x Y_t^{a,b}(t_k, x) \right|^p \right] \leq C \left( 1 + \frac{1}{x^{\frac{\sigma}{\sigma + 1} + 1}} \right),
\]
(4.14)

for any $k \in \{0, ..., n - 1\}$, $x \in \mathbb{R}_+^*$ and $t \in [t_k, t_{k+1}]$.

Now, let us recall that under condition $a \geq \sigma$, for any $t \in [t_k, t_{k+1}]$, the random variable $Y_t^{a,b}(t_k, x)$ belongs to $\mathbb{D}^{1,2}$ (see [2 Corollary 4.2]). From (4.3) and the chain rule of the Malliavin calculus, its corresponding Malliavin derivative satisfies the following equation
\[
D_s Y_t^{a,b}(t_k, x) = \sqrt{2\sigma Y_s^{a,b}(t_k, x)} - b \int_s^t D_u Y_u^{a,b}(t_k, x) \, du
\]
\[+ \int_s^t \frac{\sqrt{\sigma}}{2Y_u^{a,b}(t_k, x)} D_u Y_u^{a,b}(t_k, x) \, dW_u,
\]
(4.15)

for $s \leq t$, and $D_s Y_t^{a,b}(t_k, x) = 0$ for $s > t$. Furthermore, using the same arguments as in (2.59), the Malliavin derivative $D_s Y_t^{a,b}(t_k, x)$ can be rewritten as
\[
D_s Y_t^{a,b}(t_k, x) = \sqrt{2\sigma Y_s^{a,b}(t_k, x)} \partial_x Y_t^{a,b}(t_k, x)(\partial_x Y_s^{a,b}(t_k, x))^{-1} 1_{[t_k, t]}(s).
\]
(4.16)

On the other hand, by condition $a \geq \sigma$ and [2 Corollary 4.2], its explicit expression is given by
\[
D_s Y_t^{a,b}(t_k, x) = \sqrt{2\sigma Y_s^{a,b}(t_k, x)} \exp \left\{ \int_s^t \left( - \frac{b}{2} - \frac{3a}{4} \frac{\sigma}{Y_u^{a,b}(t_k, x)} \right) du \right\} 1_{[t_k, t]}(s).
\]
(4.17)

The Malliavin differentiability of the flow process and its inverse is guaranteed by the following lemma.

**Lemma 4.3.** Let $(a, b) \in \Theta \times \Sigma$, $k \in \{0, ..., n - 1\}$, $t \in [t_k, t_{k+1}]$, and $x \in \mathbb{R}_+^*$.

(i) Assume condition $\frac{a}{\sigma} > 4$. Then, $\partial_x Y_t^{a,b}(t_k, x) \in \mathbb{D}^{1,2}$. Furthermore,
\[
D_s (\partial_x Y_t^{a,b}(t_k, x)) = \partial_x Y_t^{a,b}(t_k, x) \left( \sqrt{\frac{\sigma}{2}} \frac{1}{Y_s^{a,b}(t_k, x)} + \frac{\sigma}{4} \int_s^t \frac{1}{(Y_u^{a,b}(t_k, x))^2} D_u Y_u^{a,b}(t_k, x) \, du \right)
\]
\[- \frac{1}{2} \sqrt{\frac{\sigma}{2}} \int_s^t \frac{1}{(Y_u^{a,b}(t_k, x))^2} D_u Y_u^{a,b}(t_k, x) \, dW_u \right) 1_{[t_k, t]}(s).
\]
(4.18)
(ii) Assume condition $\frac{a}{\sigma} > \frac{9 + \sqrt{57}}{2}$. Then, $(\partial_x Y_t^{a,b}(t_k, x))^{-1} \in \mathbb{D}^{1,2}$ and $\frac{Y_t^{a,b}(t_k, x)}{\partial_y Y_t^{a,b}(t_k, x)} \in \mathbb{D}^{1,2}$.

Furthermore,

$$D_s \left( \frac{1}{\partial_x Y_t^{a,b}(t_k, x)} \right) = \frac{-1}{(\partial_x Y_t^{a,b}(t_k, x))^2} D_s (\partial_x Y_t^{a,b}(t_k, x)) 1_{[t_k, t]}(s),$$

(4.19)

$$D_s \left( \frac{Y_t^{a,b}(t_k, x)}{\partial_y Y_t^{a,b}(t_k, x)} \right) = \frac{1}{\partial_y Y_t^{a,b}(t_k, x)} D_s Y_t^{a,b}(t_k, x) + Y_t^{a,b}(t_k, x) D_s \left( \frac{1}{\partial_y Y_t^{a,b}(t_k, x)} \right).$$

(4.20)

For any $t > s$, the law of $Y_t^{a,b}$ conditioned on $Y_s^{a,b} = x$ possesses the transition density $p_{t-s}^{a,b}(t-s, x, y)$. Following [19, Proposition 4.1], the score functions are expressed in terms of a conditional expectation of a Skorohod integral.

**Proposition 4.4.** Assume condition $\frac{a}{\sigma} > \frac{9 + \sqrt{57}}{2}$. Then, for all $k \in \{0, ..., n - 1\}$, $(a, b) \in \Theta \times \Sigma$, $\beta \in \{a, b\}$ and $x, y \in \mathbb{R}_+^*$,

$$\frac{\partial_{\beta} p_{t}^{a,b}}{p_{t}^{a,b}} (\Delta_n, x, y) = \frac{1}{\Delta_n} E_{t,s}^{a,b} \left[ \delta \left( \partial_{\beta} Y_{t}^{a,b}(t_k, x) U_{a,b}(t_k, x) \right) Y_{a,b}^{r} = y \right],$$

where $U_{a,b}(t_k, x) := (U_{t}^{a,b}(t_k, x), t \in [t_k, t_{k+1}])$ with $E_{t,s}^{a,b}$ being the law of $Y_{t}^{a,b}$ conditioned on $Y_{s}^{a,b} = x$.

Furthermore, under condition $\frac{a}{\sigma} > 5 + 3\sqrt{3}$, the Skorohod integrals are decomposed as follows

$$\delta \left( \partial_{\beta} Y_{t}^{a,b}(t_k, x) U_{a,b}(t_k, x) \right) = \frac{\Delta_n}{\sqrt{2} \sigma x} (W_{t_{k+1}} - W_{t_k}) + R_{1}^{a,b} + R_{2}^{a,b} + R_{3}^{a,b},$$

(4.21)

$$\delta \left( \partial_{\beta} Y_{t}^{a,b}(t_k, x) U_{a,b}(t_k, x) \right) = -\frac{\Delta_n}{\sqrt{2} \sigma} x (W_{t_{k+1}} - W_{t_k}) - x R_{1}^{a,b} + H_{2}^{a,b} + H_{3}^{a,b},$$

(4.22)

where

$$R_{1}^{a,b} = R_{1}^{a,b}(t_k, x) = \Delta_n \int_{t_k}^{t_{k+1}} \frac{1}{\sqrt{2} \sigma Y_{t}^{a,b}(t_k, x)} \left[ \frac{\partial_{\beta} Y_{t}^{a,b}(t_k, x)}{\partial_{\beta} Y_{t}^{a,b}(t_k, x)} - \frac{\partial_{\beta} Y_{t}^{a,b}(t_k, x)}{\partial_{\beta} Y_{t}^{a,b}(t_k, x)} \right] dW_s,$$

$$R_{2}^{a,b} = R_{2}^{a,b}(t_k, x) = \int_{t_k}^{t_{k+1}} \frac{1}{\partial_{\beta} Y_{t}^{a,b}(t_k, x)} \left[ \frac{1}{\partial_{\beta} Y_{t}^{a,b}(t_k, x)} - \frac{1}{\partial_{\beta} Y_{t}^{a,b}(t_k, x)} \right] dW_s,$$

$$R_{3}^{a,b} = R_{3}^{a,b}(t_k, x) = \int_{t_k}^{t_{k+1}} \frac{1}{\partial_{\beta} Y_{t}^{a,b}(t_k, x)} \left[ \frac{1}{\partial_{\beta} Y_{t}^{a,b}(t_k, x)} - \partial_{\beta} Y_{t}^{a,b}(t_k, x) \right] dW_s,$$

$$H_{2}^{a,b} = H_{2}^{a,b}(t_k, x) = \int_{t_k}^{t_{k+1}} \frac{1}{\partial_{\beta} Y_{t}^{a,b}(t_k, x)} \left[ \frac{1}{\partial_{\beta} Y_{t}^{a,b}(t_k, x)} - \partial_{\beta} Y_{t}^{a,b}(t_k, x) \right] dW_s,$$

$$H_{3}^{a,b} = H_{3}^{a,b}(t_k, x) = \int_{t_k}^{t_{k+1}} \frac{1}{\partial_{\beta} Y_{t}^{a,b}(t_k, x)} \left[ \frac{1}{\partial_{\beta} Y_{t}^{a,b}(t_k, x)} - \partial_{\beta} Y_{t}^{a,b}(t_k, x) \right] dW_s.$$

The following crucial estimates for the terms appearing in Proposition 4.4 will be needed.

**Lemma 4.5.** Let $(a, b) \in \Theta \times \Sigma$, $k \in \{0, ..., n - 1\}$, and $x \in \mathbb{R}_+^*$.  

(i) Under condition \( \frac{a}{\sigma} > 5 + 3\sqrt{2} \), we have
\[
\mathbb{E}_{\Omega,x}^a [R_{1}^a + R_{2}^a + R_{3}^a] = 0, \tag{4.23}
\]
\[
\mathbb{E}_{\Omega,x}^a [-xR_{1}^a + H_{2}^a + H_{3}^a] = 0. \tag{4.24}
\]

(ii) Let \( q \geq 1 \). Under condition \( \frac{a}{\sigma} > 4q + 1 + \sqrt{2q(8q + 1)} \), there exists \( C > 0 \) such that
\[
\mathbb{E}_{\Omega,x}^a [R_{1}^a + R_{2}^a + R_{3}^a]^{2q} \leq C \Delta_n^{4q} \sum_{\alpha(q) \in I} \frac{1}{x^{\alpha(q)}}, \tag{4.25}
\]
\[
\mathbb{E}_{\Omega,x}^a [-xR_{1}^a + H_{2}^a + H_{3}^a]^{2q} \leq C \Delta_n^{4q} (1 + x^{2q}) \sum_{\alpha(q) \in I} \frac{1}{x^{\alpha(q)}}, \tag{4.26}
\]
where \( I \) is a finite set. Moreover, if we assume \( q \in \left[ 1, \frac{33+\sqrt{321}}{48} \right] \) and condition (A) then \( q \leq \alpha(q) < \frac{a}{\sigma} - \frac{1}{2} \) for all \( \alpha(q) \in I \).

5. Proof of Lemma 2.1

Proof. To avoid confusion with the observed process \( X^{a,b} \) generated by the Brownian motion \( B \), on the probability space \( (\tilde{\Omega}, \tilde{\mathcal{F}}, \tilde{P}) \) we introduce an independent copy \( Y^{a,b} = (Y^{a,b}_t)_{t \geq 0} \) of \( X^{a,b} \), which is associated to the Brownian motion \( W \) independent of \( B \) and which is defined by \( [2.2] \). Then \( (\Omega, \mathcal{F}, \{ \mathcal{F}_t \}_{t \geq 0}, P) \) denotes the product filtered probability space of \( (\tilde{\Omega}, \tilde{\mathcal{F}}, \{ \tilde{\mathcal{F}}_t \}_{t \geq 0}, \tilde{P}) \) and \( (\Omega, \mathcal{F}, \{ \mathcal{F}_t \}_{t \geq 0}, P) \), i.e., \( \Omega = \tilde{\Omega} \times \tilde{\mathcal{F}}, \mathcal{F} = \tilde{\mathcal{F}} \otimes \mathcal{F} = \tilde{\mathcal{F}} \otimes \tilde{\mathcal{F}}, P = \tilde{P} \otimes \tilde{P}, \mathcal{F}_t = \tilde{\mathcal{F}}_t \otimes \mathcal{F}_t, \) and \( E = \tilde{E} \otimes \tilde{E} \), where \( E, \tilde{E}, \tilde{E} \) denote the expectation w.r.t. \( P, \tilde{P} \) and \( \tilde{P} \).

Using the decomposition \( [2.1] \) and Proposition \( [4.4] \) under condition \( \frac{a}{\sigma} > 5 + 3\sqrt{2} \), we obtain
\[
\sum_{k=0}^{n-1} (R_{k,n} + H_{k,n}) = \sum_{k=0}^{n-1} u_{\varphi_1,n}(a_0, b_0) \int_0^1 \frac{\partial_0 p^{a}_{\varphi_1}(\xi, b_0)}{p^{a}_{\varphi_1}(\xi, b_0)} (\Delta_n, X^{a_0,b_0}(t), X^{a_0,b_0}) d\xi
\]
\[
+ \sum_{k=0}^{n-1} v_{\varphi_2,n}(a_0, b_0) \int_0^1 \frac{\partial_0 p^{b}_{\varphi_2}(\xi, b_0)}{p^{b}_{\varphi_2}(\xi, b_0)} (\Delta_n, X^{a_0,b_0}(t), X^{a_0,b_0}, X^{a_0,b_0}) d\xi
\]
\[
= \sum_{k=0}^{n-1} u_{\varphi_1,n}(a_0, b_0) \int_0^1 \tilde{E}_{\Omega,x}^a (t, X^{a_0,b_0}, \tilde{\mathcal{F}}_t) \left[ -\frac{\Delta_n}{\sqrt{2\sigma X^{a_0,b_0}}}(W_{t_{k+1}} - W_{t_k}) + R^{a}(t,b_0)Y^{a}(t,b_0) = X^{a_0,b_0} \right] d\xi
\]
\[
+ \sum_{k=0}^{n-1} v_{\varphi_2,n}(a_0, b_0) \int_0^1 \tilde{E}_{\Omega,x}^a (t, X^{a_0,b_0}, \tilde{\mathcal{F}}_t) \left[ -\frac{\Delta_n}{\sqrt{2\sigma X^{a_0,b_0}}}(W_{t_{k+1}} - W_{t_k}) + H^{a,b}(t,b_0)Y^{a,b}(t,b_0) = X^{a_0,b_0} \right] d\xi
\]
\[- \sum_{k=0}^{n-1} (\xi_{k,n} + \eta_{k,n}),
\]
where
\[
R^{a}(t,b_0) = R^{a}(t,b_0) + R^{b}(t,b_0) + R^{\varphi_3}(t,b_0) = -X^{a_0,b_0}R^{a_0,b_0}(t) + H^{a_0,b}(t) + H^{a,b}(t,b_0).
\]
Then, from equation \( [4.2] \), we write
\[
W_{t_{k+1}} - W_{t_k} = \frac{1}{\sqrt{2\sigma Y^{a,b}(s)}} (Y^{a,b}(s) - Y^{a,b}(s) - (a - bY^{a,b}(s)) \Delta_n + b \int_{t_k}^{t_{k+1}} (Y^{a,b}(s) - Y^{a,b}(s)) ds
\]
\[- \int_{t_k}^{t_{k+1}} \left( \sqrt{2\sigma Y^a_{t_k}} - \sqrt{2\sigma Y^a_{t_k}} \right) dB_s. \]

This implies that

\[ n \sum_{k=0}^{n-1} \left( R_{k,n} + H_{k,n} \right) = n \sum_{k=0}^{n-1} \frac{u_1 (a_0, b_0)}{\Delta n} \int_0^1 \frac{E_{a,0} (t_k, X^n_{t_k})}{\Delta_n} \left[ \frac{-R_4 (a_0, b_0)}{2\sigma X^n_{t_k}} + \frac{R_5 (a_0, b_0)}{2\sigma X^n_{t_k}} \left| Y^n_{t_k} = X^n_{t_k} \right. \right] d\ell \]

where

\[ R_4 (a_0, b_0) = -\frac{\Delta_n}{2\sigma \sqrt{X^n_{t_k}}} b \int_{t_k}^{t_{k+1}} (Y^n_{s} - Y^n_{t_k}) ds, \]

\[ R_5 (a_0, b_0) = \frac{\Delta_n}{2\sigma \sqrt{X^n_{t_k}}} \int_{t_k}^{t_{k+1}} \left( \sqrt{Y^n_{s} - \sqrt{Y^n_{t_k}}} \right) dB_s. \]

Next, using equation (1.4), we write

\[ X^n_{t_{k+1}} = X^n_{t_k} + \sqrt{2\sigma X^n_{t_k}} (B_{t_k} - B_{t_k}) + (a_0 - b_0 X^n_{t_k}) \Delta_n \]

\[ - b_0 \int_{t_k}^{t_{k+1}} (X^n_{s} - X^n_{t_k}) ds + \int_{t_k}^{t_{k+1}} \left( \sqrt{2\sigma X^n_{s}} - \sqrt{2\sigma X^n_{t_k}} \right) dB_s. \]
Consequently, using the definition of $\xi_{k,n}$, $\eta_{k,n}$, we get
\[
\sum_{k=0}^{n-1} (R_{k,n} + H_{k,n}) = \sum_{k=0}^{n-1} \frac{w_{\xi_{k,n}}(a_0, b_0)}{\Delta_n} \int_0^1 \left\{ R_{6,a,b}^{a_0,b_0} + R_{7}^{a_0,b_0} + \tilde{E}_{t_k,1}^{a(t),b_0} \left[ -R_{4}^{a(t),b_0} - R_{5}^{a(t),b_0} + R_{a}^{a(t),b_0} | Y_{t_k+1} = X_{t_k+1}^{k_0} \right] \right\} \, dt \\
+ \sum_{k=0}^{n-1} \frac{w_{\eta_{k,n}}(a_0, b_0)}{\Delta_n} \int_0^1 \left\{ -X_{t_k}^{a,b}R_{6,a,b}^{a_0,b_0} - X_{t_k}^{a_0,b_0}R_{7}^{a_0,b_0} \right\} \, dt,
\]
where
\[
R_{6,a,b}^{a_0,b_0} = -\frac{\Delta_n}{2\sigma X_{t_k}^{a_0,b_0}} b_0 \int_{t_k}^{t_k+1} (X_{s}^{a_0,b_0} - X_{t_k}^{a_0,b_0}) \, ds,
\]
\[
R_{7,a,b}^{a_0,b_0} = \frac{\Delta_n}{\sqrt{2\sigma X_{t_k}^{a_0,b_0}}} \int_{t_k}^{t_k+1} \left( \sqrt{X_{s}^{a_0,b_0}} - \sqrt{X_{t_k}^{a_0,b_0}} \right) dB_s.
\]

This, together with Lemma 5.3, 5.8 below, finishes the proof of Lemma 2.1.

Now, it remains to prove Lemma 5.3, 5.8 below. To do so, we need the following preliminary part. Let $\tilde{P}_{t_k,x}^{a,b}$ and $\tilde{E}_{t_k,x}^{a,b}$ denote respectively the probability law of $X_{t_k}^{a,b}$ starting at $x$ at time $t_k$ and the expectation w.r.t. $\tilde{P}_{t_k,x}^{a,b}$, i.e., $\tilde{P}_{t_k,x}^{a,b}(A) = \tilde{E}[1_A | X_{t_k}^{a,b} = x]$ for all $A \in \tilde{\mathcal{F}}$ and $\tilde{E}_{t_k,x}^{a,b}[V] = \tilde{E}[V | X_{t_k}^{a,b} = x]$ for all $\tilde{\mathcal{F}}$-measurable random variables $V$. We introduce change of measures on $I_k := [t_k, t_{k+1}]$. For all $a, a_1 \in \mathbb{R}^*_+, b, b_1 \in \mathbb{R}$, $x \in \mathbb{R}^*_+$ and $k \in \{0, \ldots, n-1\}$, by [3, Lemma 3.1], for any $a > \sigma$ the probability measures $\tilde{P}_{t_k,x}^{a_1,b_1}$ and $\tilde{P}_{t_k,x}^{a,b}$ are absolutely continuous w.r.t. each other and its Radon-Nikodym derivative is given by

\[
\frac{d\tilde{P}_{t_k,x}^{a_1,b_1}}{d\tilde{P}_{t_k,x}^{a,b}}((X_{t}^{a,b})_{t \in I_k}) = \exp \left\{ \int_{t_k}^{t_k+1} \frac{a_1 - a - (b_1 - b)X_{s}^{a,b}}{2\sigma X_{s}^{a,b}} \, dX_{s}^{a,b} - \frac{1}{2} \int_{t_k}^{t_k+1} \frac{(a_1 - b_1 X_{s}^{a,b})^2 - (a - b X_{s}^{a,b})^2}{2\sigma X_{s}^{a,b}} \, ds \right\}.
\]

Similarly,

\[
\frac{d\tilde{P}_{t_k,x}^{a_1,b_1}}{d\tilde{P}_{t_k,x}^{a,b}}((Y_{t}^{a,b})_{t \in I_k}) = \exp \left\{ \int_{t_k}^{t_k+1} \frac{a_1 - a - (b_1 - b)Y_{s}^{a,b}}{2\sigma Y_{s}^{a,b}} \, dY_{s}^{a,b} - \frac{1}{2} \int_{t_k}^{t_k+1} \frac{(a_1 - b_1 Y_{s}^{a,b})^2 - (a - b Y_{s}^{a,b})^2}{2\sigma Y_{s}^{a,b}} \, ds \right\}.
\]

To prove Lemma 2.1 we need the following useful lemma related to the change of measures.

Lemma 5.1. Let $V$ denote a $\tilde{\mathcal{F}}_{t_{k+1}}$-measurable random variable which can be $R_{a,b}$, $(R_{a,b})^2$, $H_{a,b}$, $(H_{a,b})^2$, $R_{4,a,b}$, $(R_{4,a,b})^2$, $R_{5,a,b}$, $(R_{5,a,b})^2$. Assume condition $a > \sigma$. Then, for any $k \in \ldots$
\{0, ..., n - 1\} and \(x \in \mathbb{R}^+_t\),

\[
\hat{E}^{a_0,b_0}_{t_k,x} \left[ E^{a,b}_{t_{k+1}} \left[ V | Y^{a,b}_{t_{k+1}} = X^{a_0,b_0}_{t_{k+1}} \right] \right] = \hat{E}^{a_0,b_0}_{t_k,x} \left[ V \right] + \hat{E}^{a,b}_{t_k,x} \left[ \hat{E}^{a_0,b_0}_{t_{k+1}} \left[ V | Y^{a,b}_{t_{k+1}} \right] \right] \left( \frac{d\hat{P}^{a_0,b_0}_{t_k,x}}{dP^{a,b}_{t_k,x}} \right)(Y^a_t)_{t \in I_k) - 1) \right].
\]

(5.3)

Similarly, let \(\hat{V}\) be a \(\hat{F}_{t_{k+1}}\)-measurable random variable. Then, we have

\[
\hat{E}^{a_0,b_0}_{t_k,x} \left[ \hat{V} \right] = \hat{E}^{a,b}_{t_k,x} \left[ \hat{V} \right] + \hat{E}^{a,b}_{t_k,x} \left[ \hat{V} \left( \frac{d\hat{P}^{a_0,b_0}_{t_k,x}}{dP^{a,b}_{t_k,x}} \right)(X^a_t)_{t \in I_k) - 1) \right].
\]

(5.4)

**Proof.** For simplicity, we set \(g(x, y) := \hat{E}^{a,b}_{t_k,x} [V | Y^{a,b}_{t_{k+1}} = y]\) for all \(y \in \mathbb{R}^+_t\). Applying change of measures, we have that

\[
\hat{E}^{a_0,b_0}_{t_k,x} \left[ E^{a,b}_{t_{k+1}} \left[ V | Y^{a,b}_{t_{k+1}} = X^{a_0,b_0}_{t_{k+1}} \right] \right] = \hat{E}^{a_0,b_0}_{t_k,x} \left[ g(x, X^{a_0,b_0}_{t_{k+1}}) \right] = \hat{E}^{a,b}_{t_k,x} \left[ g(x, X^{a,b}_{t_{k+1}}) \frac{d\hat{P}^{a_0,b_0}_{t_k,x}}{dP^{a,b}_{t_k,x}} ((X^a_t)_{t \in I_k) - 1) \right] = \hat{E}^{a,b}_{t_k,x} \left[ \frac{d\hat{P}^{a_0,b_0}_{t_k,x}}{dP^{a,b}_{t_k,x}} \left( \hat{P}^{a_0,b_0}_{t_k,x} \right) (Y^a_t)_{t \in I_k) - 1) \right] = \hat{E}^{a,b}_{t_k,x} \left[ \hat{V} \left( \frac{d\hat{P}^{a_0,b_0}_{t_k,x}}{dP^{a,b}_{t_k,x}} \right)(X^a_t)_{t \in I_k) - 1) \right],
\]

where we have used the fact that \(Y^{a,b}\) is the independent copy of \(X^{a,b}\). Thus, (5.3) follows. The equality (5.4) is proven using the same arguments. \(\square\)

Next, the following lemma gives the estimate for the second term in Lemma 5.1.

**Lemma 5.2.** Let \(p, q > 1\) satisfy that \(\frac{1}{p} + \frac{1}{q} = 1\) and \(V, \hat{V}\) be the same notation of the previous lemma. Assume that \(p < 2(\min(a,a_0) - 1)\) if \(a \neq a_0\). Then for any \(k \in \{0, ..., n - 1\}\) and \(x \in \mathbb{R}^+_t\), there exists a constant \(C > 0\) which does not depend on \(x\) such that

\[
\left| \hat{E}^{a,b}_{t_k,x} \left[ \hat{E}^{a_0,b_0}_{t_k,x} \left[ V | Y^{a,b}_{t_{k+1}} \right] \right] \left( \frac{d\hat{P}^{a_0,b_0}_{t_k,x}}{dP^{a,b}_{t_k,x}} \right) (Y^a_t)_{t \in I_k) - 1) \right| \leq C \sqrt{\frac{\Delta_n}{\sqrt{x}}} \left| \int_{a}^{a_0} \left( \frac{d\hat{P}^{a_0,b_0}_{t_k,x}}{dP^{a,b}_{t_k,x}} \right) (V|y) \right|^\frac{1}{q} dy \right| + C \sqrt{\Delta_n} (1 + \sqrt{x}) \int_{b}^{a_0} \left( \frac{d\hat{P}^{a_0,b_0}_{t_k,x}}{dP^{a,b}_{t_k,x}} \right) (V|y) \right|^\frac{1}{q} dy \right|.
\]

(5.5)
Similarly,
\[
\left| \tilde{E}_{t_k,x}^\alpha \left[ V \left( \frac{d\tilde{P}_{t_k,x}^{\alpha,0}}{dP_{t_k,x}^{\alpha,0}} \left( (Y_{t_k}^{\alpha,b})_{t \in I_k} \right) - 1 \right) \right] \right| \leq C \sqrt{\Delta_n} \left( \int_a^{a_0} \left| \left( \tilde{E}_{t_k,x}^\alpha \left[ \frac{\partial}{\partial \alpha} \left( \frac{d\tilde{P}_{t_k,x}^{\alpha,0}}{dP_{t_k,x}^{\alpha,0}} \right) \right] \right|^\frac{1}{q} \right) \right)^{\frac{1}{q}} d\alpha \\
+ C \sqrt{\Delta_n} (1 + \sqrt{x}) \left( \int_b^{b_0} \left| \left( \tilde{E}_{t_k,x}^\alpha \left[ \frac{\partial}{\partial \beta} \left( \frac{d\tilde{P}_{t_k,x}^{\beta,0}}{dP_{t_k,x}^{\beta,0}} \right) \right] \right|^\frac{1}{q} \right) \right)^{\frac{1}{q}} d\beta.
\]

Proof. Using (5.2), we have the following decomposition
\[
\frac{d\tilde{P}_{t_k,x}^{\alpha,0}}{dP_{t_k,x}^{\alpha,0}} \left( (Y_{t_k}^{\alpha,b})_{t \in I_k} \right) - 1 = \int_a^{a_0} \frac{\partial}{\partial \alpha} \left( \frac{d\tilde{P}_{t_k,x}^{\alpha,0}}{dP_{t_k,x}^{\alpha,0}} \right) ((Y_{t_k}^{\alpha,b})_{t \in I_k}) d\alpha + \int_b^{b_0} \frac{\partial}{\partial \beta} \left( \frac{d\tilde{P}_{t_k,x}^{\beta,0}}{dP_{t_k,x}^{\beta,0}} \right) ((Y_{t_k}^{\alpha,b})_{t \in I_k}) d\beta \\
= \int_a^{a_0} \int_{t_k}^{t_{k+1}} \frac{1}{2\sigma Y_s^{\alpha,b}} (dY_s^{\alpha,b} - (\alpha - b_0 Y_s^{\alpha,b}) ds) \frac{d\tilde{P}_{t_k,x}^{\alpha,0}}{dP_{t_k,x}^{\alpha,0}} ((Y_{t_k}^{\alpha,b})_{t \in I_k}) d\alpha \\
- \int_b^{b_0} \int_{t_k}^{t_{k+1}} \frac{1}{2\sigma Y_s^{\alpha,b}} (dY_s^{\alpha,b} - (\alpha - b_0 Y_s^{\alpha,b}) ds) \frac{d\tilde{P}_{t_k,x}^{\beta,0}}{dP_{t_k,x}^{\beta,0}} ((Y_{t_k}^{\alpha,b})_{t \in I_k}) d\beta.
\]

Then, using change of measures, equation (1.2), Hölder’s, BDG’s and Jensen’s inequalities, (1.12) and (1.13), we get that
\[
\left| \tilde{E}_{t_k,x}^\alpha \left[ E_{t_k,x}^{\alpha,0} \left( V | Y_{t_k}^{\alpha,b} \right) \right] \left( \frac{d\tilde{P}_{t_k,x}^{\alpha,0}}{dP_{t_k,x}^{\alpha,0}} ((Y_{t_k}^{\alpha,b})_{t \in I_k}) - 1 \right) \right| \\
\leq C \int_a^{a_0} \left| \left( \tilde{E}_{t_k,x}^\alpha \left[ \frac{\partial}{\partial \alpha} \left( \frac{d\tilde{P}_{t_k,x}^{\alpha,0}}{dP_{t_k,x}^{\alpha,0}} \right) \right] \right|^\frac{1}{q} \right) \left( \Delta_n \right)^{-\frac{1}{p-q}} \left( \int_{t_k}^{t_{k+1}} \left| \frac{1}{Y_s^{\alpha,b}} \right|^\frac{1}{q} \right) d\alpha \\
+ C \int_b^{b_0} \left| \left( \tilde{E}_{t_k,x}^\alpha \left[ \frac{\partial}{\partial \beta} \left( \frac{d\tilde{P}_{t_k,x}^{\beta,0}}{dP_{t_k,x}^{\beta,0}} \right) \right] \right|^\frac{1}{q} \right) \left( \Delta_n \right)^{-\frac{1}{p-q}} \left( \int_{t_k}^{t_{k+1}} \left| \frac{1}{Y_s^{\alpha,b}} \right|^\frac{1}{q} \right) d\beta.
\]

for some constant $C > 0$, where $p, q > 1$ and $\frac{1}{p} + \frac{1}{q} = 1$ with $p < 2\left( \frac{\min(a_0, a)}{\sigma} - 1 \right)$ if $a \neq a_0$. Thus, (5.5) follows. The inequality (5.6) is proven using the same arguments. \qed
Lemma 5.3. Assume condition (A). Then, as \( n \to \infty \),
\[
\sum_{k=0}^{n-1} \frac{u\varphi_{1,n}(a_0, b_0)}{\Delta_n} \int_0^1 \tilde{E}_{a_0,b_0}^{a_k}\left[ P_{a_k}^{a_0,b_0}|Y_{t_{k+1}}^{a_0,b_0} = X_{t_{k+1}}^{a_0,b_0}\right] \, d\ell \to 0.
\]

**Proof.** It suffices to show that conditions (i) and (ii) of Lemma 7.1 satisfy under the measure \( \hat{\pi}_{a_0,b_0} \) applied to the random variable
\[
\zeta_{k,n} := \frac{u\varphi_{1,n}(a_0, b_0)}{\Delta_n} \int_0^1 \tilde{E}_{a_0,b_0}^{a_k}\left[ P_{a_k}^{a_0,b_0}|Y_{t_{k+1}}^{a_0,b_0} = X_{t_{k+1}}^{a_0,b_0}\right] \, d\ell.
\]

Now, we start showing condition (i) of Lemma 7.1. Using (5.3) of Lemma 5.1 with \( V = R_{a_0,b_0}^{a_0,b_0} \), the fact that \( \tilde{E}_{a_0,b_0}^{a_k}\left[ P_{a_k}^{a_0,b_0}|Y_{t_{k+1}}^{a_0,b_0} = X_{t_{k+1}}^{a_0,b_0}\right] = 0 \) by (4.23), (5.5) of Lemma 5.2 with \( q = p = 2 \), and (4.25) of Lemma 4.5 with \( q = 1 \), we obtain that
\[
\left| \sum_{k=0}^{n-1} \tilde{E}_{a_0,b_0}^{a_0,b_0}\left[ \zeta_{k,n} \tilde{F}_{t_k} \right] \right| \leq C \sum_{k=0}^{n-1} \frac{|u|\varphi_{1,n}(a_0, b_0)}{\Delta_n} \sqrt{\Delta_n} \int_0^1 \int_0^{\alpha_0} \left( \tilde{E}_{a_0,b_0}^{a_k} \left[ |R_{a_k}^{a_0,b_0}|^2 \right] \right)^{\frac{1}{2}} \, d\alpha \, d\ell
\]
\[
\leq C u^2 \Delta_n^{\frac{1}{2}} \varphi_{1,n}(a_0, b_0)^2 \sum_{k=0}^{n-1} \sum_{\alpha(1) \in I} \frac{1}{(X_{t_k}^{a_0,b_0})^{\frac{1}{2} + \frac{\alpha(1)}{2}}},
\]
for some constant \( C > 0 \), where \( I \) is a finite set and \( 1 \leq \alpha(1) < \frac{\alpha}{\sigma} - \frac{1}{2} \) for all \( \alpha(1) \in I \). Here, to use (4.23), (4.25) and Lemma 5.2, \( \frac{\alpha}{\sigma} > 5 + 3\sqrt{2} \) and \( \frac{\alpha}{\sigma} > 2 \) are valid under condition (A).

Now, we treat three cases.

- **For subcritical case \( b_0 > 0 \)** with \( \varphi_{1,n}(a_0, b_0) = \frac{1}{\sqrt{n\Delta_n}} \), we get
  \[
  \left| \sum_{k=0}^{n-1} \tilde{E}_{a_0,b_0}^{a_0,b_0}\left[ \zeta_{k,n} \tilde{F}_{t_k} \right] \right| \leq C u^2 \Delta_n \sum_{k=0}^{n-1} \sum_{\alpha(1) \in I} \frac{1}{(X_{t_k}^{a_0,b_0})^{\frac{1}{2} + \frac{\alpha(1)}{2}}},
  \]
  which converges to zero in \( \hat{\pi}_{a_0,b_0} \)-probability using Lemma 3.2 with \( \varepsilon_n = \sqrt{\Delta_n} \) and the fact that \( \frac{1}{2} + \frac{\alpha(1)}{2} < \frac{\alpha}{\sigma} \) for all \( \alpha(1) \in I \).

- **For critical case \( b_0 = 0 \)** with \( \varphi_{1,n}(a_0, b_0) = \frac{1}{\sqrt{\log(n\Delta_n)}} \), then taking the expectation in both sides and using \( \frac{1}{2} + \frac{\alpha(1)}{2} < \frac{\alpha}{\sigma} \) for all \( \alpha(1) \in I \) and Lemma 3.3 we get that
  \[
  \tilde{E}_{a_0,b_0}^{a_0,b_0}\left[ \sum_{k=0}^{n-1} \tilde{E}_{a_0,b_0}^{a_0,b_0}\left[ \zeta_{k,n} \tilde{F}_{t_k} \right] \right] \leq C u^2 \Delta_n \sum_{\alpha(1) \in I} \frac{1}{(X_{t_k}^{a_0,b_0})^{\frac{1}{2} + \frac{\alpha(1)}{2}}},
  \]
  which tends to zero since \( \frac{\alpha(1)}{2} - \frac{1}{2} \leq 0 \) for all \( \alpha(1) \in I \).

- **For supercritical case \( b_0 < 0 \)** with \( \varphi_{1,n}(a_0, b_0) = 1 \), we proceed as in the critical case by using Lemma 3.3 to get that
  \[
  \tilde{E}_{a_0,b_0}^{a_0,b_0}\left[ \sum_{k=0}^{n-1} \tilde{E}_{a_0,b_0}^{a_0,b_0}\left[ \zeta_{k,n} \tilde{F}_{t_k} \right] \right] \leq C u^2 \Delta_n \left( C_1 + C_2 \sum_{\alpha(1) \in I} \frac{1}{(n\Delta_n)^{\frac{\alpha(1)}{2}}},
  \right),
  \]
which tends to zero.

This completes the proof of condition (i) of Lemma 4.5 for three cases. Now, we check condition (ii) of Lemma 4.5. For this, using Jensen’s inequality, (5.3) of Lemma 5.2 with \( V = (R^{(k),b_0})^2 \), (5.3) of Lemma 5.2 with \( q = q_0 = \frac{33 + \sqrt{41}}{48} > 1 \), and (4.25) of Lemma 4.5 with \( q \in \{1, q_0\} \), we obtain that

\[
\sum_{k=0}^{n-1} \mathbb{E}_{a_0,b_0}[s_{k,n}^2 | \hat{F}_{i_k}] \leq \sum_{k=0}^{n-1} \frac{n}{\sqrt{2}} (\varphi_{1,n}((a_0, b_0))^2) \int_0^1 \mathbb{E}_{a_0,b_0}[R^{(k),b_0}]^2 \limsup_{n \to \infty} \left( \mathbb{E}_{a_0,b_0}[(R^{(k),b_0})^2(Y^{(k),b_0})^2] \right) \Delta_n \sum_{k=0}^{n-1} \frac{1}{(X_{i_k}^{a_0,b_0})^{1/2 + \alpha(q_0)/2}} \frac{1}{\Delta_n} \frac{1}{\Delta_n},
\]

for some constant \( C > 0 \), where \( 1 < q_0 \leq \alpha(q_0) < \frac{a}{\sigma} - \frac{1}{2} \) for all \( \alpha(q_0) \in I \).

It is worth noticing that when using (5.5) of Lemma 5.2 with \( p, q \) satisfying \( \frac{q}{p} = 1 = 1 \) and (4.25) of Lemma 4.5 with \( q \), the conditions \( p < 2(q-1) \) and \( \alpha(q) > 4q + 1 \) are required. This implies \( \frac{a}{\sigma} > \frac{q}{2(q-1)} + 1 \) and \( \frac{a}{\sigma} > q + 1 + \sqrt{2q(8q + 1)} \). Hence, the optimal choice for \( q \) is solution to \( \frac{q}{2(q-1)} = q + 1 + \sqrt{2q(8q + 1)} \). The unique positive solution is given by \( q = q_0 = \frac{33 + \sqrt{41}}{48} \). Thus, \( \frac{a}{\sigma} > 2 + \sqrt{32} + \sqrt{41} + 1 \) which gives the required condition (A). Now, we treat three cases.

- For subcritical case \( b_0 > 0 \) with \( \varphi_{1,n}(a_0, b_0) = \frac{1}{\sqrt{n} \Delta_n} \), we get

\[
\sum_{k=0}^{n-1} \mathbb{E}_{a_0,b_0}[s_{k,n}^2 | \hat{F}_{i_k}] \leq \frac{C n}{\sqrt{2}} \Delta_n \sum_{k=0}^{n-1} \frac{1}{(X_{i_k}^{a_0,b_0})^{1/2 + \alpha(q_0)/2}} \frac{1}{\Delta_n} \frac{1}{\Delta_n},
\]

which converges to zero in \( \mathbb{P}_{a_0,b_0} \)-probability using Lemma 3.2, and the fact that \( \alpha(1) < \frac{a}{\sigma} - \frac{1}{2} \) for all \( \alpha(1) \in I \), \( \frac{1}{2} + \frac{\alpha(q_0)}{2} < \frac{a}{\sigma} \) for all \( \alpha(q_0) \in I \) since \( \frac{1}{2} + \frac{\alpha(q_0)}{2} \).

- For critical case \( b_0 = 0 \) with \( \varphi_{1,n}(a_0, 0) = \frac{1}{\sqrt{\log(n \Delta_n)}} \), then taking the expectation in both sides, we get that \( \mathbb{E}_{a_0,0}[| \sum_{k=0}^{n-1} \mathbb{E}_{a_0,0}[s_{k,n}^2 | \hat{F}_{i_k}] |] \) is bounded by

\[
C n \frac{\Delta_n^2}{\log(n \Delta_n)} \sum_{k=0}^{n-1} \sum_{\alpha(1) \in I} \mathbb{E}_{a_0,0}
\]

\[
\frac{1}{(X_{i_k}^{a_0,0})^{1/2 + \alpha(q_0)/2}} \frac{1}{\Delta_n} \frac{1}{\Delta_n},
\]

which converges to zero in \( \mathbb{P}_{a_0,0} \)-probability using Lemma 3.2, and the fact that \( \alpha(1) < \frac{a}{\sigma} - \frac{1}{2} \) for all \( \alpha(1) \in I \), \( \frac{1}{2} + \frac{\alpha(q_0)}{2} < \frac{a}{\sigma} \) for all \( \alpha(q_0) \in I \) since \( \frac{1}{2} + \frac{\alpha(q_0)}{2} \).
which tends to zero thanks to Lemma 5.3 since \( 1 \leq \alpha(1) < \frac{a}{\sigma} \) and \( \frac{3}{2} \leq \frac{\alpha(q_0)}{q_0} < \frac{a}{\sigma} \) for all \( \alpha(q_0) \in I \).

- For supercritical case \( b_0 < 0 \) with \( \varphi_{1,n}(a_0,b_0) = 1 \), we proceed similarly as in the critical case by using Lemma 5.4 and we obtain that \( \mathcal{E}_{a_0,b_0} [\sum_{k=0}^{n-1} \mathcal{E}_{a_0,b_0}[\widetilde{\zeta}_{k,n}^{2} \mathcal{E}_{t_k}^{2}]] \) is bounded by

\[
Cu^2 \Delta_n \left( C_1 + C_2 \sum_{\alpha(1) \in I} \frac{1}{(n \Delta_n)^{\alpha(1)-1}} \right) + Cu^2 |u| \Delta_n^{\frac{3}{2}} \left( C_1 + C_2 \sum_{\alpha(q_0) \in I} \frac{1}{(n \Delta_n)^{\alpha(q_0) q_0} - \frac{a}{\sigma}} \right),
\]

which tends to zero.

This completes the proof of condition (ii) of Lemma 7.1. Thus, the result follows. \( \square \)

**Lemma 5.4.** Assume condition \( \frac{a}{\sigma} > \frac{7}{2} \). Then, as \( n \to \infty \),

\[
\sum_{k=0}^{n-1} \frac{w_{\varphi_{1,n}(a_0,b_0)}}{\Delta_n} \int_0^1 (R_{t_k}^{a_0,b_0} - \mathcal{E}_{a_0,b_0}[\mathcal{E}_{t_k}^{a_0,b_0}[R_{t_k}^{a_0,b_0} Y_{t_k+1}^{a_0,b_0} = X_{t_k+1}^{a_0,b_0}]])) \, d\ell \mathcal{E}_{a_0,b_0} \to 0.
\]

**Proof.** We will show that conditions (i) and (ii) of Lemma 7.1 satisfy \( \mathcal{E}_{a_0,b_0} \) where

\[
\zeta_{k,n} := \frac{w_{\varphi_{1,n}(a_0,b_0)}}{\Delta_n} \int_0^1 (R_{t_k}^{a_0,b_0} - \mathcal{E}_{a_0,b_0}[\mathcal{E}_{t_k}^{a_0,b_0}[R_{t_k}^{a_0,b_0} Y_{t_k+1}^{a_0,b_0} = X_{t_k+1}^{a_0,b_0}]])) \, d\ell.
\]

We start showing (i) of Lemma 7.1. Using (5.3) of Lemma 5.1 with \( V = R_{t_k}^{a_0,b_0} \), the fact that \( \mathcal{E}_{t_k}^{a_0,b_0}[R_{t_k}^{a_0,b_0}] = 0 \) and \( \mathcal{E}_{a_0,b_0}[R_{t_k}^{a_0,b_0}] = 0 \) of Lemma 5.2 with \( q = p = 2 \), we obtain that

\[
\sum_{k=0}^{n-1} \mathcal{E}_{a_0,b_0}[\zeta_{k,n}(\mathcal{E}_{t_k}^{a_0,b_0})] = \sum_{k=0}^{n-1} \frac{w_{\varphi_{1,n}(a_0,b_0)}}{\Delta_n} \int_0^1 \mathcal{E}_{a_0,b_0}[\mathcal{E}_{t_k}^{a_0,b_0}[R_{t_k}^{a_0,b_0} Y_{t_k+1}^{a_0,b_0} = X_{t_k+1}^{a_0,b_0}]]) \, d\ell \mathcal{E}_{a_0,b_0} \leq \sum_{k=0}^{n-1} \frac{\sqrt{\Delta_n}}{X_{t_k}^{a_0,b_0}} \int_0^1 \int_0^{a_0} \mathcal{E}_{a_0,b_0}[((R_{a_0,b_0}^{2})^2)]^2 \, d\alpha \, d\ell.
\]

For \( p \geq 1 \), using BDG’s inequality, Itô’s formula, Hölder’s inequality, (4.12), (4.13), we get

\[
\mathcal{E}_{t_k}^{a_0,b_0,[R_{a_0,b_0}^{2p}] \mathcal{E}_{t_k}^{a_0,b_0}} \leq C \frac{\Delta_{n}^{2p}}{(X_{t_k}^{a_0,b_0})^{2p}} \int_{t_k}^{t_k+1} \mathcal{E}_{t_k}^{a_0,b_0} \left[ \left( \sqrt{Y_{s}^{a_0,b_0}} - \sqrt{Y_{t_k}^{a_0,b_0}} \right)^2 d|s| \right]^{p} \]

\[
\leq C \frac{\Delta_{n}^{2p}}{(X_{t_k}^{a_0,b_0})^{2p}} \int_{t_k}^{t_k+1} \mathcal{E}_{t_k}^{a_0,b_0} \left[ \left( \sqrt{Y_{s}^{a_0,b_0}} - \sqrt{Y_{t_k}^{a_0,b_0}} \right)^2 d|s| \right] \]

\[
\leq C \frac{\Delta_{n}^{p-1}}{(X_{t_k}^{a_0,b_0})^{2p}} \int_{t_k}^{t_k+1} \mathcal{E}_{t_k}^{a_0,b_0} \left[ \left( \sqrt{Y_{s}^{a_0,b_0}} - \sqrt{Y_{t_k}^{a_0,b_0}} \right)^2 d|s| \right] \]

\[
\leq C \frac{\Delta_{n}^{p-1}}{(X_{t_k}^{a_0,b_0})^{2p}} \int_{t_k}^{t_k+1} \mathcal{E}_{t_k}^{a_0,b_0} \left[ \left( \sqrt{Y_{s}^{a_0,b_0}} - \sqrt{Y_{t_k}^{a_0,b_0}} \right)^2 d|s| \right] \]

\[
\leq C \frac{\Delta_{n}^{p-1}}{(X_{t_k}^{a_0,b_0})^{2p}} \int_{t_k}^{t_k+1} \mathcal{E}_{t_k}^{a_0,b_0} \left[ \left( \sqrt{Y_{s}^{a_0,b_0}} - \sqrt{Y_{t_k}^{a_0,b_0}} \right)^2 d|s| \right] \]

\[
\leq C \frac{\Delta_{n}^{p-1}}{(X_{t_k}^{a_0,b_0})^{2p}} \int_{t_k}^{t_k+1} \mathcal{E}_{t_k}^{a_0,b_0} \left[ \left( \sqrt{Y_{s}^{a_0,b_0}} - \sqrt{Y_{t_k}^{a_0,b_0}} \right)^2 d|s| \right] \]

\[
\leq C \frac{\Delta_{n}^{p-1}}{(X_{t_k}^{a_0,b_0})^{2p}} \int_{t_k}^{t_k+1} \mathcal{E}_{t_k}^{a_0,b_0} \left[ \left( \sqrt{Y_{s}^{a_0,b_0}} - \sqrt{Y_{t_k}^{a_0,b_0}} \right)^2 d|s| \right] \]

\[
\leq C \frac{\Delta_{n}^{p-1}}{(X_{t_k}^{a_0,b_0})^{2p}} \int_{t_k}^{t_k+1} \mathcal{E}_{t_k}^{a_0,b_0} \left[ \left( \sqrt{Y_{s}^{a_0,b_0}} - \sqrt{Y_{t_k}^{a_0,b_0}} \right)^2 d|s| \right] \]

\[
\leq C \frac{\Delta_{n}^{p-1}}{(X_{t_k}^{a_0,b_0})^{2p}} \int_{t_k}^{t_k+1} \mathcal{E}_{t_k}^{a_0,b_0} \left[ \left( \sqrt{Y_{s}^{a_0,b_0}} - \sqrt{Y_{t_k}^{a_0,b_0}} \right)^2 d|s| \right] \]

\[
\leq C \frac{\Delta_{n}^{p-1}}{(X_{t_k}^{a_0,b_0})^{2p}} \int_{t_k}^{t_k+1} \mathcal{E}_{t_k}^{a_0,b_0} \left[ \left( \sqrt{Y_{s}^{a_0,b_0}} - \sqrt{Y_{t_k}^{a_0,b_0}} \right)^2 d|s| \right] \]

\[
\leq C \frac{\Delta_{n}^{p-1}}{(X_{t_k}^{a_0,b_0})^{2p}} \int_{t_k}^{t_k+1} \mathcal{E}_{t_k}^{a_0,b_0} \left[ \left( \sqrt{Y_{s}^{a_0,b_0}} - \sqrt{Y_{t_k}^{a_0,b_0}} \right)^2 d|s| \right] \]

\[
\leq C \frac{\Delta_{n}^{p-1}}{(X_{t_k}^{a_0,b_0})^{2p}} \int_{t_k}^{t_k+1} \mathcal{E}_{t_k}^{a_0,b_0} \left[ \left( \sqrt{Y_{s}^{a_0,b_0}} - \sqrt{Y_{t_k}^{a_0,b_0}} \right)^2 d|s| \right] \]

\[
\leq C \frac{\Delta_{n}^{p-1}}{(X_{t_k}^{a_0,b_0})^{2p}} \int_{t_k}^{t_k+1} \mathcal{E}_{t_k}^{a_0,b_0} \left[ \left( \sqrt{Y_{s}^{a_0,b_0}} - \sqrt{Y_{t_k}^{a_0,b_0}} \right)^2 d|s| \right] \]
\[ \leq C \frac{\Delta_n^{3p-1}}{(X_{t_k}^{a_0,b_0})^{2p}} \int_{t_k}^{t_{k+1}} \left((s-t_k)^{2p-1} \int_{t_k}^{s} \left( \overline{E}^{a,b}_{t_k,X_{t_k}^{a_0,b_0}} \left[ \frac{1}{Y_{u}^{a,b}} \right] + |b| \overline{E}^{a,b}_{t_k,X_{t_k}^{a_0,b_0}} [Y_{u}^{a,b}] \right) du \right) + (s-t_k)^p ds \leq C \frac{\Delta_n^{4p}}{(X_{t_k}^{a_0,b_0})^{2p}} \left( \frac{1}{(X_{t_k}^{a_0,b_0})^p} + |b|(X_{t_k}^{a_0,b_0})^p + 1 \right) \]

which converges to zero in \( \overline{P}^{a_0,b_0} \)-probability using Lemma 3.2 with \( \varepsilon_n = \sqrt{\Delta_n} \) and \( \frac{4}{\sigma} > 2 \).

For critical case \( b_0 = 0 \), then taking the expectation in both sides, we get that

\[ \overline{E}^{a_0,0} \left[ \sum_{k=0}^{n-1} E^{a_0,0}[c_k,n|\hat{F}_{t_k}] \right] \leq C u^2 \sqrt{n\Delta_n} \left( C_1 + C_2 \left( \frac{1}{n\Delta_n} + \frac{1}{\sqrt{n\Delta_n}} \right) \right), \]

which tends to zero thanks to Lemma 3.3 since \( \frac{4}{\sigma} > 2 \).

For supercritical case \( b_0 < 0 \), using Lemma 3.4, we get that

\[ \overline{E}^{a_0,b_0} \left[ \sum_{k=0}^{n-1} E^{a_0,b_0}[c_k,n|\hat{F}_{t_k}] \right] \leq C u^2 \sqrt{n\Delta_n} \left( C_1 + C_2 \log(n\Delta_n) + C_2 \left( \frac{1}{n\Delta_n} + \frac{1}{\sqrt{n\Delta_n}} \right) \right), \]

which tends to zero.

This completes the proof of condition (i) of Lemma 5.1. Now, we check condition (ii) of Lemma 5.1. For this, using Jensen’s inequality, (5.3) of Lemma 5.1 with \( V = (R_5^{(a_0,b_0)})^2 \), (5.5) of Lemma 5.2 with \( q = p = 2 \), (5.7) with \( p \in \{1,2\} \), under \( \frac{4}{\sigma} > 3 \) we obtain that

\[ \sum_{k=0}^{n-1} E^{a_0,b_0}[c_k,n|\hat{F}_{t_k}] \leq 2 \frac{u^2}{\Delta_n} \left( \varphi_{1,n}(a_0,b_0) \right)^2 \sum_{k=0}^{n-1} \int_{a_0}^{a_0} \left( \overline{E}^{a_0,b_0}_{t_k,X_{t_k}^{a_0,b_0}} [(R_7^{a_0,b_0})^2] \right) d\ell \]

\[ \leq 2 \frac{u^2}{\Delta_n} \left( \varphi_{1,n}(a_0,b_0) \right)^2 \sum_{k=0}^{n-1} \int_{a_0}^{a_0} \left( \overline{E}^{a_0,b_0}_{t_k,X_{t_k}^{a_0,b_0}} [(R_7^{a_0,b_0})^2] + \overline{E}^{a_0,b_0}_{t_k,X_{t_k}^{a_0,b_0}} [(R_5^{a_0,b_0})^2] \right) d\ell \]
\[ \leq Cu^2 \Delta_n^2 (\varphi_{1,n}(a_0, b_0))^2 \sum_{k=0}^{n-1} \left( \frac{1}{(X_{tk}^{a_0,b_0})^3} + \frac{|b_0|}{X_{tk}^{a_0,b_0}} + \frac{1}{(X_{tk}^{a_0,b_0})^2} \right) + C u^2 |u| \Delta_n^2 (\varphi_{1,n}(a_0, b_0))^3 \sum_{k=0}^{n-1} \left( \frac{1}{(X_{tk}^{a_0,b_0})^3} + \frac{|b_0|}{X_{tk}^{a_0,b_0}} + \frac{1}{(X_{tk}^{a_0,b_0})^2} \right), \]

where the estimate for \( \hat{E}_{a_0,b_0}^{a_0,b_0} [\left(R^a_{t_k} \right)^2] \) is proceeded similarly as for (5.7).

- For subcritical case \( b_0 > 0 \), we get
  \[
  \sum_{k=0}^{n-1} \hat{E}_{a_0,b_0}^{a_0,b_0} [\xi_{n,k}^2, \hat{F}_{tk}] \leq Cu^2 \Delta_n \sum_{k=0}^{n-1} \left( \frac{1}{(X_{tk}^{a_0,b_0})^3} + \frac{|b_0|}{X_{tk}^{a_0,b_0}} + \frac{1}{(X_{tk}^{a_0,b_0})^2} \right) + \frac{Cu^2 |u| \Delta_n^2}{n \sqrt{n}} \sum_{k=0}^{n-1} \left( \frac{1}{(X_{tk}^{a_0,b_0})^3} + \frac{|b_0|}{X_{tk}^{a_0,b_0}} + \frac{1}{(X_{tk}^{a_0,b_0})^2} \right),
  \]
  which converges to zero in \( \hat{E}_{a_0,b_0} \)-probability using Lemma 3.2 with \( \varepsilon_n \in \{ \Delta_n, \frac{\Delta_n}{\sqrt{n}} \} \) and \( \frac{\Delta_n}{\varepsilon_n} > \frac{7}{5} \).

- For critical case \( b_0 = 0 \), then taking the expectation in both sides, we get that \( \hat{E}^{a_0,b_0} \left[ || \sum_{k=0}^{n-1} \hat{E}^{a_0,b_0} [\xi_{n,k}^2, \hat{F}_{tk}] || \right] \) is bounded by
  \[
  Cu^2 \log(n \Delta_n) \left( C_1 + C_2 \left( \frac{1}{(n \Delta_n)^2} + \frac{1}{n \Delta_n} \right) \right) + \frac{Cu^2 |u| \Delta_n^2}{\log(n \Delta_n) \sqrt{\log(n \Delta_n)}} \left( C_1 + C_2 \left( \frac{1}{(n \Delta_n)^2} + \frac{1}{n \Delta_n} \right) \right),
  \]
  which tends to zero thanks to Lemma 3.3.

- For supercritical case \( b_0 < 0 \), using Lemma 3.4, \( \hat{E}_{a_0,b_0}^{a_0,b_0} \left[ || \sum_{k=0}^{n-1} \hat{E}_{a_0,b_0} [\xi_{n,k}^2, \hat{F}_{tk}] || \right] \) is bounded by
  \[
  Cu^2 \Delta_n \left( C_1 + C_2 \left( \log(n \Delta_n) + \frac{1}{(n \Delta_n)^2} + \frac{1}{n \Delta_n} \right) \right) + \frac{Cu^2 |u| \Delta_n^2}{\log(n \Delta_n)} \left( C_1 + C_2 \left( \frac{1}{(n \Delta_n)^2} + \frac{1}{n \Delta_n} \right) + \frac{1}{(n \Delta_n)^2} \right),
  \]
  which tends to zero.

This completes the proof of condition (ii) of Lemma 7.1. Thus, the result follows. \( \square \)

**Lemma 5.5.** Assume condition \( \frac{\Delta_n}{\varepsilon_n} > \frac{7}{5} \). Then, as \( n \to \infty \),

\[
\sum_{k=0}^{n} \frac{w_{\varphi_{1,n}(a_0, b_0)}}{\Delta_n} \int_0^1 \left( R_{6a_{t_k}}^{a_0,b_0} - \hat{E}_{a_0,b_0}^{a_0,b_0} [R_{4a_{t_{k+1}}}^{a_0,b_0} | X_{t_{k+1}}^{a_0,b_0} = X_{t_{k+1}}^{a_0,b_0}] \right) dt \to 0.
\]

**Proof.** When \( b_0 = 0 \), we have \( R_{4a_{t_k}}^{a_0,b_0} = R_{6a_{t_k}}^{a_0,b_0} = 0 \). Hence, we need only to treat the subcritical and supercritical cases. It suffices to show that conditions (i) and (ii) of Lemma
satisfy under \( \tilde{\varphi}_{a_0,b_0} \) where

\[
\zeta_{k,n} := \frac{u \varphi_{1,n}(a_0, b_0)}{\Delta_n} \int_0^1 \left( R_{a_0,b_0}^a - \tilde{\varphi}_{a_0,b_0} \left[ R_{4a_0,b_0}^a \right] Y_{t_{k+1}} \right) dt.
\]

We start showing (i) of Lemma 7.1. For this, using (5.3) of Lemma 5.1 with \( V = R_{4a_0,b_0}^a \), (5.4) of Lemma 5.1 with \( \tilde{V} = R_{a_0,b_0}^a \), (5.5) and (5.6) of Lemma 5.2 with \( p = 2 \), we obtain

\[
\left| \sum_{k=0}^{n-1} \tilde{\varphi}_{a_0,b_0}[\zeta_{k,n}, \tilde{F}_{tk}] \right| = \frac{|u| \varphi_{1,n}(a_0, b_0)}{\Delta_n} \int_0^1 \left( \tilde{\varphi}_{a_0,b_0} \left[ R_{a_0,b_0}^a \right] \right) \sum_{k=0}^{n-1} \int_0^1 \left( \tilde{\varphi}_{a_0,b_0} \left[ R_{4a_0,b_0}^a \right] \right) dt.
\]

where we have used the fact that \( \tilde{\varphi}_{a_0,b_0} \left[ R_{a_0,b_0}^a \right] - \tilde{\varphi}_{a_0,b_0} \left[ R_{a_0,b_0}^a \right] \left[ R_{4a_0,b_0}^a \right] = 0 \) since \( Y_{a_0,b_0}^a \) is the independent copy of \( X_{a_0,b_0}^a \).

For \( p \geq 1 \), using equation (4.12), BDG’s inequality, Hölder’s inequality and (4.12), we get

\[
\tilde{E}_{a_0,b_0}^{a,b} \left[ \left( \int_{tk}^{tk+1} (Y_{a,b}^{a,b} - Y_{tk}^{a,b}) ds \right)^{2p} \right] \leq C_{2p-1} \int_{tk}^{tk+1} \left( Y_{a,b}^{a,b} - Y_{tk}^{a,b} \right)^{2p} ds
\]

where \( C_{2p-1} \) is a constant.

Then, applying (5.8) with \( p = 1 \), we get

\[
\left| \sum_{k=0}^{n-1} \tilde{\varphi}_{a_0,b_0}[\zeta_{k,n}, \tilde{F}_{tk}] \right| \leq C_{u^2} \left| b_0 \right| (\varphi_{1,n}(a_0, b_0))^2 \Delta_n \sum_{k=0}^{n-1} \left( \frac{1}{X_{tk}^{a_0,b_0}} \right)^2 + \frac{|b_0|}{\sqrt{X_{tk}^{a_0,b_0}}} + \frac{1}{X_{tk}^{a_0,b_0}}.
\]

For subcritical case \( b_0 > 0 \), we get

\[
\left| \sum_{k=0}^{n-1} \tilde{\varphi}_{a_0,b_0}[\zeta_{k,n}, \tilde{F}_{tk}] \right| \leq C_{u^2} \Delta_n \sum_{k=0}^{n-1} \left( \frac{1}{X_{tk}^{a_0,b_0}} \right)^2 + \frac{|b_0|}{\sqrt{X_{tk}^{a_0,b_0}}} + \frac{1}{X_{tk}^{a_0,b_0}}.
\]
which converges to zero in \( \hat{P}^{a_0,b_0}\)-probability using Lemma 3.2 with \( \varepsilon_n = \Delta_n \) and \( \frac{\sigma}{\sigma} > \frac{\Delta_n}{\Delta_n} \).

- For supercritical case \( b_0 < 0 \), using Lemma 3.4 \( \hat{E}^{a_0,b_0}[\sum_{k=0}^{n-1} \hat{E}^{a_0,b_0}[\xi_{k,n}|\mathcal{F}_k]] \) is bounded by

\[
Cu^2 \Delta_n \left( C_1 + C_2 (\log(\Delta_n) + \frac{1}{\sqrt{n\Delta_n}}) \right) + Cu^2 \sqrt{n\Delta_n},
\]

which tends to zero.

This complete the proof of condition (i) of Lemma 7.1. Next, using Jensen’s inequality, (5.3) of Lemma 5.1 with \( V = (R_4^{a(\ell),b_0})^2 \), (5.5) of Lemma 5.2 with \( q = p = 2 \), and (5.8) with \( p \in \{1, 2\} \), we obtain

\[
s_{\Delta_n}^{a_0,b_0} \lesssim 2 \sum_{k=0}^{n-1} \hat{E}^{a_0,b_0}[\xi_{k,n}^2|\mathcal{F}_k] \leq 2 u^2 (\varphi_{1,n}(a_0,b_0))^2 \sum_{k=0}^{n-1} \left\{ \hat{E}^{a_0,b_0}_{t_k,X_{t_k}^{a_0,b_0}}[(R_6^{a_0,b_0})^2] + \hat{E}^{a_0,b_0}_{t_k,X_{t_k}^{a_0,b_0}}[R_4^{a(\ell),b_0}]^2 | \right\} d\ell
\]

\[
\leq 2 u^2 (\varphi_{1,n}(a_0,b_0))^2 \sum_{k=0}^{n-1} \left\{ \hat{E}^{a_0,b_0}_{t_k,X_{t_k}^{a_0,b_0}}[(R_6^{a_0,b_0})^2] + \hat{E}^{a_0,b_0}_{t_k,X_{t_k}^{a_0,b_0}}[R_4^{a(\ell),b_0}]^2 | \right\} d\ell
\]

\[
\leq Cu^2 b_0^2 \Delta_n (\varphi_{1,n}(a_0,b_0))^2 \sum_{k=0}^{n-1} \left( \frac{1}{X_{t_k}^{a_0,b_0}} + \frac{1}{b_0} \right)
\]

\[
+ Cu^2 |u|^2 b_0^2 \Delta_n (\varphi_{1,n}(a_0,b_0))^3 \sum_{k=0}^{n-1} \left( \frac{1}{X_{t_k}^{a_0,b_0}} + \frac{1}{X_{t_k}^{a_0,b_0}} \right)
\]

where the estimate for \( \hat{E}^{a_0,b_0}_{t_k,X_{t_k}^{a_0,b_0}}[(R_6^{a_0,b_0})^2] \) is proceeded similarly as for (5.3).

- For subcritical case \( b_0 > 0 \) with \( \varphi_{1,n}(a_0,b_0) = \frac{1}{\sqrt{\Delta_n}} \), we get

\[
s_{\Delta_n}^{a_0,b_0} \lesssim 2 \sum_{k=0}^{n-1} \hat{E}^{a_0,b_0}[\xi_{k,n}^2|\mathcal{F}_k] \leq 2 \frac{u^2}{n} \sum_{k=0}^{n-1} \left( \frac{1}{X_{t_k}^{a_0,b_0}} + \frac{1}{b_0} \right)
\]

\[
+ Cu^2 |u|^2 \frac{\Delta_n^2}{n} \sum_{k=0}^{n-1} \left( \frac{1}{X_{t_k}^{a_0,b_0}} + \frac{1}{b_0} \right)
\]

which converges to zero in \( \hat{P}^{a_0,b_0}\)-probability using Lemma 3.2 with \( \varepsilon_n \in \{\frac{\Delta_n}{\sqrt{n}}, \frac{\Delta_n^2}{\Delta_n}\} \) and \( \frac{\sigma}{\sigma} > \frac{\Delta_n}{\Delta_n} \).

- For supercritical case \( b_0 < 0 \), using Lemma 3.4 \( \hat{E}^{a_0,b_0}[\sum_{k=0}^{n-1} \hat{E}^{a_0,b_0}[\xi_{k,n}^2|\mathcal{F}_k]] \) is bounded by

\[
Cu^2 \Delta_n (C_1 + n \Delta_n + C_2 (\frac{1}{n \Delta_n} + \log(n \Delta_n)))
\]
Lemma 5.6. Assume condition (A) Then, as \( n \to \infty \),

\[
\sum_{k=0}^{n-1} \frac{v_2(a_0, b_0)}{\Delta_n} \int_0^1 \tilde{E}_{a_n, b(\ell)}^{a_n, b(\ell)} [H_{t_k, X} a_n, b_0] [Y_{a_n, b(\ell)}]_{t_k+1} = \tilde{X}_{t_k+1}^{a_0, b_0} d\ell \to 0.
\]

Proof. We are going to apply Lemma 4.1 with

\[ \zeta_{k,n} := \frac{v_2(a_0, b_0)}{\Delta_n} \int_0^1 \tilde{E}_{a_n, b(\ell)}^{a_n, b(\ell)} [H_{t_k, X} a_n, b_0] [Y_{a_n, b(\ell)}]_{t_k+1} = \tilde{X}_{t_k+1}^{a_0, b_0} d\ell. \]

First, we start showing condition (i) of Lemma 4.1 Using (5.3) of Lemma 5.1 with \( V = H_{a_n, b(\ell)} \), the fact that \( \tilde{E}_{a_n, b(\ell)}^{a_n, b(\ell)} [H_{t_k, X} a_n, b_0] = 0 \) by (4.24), (5.5) of Lemma 5.2 with \( q = p = 2 \), and (4.26) of Lemma 4.5 with \( q = 1 \), we obtain that

\[
\left| \sum_{k=0}^{n-1} \tilde{E}_{a_n, b_0}^{a_n, b_0} [\zeta_{k,n} | \tilde{F}_{t_k}] \right| \leq C \sum_{k=0}^{n-1} \frac{|v_2(a_0, b_0)|}{\Delta_n} \int_0^1 \left( \sqrt{\Delta_n} \right) \left( \int_{a_n}^{b_0} \left( \tilde{E}_{a_n, b(\ell)}^{a_n, b(\ell)} [H_{t_k, X} a_n, b_0] \left| [H_{a_n, b(\ell)}] \right|^2 \right) \left( \phi d\phi \right) \right) d\ell
\]

\[
\leq C |v_2(a_0, b_0)| \Delta_n \sum_{k=0}^{n-1} \left( \frac{1}{\sqrt{n} \Delta_n} |a_0, b_0| + (1 + \sqrt{n} \Delta_n) |v_2(a_0, b_0)| \right)
\]

\[
\times (1 + X_{t_k}^{a_0, b_0}) \sum_{\alpha(1) \in I} \left( \frac{1}{X_{t_k}^{a_0, b_0}} \right) = \sum_{\alpha(1) \in I} \left( \frac{1}{X_{t_k}^{a_0, b_0}} \right)
\]

- For subcritical case \( b_0 > 0 \) with \( (\varphi_{1, n}(a_0, b_0), \varphi_{2, n}(a_0, b_0)) = (\frac{1}{\sqrt{n} \Delta_n}, \frac{1}{\sqrt{n} \Delta_n}) \), we get

\[
\left| \sum_{k=0}^{n-1} \tilde{E}_{a_n, b_0}^{a_n, b_0} [\zeta_{k,n} | \tilde{F}_{t_k}] \right| \leq C \sqrt{\Delta_n} \sum_{k=0}^{n-1} \sum_{\alpha(1) \in I} \left( \frac{1}{X_{t_k}^{a_0, b_0}} \right) \frac{1}{a_n^{(1)}} + \frac{1}{X_{t_k}^{a_0, b_0}} \frac{1}{a_n^{(1)}} + \frac{1}{X_{t_k}^{a_0, b_0}} \frac{1}{a_n^{(1)}}
\]

which converges to zero in probability using Lemma 3.2 with \( \varepsilon_n = \sqrt{\Delta_n} \) and the fact that \( \frac{a_n^{(1)}}{2} + \frac{1}{2} < \frac{a_n^{(1)}}{2} \) for all \( \alpha(1) \in I \).

- For critical case \( b_0 = 0 \) with \( (\varphi_{1, n}(a_0, 0), \varphi_{2, n}(a_0, 0)) = (\frac{1}{\sqrt{\log(n \Delta_n)}} \frac{1}{n \Delta_n}) \), then taking the expectation in both sides, we get that \( \tilde{E}_{a_n, 0}^{a_n, 0} [\left| \sum_{k=0}^{n-1} \tilde{E}_{a_n, 0}^{a_n, 0} [\zeta_{k,n} | \tilde{F}_{t_k}] \right|] \) is bounded by

\[
\frac{\sqrt{\Delta_n}}{\sqrt{\log(n \Delta_n)}} \left( C_1 + C_2 \sum_{\alpha(1) \in I} \left( \frac{1}{n \Delta_n} \frac{1}{a_n^{(1)}} + \frac{1}{n \Delta_n} \frac{1}{a_n^{(1)}} \right) \right)
\]

This completes the proof of condition (ii) of Lemma 5.1. Thus, the result follows. \( \square \)
\begin{align*}
+ \sqrt{\Delta_n}(C_1 + C_2 \sum_{\alpha(1) \in I} \left( \frac{1}{(n \Delta_n)^{\frac{1}{2}+\theta}} + \frac{1}{(n \Delta_n)^{\frac{1}{2}}} \right))
\end{align*}

which tends to zero thanks to Lemma 6.3.

\bullet \text{ For supercritical case } \beta_0 < 0 \text{ with } (\varphi_{1,n}(a_0, b_0), \varphi_{2,n}(a_0, b_0)) = \left(1, e^{\beta_0 \frac{\alpha(1)}{2}}\right), \text{ using Lemma 3.4, } \widehat{E}_{\alpha_0, \beta_0} \left[ \sum_{k=0}^{n-1} \widehat{E}_{\alpha_0, \beta_0}[\xi_k, F_k] \right] \text{ is bounded by}

\begin{align*}
&\leq \sqrt{\Delta_n} e^{\beta_0 n \Delta_n} \sum_{\alpha(1) \in I} \left( \frac{1}{(n \Delta_n)^{\frac{1}{2}}} + \frac{1}{(n \Delta_n)^{\frac{1}{2}+\theta}} \right) \\
&+ \sqrt{\Delta_n} e^{\beta_0 n \Delta_n} \left( C_1 + C_2 \sum_{\alpha(1) \geq 2} \left( \frac{1}{(n \Delta_n)^{\frac{1}{2}}} + \frac{1}{(n \Delta_n)^{\frac{1}{2}+\theta}} \right) \right) \\
&+ \sqrt{\Delta_n} e^{\beta_0 n \Delta_n} \left( C_1 + C_2 \sum_{\alpha(1) \geq 3} \left( \frac{1}{(n \Delta_n)^{\frac{1}{2}}} + \frac{1}{(n \Delta_n)^{\frac{1}{2}+\theta}} \right) \right)
\end{align*}

which tends to zero.

This completes the proof of condition (i) of Lemma 7.1. Next, using Jensen’s inequality, \[5.3\] of Lemma 5.1 with \(V = (H^{a,b}(\ell))^2\), \[5.5\] of Lemma 5.2 with \(q = q_0 = \frac{33+\sqrt{13}}{48}\), and \[1.20\] of Lemma 4.5 with \(q \in \{1, q_0\}\), under (A), we obtain

\begin{align*}
&\sum_{k=0}^{n-1} \widehat{E}_{\alpha_0, \beta_0} \left[ \xi_{k,n}^2 | F_k \right] \\
&\leq \sum_{k=0}^{n-1} \frac{v^2(\varphi_{2,n}(a_0, b_0))^2}{\Delta_n^2} \int_0^1 \widehat{E}_{\alpha_0, \beta_0} \left[ \widehat{E}_{t_k+1, Y_{t_k}^2} \left( H^{a,b}(\ell)^2 | Y_{t_k+1}^a = Y_{t_k+1}^b \right) \right] d\ell \\
&\leq \sum_{k=0}^{n-1} \frac{v^2(\varphi_{2,n}(a_0, b_0))^2}{\Delta_n^2} \int_0^1 \left\{ \frac{v^2}{2 \Delta_n} \int_{b(\ell)}^{b(\ell)} \left( \frac{1}{H^{a,b}(\ell)^2} \right) d\ell \right\} \frac{\Delta_n}{\Delta_{k+1}} \frac{1}{\Delta_{k+1}} \frac{1}{\Delta_{k+1}} d\beta \\
&+ C \sqrt{\Delta_n} \left( 1 + \frac{\Delta_{k+1}}{\Delta_k} \right) \int_{b(\ell)}^{b(\ell)} \left( \frac{1}{H^{a,b}(\ell)^2} \right) d\ell \\
&\leq Cv^2(\varphi_{2,n}(a_0, b_0))^2 \Delta_n \sum_{k=0}^{n-1} \frac{1}{(X_{t_k}^a \Delta_{k+1})} \sum_{\alpha(1) \in I} \frac{1}{(X_{t_k}^a \Delta_{k+1})} \alpha(1)
\end{align*}
Lemma 5.7. Assume condition \( \frac{3}{5} > \frac{2}{5} \). Then, as \( n \to \infty \),
\[
\sum_{k=0}^{n-1} \frac{1}{\Delta_n} \int_0^1 \left( -X_{t_k}^{a_0,b_0} R_{t_k}^{a_0,b_0} + \hat{E}_{t_k,x_{t_k}^{a_0,b_0}}[X_{t_k}^{a_0,b_0}, R_{t_k}^{a_0,b_0}, Y_{t_{k+1},b_0} = Y_{t_{k+1}}] \right) d\ell \xrightarrow{\hat{P}^{a_0,b_0}} 0.
\]

For subcritical case \( b_0 > 0 \), we proceed similarly as above.

For critical case \( b_0 = 0 \), then taking the expectation in both sides, we get that 
\[
\hat{E}_{t_k}^{a_0,0}[\sum_{k=0}^{n-1} \hat{E}_{t_k,x_{t_k}^{a_0,b_0}}[\zeta_{k,n}^2 | \bar{F}_{t_k}]]
\]

which tends to zero thanks to Lemma 5.3.

For supercritical case \( b_0 < 0 \), using Lemma 3.4
\[
\hat{E}_{t_k}^{a_0,b_0}[\sum_{k=0}^{n-1} \hat{E}_{t_k,x_{t_k}^{a_0,b_0}}[\zeta_{k,n}^2 | \bar{F}_{t_k}]]
\]

is bounded by
\[
e^{b_0 n \Delta_n} \Delta_n \left( C_1 + C_2 \sum_{\alpha(1) \in I} \left( \frac{1}{(n \Delta_n)^{\alpha(1)-1}} + \frac{1}{(n \Delta_n)^{\alpha(1)-3}} \right) \right)
\]

which tends to zero.

This completes the proof of condition (ii) of Lemma 7.2. Thus, the result follows.

Lemma 5.7. Assume condition \( \frac{3}{5} > \frac{2}{5} \). Then, as \( n \to \infty \),
Proof. We will show that conditions (i) and (ii) of Lemma 7.1 satisfy under $\hat{E}^{a_0,b_0}$ where

$$\zeta_{k,n} := \frac{\varphi_{2,n}(a_0, b_0)}{\Delta_n} \int_0^1 \left( -X_{t_k}^{a_0,b_0} R_7^{a_0,b_0} + \hat{E}_{t_k}^{a_0,b_0} [X_{t_k}^{a_0,b_0} R_5^{a_0,b_0} | Y_{t_k+1} = X_{t_k+1}^{a_0,b_0}] \right) dl.$$

We start showing (i) of Lemma 7.1. For this, using (5.3) of Lemma 5.1 with Jensen’s inequality, (5.3) of Lemma 5.1 with

For supercritical case

For critical case

For subcritical case

$$\left| \sum_{k=0}^{n-1} \hat{E}^{a_0,b_0} [\zeta_{k,n} | \mathcal{F}_{t_k}] \right|$$

$$= \left| \sum_{k=0}^{n-1} \frac{\varphi_{2,n}(a_0, b_0)}{\Delta_n} \int_0^1 \hat{E}_{t_k}^{a_0,b_0} [X_{t_k}^{a_0,b_0} R_5^{a_0,b_0} | Y_{t_k+1} = X_{t_k+1}^{a_0,b_0}] dl \right|$$

$$\leq C |\varphi_{2,n}(a_0, b_0)| \Delta_n \sum_{k=0}^{n-1} \left( \frac{\Delta_n}{X_{t_k}^{a_0,b_0}} \right)^{1/2} \left( \hat{E}_{t_k}^{a_0,b_0} |X_{t_k}^{a_0,b_0} R_5^{a_0,b_0}| \right)^{1/2} dl$$

$$\leq C |\varphi_{2,n}(a_0, b_0)| \Delta_n \sum_{k=0}^{n-1} \left( u |\varphi_{1,n}(a_0, b_0)| \left( \frac{1}{X_{t_k}^{a_0,b_0}} + 1 + \frac{1}{\sqrt{X_{t_k}^{a_0,b_0}}} \right) + |\varphi_{2,n}(a_0, b_0)| (1 + \sqrt{X_{t_k}^{a_0,b_0}}) \left( \frac{1}{\sqrt{X_{t_k}^{a_0,b_0}}} + \frac{1}{\sqrt{X_{t_k}^{a_0,b_0}} + 1} \right) \right).$$

- For subcritical case $b_0 > 0$, we proceed similarly as above.
- For critical case $b_0 = 0$, then taking the expectation in both sides, we get that $\hat{E}^{a_0,0} [\sum_{k=0}^{n-1} \hat{E}^{a_0,0} [\zeta_{k,n} | \mathcal{F}_{t_k}]]$ is bounded by

$$C \frac{\sqrt{\Delta_n}}{n \Delta_n \sqrt{\log(n \Delta_n)}} \left( \log(n \Delta_n) + n \Delta_n + \sqrt{n \Delta_n} \right)$$

$$+ C \sqrt{\Delta_n} \left( \frac{1}{n \Delta_n^{1/2}} + \frac{1}{\sqrt{n \Delta_n}} + \frac{1}{n \Delta_n} + 1 \right),$$

which tends to zero thanks to Lemma 5.3.
- For supercritical case $b_0 < 0$, using Lemma 5.4 $\hat{E}^{a_0,0} [\sum_{k=0}^{n-1} \hat{E}^{a_0,0} [\zeta_{k,n} | \mathcal{F}_{t_k}]]$ is bounded by

$$Ce^{\frac{1}{2}b_0 n \Delta_n} \sqrt{\Delta_n} \left( \log(n \Delta_n) + n \Delta_n + \sqrt{n \Delta_n} \right)$$

$$+ C \left( \left( \sqrt{n \Delta_n^2} + n \Delta_n^3 \right) e^{\frac{1}{2}b_0 n \Delta_n} + \sqrt{n \Delta_n} e^{\frac{1}{2}b_0 n \Delta_n} + \sqrt{\Delta_n} \right),$$

which tends to zero.

This completes the proof of condition (i) of Lemma 7.1. Next, using Jensen’s inequality, (5.3) of Lemma 5.1 with $V = (X_{t_k}^{a_0,b_0} R_5^{a_0,b_0})^2$, (5.5) of Lemma 5.2 with $q = p = 2$, (5.7) with
Lemma 5.8. Assume condition $\frac{a}{\sigma} > 1$. Then, as $n \to \infty$,
\[
\sum_{k=0}^{n-1} \frac{\varphi_{2,n}(a_0, b_0)}{\Delta_n} \int_{0}^{1} \left( -X_{t_k}^{a_0, b_0} R_6^{a_0, b_0} + \hat{E}_{t_k, X_{t_k}^{a_0, b_0}} \left[ X_{t_k}^{a_0, b_0} R_4^{a_0, b_0} | Y_{t_{k+1}}^{a_0, b_0} = X_{t_{k+1}}^{a_0, b_0} \right] \right) d\ell \to 0.
\]
Proof. We rewrite
\[
\frac{v\varphi_{2,n}(a_0, b_0)}{\Delta_n} \int_0^1 \left( -X_{t_k}^{a_0, b_0} R_{t_k}^{a_0, b_0} + \bar{E}_{t_k, X_{t_k}^{a_0, b_0}}^{a_0, b_0}(X_{t_k}^{a_0, b_0} R_{t_k}^{a_0, b_0} | Y_{t_k+1}^{a_0, b_0} = X_{t_k+1}^{a_0, b_0}) \right) d\ell
= M_{k,n,1} + M_{k,n,2},
\]
where
\[
M_{k,n,1} = -\frac{v^2}{2\sigma} (\varphi_{2,n}(a_0, b_0))^2 \int_0^{t_{k+1}} \ell \int_{t_k}^{t_{k+1}} (X_s^{a_0, b_0} - X_{t_k}^{a_0, b_0}) ds d\ell,
\]
\[
M_{k,n,2} = \frac{v}{2\sigma} \varphi_{2,n}(a_0, b_0) \int_0^1 b(\ell) \left\{ \int_{t_k}^{t_{k+1}} (X_s^{a_0, b_0} - X_{t_k}^{a_0, b_0}) ds - \bar{E}_{t_k, X_{t_k}^{a_0, b_0}}^{a_0, b_0}(X_s^{a_0, b_0} - Y_{t_k}^{a_0, b_0}) ds | Y_{t_k+1}^{a_0, b_0} = X_{t_k+1}^{a_0, b_0} \right\} d\ell.
\]
First, we treat \(\sum_{k=0}^{n-1} M_{k,n,1}\).

- For subcritical case \(b_0 > 0\) with \(\varphi_{2,n}(a_0, b_0) = \frac{1}{\sqrt{n\Delta_n}}\), applying Lemma 1.2 (i), we get

\[
\bar{E}_{t_k, X_{t_k}^{a_0, b_0}}^{a_0, b_0}(X_s^{a_0, b_0} - X_{t_k}^{a_0, b_0}) \leq C v^2 \sqrt{n\Delta_n},
\]
which tends to zero.

- For critical case \(b_0 = 0\) with \(\varphi_{2,n}(a_0, 0) = \frac{1}{n\Delta_n}\), applying Lemma 1.2 (ii), we get

\[
\bar{E}_{t_k, X_{t_k}^{a_0, b_0}}^{a_0, b_0}(X_s^{a_0, b_0} - X_{t_k}^{a_0, b_0}) \leq C v^2 \frac{\sqrt{n\Delta_n}}{(n\Delta_n)^2} \leq C v^2 \frac{\sqrt{n\Delta_n}}{(n\Delta_n)^2} \left( \frac{(n\Delta_n)\frac{1}{2} + \sqrt{x_0 n \Delta_n}}{2} \right),
\]
which tends to zero.

- For supercritical case \(b_0 < 0\) with \(\varphi_{2,n}(a_0, b_0) = e^{b_0 \frac{a_0}{b_0} n\Delta_n}\), we get

\[
\bar{E}_{t_k, X_{t_k}^{a_0, b_0}}^{a_0, b_0}(X_s^{a_0, b_0} - X_{t_k}^{a_0, b_0}) \leq C v^2 e^{b_0 n\Delta_n} \left\{ \int_{t_k}^{t_{k+1}} \bar{E}_{t_k, X_{t_k}^{a_0, b_0}}^{a_0, b_0}(X_s^{a_0, b_0} - X_{t_k}^{a_0, b_0}) ds \right\}
\]

\[
\leq C v^2 e^{b_0 n\Delta_n} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \left( \int_{t_k}^{s} (a_0 + |b_0| |\bar{E}_{t_k, X_{t_k}^{a_0, b_0}}^{a_0, b_0}| X_{t_k}^{a_0, b_0} du \right) + \sqrt{2\sigma} \left( \int_{t_k}^{s} |\bar{E}_{t_k, X_{t_k}^{a_0, b_0}}^{a_0, b_0}| du \right) \right\} ds
\]

\[
\leq C v^2 e^{b_0 n\Delta_n} \sum_{k=0}^{n-1} \int_{t_k}^{t_{k+1}} \left( \int_{t_k}^{s} (a_0 + |b_0| (x_0 - \frac{a_0}{b_0}) e^{-b_0 u} + \frac{a_0}{b_0}) du \right) + \sqrt{2\sigma} \left( \int_{t_k}^{s} (x_0 - \frac{a_0}{b_0}) e^{-b_0 u} + \frac{a_0}{b_0} du \right) \right\} ds
\]

\[
\leq C v^2 e^{b_0 n\Delta_n} \left( n\Delta_n^2 + \Delta_n e^{-b_0 n\Delta_n} + \sqrt{\Delta_n} e^{-b_0 n\Delta_n} + n\Delta_n^{\frac{1}{2}} \right),
\]
which tends to zero. Thus, \(\sum_{k=0}^{n-1} M_{k,n,1} \to 0\) as \(n \to \infty\). Next, we are going to show that \(\sum_{k=0}^{n-1} M_{k,n,2} \to 0\) by applying Lemma 1.1. For this, using (5.3) of Lemma 5.1 with \(V = \cdot\)
\[ V^{a_n,b}(\ell) = \int_{t_k}^{t_{k+1}} (Y_{\ell}^{a_n,b}(\ell) - Y_{\ell}^{a_n,b}(\ell)) ds, \] (5.4) of Lemma 5.1 with \( \hat{V} = \hat{V}^{a_0,b_0} = \int_{t_k}^{t_{k+1}} (X_{a_0,b_0}^n - X_{t_k}^{a_0,b_0}) ds, \] (5.5) and (5.6) of Lemma 5.2 with \( p = 2, \) (5.8) with \( p = 1, \) we obtain that

\[
\left| \sum_{k=0}^{n-1} \tilde{E}_{\sigma_0,0} [M_{k,n,2} | \hat{F}_{t_k}] \right| \leq \sum_{k=0}^{n-1} \frac{\varepsilon_{n_2}(a_0, b_0)}{2^k} \left| \int_{0}^{t_{k+1}} b(\ell) \left\{ \hat{E}^{a_n,b}(\ell) \right\}_{t_k,X_{t_k}^{a_0,b_0}} \right| d\ell
\]

For subcritical case \( a_0 > 0, \) we proceed similarly as above.

For critical case \( b_0 = 0, \) then taking the expectation in both sides and using Lemma 3.3, we get that \( \tilde{E}_{a_0,0} \) is bounded by

\[
C \left( \Delta_n + \frac{1}{\sqrt{\log(n^{\Delta_n})}} (\sqrt{\Delta_n} + \sqrt{n^{\Delta_n}}) + \frac{1}{n} + \sqrt{n^{\Delta_n}} \right),
\]

which tends to zero since \( n^{\Delta_n} \to 0. \)

For supercritical case \( b_0 < 0, \) using Lemma 3.4, \( \tilde{E}_{a_0,0} \) is bounded by

\[
C \left( \Delta_n + (\sqrt{n^{\Delta_n}} + n^{\Delta_n}) e^{-\Delta_n b_0 n^{\Delta_n}} + n^{\Delta_n} e^{b_0 n^{\Delta_n}} + \Delta_n e^{-\frac{1}{2} b_0 n^{\Delta_n}} \right),
\]

which tends to zero since \( \Delta_n e^{-b_0 n^{\Delta_n}} \to 0. \)
This completes the proof of condition (i) of Lemma 7.1. Next, using Jensen’s inequality, (5.3) of Lemma 5.1 with $(V_{a_n, b_0}^\alpha)^2$, (5.5) of Lemma 5.2 with $q = p = 2$, (5.8) with $p \in \{1, 2\}$, we obtain that

$$
\sum_{k=0}^{n-1} \left[ M_{k,n}^2 \right] \left[ \sum_{k=0}^{n-1} b(\ell)^2 \frac{1}{4\sigma^2} (\varphi_{2,n}(a_0, b_0))^2 \int_0^1 \alpha d\alpha \right]
$$

\begin{align*}
&
+ \int_0^1 \alpha d\alpha \left[ \sum_{k=0}^{n-1} b(\ell)^2 \left( \sqrt{X_{a_n, b_0}} \right) \frac{1}{2} \left| V_{a_n, b_0}^\alpha \right| \right] d\ell
\end{align*}

\begin{align*}
&
\leq C v^2 (\varphi_{2,n}(a_0, b_0))^2 \Delta_n^3 \sum_{k=0}^{n-1} \left( (1 + (X_{a_n, b_0})^2 + X_{a_n, b_0}) + \sqrt{X_{a_n, b_0}} \right)
\end{align*}

\begin{align*}
&
+ \sqrt{X_{a_n, b_0}} \left( X_{a_n, b_0}^2 + X_{a_n, b_0} \right) \left( (1 + (X_{a_n, b_0})^2 + X_{a_n, b_0}) \right).
\end{align*}

For subcritical case $b_0 > 0$, we proceed similarly as above.

For critical case $b_0 = 0$, then taking the expectation in both sides, we get that $\mathbb{E}^\alpha_{a_n, b_0} [\sum_{k=0}^{n-1} \left( X_{a_n, b_0}^\alpha \right)^2 ]$ is bounded by

$$
C \left( \Delta_n^2 + \frac{\Delta_n}{n} + \frac{1}{(n\Delta_n)^2} + \frac{1}{n\Delta_n} + \frac{1}{(n\Delta_n)^2} + \frac{1}{\sqrt{n\Delta_n}} + \sqrt{\frac{n\Delta_n^3}{\log(n\Delta_n)}} + \sqrt{n\Delta_n^3 + n\Delta_n^3} \right),
$$

which tends to zero thanks to Lemma 3.3 since $n\Delta_n^3 \to 0$.

For supercritical case $b_0 < 0$, using Lemma 3.4 $\mathbb{E}^\alpha_{a_n, b_0} [\sum_{k=0}^{n-1} \left( X_{a_n, b_0}^\alpha \right)^2 ]$ is bounded by

$$
C \left( \Delta_n^2 + \Delta_n^2 e^{\frac{1}{2}b_0 n \Delta_n} + \frac{\Delta_n}{n} + \frac{1}{(n\Delta_n)^2} + \frac{1}{n\Delta_n} + \frac{1}{\sqrt{n\Delta_n^3}} + \sqrt{\frac{n\Delta_n^3}{\log(n\Delta_n)}} + \frac{\Delta_n^2}{e^{b_0 n \Delta_n}} + n\Delta_n^2 e^{\frac{1}{2}b_0 n \Delta_n} + \Delta_n^2 e^{-b_0 n \Delta_n} \right),
$$

which tends to zero since $\Delta_n^2 e^{-b_0 n \Delta_n} \to 0$.

This completes the proof of condition (ii) of Lemma 7.1. Thus, the result follows. \hfill \Box

6. Appendix A: Proof of technical results

6.1. Proof of Lemma 4.2.
Proof. First, recall that the estimates (4.12) and (4.13) can be found in [11, Lemma 2.1 and 3.1] or [17, Lemma 3.1]. Next, we treat (4.14).

For all $a, a_1 \in \mathbb{R}_+^*, b, b_1 \in \mathbb{R}$, $x \in \mathbb{R}_+^*$ and $k \in \{0, ..., n - 1\}$, by [6, Lemma 3.1], for any $a > \sigma$ the probability measures $P_{t_k,x}^{a_1,b_1}$ and $P_{t_k,x}^{a,b}$ are absolutely continuous w.r.t. each other and its Radon-Nikodym derivative is given by

$$
\frac{dP_{t_k,x}^{a_1,b_1}}{dP_{t_k,x}^{a,b}}((Y_s^{a,b}(t_k, x))_{s \in I_k}) = \exp \left\{ \int_{t_k}^{t_{k+1}} \frac{a_1 - a - (b_1 - b)Y_s^{a,b}(t_k, x)}{2\sigma Y_s^{a,b}(t_k, x)} \, ds \right\}
$$

$$
- \frac{1}{2} \int_{t_k}^{t_{k+1}} \frac{(a_1 - a - (b_1 - b)Y_s^{a,b}(t_k, x))^2 - (a - b)Y_s^{a,b}(t_k, x))^2}{2\sigma Y_s^{a,b}(t_k, x)} \, ds \right\}
$$

$$
= \exp \left\{ \int_{t_k}^{t_{k+1}} \frac{a_1 - a - (b_1 - b)Y_s^{a,b}(t_k, x)}{2\sigma Y_s^{a,b}(t_k, x)} \, ds \right\}
$$

Using (4.17) and the change of measures, we have that for any $p \in \mathbb{R},$

$$
\tilde{E}_{t_k,x}^{a,b}[|\partial_x Y_t^{a,b}(t_k, x)|^p] = e^{-bp(t-t_k)}\tilde{E}_{t_k,x}^{a,b}[\exp \left\{ \frac{-p\sigma}{4} \int_{t_k}^t \frac{du}{Y_u^{a,b}(t_k, x)} + \frac{p\sigma}{2} \int_{t_k}^t \frac{dW_u}{Y_u^{a,b}(t_k, x)} \right\}]
$$

$$
= e^{-bp(t-t_k)}\tilde{E}_{t_k,x}^{a,b} \left[ \exp \left\{ \frac{p(p-1)\sigma}{4} \int_{t_k}^t \frac{du}{Y_u^{a,b}(t_k, x)} \right\} \right]
$$

$$
\times \exp \left\{ p \sqrt{\frac{\sigma}{2}} \int_{t_k}^t \frac{dW_u}{Y_u^{a,b}(t_k, x)} - \frac{p^2\sigma}{4} \int_{t_k}^t \frac{du}{Y_u^{a,b}(t_k, x)} \right\}
$$

$$
= e^{-bp(t-t_k)}\tilde{E}_{t_k,x}^{a,b} \left[ \exp \left\{ \frac{p(p-1)\sigma}{4} \int_{t_k}^t \frac{du}{Y_u^{a,b}(t_k, x)} \right\} \right]
$$

$$
\times \frac{d\tilde{P}_{t_k,x}^{a+\sigma \beta}}{d\tilde{P}_{t_k,x}^{a,b}}((Y_s^{a,b}(t_k, x))_{s \in [t_k,t)})
$$

$$
= e^{-bp(t-t_k)}\tilde{E}_{t_k,x}^{a+\sigma \beta} \left[ \exp \left\{ \frac{p(p-1)\sigma}{4} \int_{t_k}^t \frac{du}{Y_u^{a+\sigma \beta}(t_k, x)} \right\} \right].
$$

(6.1)

Then, applying Lemma 4.1 to the probability measure $\tilde{P}_{t_k,x}^{a+\sigma \beta}$ with $\mu = \frac{p(p-1)\sigma}{4}$, we get that for any $p \geq -\frac{(\frac{\sigma}{2} - 1)^2}{2(\frac{\sigma}{2} - 1)}$ and $t \in [t_k, t_{k+1})$,

$$
\tilde{E}_{t_k,x}^{a+\sigma \beta} \left[ \exp \left\{ \frac{p(p-1)\sigma}{4} \int_{t_k}^t \frac{du}{Y_u^{a+\sigma \beta}(t_k, x)} \right\} \right] \leq C_p \left( 1 + \frac{1}{x^{\frac{1}{2} - 1 + p}} \right).
$$

This, together with (6.1), gives the desired estimate (4.14).

6.2. Proof of Lemma 4.3

Proof. (i) For $t_k \leq s \leq t \leq t_{k+1}$, using (4.17), we have

$$
\partial_x Y_t^{a,b}(t_k, x) \left( \sqrt{\frac{\sigma}{2}} \frac{1}{Y_s^{a,b}(t_k, x)} + \frac{\sigma}{4} \int_s^t \frac{1}{(Y_u^{a,b}(t_k, x))^2} D_s Y_u^{a,b}(t_k, x) \, du \right)
$$

$$
- \frac{1}{2} \sqrt{\frac{\sigma}{2}} \int_s^t \frac{1}{(Y_u^{a,b}(t_k, x))^2} D_s Y_u^{a,b}(t_k, x) \, dW_u \right)_1(t_k,t) \left( x \right) = \partial_x Y_t^{a,b}(t_k, x) \left( \sqrt{\frac{\sigma}{2}} \frac{1}{Y_s^{a,b}(t_k, x)} \right)
$$
\[
+ \frac{\sigma}{4} \int_{t}^{\tau} \frac{\sqrt{2\sigma}}{(Y_{u}^{a,b}(t,k,x))^{\frac{1}{2}}} \exp \left\{ \int_{u}^{t} \left( -\frac{b}{2} - \frac{a - \sigma}{4} Y_{\xi}^{a,b}(t,k,x) \right) d\xi \right\} \frac{1}{\sqrt{2\sigma}} \exp \left\{ \int_{s}^{u} \left( -\frac{b}{2} - \frac{a - \sigma}{4} Y_{\xi}^{a,b}(t,k,x) \right) d\xi \right\} dW_{u} \left( 1_{[t_{k},t]}(s) \right) \\
- \frac{\sigma}{2} \int_{s}^{t} \frac{1}{Y_{u}^{a,b}(t,k,x)} \exp \left\{ \int_{s}^{t} \left( -\frac{b}{2} - \frac{a - \sigma}{4} Y_{\xi}^{a,b}(t,k,x) \right) d\xi \right\} dW_{u} \left( 1_{[t_{k},t]}(s) \right) 
\]

We will show that under condition \( \frac{a}{\sigma} > 4 \), this expression is contained in \( L^{2}(\tilde{\Omega} \times [t_{k}, t_{k+1}]) \). In fact, using the fact that the exponential terms can be bounded by a positive constant since \( a > \sigma \), BDG’s and Hölder’s inequalities with \( \frac{1}{p} + \frac{1}{q} = 1 \), \((4.13)\) and \((4.14)\), we get that

\[
C E_{t_{k}}^{a,b} \left[ \left| \partial_{x} Y_{t}^{a,b}(t,k,x) \right|^{2} \right] \leq C E_{t_{k}}^{a,b} \left[ \left| \partial_{x} Y_{t}^{a,b}(t,k,x) \right|^{2p} \right] + C E_{t_{k}}^{a,b} \left[ \left| \partial_{x} Y_{t}^{a,b}(t,k,x) \right|^{2q} \right] 
\]

\[
+ C E_{t_{k}}^{a,b} \left[ \left| \partial_{x} Y_{t}^{a,b}(t,k,x) \right|^{2} \right] \int_{s}^{t} \frac{1}{Y_{u}^{a,b}(t,k,x)^{2}} dW_{u} 
\]

\[
\leq C \left( E_{t_{k}}^{a,b} \left[ \frac{1}{Y_{u}^{a,b}(t,k,x)^{p}} \right] \right)^{\frac{1}{2}} \left( E_{t_{k}}^{a,b} \left[ \left| \partial_{x} Y_{t}^{a,b}(t,k,x) \right|^{2q} \right] \right)^{\frac{1}{q}} 
\]

\[
+ C \left( E_{t_{k}}^{a,b} \left[ \int_{s}^{t} \frac{dW_{u}}{Y_{u}^{a,b}(t,k,x)^{2}} \right] \right)^{\frac{1}{p}} \left( E_{t_{k}}^{a,b} \left[ \left| \partial_{x} Y_{t}^{a,b}(t,k,x) \right|^{2q} \right] \right)^{\frac{1}{q}} 
\]

\[
+ C \left( E_{t_{k}}^{a,b} \left[ \int_{s}^{t} \frac{dW_{u}}{Y_{u}^{a,b}(t,k,x)^{2}} \right] \right)^{\frac{1}{p}} \left( E_{t_{k}}^{a,b} \left[ \left| \partial_{x} Y_{t}^{a,b}(t,k,x) \right|^{2q} \right] \right)^{\frac{1}{q}} 
\]

\[
\leq C \left( 1 + \frac{1}{x^{2q} + 1} \right) \left( 1 + \frac{1}{x^{2q} + 1} \right) \left( 1 + \frac{1}{x^{2q} + 1} \right) 
\]

where \( p > 1 \) and \( q \) is close to 1. Indeed, the condition required here is 3p < \( \frac{a}{\sigma} - 1 \) and \( \frac{a}{\sigma} > 4 \), we only need to choose \( p \in (1, \frac{1}{3}(\frac{a}{\sigma} - 1)) \). Thus, under \( \frac{a}{\sigma} > 4 \),

\[
\tilde{E}_{t_{k}}^{a,b} \left[ \int_{t_{k}}^{t_{k+1}} \left| \partial_{x} Y_{t}^{a,b}(t,k,x) \left( \sqrt{2\sigma} \frac{1}{Y_{\xi}^{a,b}(t,k,x)} + \frac{\sigma}{4} \right) \right| \right] \frac{1}{\sqrt{2\sigma}} \exp \left\{ \int_{s}^{t} \left( -\frac{b}{2} - \frac{a - \sigma}{4} Y_{\xi}^{a,b}(t,k,x) \right) d\xi \right\} dW_{u} \left( 1_{[t_{k},t]}(s) \right) 
\]

\[
- \frac{1}{2} \sqrt{2} \int_{s}^{t} \frac{1}{Y_{u}^{a,b}(t,k,x)} \left( D_{s} Y_{u}^{a,b}(t,k,x) dW_{u} \right)^{2} ds 
\]
Moreover, applying Lemma 4.2 with $p = 2$ guarantees that $\partial_x Y_t^{a,b}(t_k, x) \in D^{1,2}$ under $\frac{a}{\sigma} > 4$ thanks to Theorem 7.3, and furthermore, its Malliavin derivative is given by (4.18).

Next, to prove (ii) the following lemma will be useful.

**Lemma 6.1.** Let $p > 1$. Assume condition $\frac{a}{\sigma} > \frac{7p + 4 + \sqrt{p(19p + 16)}}{8}$ for (6.2) and (6.4), and condition $\frac{a}{\sigma} > p + 1 + \sqrt{p(p + 1)}$ for (6.3). Then for any $(a, b) \in \Theta \times \Sigma$, $k \in \{0, ..., n - 1\}$, $t_k \leq s \leq t \leq t_{k+1}$, and $x \in \mathbb{R}_+^*$, there exists a constant $C > 0$ which does not depend on $x$ such that

$$
\widetilde{\Gamma}_{t_k, x}^{a,b} \left[ \frac{D_s(\partial_x Y_t^{a,b}(t_k, x))^2}{(\partial_x Y_t^{a,b}(t_k, x))^2} \right] \leq C \left( 1 + \frac{1}{x^2} \right) \left( \frac{1}{x^{2p_0}} + \frac{1}{x^p} \right), \tag{6.2}
$$

$$
\widetilde{\Gamma}_{t_k, x}^{a,b} \left[ \frac{D_s Y_t^{a,b}(t_k, x)}{(\partial_x Y_t^{a,b}(t_k, x))^2} \right] \leq C \left( 1 + \frac{1}{x^2} \right) \left( 1 + x^\frac{a}{\sigma} \right), \tag{6.3}
$$

$$
\widetilde{\Gamma}_{t_k, x}^{a,b} \left[ \left| Y_t^{a,b}(t_k, x) D_s \left( \partial_x Y_t^{a,b}(t_k, x) \right) \right|^p \right] \leq C \left( 1 + \frac{1}{x^2} \right) \left( 1 + x^p \right) \left( \frac{1}{x^{2p_0}} + \frac{1}{x^p} + \frac{1}{x^p} \right), \tag{6.4}
$$

where $p_0 = \frac{21p + 8 + \sqrt{9p(49p + 16)}}{8(p + 1)}$, $p_2 > 1$ and $p_2$ is close to 1.

(ii) In the same way we show that the expression $\frac{1}{(\partial_x Y_t^{a,b}(t_k, x))^2} D(\partial_x Y_t^{a,b}(t_k, x))$ is contained in $L^2(\Omega \times [t_k, t_{k+1}])$ under condition $\frac{a}{\sigma} > \frac{9 + \sqrt{57}}{2}$. Indeed, applying (6.2) of Lemma 6.1 with $p = 2$, condition $\frac{a}{\sigma} > \frac{9 + \sqrt{57}}{2}$ ensures that

$$
\widetilde{\Gamma}_{t_k, x}^{a,b} \left[ \left| D_s(\partial_x Y_t^{a,b}(t_k, x))^2 \right| \left( \partial_x Y_t^{a,b}(t_k, x) \right)^2 \right] \leq C \left( 1 + \frac{1}{x^2} \right) \left( \frac{1}{x} + \frac{3}{x^3} + \frac{1}{x^2} \right),
$$

where $p_0 = \frac{25 + \sqrt{113}}{28}$. This implies that

$$
\widetilde{\Gamma}_{t_k, x}^{a,b} \left[ \int_{t_k}^{t_{k+1}} \left| D_s(\partial_x Y_t^{a,b}(t_k, x))^2 \right| \left( \partial_x Y_t^{a,b}(t_k, x) \right)^2 \right] \leq C \Delta_n \left( 1 + \frac{1}{x^2} \right) \left( \frac{1}{x} + \frac{3}{x^3} + \frac{1}{x^2} \right) < +\infty.
$$

Moreover, applying Lemma 4.2 with $p = -2$, (4.14) is satisfied under condition $\frac{a}{\sigma} > 3 + \sqrt{r}$. This guarantees that $(\partial_x Y_t^{a,b}(t_k, x))^{-1} \in D^{1,2}$ under condition $\frac{a}{\sigma} > \frac{9 + \sqrt{57}}{2}$ thanks to Lemma 7.4 and, furthermore, its Malliavin derivative is given by (4.19).

Finally, in the same way we show that under condition $\frac{a}{\sigma} > \frac{9 + \sqrt{57}}{2}$,

$$
\frac{1}{\partial_x Y_t^{a,b}(t_k, x)} D Y_t^{a,b}(t_k, x) + Y_t^{a,b}(t_k, x) D \left( \frac{1}{\partial_x Y_t^{a,b}(t_k, x)} \right)
$$
is contained in \( L^2(\Omega \times [t_k, t_{k+1}]) \). Indeed, applying (6.3) and (6.4) of Lemma 6.1, with \( p = 2 \), condition \( \frac{a}{\sigma} > \frac{9 + \sqrt{57}}{2} \) ensures that

\[
\tilde{E}_{t_k,x} \left[ \frac{1}{\partial_x Y_t^{a,b}(t_k,x)} \right] \leq 2 \tilde{E}_{t_k,x} \left[ \left( \frac{1}{\partial_x Y_t^{a,b}(t_k,x)} \right)^2 \right] \leq C \left( 1 + \frac{1}{x^{2p_2-1}} \right) (1 + x^2) \left( \frac{1}{x} + \frac{1}{x^3} + \frac{1}{x^2} \right),
\]

where \( p_0 = \frac{25 + \sqrt{913}}{28} \), \( p_2 > 1 \) and \( p_2 \) is close to 1. This implies that under condition \( \frac{a}{\sigma} > \frac{9 + \sqrt{57}}{2} \),

\[
\tilde{E}_{t_k,x} \left[ \int_{t_k}^{t_{k+1}} \frac{1}{\partial_x Y_t^{a,b}(t_k,x)} D_s Y_t^{a,b}(t_k,x) + Y_t^{a,b}(t_k,x) D_s \left( \frac{1}{\partial_x Y_t^{a,b}(t_k,x)} \right) \right] \leq C \Delta_n \left( 1 + \frac{1}{x^{2p_2-1}} \right) (1 + x^2) \left( \frac{1}{x} + \frac{1}{x^3} + \frac{1}{x^2} \right) < +\infty.
\]

On the other hand, using Hölder’s inequality with \( \frac{1}{p_1} + \frac{1}{q_1} = 1 \), we get

\[
\tilde{E}_{t_k,x} \left[ \frac{Y_t^{a,b}(t_k,x)}{\partial_x Y_t^{a,b}(t_k,x)} \right] \leq \left( \tilde{E}_{t_k,x} \left[ \frac{1}{\partial_x Y_t^{a,b}(t_k,x)} \right]^{2p_1} \right)^{\frac{1}{p_1}} \left( \tilde{E}_{t_k,x} \left[ Y_t^{a,b}(t_k,x) \right]^{2q_1} \right)^{\frac{1}{q_1}} \leq C \left( 1 + \frac{1}{x^{2p_2-1}} \right) (1 + x^2) < +\infty,
\]

where \( p_1 > 1 \) and \( p_1 \) is close to 1. Indeed, the condition required here is \(-2p_1 \geq -\frac{(a - 1)^2}{2(a - \frac{1}{2})} \) and \( \frac{a}{\sigma} > 3 + \sqrt{6} \), thus we only need to choose \( p_1 \in (1, \frac{(a - 1)^2}{2(a - \frac{1}{2})}) \). Hence \( Y_t^{a,b}(t_k,x) / \partial_x Y_t^{a,b}(t_k,x) \in L^2(\Omega) \) under \( \frac{a}{\sigma} > 3 + \sqrt{6} \). This guarantees thanks to Theorem 7.1 that \( Y_t^{a,b}(t_k,x) / \partial_x Y_t^{a,b}(t_k,x) \in \mathbb{D}^{1,2} \) under condition \( \frac{a}{\sigma} > \frac{9 + \sqrt{57}}{2} \) and, furthermore, its Malliavin derivative is given by (4.20). Thus, the result follows.

6.3. Proof of Lemma 6.1

Proof. First, we treat (6.2). For \( t_k \leq s \leq t \leq t_{k+1} \), from (4.18) and (4.17), under \( \frac{a}{\sigma} > 4 \) we have

\[
-\frac{1}{(\partial_x Y_t^{a,b}(t_k,x))^2} D_s (\partial_x Y_t^{a,b}(t_k,x)) = -\frac{1}{\partial_x Y_t^{a,b}(t_k,x)} \{ \sqrt{\sigma} \frac{1}{\sqrt{Y_t^{a,b}(t_k,x)}} + \frac{\sigma}{4} \int_s^t \frac{\sqrt{2\sigma}}{Y_u^{a,b}(t_k,x)^{\frac{3}{2}}} \exp \left\{ \int_s^u \left( -\frac{b}{2} - \left( \frac{a}{2} - \frac{\sigma}{4} \right) \frac{1}{Y_x^{a,b}(t_k,x)} \right) dx \right\} du \}
\]

\[
+ \frac{\sigma}{4} \int_s^t \frac{\sqrt{2\sigma}}{Y_u^{a,b}(t_k,x)^{\frac{3}{2}}} \exp \left\{ \int_s^u \left( -\frac{b}{2} - \left( \frac{a}{2} - \frac{\sigma}{4} \right) \frac{1}{Y_x^{a,b}(t_k,x)} \right) dx \right\} dW_u \}
\]

(6.5)
Hence, the optimal choice for $p_a$ under condition $\text{(4.13)}$ and $\text{(4.14)}$, we get that

$$\tilde{E}_{t,k,x}^a \left[ \left| \frac{1}{\partial_Y a b} \int (Y_a b(t_k,x))^2 \right|^p \right] + C \tilde{E}_{t,k,x}^a \left[ \left| \frac{1}{\partial_Y a b} \int (Y_u a b(t_k,x))^2 \right|^p \right] \leq C \left( \tilde{E}_{t,k,x}^a \left[ \left| \frac{1}{\partial_Y a b} (t_k,x)^2 \right|^p \right] \right)^{\frac{1}{q_4}}$$

$$\leq C \left( 1 + \frac{1}{x^{q_4-2}} \right) \frac{1}{x^{2p}} + C \left( 1 + \frac{1}{x^{q_4-2}} \right) \left( a_{p_4-1} \int \tilde{E}_{t,k,x}^a \left[ \left| \frac{1}{Y_a b(t_k,x)} \right|^p \right] du \right)^{\frac{1}{q_4}}$$

$$\leq C \left( 1 + \frac{1}{x^{q_4-2}} \right) \frac{1}{x^{2p}} + C \left( 1 + \frac{1}{x^{q_4-2}} \right) \frac{1}{x^{2p}} + C \left( 1 + \frac{1}{x^{q_4-2}} \right) \frac{1}{x^{2p}}.$$

Here, conditions are required as follows

$$-pp_4 \geq - \frac{(a - \frac{1}{2})^2}{2(a - \frac{1}{2})}, \quad \frac{3}{2} p q_4 < a - 1.$$

This implies that

$$a \geq pp_4 + \sqrt{p_4 (pp_4 + 1)}, \quad \frac{a}{\sigma} > \frac{3}{2} p q_4 + 1 = \frac{3}{2} \frac{pp_4}{p_4 - 1} + 1.$$

Hence, the optimal choice for $p_4$ is solution to

$$pp_4 + \sqrt{p_4 (pp_4 + 1)} = \frac{3}{2} \frac{pp_4}{p_4 - 1}.$$

The unique positive solution is given by $p_4 = \frac{21p + 8 + \sqrt{9p(49p + 16)}}{8(3p + 1)} > 1$. Thus, $\text{(6.2)}$ is valid under condition $\frac{a}{\sigma} > \frac{7p + 4 + \sqrt{p_4(49p + 16)}}{4}$.

Next, we treat $\text{(6.3)}$. For $t_k \leq s \leq t \leq t_{k+1}$, using $\text{(4.17)}$, under condition $a \geq \sigma$ we have

$$\frac{1}{\partial_Y a b(t_k,x)} D_a Y_a b(t_k,x) = \sqrt{2 \sigma Y_a b(t_k,x)} \exp \left( \int_s^t \left( -\frac{b}{2} - \frac{a}{4} \right) \frac{1}{Y_u a b(t_k,x)} \right) \left( \int_s^t \left( -\frac{b}{2} - \frac{a}{4} \right) \frac{1}{Y_u a b(t_k,x)} du \right).$$
Then, using the fact that the exponential terms can be bounded by a positive constant since $a > \sigma$, Hölder’s inequality with $\frac{1}{p_2} + \frac{1}{q_2} = 1$, (4.12) and (4.14), we get that

$$
\mathbb{E}_{t_k,x}^{a,b} \left[ \left| \frac{1}{\partial_x Y^a_{t_k}(t_k,x)} D_s Y^a_{t_k}(t_k,x) \right|^p \right] \leq C \mathbb{E}_{t_k,x}^{a,b} \left[ \left| \frac{\sqrt{r^a_{t_k}(t_k,x)}}{\partial_x Y^a_{t_k}(t_k,x)} \right|^p \right]
$$

$$
\leq C \left( \mathbb{E}_{t_k,x}^{a,b} \left[ \left| \frac{1}{\partial_x Y^a_{t_k}(t_k,x)} \right|^{pp_2} \right] \right)^{\frac{1}{p_2}} \left( \mathbb{E}_{t_k,x}^{a,b} \left[ \left| Y^a_{t_k}(t_k,x) \right|^{pp_2} \right] \right)^{\frac{1}{p_2}} \leq C \left( 1 + \frac{1}{x^{2p_2}} \right)^{\frac{1}{2}} (1 + x^\frac{q_2}{2}),
$$

where $p_2 > 1$ and $p_2$ is close to 1. Indeed, the condition required here is $-pp_2 \geq -\frac{(p-1)^2}{2(p-\frac{3}{2})}$ and $\frac{a}{\sigma} > p + 1 + \sqrt{p(p+1)}$, thus we only need to choose $p_2 \in (1, \frac{(p-1)^2}{2p(p-\frac{3}{2})})$. Hence, (6.3) is valid under condition $\frac{a}{\sigma} > p + 1 + \sqrt{p(p+1)}$.

Finally, we treat (6.4). For $t_k \leq s \leq t \leq t_{k+1}$, using (4.19) and (6.5), under $\frac{a}{\sigma} > \frac{9+\sqrt{57}}{2}$, we have

$$
Y^a_{t_k}(t_k,x) D_s \left( \frac{1}{\partial_x Y^a_{t_k}(t_k,x)} \right) = -\frac{Y^a_{t_k}(t_k,x)}{\partial_x Y^a_{t_k}(t_k,x)} \left\{ \sqrt{\frac{\sigma}{2}} \frac{1}{\sqrt{Y^a_{t_k}(t_k,x)}} + \frac{\sigma}{4} \int_s^t \sqrt{2\sigma} \exp \left\{ \int_u^s \left( -b + \frac{a}{2} - \frac{\sigma}{4} \right) \frac{1}{\sqrt{Y^a_{\xi}(t_k,x)}} d\xi \right\} du \right.
$$

$$
- \frac{\sigma}{2} \int_s^t \frac{1}{Y^a_{t_k}(t_k,x)} \exp \left\{ \int_u^s \left( -b + \frac{a}{2} - \frac{\sigma}{4} \right) \frac{1}{\sqrt{Y^a_{\xi}(t_k,x)}} d\xi \right\} dW_u \right\}. \quad (6.6)
$$

Then, using the fact that the exponential terms can be bounded by a positive constant since $a > \sigma$, BDG’s and Hölder’s inequalities with $\frac{1}{p_3} + \frac{1}{q_3} = 1$ and $\frac{1}{p_3} + \frac{1}{q_3} = 1$, (4.12), (4.13) and (4.14), we get that

$$
\mathbb{E}_{t_k,x}^{a,b} \left[ \left| Y^a_{t_k}(t_k,x) D_s \left( \frac{1}{\partial_x Y^a_{t_k}(t_k,x)} \right) \right|^p \right] \leq C \mathbb{E}_{t_k,x}^{a,b} \left[ \left| \frac{Y^a_{t_k}(t_k,x)}{\partial_x Y^a_{t_k}(t_k,x)} \right|^p \right]
$$

$$
+ C \mathbb{E}_{t_k,x}^{a,b} \left[ \left| \frac{Y^a_{t_k}(t_k,x)}{\partial_x Y^a_{t_k}(t_k,x)} \right|^{pp_2} \right] + C \mathbb{E}_{t_k,x}^{a,b} \left[ \left| Y^a_{t_k}(t_k,x) \right|^{pp_2} \right] \leq C \left( \mathbb{E}_{t_k,x}^{a,b} \left[ \left| \frac{1}{\partial_x Y^a_{t_k}(t_k,x)} \right|^{pp_2} \right] \right)^{\frac{1}{p_2}} \left( \mathbb{E}_{t_k,x}^{a,b} \left[ \left| Y^a_{t_k}(t_k,x) \right|^{pp_2} \right] \right)^{\frac{1}{p_2}} \leq C \left( 1 + x^{p(p+1)} \right)^{\frac{1}{p_2}} (1 + x^p).
$$
Hence, the optimal choice for $a$ where $a > pp_3 + \sqrt{pp_3 (pp_3 + 1)} + 1$, $a > \frac{3}{2} pp_3 + 1 = \frac{3}{2} pp_3 - 1 + 1$.

Hence, the optimal choice for $p_3$ is solution to

$$pp_3 + \sqrt{pp_3 (pp_3 + 1)} = \frac{3}{2} pp_3 - 1.$$ 

The unique positive solution is given by $pp_3 = \frac{21p + 8 + \sqrt{9p(49p + 16)}}{8(3p + 1)} > 1$. Thus, (6.4) is valid under condition $\frac{q}{2} > \frac{\sqrt{7p + 4 + \sqrt{p(49p + 16)}}}{4}$. \hfill □

### 6.4. Proof of Proposition 4.4

Proof. We are going to apply Theorem 7.3. First, we wish to show $\partial_a Y_{t_{k+1}}^{a,b}(t_k, x)U_{t_k}^{a,b}(t_k, x) \in \text{Dom } \delta$ under condition $\frac{a}{\sigma} > \frac{\sigma + \sqrt{\sigma}}{2}$. For this, we write

$$\partial_a Y_{t_{k+1}}^{a,b}(t_k, x)U_{t_k}^{a,b}(t_k, x) = \frac{\partial_a Y_{t_{k+1}}^{a,b}(t_k, x)}{\sqrt{2\sigma Y_{t_{k+1}}^{a,b}(t_k, x)}}(\partial_x Y_{t_{k+1}}^{a,b}(t_k, x))^{-1} \partial_x Y_{t_{k+1}}^{a,b}(t_k, x) = Fu, \quad (6.7)$$

where $F = \partial_a Y_{t_{k+1}}^{a,b}(t_k, x)(\partial_x Y_{t_{k+1}}^{a,b}(t_k, x))^{-1}$ and $u = \frac{1}{\sqrt{2\sigma Y_{t_{k+1}}^{a,b}(t_k, x)}} \partial_x Y_{t_{k+1}}^{a,b}(t_k, x)$. Here $u = (u_t, t \in [t_k, t_{k+1}])$ is an adapted process then it belongs to Dom $\delta$. By Theorem 7.3 it suffices to show that $F \in \mathbb{D}^{1,2}$ and $Fu \in L^2(\bar{\Omega}; H) \cong L^2([t_k, t_{k+1}] \times \bar{\Omega}, \mathbb{R})$, where $H = L^2([t_k, t_{k+1}], \mathbb{R})$.

From (4.10), we write

$$F = \frac{\partial_a X_{t_{k+1}}^{a,b}(t_k, x)}{\partial_x X_{t_{k+1}}^{a,b}(t_k, x)} = \int_{t_k}^{t_{k+1}} \frac{dr}{\partial_x X_{t_k}^{a,b}(t_k, x)}.$$ 

By assertion (ii) of Lemma 4.3, under condition $\frac{q}{2} > \frac{9 + \sqrt{9\sigma}}{2}$, $(\partial_x Y_{t_k}^{a,b}(t_k, x))^{-1} \in \mathbb{D}^{1,2}$ for any $t \in [t_k, t_{k+1}]$. Thus, it is straightforward that $F \in \mathbb{D}^{1,2}$ under condition $\frac{q}{2} > \frac{9 + \sqrt{9\sigma}}{2}$.\hfill □
Furthermore, for $t_k \leq s \leq r \leq t_{k+1}$,

$$D_s F = \int_s^{t_{k+1}} D_x \left( \frac{1}{\partial_x Y^{a,b}_r(t_k, x)} \right) dr.$$

Next, we check $Fu \in L^2([t_k, t_{k+1}] \times \tilde{\Omega}, \mathbb{R})$. For this, using Hölder's inequality repeatedly with $rac{1}{p} + rac{1}{q} = 1$ and $\frac{1}{p_1} + \frac{1}{q_1} = 1$, together with (4.13)-(4.14), we get that

$$\tilde{E}_{t_k,x}^{a,b} \left[ (Fu)^2 \right] = \tilde{E}_{t_k,x}^{a,b} \left[ \left( \int_{t_k}^{t_{k+1}} \frac{dr}{\partial_x Y^{a,b}_r(t_k, x)} \right)^2 \right] \leq \frac{1}{2\sigma} \left( \int_{t_k}^{t_{k+1}} \frac{dr}{\partial_x Y^{a,b}_r(t_k, x)} \right)^{2p} \leq C n \Delta^{2p-1} \int_{t_k}^{t_{k+1}} \tilde{E}_{t_k,x}^{a,b} \left[ \left( \frac{1}{\partial_x Y^{a,b}_r(t_k, x)} \right)^{2pp_1} \right] dr \leq C \Delta_n^{2p-1} \int_{t_k}^{t_{k+1}} \tilde{E}_{t_k,x}^{a,b} \left[ \left( \frac{1}{\partial_x Y^{a,b}_r(t_k, x)} \right)^{2pp_1} \right] dr \leq C \Delta_n^{2p-1} \int_{t_k}^{t_{k+1}} \tilde{E}_{t_k,x}^{a,b} \left[ (Fu)^2 \right] dt < +\infty.$$

All conditions required here are as follows

$$-2pp_1 \geq \frac{(a-1)1}{2(a-2)}, \quad pq_1 < \frac{a}{\sigma} - 1.$$
Next, under condition $\frac{a}{\sigma} > \frac{9+\sqrt{57}}{2}$, we proceed as in the proof of Proposition 3.1 of [32] with $\beta = a$ (see pages 441 and 442) to get the following representation of the score function

$$\frac{\partial a Y_{t_k}^a}{\partial a} (\Delta_n, x, y) = \frac{1}{\Delta_n} \mathbb{E}_{t_k, x} \left[ \delta \left( \partial_a Y_{t_{k+1}}^a (t_k, x) U_{t_k}^a (t_k, x) \right) Y_{t_{k+1}}^a = y \right].$$

Now, we wish to show (4.21). In fact, using condition $\frac{a}{\sigma} > \frac{9+\sqrt{57}}{2}$ and the fact that the Skorohod integral and the Itô integral of an adapted process coincide $\delta(u) = \int_{t_k}^{t_{k+1}} \frac{\partial a Y_{t_k}^a (t_k, x)}{\sqrt{2 \sigma Y_{t_k}^a}} dW_s$, we have

$$F \delta(u) - \langle DF, u \rangle_H = \int_{t_k}^{t_{k+1}} \frac{dr}{\partial X_{t_k}^a, y} \int_{t_k}^{t_{k+1}} \frac{\partial a Y_{t_k}^a (t_k, x)}{\sqrt{2 \sigma Y_{t_k}^a}} dW_s - \int_{t_k}^{t_{k+1}} D_s \left( \frac{1}{2} \frac{\partial a Y_{t_k}^a (t_k, x)}{\sqrt{2 \sigma Y_{t_k}^a}} \right) dr \frac{\partial a Y_{t_k}^a (t_k, x)}{\sqrt{2 \sigma Y_{t_k}^a}} ds. \quad (6.8)$$

We next add and subtract the term $\frac{\partial a Y_{t_k}^a (t_k, x)}{\sqrt{2 \sigma Y_{t_k}^a}}$ in the second integral, and the term $\frac{1}{\partial a Y_{t_k}^a (t_k, x)}$ in the first integral. This, together with $Y_{t_k}^a (t_k, x) = x$, implies that

$$F \delta(u) - \langle DF, u \rangle_H = \frac{\Delta_n}{\sqrt{2 \sigma x}} (W_{t_{k+1}} - W_{t_k}) + R_{1, t_k}^a + R_{2, t_k}^a + R_{3, t_k}^a. \quad (6.9)$$

Then, applying (4.25) of Lemma 4.5 with $q = 1$, under condition $\frac{a}{\sigma} > 5 + 3\sqrt{2}$, we get

$$E_{t_k, x} \left[ (F \delta(u) - \langle DF, u \rangle_H)^2 \right] \leq \frac{\Delta_n^2}{\sigma x} E_{t_k, x} \left[ (W_{t_{k+1}} - W_{t_k})^2 \right] + 2E_{t_k, x} \left[ (R_{1, t_k}^a + R_{2, t_k}^a + R_{3, t_k}^a)^2 \right] \leq \frac{\Delta_n^2}{\sigma x} + C \Delta_n^4 \sum_{\alpha(1) \in I} \frac{1}{x^{\alpha(1)}} < +\infty,$$

where $I$ is a finite set. Thus, we have shown that $F \delta(u) - \langle DF, u \rangle_H$ is square integrable under condition $\frac{a}{\sigma} > 5 + 3\sqrt{2}$. Consequently, by Theorem 7.3 under condition $\frac{a}{\sigma} > 5 + 3\sqrt{2}$ we have

$$\delta(Fu) = F \delta(u) - \langle DF, u \rangle_H.$$

This, together with (6.7) and (6.9), gives (4.21) under condition $\frac{a}{\sigma} > 5 + 3\sqrt{2}$.

Finally, we write

$$\partial_a Y_{t_{k+1}}^a (t_k, x) U_{t_k}^a (t_k, x) = \frac{\partial a Y_{t_{k+1}}^a (t_k, x)}{\sqrt{2 \sigma Y_{t_k}^a}} (\partial_a Y_{t_{k+1}}^a (t_k, x))^{-1} \partial a Y_{t_k}^a (t_k, x) = F_u, \quad (6.10)$$

where $F = \partial a Y_{t_{k+1}}^a (t_k, x) (\partial a Y_{t_{k+1}}^a (t_k, x))^{-1}$. From (4.11), we have

$$F = \frac{\partial a Y_{t_{k+1}}^a (t_k, x)}{\partial a Y_{t_{k+1}}^a (t_k, x)} = - \int_{t_k}^{t_{k+1}} \frac{Y_{t_k}^a (t_k, x)}{\partial a Y_{t_k}^a (t_k, x)} dr.$$
Then, by assertion (ii) of Lemma 4.3 and proceeding as above, we get that under condition $\frac{a}{\sigma} > \frac{9 + \sqrt{57}}{2}$, $\partial_{t}Y_{t_{k+1}}^{a,b}(t_{k}, x) + U^{a,b}(t_{k}, x) \in \text{Dom} \, \delta$ and

$$\frac{\partial_{b}F^{a,b}_{ \partial_{t}Y_{t_{k+1}}^{a,b}(t_{k}, x)}(\Delta \mu, x, y)}{\partial_{a}U^{a,b}(t_{k}, x)} = \frac{1}{\Delta a} \tilde{E}_{t_{k}, x}^{a,b} \left[ \delta \left( \partial_{t}Y_{t_{k+1}}^{a,b}(t_{k}, x)U^{a,b}(t_{k}, x) \right) \bigg| Y_{t_{k+1}}^{a,b} = y \right].$$

Furthermore, using the same arguments as for (6.3), we can easily check that under condition $\frac{a}{\sigma} > \frac{9 + \sqrt{57}}{2}$,

$$\tilde{F} \delta(u) - \langle DF, u \rangle_{H} = - \int_{t_{k}}^{t_{k+1}} \frac{Y_{r}^{a,b}(t_{k}, x)}{\partial_{x}Y_{r}^{a,b}(t_{k}, x)} dr \int_{t_{k}}^{t_{k+1}} \frac{\partial_{x}Y_{s}^{a,b}(t_{k}, x)}{\partial_{x}Y_{s}^{a,b}(t_{k}, x)} \sqrt{2\sigma Y_{s}^{a,b}(t_{k}, x)} dW_{s}$$

$$+ \int_{t_{k}}^{t_{k+1}} \int_{s}^{t_{k+1}} D_{s} \left( \frac{Y_{r}^{a,b}(t_{k}, x)}{\partial_{x}Y_{r}^{a,b}(t_{k}, x)} \right) dr \frac{\partial_{x}Y_{s}^{a,b}(t_{k}, x)}{\sqrt{2\sigma Y_{s}^{a,b}(t_{k}, x)}} ds.$$  

We next add and subtract the term $\frac{Y_{t_{k}}^{a,b}(t_{k}, x)}{\partial_{x}Y_{t_{k}}^{a,b}(t_{k}, x)}$ in the first integral, and the term $\frac{\partial_{x}Y_{t_{k}}^{a,b}(t_{k}, x)}{\sqrt{2\sigma Y_{t_{k}}^{a,b}(t_{k}, x)}}$ in the second integral. This, together with $Y_{t_{k}}^{a,b}(t_{k}, x) = x$, shows that

$$\tilde{F} \delta(u) - \langle DF, u \rangle_{H} = - \frac{\Delta a}{\sqrt{2\sigma}} \sqrt{x} (W_{t_{k+1}} - W_{t_{k}}) - xR_{1}^{a,b} + H_{2}^{a,b} + H_{3}^{a,b}. \quad (6.11)$$

Then, applying (4.26) of Lemma 4.5 with $q = 1$, we get that $\tilde{F} \delta(u) - \langle DF, u \rangle_{H}$ is square integrable under condition $\frac{a}{\sigma} > 5 + 3\sqrt{2}$. Consequently, from (7.1) of Theorem 7.3 (6.10) and (6.11) we conclude (4.22) under condition $\frac{a}{\sigma} > 5 + 3\sqrt{2}$. Thus, the result follows. \hfill \Box

6.5. Proof of Lemma 4.5.

Proof. Proof of (4.23) and (4.24): These facts follow easily from (4.21), (4.22), and properties of the moment of the Skorohod integral and the Brownian motion.

Proof of (4.25). Observe that

$$\tilde{E}_{t_{k}, x}^{a,b} \left[ \left| R_{11}^{a,b} \right|^{2q} \right] \leq 3^{q-1} \left( \tilde{E}_{t_{k}, x}^{a,b} \left[ \left| R_{11}^{a,b} \right|^{2q} \right] + \tilde{E}_{t_{k}, x}^{a,b} \left[ \left| R_{21}^{a,b} \right|^{2q} \right] + \tilde{E}_{t_{k}, x}^{a,b} \left[ \left| R_{31}^{a,b} \right|^{2q} \right] \right). \quad (6.12)$$

First, we treat the term $R_{11}^{a,b}$. Using BDG’s inequality, we have that

$$\tilde{E}_{t_{k}, x}^{a,b} \left[ \left| R_{11}^{a,b} \right|^{2q} \right] \leq C \Delta_{n}^{2q} \tilde{E}_{t_{k}, x}^{a,b} \left[ \int_{t_{k}}^{t_{k+1}} \left( \frac{\partial_{x}Y_{s}^{a,b}(t_{k}, x)}{\sqrt{Y_{s}^{a,b}(t_{k}, x)}} - \frac{\partial_{x}Y_{s}^{a,b}(t_{k}, x)}{\sqrt{Y_{s}^{a,b}(t_{k}, x)}} \right)^{2} ds \right]^{q}$$

$$\leq C \Delta_{n}^{2q} \Delta_{n}^{-1} \int_{t_{k}}^{t_{k+1}} R_{11}^{a,b} ds,$$

where

$$R_{11}^{a,b} = \tilde{E}_{t_{k}, x}^{a,b} \left[ \left( \frac{\partial_{x}Y_{s}^{a,b}(t_{k}, x)}{\sqrt{Y_{s}^{a,b}(t_{k}, x)}} - \frac{\partial_{x}Y_{s}^{a,b}(t_{k}, x)}{\sqrt{Y_{s}^{a,b}(t_{k}, x)}} \right)^{2q} \right].$$
By Itô’s formula, it can be checked that
\[
\frac{\partial_t Y_{s,a,b}(t_k, x)}{\sqrt{Y_{s,a,b}(t_k, x)}} - \frac{\partial_t Y_{s,a,b}(t_k, x)}{\sqrt{Y_{s,a,b}(t_k, x)}} = \int_{t_k}^{s} \frac{\partial_x Y_{s,a,b}^a(t_k, x)}{\sqrt{Y_{s,a,b}(t_k, x)}} \left( \frac{\partial_x Y_{s,a,b}^a(t_k, x)}{Y_{s,a,b}(t_k, x)} \right) \frac{du}{2 \sqrt{Y_{s,a,b}(t_k, x)}}
\]
which, together with Hölder’s inequality with \( \frac{1}{p} + \frac{1}{q} = 1, (4.13) \) and \( (4.14) \), implies that
\[
R_{11}^{a,b} \leq C \Delta_n^{2q-1} \int_{t_k}^{s} \left\{ \mathbb{E}_{t_k, x} \left[ \left( \frac{\partial_x Y_{s,a,b}^a(t_k, x)}{Y_{s,a,b}(t_k, x)} \right)^2 \right] \right\} \frac{du}{2 q_0} 
\]
\[
= C \Delta_n^{2q-1} \int_{t_k}^{s} \left\{ \left( \mathbb{E}_{t_k, x} \left[ \left( \frac{\partial_x Y_{s,a,b}^a(t_k, x)}{Y_{s,a,b}(t_k, x)} \right)^{2q_0} \right] \right) \right\} \frac{du}{2 q_0} 
\]
\[
\leq C \Delta_n^{2q-1} \int_{t_k}^{s} \left\{ \left( 1 + \frac{1}{x^{\frac{3}{2} - 1 + 2q_0}} \right) \left( \frac{1}{x^{3q_0}} + \frac{1}{x^q} \right) \right\} \frac{du}{2 q_0}
\]
Here, \( q_0 \) should be chosen close to 1 in order that \( 3q_0 < \frac{\alpha}{\sigma} - 1 \). Thus, by choosing \( q_0 \in (1, \frac{1}{3} \left( \frac{\alpha}{\sigma} - 1 \right)) \), under condition \( \frac{\alpha}{\sigma} > 3q + 1 \), we have
\[
\mathbb{E}_{t_k, x} \left[ \left( R_{11}^{a,b} \right)^{2q} \right] \leq C \Delta_n^{5q} \left( 1 + \frac{1}{x^{\frac{3}{2} - 1 + q_0}} \right) \left( \frac{1}{x^{3q_0}} + \frac{1}{x^q} \right) = C \Delta_n^{5q} \sum_{\alpha(q) \in I_1} \frac{1}{x^{\alpha(q)}}, \quad (6.13)
\]
where \( p_0 > 1 \) with \( q_0 = \frac{p_0}{p_0 - 1} \) close to 1, \( I_1 \) is a finite set and \( \alpha(q) \geq q \) for all \( \alpha(q) \in I_1 \). The highest power \( \alpha(q) \) corresponds to \( \frac{\alpha-1}{2p_0} + 4q \). Then, when \( q \in \left[ 1, \frac{33 + \sqrt{321}}{48} \right] \) and \( \frac{\alpha}{\sigma} > \frac{21 + \sqrt{321}}{4} \), it suffices to choose \( p_0 \) large enough to get \( \frac{\alpha-1}{2p_0} + 4q < \frac{\alpha}{\sigma} - \frac{1}{2} \).

Next, we treat the term \( R_{21}^{a,b} \). Using Hölder’s inequality with \( \frac{1}{p} + \frac{1}{q} = 1 \), we have
\[
\mathbb{E}_{t_k, x} \left[ \left( R_{21}^{a,b} \right)^{2q} \right] \leq (R_{21}^{a,b})^{\frac{1}{p}} (R_{22}^{a,b})^{\frac{1}{q}},
\]
where
\[
R_{21}^{a,b} = \mathbb{E}_{t_k, x} \left[ \int_{t_k}^{t_{k+1}} \left( \frac{1}{2 \sigma Y_{s,a,b}^a(t_k, x)} \right) dW_s \right]^{2q},
\]
\[
R_{22}^{a,b} = \mathbb{E}_{t_k, x} \left[ \int_{t_k}^{t_{k+1}} \left( \frac{1}{2 \sigma Y_{s,a,b}^a(t_k, x)} \right) dW_s \right]^{2q}.
\]
First, observe that \( R_{21}^{a,b} \leq C \Delta_n^{2q-1} \int_{t_k}^{t_{k+1}} R_{212}^{a,b} ds \), where
\[
R_{212}^{a,b} = \mathbb{E}_{t_k, x} \left[ \left( \frac{1}{2 \sigma Y_{s,a,b}^a(t_k, x)} \right) dW_s \right]^{2q},
\]
From (4.14), Itô’s formula and $\partial_x Y_{t_k}^{a,b}(t_k, x) = 1$, for any $t \in [t_k, t_{k+1}]$, we have
\[
\frac{1}{\partial_x Y_{t_k}^{a,b}(t_k, x)} - \frac{1}{\partial_x Y_{t_k}^{a,b}(t_k, x)} = \int_{t_k}^{s} \left( \frac{b}{\partial_x Y_{t_k}^{a,b}(t_k, x)} + \frac{\sigma}{Y_{t_k}^{a,b}(t_k, x) \partial_x Y_{t_k}^{a,b}(t_k, x)} \right) du \\
- \int_{t_k}^{s} \frac{\sqrt{\sigma}}{\sqrt{2Y_{t_k}^{a,b}(t_k, x) \partial_x Y_{t_k}^{a,b}(t_k, x)}} dW_u.
\] (6.14)

Therefore, $R_{212}^{a,b} \leq C(R_{2121}^{a,b} + R_{2122}^{a,b} + R_{2123}^{a,b})$, where
\[
R_{2121}^{a,b} = \mathbb{E}_{t_k,x} \left[ \left| \int_{t_k}^{s} \frac{du}{\partial_x Y_{t_k}^{a,b}(t_k, x)} \right|^{2q_{\overline{p}}} \right], \\
R_{2122}^{a,b} = \mathbb{E}_{t_k,x} \left[ \left| \int_{t_k}^{s} \frac{du}{Y_{t_k}^{a,b}(t_k, x) \partial_x Y_{t_k}^{a,b}(t_k, x)} \right|^{2q_{\overline{p}}} \right], \\
R_{2123}^{a,b} = \mathbb{E}_{t_k,x} \left[ \int_{t_k}^{s} \frac{1}{\sqrt{Y_{t_k}^{a,b}(t_k, x) \partial_x Y_{t_k}^{a,b}(t_k, x)}} dW_u \right]^{2q_{\overline{p}}}.
\]

Using (4.14),
\[
R_{2121}^{a,b} \leq \Delta_n^{2q_{\overline{p}}-1} \int_{t_k}^{s} \mathbb{E}_{t_k,x} \left[ \frac{1}{|\partial_x Y_{t_k}^{a,b}(t_k, x)|^{2q_{\overline{p}}}} \right] du \leq C \Delta_n^{2q_{\overline{p}}} \left( 1 + \frac{1}{x^{\frac{p_1}{q_1} - q_{\overline{p}}} - q_{\overline{p}}} \right).
\]

Next, using Hölder’s inequality with $\frac{1}{p_1} + \frac{1}{q_1} = 1$, (4.13) and (4.14),
\[
R_{2122}^{a,b} \leq \Delta_n^{2q_{\overline{p}}-1} \int_{t_k}^{s} \mathbb{E}_{t_k,x} \left[ \frac{1}{|Y_{t_k}^{a,b}(t_k, x)|^{q_{\overline{p}}}} \frac{1}{|\partial_x Y_{t_k}^{a,b}(t_k, x)|^{q_{\overline{p}}}} \right] du \\
\leq \Delta_n^{2q_{\overline{p}}-1} \int_{t_k}^{s} \left( \mathbb{E}_{t_k,x} \left[ |Y_{t_k}^{a,b}(t_k, x)|^{q_{\overline{p}}q_{\overline{p}}} \right] \right)^{\frac{1}{q_1}} \left( \mathbb{E}_{t_k,x} \left[ |\partial_x Y_{t_k}^{a,b}(t_k, x)|^{q_{\overline{p}}q_{\overline{p}}} \right] \right)^{\frac{1}{q_1}} du \\
\leq C \Delta_n^{2q_{\overline{p}}} \left( 1 + \frac{1}{x^{\frac{p_1}{q_1} - q_{\overline{p}}} - q_{\overline{p}}} \right).
\]

Finally, using BDG’s and Hölder’s inequalities with $\frac{1}{p_1} + \frac{1}{q_1} = 1$, (4.13) and (4.14),
\[
R_{2123}^{a,b} \leq \Delta_n^{q_{\overline{p}}-1} \int_{t_k}^{s} \mathbb{E}_{t_k,x} \left[ \frac{1}{|Y_{t_k}^{a,b}(t_k, x)|^{q_{\overline{p}}}} \frac{1}{|\partial_x Y_{t_k}^{a,b}(t_k, x)|^{q_{\overline{p}}}} \right] du \\
\leq \Delta_n^{q_{\overline{p}}-1} \int_{t_k}^{s} \left( \mathbb{E}_{t_k,x} \left[ Y_{t_k}^{a,b}(t_k, x) \right]^{q_{\overline{p}}q_{\overline{p}}} \right)^{-\frac{1}{p_1}} \left( \mathbb{E}_{t_k,x} \left[ |\partial_x Y_{t_k}^{a,b}(t_k, x)|^{q_{\overline{p}}q_{\overline{p}}} \right] \right)^{-\frac{1}{q_1}} du \\
\leq C \Delta_n^{q_{\overline{p}}} \left( 1 + \frac{1}{x^{\frac{p_1}{q_1} - q_{\overline{p}}} - q_{\overline{p}}} \right).
\]

Thus, we have shown that
\[
R_{212}^{a,b} \leq C \Delta_n^{2q_{\overline{p}}} \left( 1 + \frac{1}{x^{\frac{p_1}{q_1} - q_{\overline{p}}} - q_{\overline{p}}} \right) + C \Delta_n^{2q_{\overline{p}}} \left( 1 + \frac{1}{x^{\frac{p_1}{q_1} - q_{\overline{p}}} - q_{\overline{p}}} \right) + C \Delta_n^{q_{\overline{p}}} \left( 1 + \frac{1}{x^{\frac{p_1}{q_1} - q_{\overline{p}}} - q_{\overline{p}}} \right),
\]

which implies that
\[
R_{21}^{a,b} \leq C \Delta_n^{2q_{\overline{p}}} \left( \Delta_n^{2q_{\overline{p}}} \left( 1 + \frac{1}{x^{\frac{p_1}{q_1} - q_{\overline{p}}} - q_{\overline{p}}} \right) + \Delta_n^{2q_{\overline{p}}} \left( 1 + \frac{1}{x^{\frac{p_1}{q_1} - q_{\overline{p}}} - q_{\overline{p}}} \right) + \Delta_n^{q_{\overline{p}}} \left( 1 + \frac{1}{x^{\frac{p_1}{q_1} - q_{\overline{p}}} - q_{\overline{p}}} \right) \right) \}.
Next, using BDG’s and Hölder’s inequalities with \( \frac{1}{p_2} + \frac{1}{q_2} = 1 \), (4.13) and (4.14),

\[
R_{22}^{a,b} \leq C \tilde{E}_{t_k,x}^{a,b} \left[ \int_{t_k}^{t_{k+1}} \left( \frac{\partial_x Y_s^{a,b}(t_k, x)}{Y_s^{a,b}(t_k, x)} \right)^2 ds \right]^{\frac{q_2}{2q_1}} \leq C \Delta_n^{\frac{q_2}{2q_1} - 1} \int_{t_k}^{t_{k+1}} \tilde{E}_{t_k,x}^{a,b} \left[ \frac{1}{Y_s^{a,b}(t_k, x)} \right]^{\frac{q_2}{2q_1}} ds \\
\leq C \Delta_n^{\frac{q_2}{2q_1} - 1} \left( \int_{t_k}^{t_{k+1}} \tilde{E}_{t_k,x}^{a,b} \left[ \frac{1}{|\partial_x Y_s^{a,b}(t_k, x)|^{2q_2/q_1}} \right] ds \right)^{\frac{1}{2}} \\
\leq C \Delta_n^{\frac{q_2}{2q_1} \left( 1 + \frac{1}{x^{q_2/q_1}} \right)}.
\]

Here, \( p_2 \) should be chosen close to 1 in order that \( p_2q_1 < \frac{a}{\sigma} - 1 \). In order to apply (4.13) and (4.14) to estimate two terms above \( R_{21}^{a,b} \) and \( R_{22}^{a,b} \), all conditions required here are as follows

\[
-2q_1\tilde{q}_1p > -\left( \frac{a}{\sigma} - 1 \right)^2, \quad 2p_1\tilde{q}_1p < \frac{a}{\sigma} - 1, \quad q_1q_1 < \frac{a}{\sigma} - 1.
\]

This implies that

\[
a \geq 2q_1\tilde{q}_1p + \sqrt{2q_1\tilde{q}_1p(2q_1\tilde{q}_1p + 1)} + 1, \quad \frac{a}{\sigma} > \frac{2q_1\tilde{q}_1p}{q_1 - 1} + 1, \quad \frac{a}{\sigma} > \frac{q_1q_1}{p - 1} + 1.
\]

Here, the optimal choice for \( \tilde{p} \) and \( q_1 \) corresponds to choose them in a way which gives minimal restrictions on the ratio \( \frac{a}{\sigma} \). That is,

\[
2q_1\tilde{q}_1p + \sqrt{2q_1\tilde{q}_1p(2q_1\tilde{q}_1p + 1)} = \frac{2q_1\tilde{q}_1p}{q_1 - 1} = \frac{q_1q_1}{p - 1}.
\]

Thus, the unique solution is given by \( \tilde{p} = \frac{21q + 4 + 3\sqrt{q(49q + 8)}}{2(11q + 2 + \sqrt{q(49q + 8)})} \) and \( q_1 = \frac{11q + 2 + \sqrt{q(49q + 8)}}{2(6q + 1)} \), which implies \( \frac{a}{\sigma} > \frac{7q}{2} + \frac{1}{2}\sqrt{q(49q + 8)} + 1 \). Therefore, under \( \frac{a}{\sigma} > \frac{7q}{2} + \frac{1}{2}\sqrt{q(49q + 8)} + 1 \), we have shown that

\[
\tilde{E}_{t_k,x}^{a,b}[R_{21}^{a,b} | 2q] \leq C \Delta_n^{q_1} \left( 1 + \frac{1}{x^{q_2/q_1}} \right) \left( 1 + \frac{1}{x^{q_1/q_1}} \right) \left( 1 + \frac{1}{x^{q_2/q_1}} \right) \left( \frac{1}{x^{2q_2}} + \frac{1}{x^{q_2}} \right)
\]

\[
= C \Delta_n^{q_1} \sum_{\alpha(q) \in I_2} \frac{1}{x^{\alpha(q)}}, \quad (6.15)
\]

where \( \tilde{p} = \frac{21q + 4 + 3\sqrt{q(49q + 8)}}{2(11q + 2 + \sqrt{q(49q + 8)})} \), \( \tilde{q} = \frac{p}{p^2} = \frac{21q + 4 + 3\sqrt{q(49q + 8)}}{2(11q + 2 + \sqrt{q(49q + 8)})} - q + \sqrt{q(49q + 8)} \), \( q_1 = \frac{11q + 2 + \sqrt{q(49q + 8)}}{2(6q + 1)} \), \( q_1\tilde{p} = \frac{21q + 4 + 3\sqrt{q(49q + 8)}}{4(6q + 1)} \), \( q_2 > 1 \) with \( q_2, q_2, q_2 \) close to 1 and \( I_2 \) is a finite set. When \( q \in [1, \frac{33 + \sqrt{321}}{48}] \) and \( \frac{a}{\sigma} > \frac{21 + \sqrt{321}}{48} \), it is obvious that \( \alpha(q) \geq q \) for all \( \alpha(q) \in I_2 \) and it suffices to choose \( q_2 \) large enough to get \( \left( \frac{a}{\sigma} - 1 \right) \left( \frac{1}{2q_1q} + \frac{1}{2q_2q} \right) + 3q < \frac{a}{\sigma} - \frac{1}{2} \) since \( q_1\tilde{p} > 1.6 \) and \( \left( \frac{a}{\sigma} - 1 \right) \left( \frac{1}{2q_1q} + \frac{1}{2q_2q} \right) < \frac{a}{\sigma} - \frac{1}{2} \) since \( p > 1.099 \).

Finally, we treat the term \( R_{31}^{a,b} \). Using Hölder’s inequality with \( \frac{1}{p_3} + \frac{1}{q_3} = 1 \),

\[
\tilde{E}_{t_k,x}^{a,b}[R_{31}^{a,b} | 2q] \leq \Delta_n^{2q_1 - 1} \int_{t_k}^{t_{k+1}} \tilde{E}_{t_k,x}^{a,b} \left( \int_{t_k}^{t_{k+1}} D_{t_s} \left( \frac{1}{2q_1} \right) \frac{1}{Y_s^{a,b}(t_k, x)} ds \right) \frac{1}{\sqrt{2q_1 Y_s^{a,b}(t_k, x)}}^{2q_1} ds
\]
Here, the optimal choice for $p_3$ corresponds to choose them in a way which gives minimal restrictions on the ratio $\frac{a}{\sigma}$. That is,

$$2q_3p_4 + \sqrt{2q_3p_4 (2q_3p_4 + 1)} = \frac{3q_3p_4}{p_4 - 1} = \frac{q_3}{p_3 - 1} + 1.$$

Thus, the unique solution is given by $p_3 = \frac{2}{\sqrt{4q_3 + 1} + \sqrt{2q_3}}$ and $p_4 = 1 + \frac{3q_3}{2\sqrt{4q_3 + 1}}$, which implies that $\frac{a}{\sigma} > 4q + 1 + \sqrt{2q(8q + 1)}$. Therefore, under $\frac{a}{\sigma} > 4q + 1 + \sqrt{2q(8q + 1)}$, we obtain

$$\hat{E}_{t_k,x} [\| R_{3}^{a,b} \|_{q}] \leq C \Delta_n^{2q_3} \left( \frac{1}{x^{2q_3p_4}} \right)^{\frac{1}{q_3}} + \frac{1}{x^{2q_3p_4}} \frac{1}{x^{q_3q_5}}.$$
\[ + \Delta_n^3 (1 + \frac{1}{x^{2q + 3} - q}) \left( \frac{1}{x^{2q}} \right) \left( 1 + \frac{1}{x^{2q + 3} - q} \right) \frac{1}{x^q} \leq C \Delta_n^3 (1 + \frac{1}{x^{2q + 3} - q}) \left( \frac{1}{x^{2q}} \right) \left( \frac{1}{x^{2q + 3} - q} \right) \frac{1}{x^q} = C \Delta_n^3 \sum_{\alpha(q) \in I_3} \frac{1}{x^\alpha(q)}, \] (6.16)

where \( p_3 = \frac{2\sqrt{1 + 8q + 4\sqrt{q}}}{2\sqrt{1 + 8q + 3\sqrt{q}}}, \ q_3 = \frac{p_3}{p_3 - 1} = 4 + \sqrt{2(8 + \frac{1}{q})}, \ p_4 = 1 + \frac{3}{2} \sqrt{2q(1 + 8q)} + 3q, \ p_5 = 1 + 2 \sqrt{2q(1 + 8q)}, \ p_5 > 1 \) with \( p_3 - 1 \) close to 1, \( I_3 \) is a finite set and \( \alpha(q) \geq q \) for all \( \alpha(q) \in I_3 \). The highest power \( \alpha(q) \) corresponds to \( (\frac{a}{\sigma} - 1)(\frac{1}{2p_3 p_4} + \frac{1}{2p_3 p_4}) + 4q \). Then, when \( q \in [1, \frac{33 + \sqrt{321}}{48}] \) and \( \frac{a}{\sigma} > 21 + \sqrt{321} \), it suffices to choose \( p_5 \) large enough to get \( (\frac{a}{\sigma} - 1)(\frac{1}{2p_3 p_4} + \frac{1}{2p_3 p_4}) + 4q < \frac{a}{\sigma} - \frac{1}{2} \) since \( p_3 p_4 > 1.9 \).

From (6.12), (6.13), (6.15) and (6.16), under condition \( \frac{a}{\sigma} > 4q + 1 + \sqrt{2q(8q + 1)} \), we obtain

\[ E_t^{a,b} \left[ \left| \sum_{k,n} \left| R_1^{a,b} + R_2^{a,b} + R_3^{a,b} \right|^2 \right| \right] \leq C \Delta_n^3 \sum_{\alpha(q) \in I} \frac{1}{x^\alpha(q)}, \]

where \( I = I_1 \cup I_2 \cup I_3 \) is a finite set. Moreover, when \( q \in [1, \frac{33 + \sqrt{321}}{48}] \) and condition (A) holds, \( \alpha(q) \) satisfies \( q \leq \alpha(q) < \frac{a}{\sigma} - \frac{1}{2} \) for all \( \alpha(q) \in I \). Thus, we conclude the desired estimate (6.25).

Proof of (6.26). We proceed in the same way as in the proof of (6.25) where we use

\[ \frac{Y_s^{a,b}(t_k, x)}{\partial_x Y_s^{a,b}(t_k, x)} = a \int_{t_k}^s \frac{dW_u}{\partial_x Y_u^{a,b}(t_k, x)} + \sqrt{\frac{\sigma}{2}} \int_{t_k}^s \frac{\sqrt{Y_u^{a,b}(t_k, x)}}{\partial_x Y_u^{a,b}(t_k, x)} dW_u \]

instead of (6.14). \( \square \)

Remark 6.2. When we use Cauchy-Schwarz’s inequality instead of Hölder’s inequality to estimate \( \left| R_1^{a,b} + R_2^{a,b} + R_3^{a,b} \right|^2 \), the required condition will be \( \frac{a}{\sigma} > 8q + 1 + \sqrt{8q(8q + 1)} \) which is actually bigger than \( 4q + 1 + \sqrt{2q(8q + 1)} \).

7. Appendix B: Useful results

We recall a classical convergence result and a central limit theorem on triangular arrays of random variables. For each \( n \in \mathbb{N} \), let \( (\zeta_{k,n})_{k \geq 1} \) be a sequence of random variables defined on \((\Omega, \mathcal{F}, \{\mathcal{F}_t\}_{t \geq 0}, P)\), and we assume that \( \zeta_{k,n} \) are \( \mathcal{F}_{t_{k+1}} \)-measurable for all \( k \).

Lemma 7.1. [21] Lemma 3.4] Assume that as \( n \to \infty \),

\[ \text{(i)} \sum_{k=0}^{n-1} E[\zeta_{k,n} | \mathcal{F}_k] \overset{P}{\to} 0, \quad \text{and} \quad \text{(ii)} \sum_{k=0}^{n-1} E[\zeta_{k,n}^2 | \mathcal{F}_k] \overset{P}{\to} 0. \]

Then as \( n \to \infty \), \( \sum_{k=0}^{n-1} \zeta_{k,n} \overset{P}{\to} 0 \).
Theorem 7.2. \[24, \text{Lemma 3.6}\] Assume that there exist real numbers $M$ and $V > 0$ such that as $n \to \infty$,

\begin{align*}
(i) \quad & \sum_{k=0}^{n-1} \mathbb{E}[\zeta_{k,n}|\mathcal{F}_{t_k}] \xrightarrow{P} M, \\
(ii) \quad & \sum_{k=0}^{n-1} \left( \mathbb{E}[\zeta_{k,n}^2|\mathcal{F}_{t_k}] - (\mathbb{E}[\zeta_{k,n}|\mathcal{F}_{t_k}])^2 \right) \xrightarrow{P} V, \quad \text{and} \\
(iii) \quad & \sum_{k=0}^{n-1} \mathbb{E}[\zeta_{k,n}^4|\mathcal{F}_{t_k}] \xrightarrow{P} 0.
\end{align*}

Then as $n \to \infty$, \[\sum_{k=0}^{n-1} \zeta_{k,n} \xrightarrow{L(P)} N + M, \] where $N$ is a centered Gaussian random variable with variance $V$.

Theorem 7.3. \[38, \text{Proposition 1.3.3}\] Let $F \in \mathbb{D}^{1,2}$ and $u$ be in the domain of $\delta$ such that $Fu \in L^2(\Omega; H)$. Then $Fu$ belongs to the domain of $\delta$ and the following equality is true

\[\delta(Fu) = F\delta(u) - \langle DF, u \rangle_H, \tag{7.1}\]

provided the right-hand side of (7.1) is square integrable.

Theorem 7.4. \[37, \text{Lemma 2.1}\] Let $\varphi \in C^1(\mathbb{R})$ be a continuously differentiable function and let $F \in \mathbb{D}^{1,2}$. Then $\varphi(F) \in \mathbb{D}^{1,2}$ if and only if $\varphi(F) \in L^2(\Omega)$ and $\varphi'(F)DF \in L^2(\Omega \times [0, T])$, and under these hypotheses

\[D(\varphi(F)) = \varphi'(F)DF.\]
