ON KALMAN’S FUNCTOR FOR BOUNDED
HEMI-IMPICATIVE SEMILATTICES AND HEMI-IMPICATIVE LATTICES

RAMON JANSANA AND HERNAN JAVIER SAN MARTÍN

Abstract. Hemi-implicative semilattices (lattices), originally defined under the name of weak implicative semilattices (lattices), were introduced by the second author of the present paper. A hemi-implicative semilattice is an algebra \((H, \land, \rightarrow, 1)\) of type \((2, 2, 0)\) such that \((H, \land)\) is a meet semilattice, \(1\) is the greatest element with respect to the order, \(a \rightarrow a = 1\) for every \(a \in H\) and for every \(a, b, c \in H\), if \(a \leq b \rightarrow c\) then \(a \land b \leq c\). A bounded hemi-implicative semilattice is an algebra \((H, \land, \rightarrow, 0, 1)\) of type \((2, 2, 0, 0)\) such that \((H, \land, \rightarrow, 1)\) is a hemi-implicative semilattice and \(0\) is the first element with respect to the order. A hemi-implicative lattice is an algebra \((H, \land, \lor, \rightarrow, 0, 1)\) of type \((2, 2, 2, 0, 0)\) such that \((H, \land, \lor, \rightarrow, 1)\) is a bounded distributive lattice and the reduct algebra \((H, \land, \rightarrow, 1)\) is a hemi-implicative semilattice.

In this paper we introduce an equivalence for the categories of bounded hemi-implicative semilattices and hemi-implicative lattices, respectively, which is motivated by an old construction due J. Kalman that relates bounded distributive lattices and Kleene algebras.

Keywords: Semilattices, distributive lattices, implications, categorical equivalences, congruences.

1. Introduction

Inspired by results due to J. Kalman relating to lattices \cite{15}, R. Cignoli proved in \cite{8} that a construction of J. Kalman can be extended to a functor \(K\) from the category of bounded distributive lattices to the category of Kleene algebras and that this functor has a left adjoint \cite{5} Theorem 1.7]. He also showed that there exists an equivalence between the category of bounded distributive lattices and the full subcategory of centered Kleene algebras whose objects satisfy a condition called interpolation property \cite{8} Theorem 2.4]. Moreover, R. Cignoli also proved that there exists an equivalence between the category of Heyting algebras and the category of centered Nelson algebras \cite{5} Theorem 3.14]. These results were extended by J.L. Castiglioni, R. Lewin, M. Menni and M. Sagastume in the context of residuated lattices \cite{3, 4}. On the other hand, the original Kalman’s construction was also extended in \cite{5} by J.L. Castiglioni, S. Celani and the second author of the present article to the framework of algebras with implication \((H, \land, \lor, \rightarrow, 0, 1)\) which satisfy the following additional condition: for every \(a, b, c \in H\), if \(a \leq b \rightarrow c\) then \(a \land b \leq c\). Algebras with implication were introduced by S. Celani in \cite{6}.

A generalization of Heyting algebras is provided by the notion of hemi-implicative semilattice (lattice), introduced in \cite{21} under the name weak implicative semilattices (lattices). An algebra \((H, \land, \rightarrow, 1)\) of type \((2, 2, 0)\) is said to be a hemi-implicative semilattice if \((H, \land, 1)\) is an upper bounded semilattice\(^1\) \(a \rightarrow a = 1\) for every \(a \in H\).

---

\(^1\)Let \((H, \leq)\) be a poset. If any two elements \(a, b \in H\) have a greatest lower bound (i.e., an infimum), which is denoted by \(a \land b\), then the algebra \((H, \land)\) is called a meet semilattice. Throughout this paper we write \(\text{semilattice}\) in place of \(\text{meet semilattice}\). A semilattice \((H, \land)\) is said to be upper bounded if it has a greatest element; in this case we write \((H, \land, 1)\), where 1 is
and for every \(a, b, c \in H\), if \(a \leq b \rightarrow c\) then \(a \land b \leq c\). A **bounded hemi-implicative semilattice** is an algebra \((H, \land, \rightarrow, 0, 1)\) of type \((2, 2, 0, 0)\) such that \((H, \land, \rightarrow, 0)\) is a hemi-implicative semilattice and 0 is the first element with respect to the order. A **hemi-implicative lattice** is an algebra \((H, \land, \lor, \rightarrow, 0, 1)\) of type \((2, 2, 2, 0, 0)\) such that \((H, \land, \lor, 0, 1)\) is a bounded distributive lattice and the reduct algebra \((H, \land, \rightarrow, 1)\) is a hemi-implicative semilattice. Implicative semilattices \([17]\) and Hilbert algebras with infimum \([12]\) are examples of hemi-implicative semilattices. Semi-Heyting algebras \([20]\) and some algebras studied in \([5]\) are examples of hemi-implicative lattices. For instance, the RWH-algebras, introduced and studied by S. Celani and the first author of this article in \([7]\), are examples of hemi-implicative lattices.

The applications of Kalman’s construction given in \([8]\) suggest that it is potentially fruitful to understand Kalman’s work in the context of bounded hemi-implicative semilattices and hemi-implicative lattices. We do this in the present paper. The main goal of the paper is to introduce and study an equivalence for the categories of bounded hemi-implicative semilattices and hemi-implicative lattices, respectively, and for some of its full subcategories.

The paper is organized as follows. In Section 2 we give some results about Kalman’s functor for bounded distributive lattices and Heyting algebras. In Section 3 we generalize Kalman’s functor for the category whose objects are posets with first element and whose morphisms are maps which preserve finite existing infima and the first element (note that the morphisms of this category are in particular order-preserving maps). Moreover, we apply the mentioned equivalence in order to build up an equivalence for the category whose objects are bounded semilattices and whose morphisms are the corresponding algebra homomorphisms. In Section 4 we recall definitions and properties about hemi-implicative semilattices (lattices) \([21]\), Hilbert algebras with infimum \([12]\), implicative semilattices \([17]\) and semi-Heyting algebras \([20]\). In Section 5 we employ results of sections 3 and 4 in order to establish equivalences, following the original Kalman’s construction, for the categories of bounded hemi-implicative semilattices, bounded Hilbert algebras with infimum, bounded implicative semilattices, hemi-implicative lattices, respectively, and the category of semi-Heyting algebras. Finally, in Section 6 we introduce and study the notion of well-behaved congruences for the objects corresponding to the categories introduced in Section 5.

We give a table with some of the categories we shall consider in this paper:

the last element of \((H, \leq)\). A **bounded semilattice** is an algebra \((H, \land, 0, 1)\) of type \((2, 0, 0)\) such that \((H, \land, 1)\) is an upper bounded semilattice and 0 is the first element of \((H, \leq)\). Frequently in the literature what we call upper bounded semilattice is known as bounded semilattice.
If $A$ is one of the categories $\mathcal{K}_c$, $\mathcal{KP}$, $\mathcal{KMS}$, $\mathcal{KhIS}_0$, $\mathcal{KHil}_0$, and $\mathcal{KhBDL}$, then we write $A^{\CK}$ to denote the full subcategory of $A$ whose objects satisfy the condition $(\CK)$, that will be defined later.

The results we expound in the present paper are motivated by the abstraction of ideas coming from different varieties of algebras related to some constructive logics, as Heyting algebras and Nelson algebras, and in particular by the existent categorical equivalence between the category of Heyting algebras and the category of centered Nelson algebras (see [8]) combined with the fact that the variety of centered Nelson algebras is term equivalent to the variety of centered Nelson lattices, as it is shown in [22] (see also [2]). In this paper we introduce and study categories which are closely connected with the category of centered Nelson lattices, as for instance the category $\mathcal{KP}$ of Kleene posets (of which centered Nelson lattices can be seen as particular cases) and the category $\mathcal{KhBDL}$ of centered Kleene algebras endowed with a binary operation which generalizes the implication of Nelson lattices. We consider that the study of the above mentioned categories is interesting in itself. We also think that the categorical equivalences and some related properties studied in this paper can be of interest for future work concerning the understanding of the categories of bounded hemi-implicative semilattices and hemi-implicative lattices, respectively.

## 2. Basic results

The definition of the functor from the category of Kleene algebras to the category of bounded distributive lattices given by R. Cignoli [8] is based on Priestley duality, and the interpolation property for Kleene algebras considered by Cignoli in establishing the equivalence is stated in topological terms. On the other hand, M. Sagastume proved in an unpublished manuscript [19] that in centered Kleene algebras the interpolation property is equivalent to an algebraic condition called $(\CK)$, that we will state later on. Moreover, she presented an equivalence between the category of bounded distributive lattices and the category of centered Kleene algebras that satisfy $(\CK)$, but using a different (purely algebraic) construction to that given by R. Cignoli in [8]. In what follows we describe this equivalence whose details can be found in [5].

We assume the reader is familiar with bounded distributive lattices and Heyting algebras [1]. A *De Morgan algebra* is an algebra $(H, \wedge, \lor, \sim, 0, 1)$ of type $(2, 2, 1, 0, 0)$ such that $(H, \wedge, 0, 1)$ is a bounded distributive lattice and $\sim$ fulfills the equations

$$\sim \sim x = x \quad \text{and} \quad \sim (x \lor y) = \sim x \land \sim y.$$  

An operation $\sim$ which satisfies the previous two equations is called a *De Morgan involution*. A *Kleene algebra* is a De Morgan algebra in which the inequality

$$x \land \sim x \leq y \lor \sim y$$
holds. A centered Kleene algebra is an algebra \((H, \land, \lor, \sim, c, 0, 1)\) where the algebra \((H, \land, \lor, \sim, 0, 1)\) is a Kleene algebra and \(c\) is an element such that \(c = \sim c\). It is immediate to see that \(c\) is necessarily unique. The element \(c\) is called center. We write \(\text{BDL}\) for the category of bounded distributive lattices and \(\text{KA}_c\) for the category of centered Kleene algebras. In both cases the morphisms are the corresponding algebra homomorphisms. It is interesting to note that if \(T\) and \(U\) are centered Kleene algebras and \(f : T \to U\) is a morphism of Kleene algebras then \(f\) preserves necessarily the center, i.e., \(f(c) = c\).

The functor \(K\) from the category \(\text{BDL}\) to the category \(\text{KA}_c\) is defined as follows. For an object \(H \in \text{BDL}\) we let

\[
K(H) := \{(a, b) \in H \times H : a \land b = 0\}.
\]

This set is endowed with the operations and the distinguished elements defined by:

\[
\begin{align*}
(a, b) \lor (d, e) & := (a \lor d, b \land e) \\
(a, b) \land (d, e) & := (a \land d, b \lor e) \\
\sim(a, b) & := (b, a) \\
0 & := (0, 1) \\
1 & := (1, 0) \\
c & := (0, 0)
\end{align*}
\]

We have that \((K(H), \land, \lor, \sim, c, 0, 1) \in \text{KA}_c\).

For a morphism \(f : H \to G \in \text{BDL}\), the map \(K(f) : K(H) \to K(G)\) defined by

\[
K(f)(a, b) = (f(a), f(b))
\]

is a morphism in \(\text{KA}_c\). Hence, \(K\) is a functor from \(\text{BDL}\) to \(\text{KA}_c\).

Let \((T, \land, \lor, \sim, c, 0, 1) \in \text{KA}_c\). The set

\[
C(T) := \{x \in T : x \geq c\}
\]

is the universe of a subalgebra of \((T, \land, \lor, c, 1)\) and \((C(T), \land, \lor, c, 1) \in \text{BDL}\). Moreover, if \(g : T \to U\) is a morphism in \(\text{KA}_c\), then the map \(C(g) : C(T) \to C(U)\), given by \(C(g)(x) = g(x)\), is a morphism in \(\text{BDL}\). Thus, \(C\) is a functor from \(\text{KA}_c\) to \(\text{BDL}\).

Let \(H \in \text{BDL}\). The map \(\alpha_H : H \to C(K(H))\) given by \(\alpha_H(a) = (a, 0)\) is an isomorphism in \(\text{BDL}\). If \(T \in \text{KA}_c\), then the map \(\beta_T : T \to K(C(T))\) given by \(\beta_T(x) = (x \land c, \sim x \lor c)\) is injective and a morphism in \(\text{KA}_c\). It is not difficult to show that the functor \(K : \text{BDL} \to \text{KA}_c\) has as left adjoint the functor \(C : \text{KA}_c \to \text{BDL}\) with unit \(\beta\) and counit \(\alpha^{-1}\).

We are interested though in an equivalence between \(\text{BDL}\) and the full subcategory of \(\text{KA}_c\) whose objects satisfy the condition \((\text{CK})\) we proceed to state.

Let \(T \in \text{KA}_c\). We consider the algebraic condition:

\[
(\text{CK}) \quad (\forall x, y \geq c)(x \land y = c \implies (\exists z)(z \lor c = x \land \sim z \lor c = y)).
\]

This condition characterizes the surjectivity of \(\beta_T\), that is, for every \(T \in \text{KA}_c\), \(T\) satisfies \((\text{CK})\) if and only if \(\beta_T\) is a surjective map, as shown in [19]. The condition \((\text{CK})\) is not necessarily verified in every centered Kleene algebra (see [5]).

We write \(\text{KA}_c^{\text{CK}}\) for the full subcategory of \(\text{KA}_c\) whose objects satisfy \((\text{CK})\). The functor \(K\) can then be seen as a functor from \(\text{BDL}\) to \(\text{KA}_c^{\text{CK}}\). The next theorem was proved by M. Sagastume in [19]. A complete proof of it can be also found in [5].

**Theorem 1.** The functors \(K\) and \(C\) establish a categorical equivalence between \(\text{BDL}\) and \(\text{KA}_c^{\text{CK}}\) with natural isomorphisms \(\alpha\) and \(\beta\).

Let \(T \in \text{KA}_c\). We know that \(\beta_T\) is not necessarily a surjective map. However we will prove that \(\beta_T\) is an epimorphism. Before, we need a lemma that is interesting
Proposition 3. Suppose that \( f : T \to U \) and \( g : T \to U \) are morphisms in \( \text{KA}_c \) and \( f(x) = g(x) \) whenever \( x \in C(T) \), then \( f(x) = g(x) \) for every \( x \in T \).

Proof. Suppose that \( f(x) = g(x) \) whenever \( x \in C(T) \). Let \( x \) be an arbitrary element of \( T \). Then

\[
\begin{align*}
f(x) \vee c &= f(x) \vee f(c) \\
&= f(x \vee c) \\
&= g(x \vee c) \\
&= g(x) \vee g(c) \\
&= g(x) \vee c,
\end{align*}
\]

so we obtain that \( f(x) \vee c = g(x) \vee c \). Similarly we can prove that \( \sim f(x) \vee c = \sim g(x) \vee c \), which is equivalent to \( f(x) \wedge c = g(x) \wedge c \). Hence, it follows from the distributivity of the underlying lattice of \( U \) that \( f(x) = g(x) \).

\[\blacksquare\]

Proposition 3. Let \( T \in \text{KA}_c \). Then \( \beta_T \) is an epimorphism.

Proof. Let \( f : K(C(T)) \to U \) and \( g : K(C(T)) \to U \) be morphisms in \( \text{KA}_c \) such that \( f \circ \beta_T = g \circ \beta_T \), where \( \circ \) denotes the composition of functions. We will prove that \( f = g \). Let \( (x, y) \in C(K(C(T))) \), i.e., \( x \wedge y = c \), \( x \geq c \), \( y \geq c \) and \( (c, c) \leq (x, y) \), where we also write \( \leq \) for the order associated to the underlying lattice of \( K(C(T)) \).

In particular we have that \( y \leq c \), so \( y = c \). Then \( (x, y) = (x, c) \). Besides, since \( x \geq c \) we have that \( \beta_T(x) = (x, c) \). Then

\[
\begin{align*}
f(x, y) &= f(x, c) \\
&= (f \circ \beta_T)(x) \\
&= (g \circ \beta_T)(x) \\
&= g(x, c) \\
&= g(x, y).
\end{align*}
\]

Hence, \( f(x, y) = g(x, y) \) whenever \( (x, y) \in C(K(C(T))) \). Therefore, it follows from Lemma 2 that \( f(x, y) = g(x, y) \) for every \( (x, y) \in K(C(T)) \), which was our aim. \[\blacksquare\]

Let \( H \in \text{BDL} \) and \( a, b \in H \). If the relative pseudocomplement of \( a \) with respect to \( b \) exists, then we denote it by \( a \to_{HA} b \). Recall that a Nelson algebra \([8]\) is a Kleene algebra such that for each pair \( x, y \) there exists the binary operation \( \Rightarrow \) given by \( x \Rightarrow y := x \to_{HA} (\sim x \vee y) \) and for every \( x, y, z \) it holds that \( (x \wedge y) \Rightarrow z = x \Rightarrow (y \Rightarrow z) \). The binary operation \( \Rightarrow \) so defined is called the weak implication.

We denote by \( HA \) the category of Heyting algebras. M. Fidel \([11]\) and D. Vakarelov \([23]\) proved independently that if \( H \in HA \), then the Kleene algebra \( K(H) \) is a Nelson algebra, in which the weak implication is defined for pairs \((a, b)\) and \((d, e)\) in \( K(H) \) as follows:

\[
(a, b) \Rightarrow (d, e) := (a \rightarrow d, a \wedge e).
\]

We say that an algebra \( (T, \wedge, \vee, \rightarrow, c, 0, 1) \) is a centered Nelson algebra if the reduct \( (T, \wedge, \vee, \rightarrow, 0, 1) \) is a Nelson algebra and \( c \) satisfies \( \sim c = c \). We write \( NA_c \) for the category of centered Nelson algebras.

The following result appears in \([8]\) Proposition 3.7 and is a reformulation of \([8]\) Theorem 3.14.

Theorem 4. The functors \( K \) and \( C \) establish a categorical equivalence between \( HA \) and \( NA_c \) with natural isomorphisms \( \alpha \) and \( \beta \).

We assume the reader is familiar with commutative residuated lattices \([13]\). An involutive residuated lattice is a bounded, integral and commutative residuated lattice \( (T, \wedge, \vee, *, \rightarrow, 0, 1) \) such that for every \( x \in T \) it holds that \( \sim \sim x = x \), where
\( \neg x := x \to 0 \) and 0 is the first element of \( T \) \cite{2}. In an involutive residuated lattice it holds that \( x \ast y = \neg(x \to \neg y) \) and \( x \to y = \neg(x \ast \neg y) \). A Nelson lattice \cite{2} is an involutive residuated lattice \( (T, \land, \lor, \ast, \to, 0, 1) \) which satisfies the additional inequality \( (x^2 \to y) \land ((\neg y)^2 \to \neg x) \leq x \to y \), where \( x^2 := x \ast x \). See also \cite{22}.

**Remark 5.** Let \( (T, \land, \lor, \Rightarrow, \sim, 0, 1) \) be a Nelson algebra. We define on \( T \) the binary operations \( \ast \) and \( \to \) by

\[
x \ast y := \sim(x \Rightarrow \sim y) \lor (y \Rightarrow \sim x), \quad x \to y := (x \Rightarrow y) \land (\sim y \Rightarrow \sim x).
\]

Then Theorem 3.1 of \cite{2} says that \( (T, \land, \lor, \Rightarrow, \sim, 0, 1) \) is a Nelson lattice. Moreover, \( \sim x = \neg x = x \to 0 \).

Let \( (T, \land, \lor, \ast, \to, 0, 1) \) be a Nelson lattice. We define on \( T \) a binary operation \( \Rightarrow \) and a unary operation \( \sim \) by

\[
x \Rightarrow y := x^2 \to y, \quad \sim x := \neg x,
\]

where \( x^2 = x \ast x \). Then Theorem 3.6 of \cite{2} says that the algebra \( (T, \land, \lor, \Rightarrow, \sim, 0, 1) \) is a Nelson algebra.

In \cite{2} Theorem 3.11 it was also proved that the category of Nelson algebras and the category of Nelson lattices are isomorphic. Taking into account the construction of this isomorphism in \cite{2} we have that the variety of Nelson algebras and the variety of Nelson lattices are term equivalent and the term equivalence is given by the operations we have defined before.

The results from \cite{2} about the connections between Nelson algebras and Nelson lattices mentioned in Remark 5 are based on results from Spinks and Veroff \cite{22}. In particular, the term equivalence of the varieties of Nelson algebras and Nelson lattices was discovered by Spinks and Veroff in \cite{22}.

A centered Nelson lattice is an algebra \( (T, \land, \lor, \ast, \to, c, 0, 1) \), where the reduct \( (T, \land, \lor, \ast, \to, 0, 1) \) is a Nelson lattice and \( c \) is an element such that \( \neg c = c \). It follows from Remark 5 that the variety of centered Nelson algebras and the variety of centered Nelson lattices are term equivalent. We write \( \text{NL}_c \) for the category of centered Nelson lattices.

**Remark 6.** Let \( (H, \land, \lor, \Rightarrow, \sim, 0, 1) \in \text{HA} \). Then \( (K(H), \land, \lor, \Rightarrow, \sim, c, 0, 1) \in \text{NA}_c \).

Hence it follows from Remark 5 that \( (K(H), \land, \lor, \ast, \to, 0, 1) \in \text{NL}_c \), where for \( (a, b) \) and \( (d, e) \) in \( K(H) \) the operations \( \ast \) and \( \to \) take the form

\[
(a, b) \ast (d, e) = (a \land d, (a \to c) \land (d \to b)), \\
(a, b) \to (d, e) = ((a \to d) \land (c \to b), a \land e).
\]

We write \( \to \) both for the implication in \( H \) as for the implication in \( K(H) \).

It follows from Theorem 4 and Remark 5 that there is a categorical equivalence between \( \text{HA} \) and \( \text{NL}_c \), as it was also mentioned in \cite{23} Corollary 2.11]. In what follows we will make explicit a construction of this equivalence.

**Proposition 7.** The functors \( K \) and \( C \) establish a categorical equivalence between \( \text{HA} \) and \( \text{NL}_c \) with natural isomorphisms \( \alpha \) and \( \beta \).

**Proof.** Let \( H \in \text{HA} \). Then the centered Kleene algebra \( (K(H), \land, \lor, \Rightarrow, \sim, c, 0, 1) \) endowed with the two operations given in Remark 5 is a centered Nelson lattice. It is immediate that if \( f \) is a morphism in \( \text{HA} \), then \( K(f) \) is a morphism in \( \text{NL}_c \).

Let \( (T, \land, \lor, \ast, \to, 0, 1) \in \text{NL}_c \). Taking into account Remark 5 we deduce that \( (T, \land, \lor, \Rightarrow, \sim, c, 0, 1) \in \text{NA}_c \), where \( x \Rightarrow y = x^2 \Rightarrow y \). Moreover,

\[
x \Rightarrow y = (x \Rightarrow y) \land (\sim y \Rightarrow \sim x).
\]
Let $x, y \geq c$. We will prove that $x \to y = x \to_{\text{HA}} y$. In order to show it, note that straightforward computations show that

\[(3) \quad x \Rightarrow y = x \to_{\text{HA}} y.
\]

Besides, $\sim y \Rightarrow \sim x = \sim y \to_{\text{HA}} (y \lor \sim x)$. Since $y \geq c$ and $\sim x \leq c$, then $y \lor \sim x = y$. Then $\sim y \Rightarrow \sim x = \sim y \to_{\text{HA}} y$. Hence, it follows from \((2)\) and \((3)\) that

$x \to y = (x \to_{\text{HA}} y) \land (\sim y \to_{\text{HA}} y)$.

Note that $x \to y = x \to_{\text{HA}} y$ if and only if $x \to_{\text{HA}} y \leq y$, which is equivalent to $\sim y \land (x \to_{\text{HA}} y) \leq y$. But $\sim y \leq c$ and $x \to_{\text{HA}} y \geq c$, so $\sim y \land (x \to_{\text{HA}} y) = \sim y$. Hence, $\sim y \land (x \to_{\text{HA}} y) \leq y$ if and only if $\sim y \leq y$. Since $y \geq c$, then $\sim y \leq c$, so $\sim y \leq y$. Then we have that $x \to y = x \to_{\text{HA}} y$. Thus, $(C(T), \land, \lor, \to, c, 0, 1) \in \text{HA}$. Straightforward computations show that if $g$ is a morphism in $\text{NL}_c$, then $C(g)$ is a morphism in $\text{HA}$.

It is also immediate that if $H \in \text{HA}$ then $\alpha_H$ is an isomorphism in $\text{HA}$. Let $(T, \land, \lor, *, \to, c, 0, 1) \in \text{NL}_c$. It follows from Theorem 4 and Remark 5 that $\beta_T$ preserves $\to$. Therefore, $\beta_T$ is an isomorphism in $\text{NL}_c$.

The main goal of this paper is to find a generalization of Proposition 7 replacing the categories of Heyting algebras and centered Nelson lattices by the categories of bounded hemi-implicative semilattices and hemi-implicative lattices, respectively. To make it possible, we start studying an equivalence for a particular category of posets with first element. Then we employ it to obtain an equivalence for the category of bounded semilattices. Finally, taking into account the last mentioned equivalence, we build up an equivalence for the categories of bounded hemi-implicative semilattices and hemi-implicative lattices, respectively, and for some of its full subcategories.

3. Kalman’s functor for posets with bottom and for bounded semilattices

In this section, we generalize the equivalence given for the category of bounded distributive lattices but replacing this category by the category whose objects are posets with first element and whose morphisms are maps which preserve finite existing infima and the first element. Then we apply this equivalence in order to establish an equivalence for the category whose objects are bounded semilattices and whose morphisms are the corresponding algebra homomorphisms. We start with some preliminary definitions and properties.

Let $(P, \leq, 0)$ be a poset with first element, and let $(P \times P, \leq)$ be the poset with universe the cartesian product $P \times P$ where the order $\leq$ is given by

\[(a, b) \preceq (d, e) \text{ if and only if } a \leq d \text{ and } e \leq b.
\]

In other words, $(P \times P, \leq)$ is the direct product of $(P, \leq)$ with its dual. Let $(P, \leq)$ and $(Q, \leq)$ be posets. Let $f : (P, \leq) \to (Q, \leq)$ be a function. We say that $f$ preserves finite existing infima if for every $a, b \in P$ such that $a \land b$ exists in $P$ then $f(a) \land f(b)$ exists in $Q$ and $f(a \land b) = f(a) \land f(b)$.

**Definition 8.** The category $P_h$ has as objects the posets with first element and has as morphisms the maps between posets with first element which preserve the finite existing infima and the first element.

Note that every morphism in $P_0$ preserves the order. It follows from the fact that morphisms preserve the finite existing infima.

Let $P \in P_h$. We define the following set:

\[(4) \quad K(P) := \{(a, b) \in P \times P : a \land b \text{ exists and } a \land b = 0\}.
\]
This set is the natural one to associate with the poset \( P \) if we aim to generalize the original Kalman’s construction given for bounded distributive lattices [15]. To attain the generalization we first order \( K(P) \) with the order induced by the poset \( (P \times P, \preceq) \) defined above. It is immediate from the definition that \( K(P) \) is closed under the unary operation \( \sim \) on \( P \times P \) given by \( \sim (a, b) = (b, a) \), and that the element \( c = (0, 0) \) belongs to \( K(P) \). Thus we obtain the structure \( K(P) := (K(P), \preceq, \sim, c) \).

The following elemental lemma plays a fundamental role in some proofs of this section.

**Lemma 9.** Let \( (b, d) \in K(P) \). The following conditions hold:
1. For every \( a \in P \), \( (a, 0) \land (b, d) \) exists in \( K(P) \) if and only if \( a \land b \) exists in \( P \). If these conditions hold, then \( (a, 0) \land (b, d) = (a \land b, d) \).
2. \( (b, d) \land (0, 0) \) exists in \( K(P) \) and \( (b, d) \land (0, 0) = (0, d) \).
3. \( (b, d) \lor (0, 0) \) exists in \( K(P) \) and \( (b, d) \lor (0, 0) = (b, 0) \).

*Proof.* In general, if \( y = (e, u) \in K(P) \), we write \( \pi_1(y) \) for the first coordinate and \( \pi_2(y) \) for the second coordinate (i.e., \( \pi_1(y) = e \) and \( \pi_2(y) = u \)). Let \( (b, d) \in K(P) \).
We proceed to the proof.
1. Suppose that \( a \in P \) and \( (a, 0) \land (b, d) \) exists in \( K(P) \). Let \( x := (a, 0) \land (b, d) \).
We have that \( x \preceq (a, 0) \) and \( x \preceq (b, d) \), so by the definition of \( \preceq \) we obtain that \( \pi_1(x) \leq a \) and \( \pi_1(x) \leq b \). Thus \( \pi_1(x) \) is a lower bound of the set \( \{a, b\} \). Let now \( e \) be a lower bound of \( \{a, b\} \), i.e., \( e \leq a \) and \( e \leq b \). The fact that \( (b, d) \in K(P) \) implies that \( (e, d) \in K(P) \). Since \( (e, d) \preceq (a, 0) \) and \( (e, d) \preceq (b, 0) \), then \( (e, d) \preceq x \). Hence, \( e \preceq \pi_1(x) \). Thus, \( \pi_1(x) = a \land b \). Conversely, suppose that \( a \land b \) exists in \( P \). We have that \( (a \land b, d) \in K(P) \), \( (a \land b, d) \preceq (a, 0) \), and \( (a \land b, d) \preceq (b, d) \). Let \( (e, u) \in K(P) \) such that \( (e, u) \preceq (a, 0) \) and \( (e, u) \preceq (b, d) \), i.e., \( e \leq a \), \( e \leq b \) and \( d \leq u \). Since \( e \preceq a \land b \), then \( (e, u) \preceq (a \land b, d) \). Hence we obtain that \( (a, 0) \land (b, d) \) exists in \( K(P) \), and moreover \( (a, 0) \land (b, d) = (a \land b, d) \).
2. To prove that \( (b, d) \land (0, 0) \) exists in \( K(P) \), let us see that \( (0, d) \) is the infimum of \( (b, d) \) and \( (0, 0) \).
We have that \( (0, d) \preceq (b, d) \) and \( (0, d) \preceq (0, 0) \), so \( (0, d) \) is a lower bound of \( \{(b, d), (0, 0)\} \). Let \( (e, u) \in K(P) \) be a lower bound of \( \{(b, d), (0, 0)\} \), so \( (e, u) \preceq (b, d) \) and \( (e, u) \preceq (0, 0) \). Hence, \( e = 0 \) and \( d \leq u \), and so \( (e, u) \preceq (0, d) \). Therefore we obtain that \( (b, d) \land (0, 0) = (0, d) \).
3. In a similar way it can be proved that \( (b, d) \lor (0, 0) \) exists in \( K(P) \) and is \( (b, 0) \).

Motivated by properties of \( K(P) \) we give the following definition.

**Definition 10.** A structure \( (T, \preceq, \sim, c) \) is a Kleene poset if the following conditions hold:
1. \( (T, \preceq) \) is a poset.
2. \( \sim \) is an unary operation on \( T \) which is an involution, i.e., \( \sim \circ x = x \) for every \( x \in T \) and is order reversing, i.e., for every \( x, y \in T \), if \( x \preceq y \), then \( \sim y \preceq \sim x \).
3. \( c = \sim c \).
4. \( x \lor c \) exists, for every \( x \in T \).
5. For every \( x \in T \), \( (x \lor c) \land (\sim x \lor c) \) exists and \( (x \lor c) \land (\sim x \lor c) = c \).
6. For every \( x, y \in T \), if \( x \land c \preceq y \land c \) and \( x \lor c \preceq y \lor c \), then \( x \preceq y \).

The element \( c \) of the previous definition will be also called center. The next lemma justifies the use of \( \land \) in the statement of the condition 6.

**Lemma 11.** Let \( (T, \preceq) \) be a poset satisfying 2., 3., 4. and 5. of Definition 10.
1. Let \( x, y \in T \). If \( x \land y \) exists, then \( \sim x \lor \sim y \) exists and \( \sim x \lor \sim y = \sim (x \land y) \).
2. For every \( x \in T \), \( x \land c \) exists and \( x \land c = \sim (\sim x \lor c) \).
3. The element $c$ is unique.

Proof. Straightforward computations show the first two assertions. In order to prove that the center is unique, let $c$ and $c'$ be centers. Then $c = (c' \lor c) \land (\sim c' \lor c)$. Since $\sim c' = c'$, then $c = c' \lor c$. Hence, $c' \leq c$. Analogously, $c \leq c'$. Thus, $c = c'$. □

In what follows we introduce the category of Kleene posets.

Definition 12. We denote by $\text{KP}$ the category whose objects are the Kleene posets and whose morphisms are the maps $g$ between Kleene posets that preserve the order, the involution and the finite existing infima over elements greater than or equal to the center.

Note that if $g : T \to U$ is a morphism in $\text{KP}$, $c$ is the center of $T$ and $c'$ is the center of $U$, then $g(c) = c'$. It follows from the fact that $g(c) = \sim g(c)$ and the fact that the center is unique.

If $T \in \text{KP}$, we define $C(T)$ as in the case of centered Kleene algebras. If $f$ is a morphism in $P_0$ and $g$ is a morphism in $\text{KP}$ we define $K(f)$ and $C(g)$ as in Section [4] respectively.

Lemma 13. (a) If $(P, \leq, 0) \in P_0$, then $(K(P), \leq, \sim, c) \in \text{KP}$.
(b) If $f \in P_0$, then $K(f) \in \text{KP}$.

Proof. It follows from straightforward computations based on Lemma [9] that if $(P, \leq, 0) \in P_0$, then $(K(P), \leq, \sim, c) \in \text{KP}$.

Let $(a, 0)$ and $(b, 0)$ be elements such that $(a, 0) \land (b, 0)$ exists. It follows from Lemma [9] that $a \land b$ exists and $(a, 0) \land (b, 0) = (a \land b, 0)$. Then, $f(a) \land f(b)$ exists and $f(a \land b) = f(a) \land f(b)$. Again by Lemma [9] we obtain that $(f(a), 0) \land (f(b), 0)$ exists and $(f(a), 0) \land (f(b), 0) = (f(a) \land f(b), 0)$. Hence, $K(f)(a, 0) \land (b, 0) = K(f)(a) \land K(f)(b), 0)$.

Therefore, $K(f)$ is a morphism in $\text{KP}$. □

Using the previous lemma, it is immediate to see that $K$ defines a functor from $P_0$ to $\text{KP}$.

Let $P \in P_0$. The map $\alpha_P : P \to C(K(P))$ given by $\alpha_P(a, b) = (a, 0)$ is easily seen to be an isomorphism in $P_0$. The fact that $\alpha_P$ is morphism is a consequence of Lemma [9].

The proof of the following lemma is immediate. It easily follows from it that $C : \text{KP} \to P_0$ is a functor.

Lemma 14.
(a) If $(T, \leq, \sim, c) \in \text{KP}$ then $(C(T), \leq, c) \in P_0$.
(b) If $g \in \text{KP}$ then $C(g) \in P_0$.

Definition 15. For $T \in \text{KP}$ we also name (CK) to the following condition

(CK) $(\forall x, y \geq c)(x \land y = c, \text{then } (\exists z)(z \lor c = x \land \sim z \lor c = y))$.

Remark 16. In Section [2] the condition (CK) was defined for centered Kleene algebras. Notice that if $(T, \land, \lor, \sim, c, 0, 1)$ is a centered Kleene algebra, then the structure $(T, \leq, \sim, c)$ is a Kleene poset, where $\leq$ is the order associated with the lattice $(T, \land, \lor)$. In particular, we have that $(T, \land, \lor, \sim, c, 0, 1)$ satisfies the condition
(CK) given in Section 15 if and only if \((T, \leq, \sim, c)\) satisfies the condition (CK) given in Definition 15. This fact justifies the use of the same label for both conditions.

As in the case of bounded distributive lattices, if \((P, \leq, 0)\) is a lattice, then the structure \((K(P), \leq, \sim, c)\) satisfies (CK).

**Remark 17.** For \(T \in K\) and \(x \in T\) we have \((x \lor c) \land (\sim x \lor c) = c\), which shows that the map \(\beta_T : T \to K(C(T))\) defined by \(\beta_T(x) = (x \lor c, \sim x \lor c)\) is a well defined map. We also have that \(T\) satisfies (CK) if and only if \(\beta_T\) is surjective.

Let \(f : (P, \leq) \to (Q, \leq)\) be an order isomorphism, i.e., a bijective map such that for every \(a, b \in P\), \(a \leq b\) if and only if \(f(a) \leq f(b)\). Let \(a, b \in P\) such that \(a \land b\) exists. Then \(f(a) \land f(b)\) exists and \(f(a) \land f(b) = f(a \land b)\). Straightforward computations prove the following remark.

**Remark 18.** Let \(f : T \to U\) be a morphism in \(K\). If \(f\) is an order isomorphism, then \(f\) is an isomorphism in \(K\).

**Lemma 19.** If \(T \in K\), then \(\beta_T\) is an injective morphism in \(K\). Moreover, if \(T\) satisfies (CK), then \(\beta_T\) is an isomorphism in \(K\).

**Proof.** In order to show that \(\beta_T\) preserves the order, let \(x, y \in T\) such that \(x \leq y\). Then \(x \lor c \leq y \lor c\) and \(\sim x \lor c \geq \sim y \lor c\), which means that \(\beta_T(x) \leq \beta_T(y)\). Thus, \(\beta_T\) preserves the order. It is immediate that \(\beta_T\) preserves the involution. Let now \(x, y \in T\) such that \(x, y \geq c\). Assume that \(x \land y\) exists. So \(\beta_T(x \land y) = (x \land y, c)\). Moreover, we have that \(\beta_T(x) = (x, c)\) and \(\beta_T(y) = (y, c)\). Thus, it follows from Lemma 16 that \((x, c) \land (y, c)\) exists and \((x, c) \land (y, c) = (x \land y, c)\). Then \(\beta_T(x \land y) = \beta_T(x) \land \beta_T(y)\). Hence, \(\beta_T\) is a morphism in \(K\).

Now we will prove that for every \(x, y \in T\), \(x \leq y\) if and only if \(\beta_T(x) \leq \beta_T(y)\). The fact that if \(x \leq y\), then \(\beta_T(x) \leq \beta_T(y)\) was proved before. In order to prove the converse, suppose that \(\beta_T(x) \leq \beta_T(y)\), i.e., \(x \lor c \leq y \lor c\) and \(x \land c \leq y \land c\). So, by the definition of Kleene poset we have \(x \leq y\). In particular, \(\beta_T\) is an injective morphism.

Finally, assume that \(T\) satisfies (CK). It follows from remarks 17 and 18 that \(\beta_T\) is an isomorphism in \(K\).

**Theorem 20.** Let \(K^{CK}\) be the full subcategory of \(K\) whose objects satisfy the condition (CK). The functors \(K\) and \(C\) establish a categorical equivalence between \(P_0\) and \(K^{CK}\) with natural isomorphisms \(\alpha\) and \(\beta\).

Let \(MS\) be the category whose objects are bounded semilattices and whose morphisms are the algebra homomorphisms.

**Definition 21.** We write \(KMS\) to denote the category whose objects are the structures \((T, \leq, \sim, c, 0, 1)\) which satisfy the following conditions:

\begin{itemize}
    \item [\text{(KM1)}] \((T, \leq, \sim, c) \in K\).
    \item [\text{(KM2)}] 0 is the first element of \((T, \leq)\) and 1 is the greatest element of \((T, \leq)\).
    \item [\text{(KM3)}] For every \(x, y \in T\), if \(x \geq c\), then \(x \land y\) exists.
    \item [\text{(KM4)}] For every \(x, y \in T\), if \(x \geq c\), then \((x \land y) \lor c = x \land (y \lor c)\).
\end{itemize}

The morphisms of \(KMS\) are maps \(g\) between objects of \(KMS\) which preserve the order, the involution and such that for every \(x, y \geq c\), \(g(x \land y) = g(x) \land g(y)\).

We write \(K^{CM}\) to denote the full subcategory of \(KMS\) whose objects satisfy the condition (CK). Note that in presence of the condition (KM1) we can replace the
Corollary 22. The functors $K$ and $C$ establish a categorical equivalence between $MS$ and $KMS^{CK}$ with natural isomorphisms $\alpha$ and $\beta$.

Proof. Let $H \in MS$. The condition (KM1) for $K(H)$ follows from Theorem 20. We also have that $(0, 1)$ is the first element of $K(H)$ and $(1, 0)$ is the last element of $K(H)$, i.e., we have the condition (KM2). Let $x, y \in K(H)$ with $x \geq c$. Then there are $a, b, d \in H$ such that $x = (a, 0)$, $y = (b, d)$ and $b \land d = 0$. Since in particular $a \land b$ exists, then it follows from Lemma 11 that $x \land y = (a \land b, d)$. Then we have proved (KM3). Again taking into account Lemma 11 we deduce that $((a, 0) \land (b, d)) \lor (0, 0) = (a \land b, 0)$. The mentioned lemma also implies that $(b, d) \lor (0, 0) = (b, 0)$ and $(a, 0) \land (b, 0) = (a \land b, 0)$. Thus, $(x \land y) \lor c = x \land (y \lor c)$, which is (KM4). Therefore $K(H) \in KMS$. It is immediate that if $T \in KMS$, then $C(T) \in MS$. □

4. The variety of hemi-implicative semilattices (lattices)

In this section we recall definitions and properties about the algebras we will consider later: hemi-implicative semilattices (lattices) [21], Hilbert algebras with infimum [12], implicative semilattices [17] and semi-Heyting algebras [20].

Definition 23. A hemi-implicative semilattice is an algebra $(H, \land, \rightarrow, 1)$ of type $(2, 2, 0)$ which satisfies the following conditions:

(W1) $(H, \land, 1)$ is an upper bounded semilattice,

(W2) for every $a, b, d \in H$, if $a \leq b \rightarrow d$ then $a \land b \leq d$,

(W3) $a \rightarrow a = 1$ for every $a \in H$.

A bounded hemi-implicative semilattice is an algebra $(H, \land, \rightarrow, 0, 1)$ of type $(2, 2, 0, 0)$ such that $(H, \land, \rightarrow, 1)$ is a hemi-implicative semilattice and $0$ is the first element with respect to the order. A hemi-implicative lattice is an algebra $(H, \land, \lor, \rightarrow, 0, 1)$ of type $(2, 2, 2, 0, 0)$ such that $(H, \land, \lor, 0, 1) \in BDL$ and $(H, \land, \rightarrow, 1)$ is a hemi-implicative semilattice.

Hemi-implicative semilattices were called weak implicative semilattices in [21]. We write $hIS_0$ for the category of bounded hemi-implicative semilattices and $hBDL$ for the category of hemi-implicative lattices.

Remark 24. If $(H, \land)$ is a semilattice and $\rightarrow$ a binary operation, then $H$ satisfies (W2) if and only if for every $a, b \in A$, $a \land (a \rightarrow b) \leq b$. Therefore, the class of hemi-implicative semilattices (lattices) is a variety [24].

The variety of Hilbert algebras is the algebraic counterpart of the implicative fragment of Intuitionistic Propositional Logic. These algebras were introduced in the early 50’s by Henkin and Skolem for some investigations on the implication in intuitionistic logic and other non-classical logics [18]. In the 1960s, they were studied especially by Horn and Diego [10].

Definition 25. A Hilbert algebra is an algebra $(H, \rightarrow, 1)$ of type $(2, 0)$ that satisfies the following conditions:

1) $a \rightarrow (b \rightarrow a) = 1$.
2) $a \rightarrow (b \rightarrow d) = (a \rightarrow b) \rightarrow (a \rightarrow d)$.
3) If $a \rightarrow b = b \rightarrow a = 1$, then $a = b$. 

11
It is well a known fact that Hilbert algebras form a variety. In every Hilbert algebra we have the partial order defined by $a \leq b$ if and only if $a \rightarrow b = 1$. In particular, $a \rightarrow a = 1$ for every $a$.

**Example 26.** In any poset $(H, \leq)$ with last element 1 it is possible to define the following binary operation:

$$a \rightarrow b = \begin{cases} 1, & \text{if } a \leq b; \\ b, & \text{if } a \nleq b. \end{cases}$$

The structure $(H, \rightarrow, 1)$ is a Hilbert algebra.

For the following definition see [12].

**Definition 27.** An algebra $(H, \land, \rightarrow, 1)$ is a Hilbert algebra with infimum if the following conditions hold:

1) $(H, \rightarrow, 1)$ is a Hilbert algebra,
2) $(H, \land, 1)$ is an upper bounded semilattice,
3) For every $a, b \in H$, $a \leq b$ if and only if $a \rightarrow b = 1$, where $\leq$ is the semilattice order.

An algebra $(H, \land, \rightarrow, 0, 1)$ of type $(2, 2, 0, 0)$ is a bounded Hilbert algebra with infimum if $(H, \land, \rightarrow, 1)$ is a Hilbert algebra with infimum and 0 is the first element with respect to the induced order.

In [12] it is proved that the class of Hilbert algebras with infimum is a variety. We note that this result also follows from the results given by P. M. Idziak in [14] for BCK-algebras with lattice operations. The following proposition can be found in [12, Theorem 2.1].

**Proposition 28.** Let $(H, \land, \rightarrow, 1)$ be an algebra of type $(2, 2, 0)$. Then $(H, \land, \rightarrow, 1)$ is a Hilbert algebra with infimum if and only if for every $a, b, d \in H$ the following conditions hold:

a) $(H, \rightarrow, 1)$ is a Hilbert algebra,

b) $(H, \land, 1)$ is an upper bounded semilattice,

c) $a \land (a \rightarrow b) = a \land b$,

d) $a \rightarrow (b \land d) \leq (a \rightarrow b) \land (a \rightarrow d)$.

In every Hilbert algebra with infimum we have $a \rightarrow a = 1$ and $a \land (a \rightarrow b) \leq b$, so the variety of Hilbert algebras with infimum is a subvariety of the variety of hemi-implicative semilattices.

We will write $\text{Hil}_0$ for the category whose objects are bounded Hilbert algebras with infimum and whose morphisms are the corresponding algebra homomorphisms. Clearly $\text{Hil}_0$ is a full subcategory of $\text{hIS}_0$.

**Definition 29.** An implicative semilattice is an algebra $(H, \land, \rightarrow)$ of type $(2, 2)$ such that $(H, \land)$ is a semilattice, and for every $a, b, d \in H$ we have that $a \land b \leq d$ if and only if $a \leq b \rightarrow d$.

Implicative semilattices have a greatest element, denoted by 1. In this paper we shall include the constant 1 in the language of the algebras. Implicative semilattices are the algebraic models of the implication-conjunction fragment of Intuitionistic Propositional Logic. For more details about these algebras see [9].

An algebra $(H, \land, \rightarrow, 0, 1)$ of type $(2, 2, 0, 0)$ is a bounded implicative semilattice if $(H, \land, \rightarrow, 1)$ is an implicative semilattice and 0 is the first element with respect to the order. We write $\text{IS}_0$ for the category whose objects are bounded implicative semilattices and whose morphisms are the corresponding algebra homomorphisms. We have that $\text{IS}_0$ is a full subcategory of $\text{hIS}_0$. 

It is part of the folklore of the subject that the class of implicative semilattices is a variety. There are many ways to axiomatize the variety of implicative semilattices. In the following lemma we propose a possible axiomatization that will play an important role in the next section.

**Lemma 30.** Let \((H, \land, \lor, \rightarrow, 0, 1)\) be an upper bounded semilattice and \(\rightarrow\) a binary operation on \(H\). The following conditions are equivalent:

(a) For every \(a, b, d \in H\), \(a \leq b \rightarrow d\) if and only if \(a \land b \leq d\).
(b) For every \(a, b, d \in H\) the following conditions hold:
   1) \(a \land (a \rightarrow b) \leq b\),
   2) \(a \rightarrow a = 1\),
   3) \(a \rightarrow (b \land d) = (a \rightarrow b) \land (a \rightarrow d)\),
   4) \(a \leq b \rightarrow (a \land b)\).

**Proof.** Assume the conditions 1), 2), 3) and 4) of (b). It follows from 1) that if \(a \leq b \rightarrow d\), then \(a \land b \leq d\). Suppose now that \(a \land b \leq d\). It follows from 3) that \(b \rightarrow (a \land b) \leq b \rightarrow d\). But by 4) we have that \(a \leq b \rightarrow (a \land b)\), so \(a \leq b \rightarrow d\). Then, \(a \leq b \rightarrow d\) if and only if \(a \land b \leq d\). For the converse of this property see [17]. □

**Remark 31.** A moment of reflection shows that implicative semilattices are Hilbert algebras with infimum where the implication is the right residuum of the infimum, or equivalently, where the following equation holds [12]: \(a \leq b \rightarrow (a \land b)\). Alternatively, it follows from Lemma [33] that an implicative semilattice is a hemi-implicative semilattice which satisfies \(a \rightarrow (b \land d) = (a \rightarrow b) \land (a \rightarrow d)\) and \(a \leq b \rightarrow (a \land b)\) for every \(a, b, d\).

Semi-Heyting algebras were introduced by H.P. Sankappanavar in [20] as an abstraction of Heyting algebras. These algebras share with Heyting algebras the following properties: they are pseudocomplemented and distributive lattices and their congruences are determined by the lattice filters.

**Definition 32.** An algebra \((H, \land, \lor, \rightarrow, 0, 1)\) of type \((2, 2, 2, 0, 0)\) is a **semi-Heyting algebra** if the following conditions hold for every \(a, b, d\) in \(H\):

- **(SH1)** \((H, \land, \lor, \rightarrow, 0, 1) \in \text{BDL}\),
- **(SH2)** \(a \land (a \rightarrow b) = a \land b\),
- **(SH3)** \(a \land (b \rightarrow d) = a \land ((a \land b) \rightarrow (a \land d))\),
- **(SH4)** \(a \rightarrow a = 1\).

We write \(\text{SH}\) for the category of semi-Heyting algebras. A semi-Heyting algebra can be seen as a hemi-implicative lattice which satisfies (SH2) and (SH3). Therefore, \(\text{SH}\) is a full subcategory of \(h\text{BDL}\).

**Remark 33.** Implicative semilattices satisfy the inequality \(a \leq b \rightarrow (a \land b)\) because \(a \land b \leq a \land b\), or simply by Lemma [33]. Semi-Heyting algebras also satisfy the inequality \(a \leq b \rightarrow (a \land b)\). This fact follows from (SH3) and (SH4) in the following way:

\[
\begin{align*}
a \land (b \rightarrow (a \land b)) &= a \land ((a \land b) \rightarrow (a \land b)) \\
&= a \land 1 \\
&= a,
\end{align*}
\]

which means that \(a \leq b \rightarrow (a \land b)\).

In the following example we will show the following facts: \(\text{Hil}_0\) is a proper subvariety of \(\text{hIS}_3\) and \(\text{SH}\) is a proper subvariety of \(h\text{BDL}\).
**Example 34.** Let \( H \) be the chain of three elements with \( 0 < a < 1 \). We define on \( H \) the following binary operation:

\[
\begin{array}{c|ccc}
\rightarrow & 0 & a & 1 \\
0 & 1 & a & 1 \\
a & 0 & 1 & 1 \\
1 & 0 & 0 & 1 \\
\end{array}
\]

Straightforward computations show that \((H, \land, \lor, \rightarrow, 0, 1) \in \text{hBDL}\). In particular, \((H, \land, \rightarrow, 0, 1) \in \text{hIS}_0\). However, \((H, \land, \rightarrow, 0, 1) \notin \text{Hil}_0\) and \((H, \land, \lor, \rightarrow, 0, 1) \notin \text{SH}\) because \(1 \land (1 \rightarrow a) \neq 1 \land a\).

It is a known fact that the variety \( \text{IS}_0 \) is properly included in \( \text{Hil}_0 \). We give an example that shows it. Let \( H \) be the universe of the boolean lattice of four elements, where \( a \) and \( b \) are the atoms. Then \((H, \land, \rightarrow, 0, 1) \in \text{Hil}_0\), where \( \rightarrow \) is the operation defined in Example 26. Since \( a \rightarrow 0 = 0 \) and \( 0 \neq b \), then \((H, \land, \rightarrow, 0, 1) \notin \text{IS}_0\).

It is also a known fact that \( \text{HA} \) is a proper subvariety of \( \text{SH} \). We also provide an example that shows it. Consider the chain of two elements. We define the following binary operation:

\[
\begin{array}{c|cc}
\rightarrow & 0 & 1 \\
0 & 1 & 0 \\
1 & 0 & 1 \\
\end{array}
\]

Then \((H, \land, \lor, \rightarrow, 0, 1) \in \text{SH}\). Since \(0 \rightarrow 1 = 0\) and \(0 \neq 1\), then \((H, \land, \lor, \rightarrow, 0, 1)\) is not a Heyting algebra.

The following diagrams show the relations among the categories defined in this section:

\[
\begin{array}{c}
\text{hIS}_0 \\
\text{Hil}_0 \\
\text{IS}_0 \\
\end{array} \quad \begin{array}{c}
\text{hBDL} \\
\text{SH} \\
\text{HA} \\
\end{array}
\]

In \([5]\) an extension of Kalman’s functor was studied for the variety of algebras with implication \((H, \land, \lor, \rightarrow, 0, 1)\) which satisfy \(a \land (a \rightarrow b) \leq b\) for every \(a, b\).

### 5. Kalman’s construction for \( \text{hIS}_0 \) and \( \text{hBDL} \)

The fact that Kalman’s construction can be extended consistently to Heyting algebras led us to believe that some of the picture could be lifted to the varieties \( \text{hIS}_0 \) and \( \text{hBDL} \). More precisely, it arises the natural question of wether is it possible to find some category \( \text{KhIS}_0 \) in order to obtain an equivalence between \( \text{hIS}_0 \) and some full subcategory of \( \text{KhIS}_0 \), making the following diagram commute:

\[
\begin{array}{c}
\text{hIS}_0 \\
\text{MS} \\
\end{array} \quad \begin{array}{c}
\text{KhIS}_0 \\
\text{KMS} \\
\end{array}
\]

Similarly, it arises the question of wether is it possible to find some category \( \text{KhBDL} \) in order to obtain an equivalence between \( \text{hBDL} \) and certain full subcategory of
KhBDL, making the following diagram commute:

\[
\begin{array}{c}
\text{hBDL} \\
\downarrow K \\
\text{BDL} \\
\downarrow K \\
\text{hIS} \\
\end{array}
\]

In this section, we answer these questions in the positive. Moreover, we extend Kalman’s functor to the categories \( \text{Hil}_0 \), \( \text{IS}_0 \) and \( \text{SH} \).

The aim of Section 8 was to obtain a categorical equivalence between \( \text{MS} \) and \( \text{KMS}^{\text{CK}} \) (Corollary 22) to be applied in the present section to the category \( \text{hIS}_0 \). For the case of the category \( \text{hBDL} \) we will also use Theorem 11 which establishes an equivalence between \( \text{BDL} \) and \( \text{KA}^{\text{CK}} \).

5.1. Kalman’s construction for \( \text{hIS}_0 \). Let \( H \in \text{hIS}_0 \). We write \( \rightarrow \) for the implication of \( H \) and define a binary operation on \( K(H) \) (also denoted \( \rightarrow \)) by

\[
(a, b) \rightarrow (d, e) := ((a \rightarrow d) \land (e \rightarrow b), a \land e).
\]

This definition is motivated by Remark 35. Note that since \( a \land b = d \land e = 0 \), then \( (a \rightarrow d) \land (e \rightarrow b) \land a \land e = 0 \) because \( a \land (a \rightarrow d) \leq d \) and \( d \land e = 0 \). Hence, \( (a, b) \rightarrow (d, e) \in K(H) \). The next definition is motivated by the original Kalman’s construction.

**Definition 35.** We denote by \( \text{KhIS}_0 \) the category whose objects are the structures \( (T, \leq, \sim, \rightarrow, c, 0, 1) \) such that \( (T, \leq, \sim, 0, 1) \in \text{KMS} \) and \( \rightarrow \) is a binary operation on \( T \) which satisfies the following conditions for every \( x, y \in T \):

\[(K1) \quad c \leq x \rightarrow (y \lor c),
\]

\[(K2) \quad x \land ((x \lor c) \rightarrow (y \lor c)) \leq y \lor c,
\]

\[(K3) \quad x \rightarrow x = 1,
\]

\[(K4) \quad (x \rightarrow y) \land c = (\sim x \land c) \lor (y \land c),
\]

\[(K5) \quad (x \rightarrow \sim y) \lor c = ((x \lor c) \rightarrow (\sim y \lor c)) \land ((y \lor c) \rightarrow (\sim x \lor c)).
\]

The morphisms of \( \text{KhIS}_0 \) are the morphisms \( g \) of \( \text{KMS} \) which satisfy the condition \( g(x \rightarrow y) = g(x) \rightarrow g(y) \) for every \( x, y \).

In what follows we will prove that if \( H \in \text{hIS}_0 \), then \( K(H) \in \text{KhIS}_0 \), where the binary operation \( \rightarrow \) in \( K(H) \) is that defined in (5).

**Proposition 36.** Let \( H \in \text{hIS}_0 \). Then \( K(H) \in \text{KhIS}_0 \). Furthermore, \( K \) extends to a functor from \( \text{hIS}_0 \) to \( \text{KhIS}_0 \), which we also denote by \( K \).

**Proof.** Throughout this proof we use lemmas 9 and 11. Recall that \( c = (0, 0) \).

Let \( (a, b), (d, e) \in K(H) \). In particular, \( (d, e) \lor c = (d, 0) \). Then

\[
(a, b) \rightarrow ((d, e) \lor c) = (a, b) \rightarrow (d, 0) = ((a \rightarrow d) \land (0 \rightarrow b), 0) \leq c.
\]

Thus we have proved the condition (K1). In order to prove (K2) we make the following computation:

\[
(a, b) \land (((a, b) \lor c) \rightarrow ((d, e) \lor c)) = (a, b) \land ((a, 0) \rightarrow (d, 0)) = (a, b) \land (a \rightarrow d, b) \land (d, b) = (d, 0) \land (d, e) \lor c.
\]
The proof of the condition (K3) is immediate. In order to prove (K4), note that
\((a, b) \to (d, e)\) and
\([(a, b) \land c] \lor [(d, e) \land c] = (0, a \land e)\) and
\((\sim(a, b) \land c) \lor ((d, e) \land c) = (0, a \lor e)\)
\[
\begin{align*}
(\sim(a, b) \land c) \lor ((d, e) \land c) & = (0, a \lor e) \\
& = (0, a \land e).
\end{align*}
\]
Hence, we have that
\[(a, b) \to (d, e) \land c = (\sim(a, b) \land c) \lor ((d, e) \land c).
\]
Finally, we shall prove (K5). First note that
\[(a, b) \to (\sim(d, e)) \lor c = ((a \to e, d)) \lor c
\]
\[
= ((a \to e) \land (d \to b), 0).
\]
Then,
\[(6) \quad ((a, b) \to (\sim(d, e)) \lor c = ((a \to e) \land (d \to b), 0).
\]
On the other hand,
\[(a, 0) \to (e, 0)) \land ((d, 0) \to (b, 0)) = ((a \to e) \land (d \to b), 0).
\]
Hence,
\[(7) \quad ((a, 0) \to (e, 0)) \land ((d, 0) \to (b, 0)) = ((a \to e) \land (d \to b), 0).
\]
Since \((a, b) \lor c = (a, 0), (d, e) \lor c = (e, 0), (d, e) \lor c = (d, 0), \) and \((\sim(a, b) \lor c = (b, 0)),\) then it follows from (6) and (7) that the condition (K5) holds. Thus, \(K(H) \in \text{KhlS}_0.\)

Let \(f : H \to G\) be a morphism in \(\text{hlS}_0.\) Straightforward computations show that \(K(f)\) preserves the implication operation, which implies that \(K(f)\) is a morphism in \(\text{KhlS}_0.\)

\begin{proof}
We have that \(C(T)\) is closed under the operation \(\to.\) In order to prove it, let \(x, y \geq c.\) By (K1) we have that
\[
\begin{align*}
c \leq (x \lor c) & \Rightarrow (y \lor c) \\
& \Rightarrow x \to y,
\end{align*}
\]
so \(x \to y \in C(T).\) Thus, the restriction of \(\to\) to \(C(T)\) is indeed an operation on \(C(T)\). Let \(x, y \geq c.\) It follows from (K2) that \(x \lor (x \to y) \leq y\) and it follows from (K3) that \(x \to x = 1.\) Then \((C(T), \land, \to, c, 1) \in \text{hlS}_0.\) The rest of the proof is immediate.
\end{proof}

\begin{remark}
For \(H \in \text{hlS}_0\) we have that \(\alpha_H(a \to b) = \alpha_H(a) \to \alpha_H(b)\) for every \(a, b \in H.\) Moreover, \(\alpha_H\) is an isomorphism in \(\text{hlS}_0.\)

For the case of \(T \in \text{KhlS}_0\) we will prove that \(\beta_T\) preserves the implication.
\end{remark}

\begin{lemma}
Let \(T \in \text{KhlS}_0.\) Then \(\beta_T\) is injective and a morphism in \(\text{KhlS}_0.\) Moreover, if \(T\) satisfies (CK) then \(\beta_T\) is an isomorphism in \(\text{KhlS}_0.\)
\end{lemma}

\begin{proof}
We need to prove that \(\beta_T(x \to y) = \beta_T(x) \to \beta_T(y)\) for every \(x, y.\) In an equivalent way, we need to prove that \(\beta_T(x \to \sim y) = \beta_T(x) \to \beta_T(\sim y)\) for every \(x, y.\) It follows from (K4) and (K5) that
\[
\begin{align*}
\beta_T(x \to \sim y) & = ((x \to \sim y) \lor c), \sim(x \to \sim y) \lor c) \\
& = ((x \lor c) \to (\sim y \lor c) \lor (\sim x \lor c), (x \lor c) \land (y \lor c)) \\
& = \beta_T(x) \to \beta_T(\sim y).
\end{align*}
\]
\end{proof}
We write $\text{KhIS}_{0}^{\text{CK}}$ for the full subcategory of $\text{KhIS}_{0}$ whose objects satisfy (CK). The proof of the following theorem follows from Corollary 22, Proposition 36, Proposition 37, Remark 38, and Lemma 39.

**Theorem 40.** The functors $\text{K}$ and $\text{C}$ establish a categorical equivalence between $\text{hIS}_{0}$ and $\text{KhIS}_{0}^{\text{CK}}$ with natural isomorphisms $\alpha$ and $\beta$.

Let $T \in \text{KhIS}_{0}$. We define the following condition for every $x, y \in T$:

$$(K6) \quad x \leq (y \vee c) \rightarrow ((x \vee c) \land (y \vee c)).$$

The next lemma is the motivation to consider the condition (K6).

**Lemma 41.** If $H \in \text{hIS}_{0}$ satisfies the inequality $a \leq b \rightarrow (a \land b)$ for every $a, b$, then $\text{K}(H)$ satisfies (K6).

**Proof.** First note that for every $(a, b) \in \text{K}(H)$, $(a, b) \vee c = (a, 0)$. In order to prove (K6) we make the following computation:

$$(d, 0) \rightarrow ((a, 0) \land (d, 0)) = (d, 0) \rightarrow (a \land d, 0) \geq (a, b).$$

Hence, we obtain (K6).

The following lemma will play an important role in this paper.

**Lemma 42.** If $T \in \text{KhIS}_{0}$ satisfies (K6), then $T$ satisfies (CK).

**Proof.** Let $x, y \geq c$ such that $x \land y = c$. Taking into account (KM3) we can define $z = (y \rightarrow \sim y) \land x$. It follows from (K4) that

$$z \land c = ((y \rightarrow \sim y) \land c) \land x = ((\sim y \land c) \lor (\sim y \land c)) \land x = (\sim y \land c) \land x = \sim y \land x = \sim y.$$

Hence, $\sim z \lor c = y$. In order to prove that $z \lor c = x$, we use the conditions (KM3), (KM4), (K5), (K6) and the fact that $x \land y = c$ as follows:

$$z \lor c = (x \land (y \rightarrow \sim y)) \lor c = x \land ((y \rightarrow \sim y) \lor c) = ((y \lor c) \rightarrow (\sim y \lor c)) \land x = (x \lor c) \land ((y \lor c) \rightarrow (x \land y)) = (x \lor c) \land ((y \lor c) \rightarrow ((x \lor c) \land (y \lor c))) = x \lor c = x.$$

Therefore, $z \lor c = x$. \qed

5.2. **Kalman’s construction for Hil$_0$.** We write $\text{KHil}_{0}$ for the full subcategory of $\text{KhIS}_{0}$ whose objects satisfy the following conditions for every $x, y, z$:

- (KHil1) $(x \lor c) \rightarrow (y \rightarrow (x \lor c)) = 1,$
- (KHil2) $x \rightarrow ((y \lor c) \rightarrow (z \lor c)) = (x \rightarrow (y \lor c)) \rightarrow (x \rightarrow (z \lor c)),$
- (KHil3) If $x \rightarrow y = y \rightarrow x = 1$, then $x = y$,
- (KHil4) $x \land ((x \lor c) \rightarrow (y \lor c)) = x \land (y \lor c),$
- (KHil5) $x \rightarrow ((y \lor c) \land (z \lor c)) \leq (x \rightarrow (y \lor c)) \land (x \rightarrow (z \lor c))$. 

17
Example 43. In every centered Kleene algebra \((T, \land, \lor, \sim, c, 0, 1)\) it is possible to define a binary operation, that we denote by \(\rightarrow\), as follows:

\[
x \rightarrow y =
\begin{cases}
1, & \text{if } x \lor c \leq y \lor c \text{ and } x \land c \leq y \land c; \\
\sim x \lor (y \land c), & \text{if } x \lor c \leq y \lor c \text{ and } x \land c \not\leq y \land c; \\
y \lor (\sim x \land c), & \text{if } x \lor c \not\leq y \lor c \text{ and } x \land c \leq y \land c; \\
((y \lor c) \land \sim x) \lor ((\sim x \lor c) \land y), & \text{if } x \lor c \not\leq y \lor c \text{ and } x \land c \not\leq y \land c.
\end{cases}
\]

It is possible to prove that \((T, \leq, \sim, c, 0, 1)\) \(\in\) \(\text{KMS}\), and it is not difficult to see that \((T, \sim, \rightarrow, c, 0, 1)\) \(\in\) \(\text{KHil}_0\).

By endowing the centered Kleene algebra given in [2] Example 2.5 with the binary operation \(\rightarrow\) just defined we obtain an example of an object of \(\text{KHil}_0\) which does not satisfy the condition (CK).

Lemma 44.

(a) If \(H \in \text{Hil}_0\), then \(\text{K}(H) \in \text{KHM}_0\).

(b) If \(T \in \text{KHil}_0\), then \(\text{C}(T) \in \text{Hil}_0\).

Proof. Let \(H \in \text{Hil}_0\) and take \((a, b), (d, e)\) and \((f, g)\) in \(\text{K}(H)\). In what follows we will use Proposition [28].

Taking into account that \(a \rightarrow (d \rightarrow a) = 1\) we obtain:

\[
\begin{align*}
(a, 0) \rightarrow ((d, 0) \rightarrow (a, 0)) & = (a, 0) \rightarrow (d \rightarrow a, 0) \\
& = (a \rightarrow (d \rightarrow f), 0) \\
& = ((a \rightarrow d) \rightarrow (a \rightarrow f), 0) \\
& = (a \rightarrow d, 0) \rightarrow (a \rightarrow f, 0) \\
& = ((a, b) \rightarrow (d, 0)) \rightarrow ((a, b) \rightarrow (f, 0)).
\end{align*}
\]

which is the condition (KHil1).

Since \(a \rightarrow (d \rightarrow f) = (a \rightarrow d) \rightarrow (a \rightarrow f)\), then

\[
\begin{align*}
(a, b) \rightarrow ((d, 0) \rightarrow (f, 0)) & = (a, b) \rightarrow (d \rightarrow f, 0) \\
& = (a \rightarrow (d \rightarrow f), 0) \\
& = ((a \rightarrow d) \rightarrow (a \rightarrow f), 0) \\
& = (a \rightarrow d, 0) \rightarrow (a \rightarrow f, 0) \\
& = ((a, b) \rightarrow (d, 0)) \rightarrow ((a, b) \rightarrow (f, 0)).
\end{align*}
\]

Hence, we have proved (KHil2).

In order to prove (KHil3) suppose that \((a, b) \rightarrow (d, e) = (d, e) \rightarrow (a, b) = (1, 0)\), so \(a \rightarrow d = d \rightarrow a = 1\) and \(b \rightarrow e = e \rightarrow b = 1\). Then \(a = d\) and \(b = e\), i.e., \((a, b) = (d, e)\), which was our aim.

The condition (KHil4) is a consequence of the equality \(a \land (a \rightarrow d) = a \land d\). Indeed,

\[
\begin{align*}
(a, b) \land ((a, 0) \rightarrow (d, 0)) & = (a, b) \land (a \rightarrow d, 0) \\
& = (a \land (a \rightarrow d), b) \\
& = (a \land d, b) \\
& = (a, b) \land (d, 0).
\end{align*}
\]

Finally, we will prove (KHil5). By the condition \(a \rightarrow (d \land f) \leq (a \rightarrow d) \land (a \rightarrow f)\) we have that

\[
\begin{align*}
(a, b) \rightarrow ((d, 0) \land (f, 0)) & = (a, b) \rightarrow (d \land f, 0) \\
& = (a \rightarrow (d \land f), 0) \\
& \leq ((a \rightarrow d) \land (a \rightarrow f), 0) \\
& = (a \rightarrow d, 0) \land (a \rightarrow f, 0) \\
& = ((a, b) \rightarrow (d, 0)) \land ((a, b) \rightarrow (f, 0)).
\end{align*}
\]

Then \(\text{K}(H) \in \text{KHM}_0\). Finally, it follows from Proposition [28] that if \(T \in \text{KHil}_0\), then \(\text{C}(T) \in \text{Hil}_0\). \(\square\)

We write \(\text{KHil}^\text{CK}\) for the full subcategory of \(\text{KHil}_0\) whose objects satisfy (CK). The following corollary follows from Theorem [40] and Lemma [44].
The functors $K$ and $C$ establish a categorical equivalence between $\text{Hil}_0$ and $\text{KHil}_{0}^{\text{CK}}$ with natural isomorphisms $\alpha$ and $\beta$.

5.3. Kalman’s construction for $\text{IS}_0$. We write $\text{KIS}_0$ for the full subcategory of $\text{KhiS}_0$ whose objects $T$ satisfy the condition (K6) and the following additional condition for every $x, y \in T$:

$$(K7) \ x \to ( (y \lor c) \land (z \lor c) ) = (x \to (y \lor c)) \land (x \to (z \lor c))$$

Lemma 46. Let $H \in \text{IS}_0$. The fact that $K(H)$ satisfies (K6) follows from lemmas $30$ and $41$. On the other hand, it follows from Lemma $30$ that

$$(a, b) \to ((d, 0) \land (f, 0)) \ = \ (a, b) \to (d \land f, 0)$$

Thus, we have the condition (K7). Then $K(H) \in \text{KIS}_0$.

The fact that if $T \in \text{KIS}_0$, then $C(T) \in \text{IS}_0$ is also consequence of Lemma $30$. □

The following corollary follows from Theorem $1$, Lemma $42$ and Lemma $46$.

Corollary 47. The functors $K$ and $C$ establish a categorical equivalence between $\text{IS}_0$ and $\text{KIS}_0$ with natural isomorphisms $\alpha$ and $\beta$.

Since $\text{IS}_0$ is a full subcategory of $\text{Hil}_0$, it follows from corollaries $16$ and $17$ that $\text{KIS}_0$ is a full subcategory of $\text{KHil}_{0}^{\text{CK}}$.

5.4. Kalman’s construction for $\text{hBDL}$. In what follows we define a category which will be related with the category $\text{hBDL}$.

Definition 48. We write $\text{KhBDL}$ for the category whose objects are the algebras $(T, \land, \lor, \to, \neg, c, 0, 1)$ of type $(2, 2, 2, 1, 0, 0, 0)$ such that $(T, \land, \lor, \to, c, 0, 1) \in \text{KA}_{c}$ and the conditions (K1), (K2), (K3), (K4) and (K5) are satisfied. The morphisms of the category are the corresponding algebra homomorphisms.

By the Example $33$ in every centered Kleene algebra $(T, \land, \lor, \to, c, 0, 1)$ we can define a binary operation $\to$ such that $(T, \land, \lor, \to, c, 0, 1) \in \text{KhBDL}$. In particular, if $(T, \land, \lor, 0, c, 1)$ is the centered Kleene algebra given in [20] Example 2.5], then $(T, \land, \lor, \to, c, 0, 1) \in \text{KhBDL}$, where $\to$ is the implication considered in Example $33$.

It is immediate that $(T, \land, \lor, c, 0, 1)$ does not satisfy the condition (CK).

Note that $(H, \land, \lor, \to, 0, 1) \in \text{hBDL}$ if and only if $(H, \land, \lor, \to, 0, 1) \in \text{hIS}_0$. Also note that $(T, \land, \lor, \to, \neg, c, 0, 1) \in \text{KhBDL}$ if and only if $(T, \land, \lor, \neg, c, 0, 1) \in \text{KA}_{c}$ and $(T, \leq, \neg, \to, c, 0, 1) \in \text{KIS}_0$. We write $\text{KhBDL}_{0}^{\text{CK}}$ for the full subcategory of $\text{KhBDL}$ whose objects satisfy (CK).

Theorem 49. The functors $K$ and $C$ establish a categorical equivalence between $\text{hBDL}$ and $\text{KhBDL}_{0}^{\text{CK}}$ with natural isomorphisms $\alpha$ and $\beta$.

Proof. It follows from Theorem $1$ and Theorem $49$. □

5.5. Kalman’s construction for $\text{SH}$. We write $\text{KSH}$ for the full subcategory of $\text{KhiBDL}$ whose objects satisfy the condition (KHi4) and the following additional condition:

$$(KSH3) \ x \land ((y \lor c) \to (z \lor c)) = x \land (((x \lor c) \land (y \lor c)) \to ((x \lor c) \land (z \lor c))).$$
Lemma 50.
(a) If $H \in \text{SH}$, then $K(H) \in \text{KSH}$.
(b) If $T \in \text{KSH}$, then $C(T) \in \text{SH}$.
(c) If $T \in \text{KSH}$, then $T$ satisfies (K6). In particular, $T$ satisfies (CK).

Proof. Let $H \in \text{SH}$. The condition (KHil4) follows from (SH2) (see proof of Lemma 43). Let $(a, b)$, $(d, e)$ and $(f, g)$ in $K(H)$. Taking into account (SH3) we have that

\[(a, b) \land ((d, 0) \rightarrow (f, 0)) = (a, b) \land (d \rightarrow f, 0) = (a \land (d \rightarrow f), b) = (a \land ((a \land d) \rightarrow (a \land f)), b) = (a, b) \land ((a \land d) \rightarrow (a \land f), 0) = (a, b) \land ((a \land d, 0) \rightarrow (a \land f, 0)) = (a, b) \land (((a, 0) \land (d, 0)) \rightarrow ((a, 0) \land (f, 0))),\]

which is the condition (KSH3). Then $K(H) \in \text{KSH}$.

It is immediate that if $T \in \text{KSH}$ then $C(T) \in \text{SH}$. In order to prove that $T$ satisfies (K6) we will use (K3) and (KSH3) as follows:

\[
x \land ((y \lor c) \rightarrow ((x \lor c) \land (y \lor c))) = x \land (((y \lor c) \rightarrow ((x \lor c) \land (y \lor c)) \lor c) = x \land (((x \lor c) \land (y \lor c)) \lor c) = x \land 1 = x.
\]

Then $x \leq (y \lor c) \rightarrow ((x \lor c) \rightarrow (y \lor c))$, i.e., the condition (K6). Therefore, it follows from Lemma 42 that $T$ satisfies (CK).

Theorem 51. The functors $K$ and $C$ establish a categorical equivalence between $\text{SH}$ and $\text{KSH}$ with natural isomorphisms $\alpha$ and $\beta$.

Proof. It follows from Theorem 19 and Lemma 50.

6. Well-behaved congruences in $\text{KhiS}_0$ and congruences in $\text{KhBDL}$

In this section we introduce the concept of the well-behaved congruences over objects of $\text{KhiS}_0$. They are equivalence relations with some additional properties. We will prove that if $T \in \text{KhiS}_0$ and $\theta$ is a well-behaved congruence on $T$, then it is possible to define on the quotient $T/\theta$ a partial order and operations so that $T/\theta \in \text{KhiS}_0$. For $T \in \text{KhiS}_0$ we study the relation between the well-behaved congruences of $T$ and the congruences of $C(T)$, and in particular for the cases where $T \in \text{KHiI}_0$ or $T \in \text{KIS}_0$. For $T \in \text{KhBDL}$ or $T \in \text{KSH}$ we also study the relation between the congruences of $T$ and the congruences of $C(T)$. Finally, we study the principal well-behaved congruences of the objects in $\text{KhiS}_0$, $\text{KHiI}_0$, and $\text{KIS}_0$ and the principal congruences of the objects in $\text{KhBDL}$ and $\text{KSH}$.

We start by fixing notation and giving some useful definitions. Let $X$ be a set, $x \in X$ and $\theta$ an equivalence relation on $X$. We write $x/\theta$ to indicate the equivalence class of $x$ associated with the equivalence relation $\theta$, and $X/\theta$ to indicate the quotient set of $X$ associated with $\theta$ (i.e., the set of equivalence classes). If $T$ is an algebra, we write $\text{Con}(T)$ to denote the set of as well as the lattice of congruences of $T$.

Definition 52. Let $T \in \text{KhiS}_0$. We say that an equivalence relation $\theta$ of $T$ is a well-behaved congruence of $T$ if it satisfies the following conditions:

(C1) $\theta \in \text{Con}(T, \rightarrow, \sim)$.
(C2) For $x, y \in T$, $(x, y) \in \theta$ if and only if $(x \lor c, y \lor c) \in \theta$ and $(\sim x \lor c, \sim y \lor c) \in \theta$.
(C3) For $x, y, z$ and $w$ in $C(T)$, if $(x, y) \in \theta$ and $(z, w) \in \theta$, then $(x \land z, y \land w) \in \theta$. 

20
Note that the intersection of any family of well-behaved congruences of \( T \in \text{KhlS}_0 \) is a well-behaved congruence; therefore the set of well-behaved congruences of \( T \) ordered by the inclusion relation is a complete lattice.

**Remark 53.** The definition of well-behaved congruence can be also given for algebras of \( \text{KhlBDL} \). In this case, if \( T \in \text{KhlBDL} \), then every congruence of \( T \) is a well-behaved congruence.

In what follows we define a binary relation in \( T/\theta \), where \( T \in \text{KhlS}_0 \) and \( \theta \) is a well-behaved congruence of \( T \).

**Definition 54.** Let \( T \in \text{KhlS}_0 \). If \( \theta \) is a well-behaved congruence of \( T \), then we define in \( T/\theta \) the following binary relation \( \lll_\theta \) by:

\[
x/\theta \lll y/\theta \text{ if and only if } ((x \lor c) \land (y \lor c), x \lor c) \in \theta \text{ and } ((\neg y \lor c) \land (\neg x \lor c), \neg y \lor c) \in \theta.
\]

If there is no ambiguity, we write \( \lll \) in place of \( \lll_\theta \). Note that the definition given is good, in the sense that it is independent of the elements selected as representatives of the equivalence classes. In order to show it, suppose that \( x/\theta \lll y/\theta \). Let \( z \in x/\theta \) and \( w \in y/\theta \). Then by (C2) we have that \((x \lor c, z \lor c) \in \theta \), \((\neg x \lor c, \neg z \lor c) \in \theta \), \((y \lor c, w \lor c) \in \theta \), and \((\neg z \lor c, \neg w \lor c) \in \theta \). Hence it follows from (C3) that

\[
((z \lor c) \land (w \lor c), (x \lor c) \land (y \lor c)) \in \theta.
\]

Since, by the assumption, \((x \lor c) \land (y \lor c), x \lor c) \in \theta \), and \((x \lor c, z \lor c) \in \theta \), then

\[
((z \lor c) \land (w \lor c), z \lor c) \in \theta.
\]

In a similar way it can be proved that \((\neg x \lor c) \land (\neg w \lor c), \neg x \lor c) \in \theta \).

**Remark 55.** Let \( T \in \text{KA}_c \) and \( \theta \in \text{Con}(T) \). Since the class of centered Kleene algebras is a variety, then \( T/\theta \in \text{KA}_c \). In particular, the lattice order \( \leq \) of \( T/\theta \) is given by \( x/\theta \leq y/\theta \) if and only if \( x/\theta = (x \land y)/\theta \). In this framework the relation \( \lll \) given in Definition 54 coincides with the relation \( \leq \), i.e.,

\[
x/\theta \leq y/\theta \text{ if and only if } x/\theta \lll y/\theta.
\]

It will prove first that from the distributivity of the underlying lattice of \( T \) it follows that \( x/\theta \leq y/\theta \) if and only if \((x \lor c, (x \land y) \lor c) \in \theta \) and \((x \land c, (x \lor y) \land c) \in \theta \).

Besides, we have that \((x \land y) \lor c = (x \lor c) \land (y \lor c) \). Since \( \theta \) preserves the involution, then \((x \land c, (x \lor y) \land c) \in \theta \) if and only if \( (\neg x \lor c, \neg x \land y \lor c) \in \theta \). Therefore

\[
(8) \ x/\theta \leq y/\theta \text{ if and only if } ((x \lor c) \land (y \lor c), x \lor c) \in \theta \text{ and } (\neg x \lor c, \neg x \land y \lor c) \in \theta.
\]

We also have

\[
(9) \ (\neg x \lor c, \neg x \land y \lor c) \in \theta \text{ if and only if } ((\neg x \lor c) \land (\neg y \lor c), \neg y \lor c) \in \theta.
\]

In order to prove (9), suppose that \( (\neg x \lor c, \neg x \land y \lor c) \in \theta \). Since \((\neg y \lor c, \neg y \lor c) \in \theta \), then taking \( \land \) we obtain that \((\neg x \lor c) \land (\neg y \lor c), \neg y \lor c) \in \theta \). Conversely, assume that \((\neg x \lor c) \land (\neg y \lor c), \neg y \lor c) \in \theta \). Since \((\neg x \lor c, \neg x \land y \lor c) \in \theta \), then taking \( \lor \) we obtain that \((\neg x \lor c, \neg x \land y \lor c) \in \theta \), so \((\neg x \lor c, \neg x \land y \lor c) \in \theta \). Then we have proved (9). Therefore, it follows from (8) and (9) that \( x/\theta \leq y/\theta \) if and only if \( x/\theta \lll y/\theta \).

**Lemma 56.** Let \( T \in \text{KhlS}_0 \) and \( \theta \) a well-behaved congruence of \( T \). Then \( (T, \lll) \) is a poset.

**Proof.** Let \( \theta \) be a well-behaved congruence of \( T \). The reflexivity of \( \theta \) implies the reflexivity of \( \lll \). In order to prove that \( \lll \) is antisymmetric, let \( x, y \in T \) be such that \( x/\theta \lll y/\theta \) and \( y/\theta \lll x/\theta \), which means that

\[
((x \lor c) \land (y \lor c), x \lor c) \in \theta,
\]

and

\[
((y \lor c) \land (x \lor c), y \lor c) \in \theta.
\]

Therefore, we have that \( x \lor c = y \lor c \) and \( y \lor c = x \lor c \). Since \( x \lor c \) and \( y \lor c \) are the representatives of the equivalent classes \( x/\theta \) and \( y/\theta \), we conclude that \( x/\theta = y/\theta \). Thus \( (T, \lll) \) is a poset.
Proposition 58.\[ ((\sim y \lor c) \land (\sim x \lor c), \sim y \lor c) \in \theta, \]
\[ ((y \lor c) \land (x \lor c), y \lor c) \in \theta, \]
\[ ((\sim x \lor c) \land (\sim y \lor c), \sim x \lor c) \in \theta. \]
Since \((x \lor c, (x \lor c) \land (y \lor c)) \in \theta\) and \((x \lor c) \land (y \lor c), y \lor c) \in \theta\), then \((x \lor c, y \lor c) \in \theta.\]
Analogously we have that \((\sim x \lor c, \sim y \lor c) \in \theta.\]
Hence, it follows from (C2) that \((x, y) \in \theta,\) i.e., \(x/\theta = y/\theta.\) We conclude that \(\leq \) is antisymmetric. Finally we will prove that \(\leq\) is transitive. Let \(x, y\) and \(z\) be elements of \(T\) such that \(x/\theta \leq y/\theta\) and \(y/\theta \leq z/\theta.\) In particular,
\[ ((x \lor c) \land (y \lor c), x \lor c) \in \theta, \]
\[ ((y \lor c) \land (z \lor c), y \lor c) \in \theta. \]
It follows from (11) and (C3) that
\[ ((x \lor c) \land (y \lor c) \land (z \lor c), (x \lor c) \land (z \lor c)) \in \theta, \]
and it follows from (11) and (C3) that
\[ ((x \lor c) \land (y \lor c) \land (z \lor c), (x \lor c) \land (y \lor c)) \in \theta. \]
Hence, by (12) and (13) we obtain that \((x \lor c) \land (y \lor c), (x \lor c) \land (z \lor c)) \in \theta.\]
Thus, taking into account (10) we have \((x \lor c) \land (z \lor c), x \lor c) \in \theta.\]
Similarly we can show that \((\sim x \lor c) \land (\sim z \lor c), \sim z \lor c) \in \theta.\]
Thus, \(x/\theta \leq z/\theta.\) Hence, \(\leq\) is transitive.\[ \square\]

Lemma 57. Let \(T \in \text{KhlS}_\theta\) and \(x, y \in T.\) If \(x \leq y,\) then \(x/\theta \leq y/\theta.\)

Proof. Let \(x \leq y.\) Then \(\sim y \leq \sim x.\) Hence, we have \(x \lor c \leq y \lor c\) and \(\sim y \lor c \leq \sim x \lor c,\)
i.e., \((x \lor c) \land (y \lor c) = x \lor c\) and \((\sim y \lor c) \land (\sim x \lor c) = \sim y \lor c.\) Since \(\theta\) is a reflexive relation, then \((x \lor c) \land (y \lor c), x \lor c) \in \theta\) and \((\sim y \lor c) \land (\sim x \lor c), \sim y \lor c) \in \theta,\) i.e.,
\(x/\theta \leq y/\theta.\)

For \(T \in \text{KhlS}_\theta\) and \(\theta\) a well-behaved congruence of \(T,\) we have in particular that \(\theta\) is a congruence of \((T, \sim, \rightarrow).\) Let us use also the symbols \(\sim\) and \(\rightarrow\) to refer to the respective induced operations on \(T/\theta.\)

Proposition 58. Let \((T, \leq, \sim, \rightarrow, 0, 1) \in \text{KhlS}_\theta\) and \(\theta\) a well-behaved congruence of \(T.\) Then \((T/\theta, \leq, \sim, \rightarrow, c/\theta, 0/\theta, 1/\theta) \in \text{KhlS}_\theta.\)

Proof. Step 1. \((T/\theta, \leq, \sim, c/\theta) \in \text{KP}.\)
It follows from Lemma 56 that \((T/\theta, \leq)\) is a poset. It is immediate that \(\sim\) is an involution in \((T/\theta, \leq)\) which is order reversing and that \(\sim c/\theta = c/\theta.\)
Let \(x \in T.\) In what follows we will prove that the supremum of \(x/\theta\) and \(c/\theta\) with respect to the order \(\leq\) exists in \(T/\theta,\) and we will denote it by \(x/\theta \lor c/\theta.\) Moreover, we will prove that \(x/\theta \lor c/\theta = (x \lor c)/\theta.\) First note that if \(y \in \theta/\theta,\) then it follows from (C2) that \((x \lor c, y \lor c) \in \theta,\) i.e., that \((x \lor c)/\theta = (y \lor c)/\theta.\) Now we will show that \(x/\theta \lor c/\theta\) exists. Since \(x \leq x \lor c\) and \(c \leq x \lor c,\) it follows from Lemma 56 that \(x/\theta \sim (x \lor c)/\theta\) and \(c/\theta \leq (x \lor c)/\theta.\) Let \(z \in T\) be such that \(x/\theta \leq z/\theta\) and \(c/\theta \leq z/\theta.\) Then \((x \lor c) \land (z \lor c), x \lor c) \in \theta,\) \((\sim z \lor c) \land (\sim x \lor c), \sim z \lor c) \in \theta\) and \((c, \sim z \lor c) \in \theta.\) We need to prove that \((x \lor c)/\theta \leq z/\theta.\) By the previous assertions we have in particular that
\[ ((x \lor c) \land (z \lor c), (x \lor c) \land (z \lor c)) \in \theta. \]
On the other hand,
\[ (\sim z \lor c) \land (\sim (x \lor c) \lor c) = c. \]
But \((c, \sim z \lor c) \in \theta,\) so
\[ ((\sim z \lor c) \land (\sim (x \lor c) \lor c), \sim z \lor c) \in \theta. \]

Hence, it follows from (14) and (15) that \( (x \lor c)/\theta \ll z/\theta \). Thus, \( x/\theta \lor c/\theta \) exists and \( x/\theta \lor c/\theta = (x \lor c)/\theta \).

In what follows we will prove that for every \( x, y \in T \),

\[
(x/\theta \lor c/\theta) \land (\neg x/\theta \lor c/\theta) = c/\theta,
\]
or, equivalently, that

\[
(16) \quad (x \lor c)/\theta \land (\neg x \lor c)/\theta = c/\theta,
\]

where we also use \( \land \) for the infimum with respect to \( \ll \). In order to prove (16), note that it follows from Lemma 57 that \( c/\theta \ll (x \lor c)/\theta \) and \( c/\theta \ll (\neg x \lor c)/\theta \). Let \( z \in T \) such that \( z/\theta \ll (x \lor c)/\theta \) and \( z/\theta \ll (\neg x \lor c)/\theta \). In particular,

\[
(17) \quad ((z \lor c) \lor (\neg x \lor c), z \lor c) \in \theta,
\]

It follows from (C3), (17) and (18) that

\[
(19) \quad ((z \lor c) \lor (x \lor c), z \lor c) \in \theta.
\]

Since \( (x \lor c) \land (\neg x \lor c) = c \), then \( (c, z \lor c) \in \theta \), i.e., \( z/\theta \ll c/\theta \). Therefore, \( (x/\theta \lor c/\theta) \land (\neg x/\theta \lor c/\theta) = c/\theta \).

For \( x, y \in T \) assume that \( (x \lor c)/\theta \ll (y \lor c)/\theta \) and \( (x \lor c)/\theta \ll (y \lor c)/\theta \). It is immediate that \( x/\theta \ll y/\theta \). Then we conclude that \( (T/\theta, \ll, \leq, c/\theta) \in KMS \).

Step 2. \((T/\theta, \ll, \leq, c/\theta, 0/\theta, 1/\theta) \in KMS\).

Since for every \( x \in T \) we have \( 0 \leq x \leq 1 \), it follows from Lemma 57 that \( 0/\theta \ll x/\theta \ll 1/\theta \), i.e., \( 0/\theta \) is the first element of \((T/\theta, \ll)\) and \( 1/\theta \) is the last element of \((T/\theta, \ll)\).

Let \( (x, z) \in \theta \) and \( (y, w) \in \theta \). It follows from (C2) that \( (x \lor c, z \lor c) \in \theta \) and \( (y \lor c, w \lor c) \in \theta \). By (C3) we have that

\[
(20) \quad ((x \lor c) \land (y \lor c), (z \lor c) \land (w \lor c)) \in \theta.
\]

Taking into account (KM4) we also have

\[
(21) \quad ((x \lor c) \land y) \lor c = (x \lor c) \land (y \lor c),
\]

\[
(22) \quad ((z \lor c) \land w) \lor c = (z \lor c) \land (w \lor c).
\]

Hence, it follows from (20), (21) and (22) that

\[
(23) \quad (((x \lor c) \land y) \lor c, ((z \lor c) \land w) \lor c) \in \theta.
\]

In a similar way, taking into account that \( (\neg x \lor c, \sim z \lor c) \in \theta \) and \( (\sim y \lor c, \sim w \lor c) \in \theta \) we have

\[
(24) \quad (((\sim x \lor c) \land \sim y) \lor c, ((\sim z \lor c) \land \sim w) \lor c) \in \theta.
\]

Then it follows from (20), (21) and (C2) that

\[
((x \lor c) \land y, (z \lor c) \land w) \in \theta.
\]

Now we will prove that \( (x/\theta \lor c/\theta) \land y/\theta \) exists and is \( (x \lor c)/\theta \lor y/\theta \). This is equivalent to prove that \( (x \lor c)/\theta \lor y/\theta \) exists and is \( (x \lor c)/\theta \lor y/\theta \). Since \( (x \lor c) \land y \leq x \lor c \land y \leq y \), then it follows from Lemma 57 that \( ((x \lor c) \land y)/\theta \ll (x \lor c)/\theta \) and \((x \lor c) \land y)/\theta \ll y/\theta \). Let \( z \in T \) be such that \( z/\theta \ll (x \lor c)/\theta \) and \( z/\theta \ll y/\theta \). In particular,

\[
(25) \quad ((z \lor c) \land (x \lor c), z \lor c) \in \theta,
\]
We need to prove that \( z/\theta \ll ((x \vee c) \land y)/\theta \), which means that
\[
((z \vee c) \land ((x \vee c) \land y) \lor c), c \in \theta
\]
and
\[
(\sim((x \vee c) \land y) \lor c) \land (\sim z \lor c), \sim((x \vee c) \land y) \lor c), c \in \theta.
\]
It follows from (KM4) that
\[
(z \vee c) \land (((x \vee c) \land y) \lor c) = (z \vee c) \land (y \lor c) \lor (x \lor c),
\]
and it follows from (25) and (C3) that
\[
((z \lor c) \land (y \lor c) \lor (x \lor c), (z \lor c) \land (y \lor c)) \in \theta.
\]
Thus, by (23), (24), and (31) we obtain (25). It is immediate that the condition 24 is equal to the condition 27 because
\[
(\sim((x \lor c) \land y) \lor c) \land (\sim z \lor c) = (\sim y \lor c) \land (\sim z \lor c),
\]
\[
(\sim((x \lor c) \land y) \lor c) = \sim y \lor c.
\]
Then \((T/\theta, \ll, \sim, c/\theta, 0/\theta, 1/\theta)\) satisfies (KM3). The condition (KM4) follows from the previous steps and from the same condition on \( T \). In consequence, we obtain that \((T/\theta, \ll, \sim, c/\theta, 0/\theta, 1/\theta) \in KMS\).

**Step 3.** \((T/\theta, \ll, \sim, c/\theta, 0/\theta, 1/\theta) \in \mathsf{KhIS}_0\). The other conditions to be an object of \( \mathsf{KhIS}_0 \) follow from the previous steps, the fact that \( T \in \mathsf{KhIS}_0 \) and Lemma 57.

We prove that \( \Sigma(\tau) \) is a well behaved congruence of \( T \).

**Lemma 59.** Let \( T \in \mathsf{KhIS}_0 \) and \( \tau \in \mathsf{Con}(C(T)) \). Then \( \Sigma(\tau) \in \mathsf{Con}_{wb}(T) \).

**Proof.** Let \( \tau \in \mathsf{Con}(C(T)) \). Straightforward computations show that \( \Sigma(\tau) \) satisfies (C2). In order to show that \( \Sigma(\tau) \) satisfies (C3), let \( x, y, z \) and \( w \) in \( C(T) \) be such that \((x, z) \in \Sigma(\tau)\) and \((z, w) \in \Sigma(\tau)\), which means that \((x, y) \in \tau\) and \((z, w) \in \tau\). Then \((x \land z, y \land w) \in \tau\), because \(\tau \in \mathsf{Con}(C(T))\). But \((x \land z) \lor c = x \land z \) and \((y \land w) \lor c = y \land w\). Thus,
\[
((x \land y) \lor c, (z \land w) \lor c) \in \tau.
\]
On the other hand, since \(\sim((x \land z) \lor c) \lor c = c\) and \(\sim((y \land w) \lor c) \lor c = c\), then
\[
(\sim((x \land z) \lor c) \lor c, \sim((y \land w) \lor c) \lor c) \in \tau.
\]
Hence, \((x \land z, z \land w) \in \Sigma(\tau)\), so the condition (C3) holds. Now we show the condition (C1). It is immediate that \( \Sigma(\tau) \) is congruence with respect to \( \sim \).

In order to prove that \( \Sigma(\tau) \) is congruence with respect to \( \rightarrow \), let \((x, y) \in \Sigma(\tau)\) and \((z, w) \in \Sigma(\tau)\), so
\[
(x \lor c, y \lor c) \in \tau,
\]
Then taking $\land$ in (32) and (33) we have
\[(x \lor c) \land (\neg z \lor c, y \lor c) \land (\neg w \lor c)) \in \tau.\]

But it follows from (K4) that $\neg(x \to z) \lor c = (x \lor c) \land (\neg z \lor c)$ and $\neg(y \to w) \lor c = (y \lor c) \land (\neg w \lor c)$ So by (32) we obtain that
\[(\neg(x \to z) \lor c, \neg(y \to w) \lor c) \in \tau.\]

On the other hand, taking $\to$ between (42) and (33) we have that
\[(x \lor c) \to (\neg z \lor c), (y \lor c) \to (w \lor c)) \in \tau,\]

and taking $\to$ between (35) and (34) we obtain
\[(\neg z \lor c) \to (\neg y \lor c)) \in \tau.\]

Define now the following elements:
\[
t := ((x \lor c) \to (z \lor c)) \land ((\neg z \lor c) \to (\neg x \lor c)),\]
\[
u := ((y \lor c) \to (w \lor c)) \land ((\neg w \lor c) \to (\neg y \lor c)).\]

Taking into account (35), (31), and (41) we have
\[(x \to z) \lor c, (y \to w) \lor c) \in \tau.\]

Thus, by (37) and (39) the condition $(x \to z, y \to w) \in \Sigma(\tau)$ is satisfied. This implies that $\Sigma(\tau) \in \text{Con}_{\text{wb}}(T)$. 

**Proposition 60.** Let $T \in \text{KhIS}$. There exists an isomorphism between $\text{Con}_{\text{wb}}(T)$ and $\text{Con}(C(T))$, which is established via the assignments $\theta \mapsto \Gamma(\theta)$ and $\tau \mapsto \Sigma(\tau)$.

**Proof.** Let $\theta \in \text{Con}_{\text{wb}}(T)$. It follows from (C1) and (C3) that $\Gamma(\theta) \in \text{Con}(C(T))$.

Suppose now that $\theta \in \text{Con}_{\text{wb}}(T)$, $\sigma \in \text{Con}_{\text{wb}}(T)$ and $\Gamma(\theta) = \Gamma(\sigma)$. Let $(x, y) \in \theta$. Then by (C2) we have $(x \lor c, y \lor c) \in \theta$ and $(\neg x \lor c, y \lor c) \in \theta$, so $(x \lor c, y \lor c) \in \Gamma(\theta)$ and $(\neg x \lor c, y \lor c) \in \Gamma(\theta)$. Hence, it follows from (C2) again that $(x, y) \in \sigma$. Thus, $\theta \subseteq \sigma$. For the same reason we have the other inclusion, so $\theta = \sigma$.

Lemma 59 shows that if $\tau \in \text{Con}(C(T))$, then $\Sigma(\tau) \in \text{Con}_{\text{wb}}(T)$. Besides it is immediate that $\Gamma(\Sigma(\tau)) = \tau$. We also have that for $\theta \in \text{Con}_{\text{wb}}(T)$ and $\sigma \in \text{Con}_{\text{wb}}(T)$, $\theta \subseteq \sigma$ if and only if $\Sigma(\theta) \subseteq \Sigma(\sigma)$. Therefore, we obtain an isomorphism between $\text{Con}_{\text{wb}}(T)$ and $\text{Con}(C(T))$. 

**Proposition 61.** Let $T \in \text{KhBDL}$. There exists an isomorphism between $\text{Con}(T)$ and $\text{Con}(C(T))$, which is established via the assignments $\theta \mapsto \Gamma(\theta)$ and $\tau \mapsto \Sigma(\tau)$. 

Let $T \in \text{KhBDL}$. If $\theta \in \text{Con}(T)$ and $\tau \in C(T)$, we define $\Gamma(\theta)$ and $\Sigma(\tau)$ as for the case of KhIS. If $\theta \in \text{Con}(T)$, then $\theta$ satisfies (C1), (C2), and (C3). Let $\tau \in C(T)$. The distributivity of the underlying lattice of $T$ proves that $\Sigma(\tau)$ preserves $\land$ and $\lor$. Then from the proof of Proposition 60 the next result follows.
Let $H \in \text{hIS}_0$ or $H \in \text{hBDL}$. Let $\theta \in \text{Con}(H)$ and $\tau \in \text{Con}(\text{C}(K(H)))$. Since the map $\alpha : H \to \text{C}(K(H))$ given by $\alpha(a) = (a,0)$ is an isomorphism, we have that the binary relation $\alpha(\theta) = \{(\alpha(a), \alpha(b)) : (a, b) \in \theta\}$ in $\text{C}(K(H))$ is a congruence of $\text{C}(K(H))$. Moreover, the relation $\alpha^{-1}(\tau)$ in $H$ given by $(a, b) \in \alpha^{-1}(\tau)$ if and only if $((a,0), (b,0)) \in \tau$ is a congruence of $H$. Then the following result follows from propositions 60 and 61.

**Corollary 62.**
(a) Let $H \in \text{hIS}_0$. There exists an isomorphism between $\text{Con}(H)$ and $\text{Con}_{\text{eh}}(\text{C}(K(H)))$, which is established via the assignments $\theta \mapsto \Sigma(\alpha(\theta))$ and $\tau \mapsto \alpha^{-1}(\Gamma(\tau))$.
(b) Let $H \in \text{hBDL}$. There exists an isomorphism between $\text{Con}(H)$ and $\text{Con}_{\text{eh}}(\text{C}(K(H)))$, which is established via the assignments $\theta \mapsto \Sigma(\alpha(\theta))$ and $\tau \mapsto \alpha^{-1}(\Gamma(\tau))$.

**Remark 63.** Let $H \in \text{hIS}_0$, $\theta \in \text{Con}(H)$ and $\tau \in \text{Con}_{\text{eh}}(\text{C}(K(H)))$. Then

\[ ((a, b), (d, e)) \in \Sigma(\alpha(\theta)) \quad \text{if and only if} \quad (a, d) \in \theta \quad \text{and} \quad (b, e) \in \theta, \]

\[ (a, b) \in \alpha^{-1}(\Gamma(\tau)) \quad \text{if and only if} \quad ((a, 0), (b, 0)) \in \tau. \]

Similarly for $H \in \text{hBDL}$.

6.1. Well-behaved congruences and congruences: the relation with some family of filters and some applications. We start by recalling some facts about congruences in $\text{hIS}_0$ and congruences in $\text{hBDL}$ [21]. Let $H \in \text{hIS}_0$ or $H \in \text{hBDL}$. As usual, we say that $F$ is a filter if it is a nonempty subset of $H$ which satisfies the following conditions:

1. If $a \in F$ and $b \in F$ then $a \land b \in F$.
2. If $a \in F$ and $a \leq b$ then $b \in F$.

We also consider the binary relation associated with $F \subseteq H$

\[ \Theta(F) = \{(a, b) \in H \times H : a \land f = b \land f \text{ for some } f \in F\}. \]

Note that if $H$ is an upper bounded semilattice and $F$ is a filter, then $\Theta(F)$ is a congruence. Let $H \in \text{hIS}_0$ or $H \in \text{hBDL}$. For $a, b, f \in H$ we define the following element of $H$:

\[ t(a, b, f) := (a \to b) \leftrightarrow ((a \land f) \to (b \land f)), \]

where $a \leftrightarrow b := (a \to b) \land (b \to a)$.

The next definition was introduced in [21].

**Definition 64.** Let $H \in \text{hIS}_0$ or $H \in \text{hBDL}$, and let $F$ be a filter of $H$. We say that $F$ is a congruent filter if $t(a, b, f) \in F$ whenever $a, b \in H$ and $f \in F$.

Note that the set of all congruent filters of $H \in \text{hIS}_0$ or of $H \in \text{hBDL}$ is closed under arbitrary intersections and therefore for every $X \subseteq H$ the congruent filter generated by $X$ exists.

**Remark 65.** Let $F$ be a congruent filter of a hemi-implicative semilattice (lattice). We will see that $(a, b) \in \Theta(F)$ if and only if $a \leftrightarrow b \in F$. In order to show it, suppose that $a \leftrightarrow b \in F$. Since $a \land (a \leftrightarrow b) = b \land (b \leftrightarrow a)$, then $(a, b) \in \Theta(F)$. Conversely, assume that $(a, b) \in \Theta(F)$, i.e., $a \land f = b \land f$ for some $f \in F$. Since $t(a, b, f) \in F$ and $t(a, b, f) = (a \to b) \leftrightarrow 1$, then $1 \to (a \to b) \in F$ because $(a \to b) \leftrightarrow 1 \leftrightarrow 1 \to (a \to b)$. Since $1 \to (a \to b) \leq a \to b$, then $a \to b \in F$. In a similar way we can show that $b \leftrightarrow a \in F$. Hence, $a \leftrightarrow b \in F$. Thus,

\[ \Theta(F) = \{(a, b) \in H \times H : a \leftrightarrow b \in F\}. \]

The following result was proved in [21].

**Theorem 66.** Let $H \in \text{hIS}_0$ or $H \in \text{hBDL}$. There exists an isomorphism between $\text{Con}(H)$ and the lattice of congruent filters of $H$, which is established via the assignments $\theta \mapsto 1/\theta$ and $F \mapsto \Theta(F)$. 
Taking into account Theorem 64, it is possible to show that Proposition 61 can be seen as a corollary of Proposition 60. In order to show this assertion, let $T_1 = (T; \wedge, \vee, \rightarrow, \neg, c, 0, 1) \in \hbdl$. Then we write $T_2 = (T; \leq, \neg, \rightarrow, c, 0, 1)$ for the corresponding object of $\khbdl$. Since the set of congruent filters of $\text{C}(T_1)$ is equal to the set of congruent filters of $\text{C}(T_2)$, then it follows from Theorem 60 that $\text{Con}(\text{C}(T_1)) = \text{Con}(\text{C}(T_2))$. In what follows we will see that $\text{Con}(T_1) = \text{Con}_{\text{wb}}(T_2)$. It is immediate that $\text{Con}(T_1) \subseteq \text{Con}_{\text{wb}}(T_2)$. Conversely, let $\theta \in \text{Con}_{\text{wb}}(T_2)$. We will prove that $\theta$ preserves $\wedge$ and $\vee$. Let $(x, y) \in \theta$ and $(z, w) \in \theta$. Then it follows from $(C2)$ that $(x \wedge c, z \wedge c) \in \theta$ and $(y \vee c, w \vee c) \in \theta$. Then by $(C3)$ we have that $((x \wedge c) \wedge (z \wedge c), (y \vee c) \wedge (w \vee c)) \in \theta$. But by the distributivity of the underlying lattice of $T_1$ we deduce that $(x \wedge z) \vee c = (x \vee c) \wedge (z \vee c)$ and $(y \wedge w) \vee c = (y \vee c) \wedge (w \vee c)$. Thus,

$$(44)\quad (x \wedge z) \vee c, (y \wedge w) \vee c \in \theta.$$ \hspace{1cm}$$

Besides, since $(x, y) \in \theta$ and $(z, w) \in \theta$, then it follows from the condition $(C2)$ that $(\neg x \wedge c, \neg y \wedge c) \in \theta$ and $(\neg y \vee c, \neg w \vee c) \in \theta$. Equivalently, we have that

$$(45)\quad (\neg x \vee c, \neg y \vee c) \in \Gamma(\theta),$$

$$(46)\quad (\neg y \vee c, \neg w \vee c) \in \Gamma(\theta).$$

Since $\Gamma(\theta) \in \text{Con}(\text{C}(T_2))$ and $\text{Con}(\text{C}(T_1)) = \text{Con}(\text{C}(T_2))$, then taking $\vee$ in (45) and (46) we obtain

$$(\neg x \vee \neg y \wedge c, \neg z \vee \neg w \wedge c) \in \theta,$$

i.e.,

$$(47)\quad (\neg (x \wedge z) \vee c, \neg (z \wedge \wedge) \vee c) \in \theta.$$ \hspace{1cm}$$

Then it follows from $(C2)$, (44) and (47) that $(x \wedge z, y \wedge w) \in \theta$. The same argument combined with $(C1)$ proves that $(x \wedge \neg z, \neg y \wedge \neg w) \in \theta$, so $(x \vee z, y \vee w) \in \theta$. Hence, $\theta$ preserves $\wedge$ and $\vee$, which implies that $\theta \in \text{Con}(T_1)$. Then $\text{Con}(T_1) = \text{Con}_{\text{wb}}(T_2)$. Therefore, since $\text{Con}(T_1) = \text{Con}_{\text{wb}}(T_2)$ and $\text{Con}(T_1) = \text{Con}(\text{C}(T_2))$, we deduce that Proposition 61 can be seen as a corollary of Proposition 60.

Corollary 67. Let $T \in \khbdl$. There exists an isomorphism between $\text{Con}_{\text{wb}}(T)$ and the lattice of congruent filters of $\text{C}(T)$, which is established via the assignments $\theta \mapsto 1/\Gamma(\theta)$ and $F \mapsto \Sigma(\Theta(F))$.

Proof. It follows from Proposition 60 and Theorem 66. \hspace{1cm} $$

Similarly, the following result follows from Proposition 61 and Theorem 66.

Corollary 68. Let $T \in \khbdl$. There exists an isomorphism between $\text{Con}_{\text{wb}}(T)$ and the lattice of congruent filters of $\text{C}(T)$, which is established via the assignments $\theta \mapsto 1/\Gamma(\theta)$ and $F \mapsto \Sigma(\Theta(F))$.

For implicational semilattices Corollary 67 can be simplified, and for semi-Heyting algebras Corollary 68 also can be simplified. More precisely: if $H \in \islg$ or $H \in \sh$ then the congruent filters of $H$ are all the filters of $H$ [21].

Let $H \in \hlg$ and $F \subseteq H$. Recall that $F$ is said to be a deductive system [10] if the following conditions are satisfied: a) $1 \in F$, b) if $a \in F$ and $a \rightarrow b \in F$ then $b \in F$. Also recall that a deductive system $F$ is said to be absorbent [12] if $a \rightarrow (a \wedge b) \in F$ whenever $a \in F$. It follows from Theorem 60 and [12] Lemma 3.3 that the congruent filters of $H$ are the absorbent deductive systems of $H$.

Definition 69. Let $A$ be an algebra and $a_1, b_1, \ldots, a_n, b_n$ elements of $A$. We write $\theta_A((a_1, b_1), \ldots, (a_n, b_n))$ for the congruence generated by $(a_1, b_1), \ldots, (a_n, b_n)$. If $T \in \khbdl$ we also write $\theta_T((a_1, b_1), \ldots, (a_n, b_n))$ for the well-behaved congruence generated by $(a_1, b_1), \ldots, (a_n, b_n)$.

Let $H \in \islg$ or $H \in \hbdl$, and let $a \in H$. We refer by $F^c(a)$ to the congruent filter generated by $\{a\}$. In [21] the following assertions were proved:
(1) if \( H \in \text{hIS}_0 \) or \( H \in \text{hBDL} \), then \((d, e) \in \theta_H(a, b)\) if and only if \( d \leftrightarrow e \in F^c(a \leftrightarrow b)\);

(2) if \( H \in \text{hS}_0 \) or \( H \in \text{SH} \) then \((d, e) \in \theta_H(a, b)\) if and only if \( a \leftrightarrow b \leq d \leftrightarrow e \).

The following remark will be used later.

**Remark 70.** Let \( H \in \text{hIS}_0 \) or \( H \in \text{hBDL} \). Let \( \tau \in \text{Con}(H) \). Then \((a, b) \in \tau\) if and only if \( a \leftrightarrow b \in 1/\tau \). Moreover, \((a, b), (d, e) \in \tau\) if and only if \((a \leftrightarrow b) \land (d \leftrightarrow e) \in 1/\tau\).

In what follows we describe some aspects of the principal well-behaved congruences of the objects of \( \text{KhlIS}_0 \) and some aspects of the principal congruences of the algebras in \( \text{KhlBDL} \). Let \( T \in \text{KhlIS}_0 \) or \( T \in \text{KhlBDL} \). For \( x \) and \( y \) elements of \( T \) we also write \( x \leftrightarrow y \) for the element \((x \rightarrow y) \land (y \rightarrow x)\).

**Lemma 71.** Let \( T \in \text{KhlIS}_0 \) or \( T \in \text{KhlBDL} \). Let \( x, y, z, w \in T \). Then

(a) \((z, w) \in \theta_T(x, y)\) if and only if \((z \lor c, w \lor c) \in \theta_{C(T)}((x \lor c, y \lor c), (\sim x \lor c, \sim y \lor c))\) and \((\sim z \lor c, \sim w \lor c) \in \theta_{C(T)}((x \lor c, y \lor c), (\sim x \lor c, \sim y \lor c))\).

(b) If \( x, y, z \) and \( w \) are in \( C(T) \), then

\[ 1/\theta_{C(T)}((x, y), (z, w)) = F^c((x \leftrightarrow y) \land (z \leftrightarrow w)). \]

**Proof.** We consider \( T \in \text{KhlIS}_0 \) (the proof for \( T \in \text{KhlBDL} \) is analogous).

First we prove a). Let \((z, w) \in \theta_T(x, y)\). Then \((z, w) \in \theta\) for every \( \theta \in \text{Con}_{wb}(T) \) such that \((x, y) \in \theta\). Now we see that

\[ (z \lor c, w \lor c) \in \theta_{C(T)}((x \lor c, y \lor c), (\sim x \lor c, \sim y \lor c)), \]

\[ (\sim z \lor c, \sim w \lor c) \in \theta_{C(T)}((x \lor c, y \lor c), (\sim x \lor c, \sim y \lor c)). \]

Let \( \tau \in \text{Con}(C(T)) \) such that \((x \lor c, y \lor c) \in \tau\) and \((\sim x \lor c, \sim y \lor c) \in \tau\). It follows from Proposition 72 that \( \Sigma(\tau) \in \text{Con}_{wb}(T) \). We also have that \((x, y) \in \Sigma(\tau)\). Then by hypothesis we obtain that \((z, w) \in \Sigma(\tau)\). Hence, \((z \lor c, w \lor c) \in \tau\) and \((\sim z \lor c, \sim w \lor c) \in \tau\), which was our aim.

Conversely, assume that \((z \lor c, w \lor c) \in \theta_{C(T)}((x \lor c, y \lor c), (\sim x \lor c, \sim y \lor c))\) and \((\sim z \lor c, \sim w \lor c) \in \theta_{C(T)}((x \lor c, y \lor c), (\sim x \lor c, \sim y \lor c))\). Let \( \theta \in \text{Con}_{wb}(T) \) be such that \((x, y) \in \theta\). It follows from Proposition 72 that \( \Gamma(\theta) \in \text{Con}(C(T)) \). Moreover, \((z \lor c, w \lor c) \in \Gamma(\theta)\) and \((\sim z \lor c, \sim w \lor c) \in \Gamma(\theta)\). Thus by hypothesis we have that \((z \lor c, w \lor c) \in \Gamma(\theta)\) and \((\sim z \lor c, \sim w \lor c) \in \Gamma(\theta)\), i.e., \((z \lor c, w \lor c) \in \theta\) and \((\sim z \lor c, \sim w \lor c) \in \theta\). Then it follows from (C2) that \((z, w) \in \theta\). Thus, \((z, w) \in \theta_T(x, y)\).

Finally, we prove b). Let \( H \in \text{hIS}_0 \). We write \( \tau \) for an arbitrary well-behaved congruence of \( H \). Then

\[ \theta_H((x, y), (z, w)) = \bigcap \{ \tau \in \text{Con}_{wb}(H) : (x, y), (z, w) \in \tau \}. \]

Hence,

\[ 1/\theta_H((x, y), (z, w)) = \bigcap \{ 1/\tau : \tau \in \text{Con}_{wb}(H) \land (x, y), (z, w) \in \tau \}. \]

Then it follows from Remark 70 that

\[ 1/\theta_H((x, y), (z, w)) = \bigcap \{ 1/\tau : \tau \in \text{Con}_{wb}(H) \land (x \leftrightarrow y) \land (z \leftrightarrow w) \in 1/\tau \}. \]

Thus, by Theorem 69 we have that

\[ 1/\theta_H((x, y), (z, w)) = F^c((x \leftrightarrow y) \land (z \leftrightarrow w)). \]

In particular, the last assertion holds for \( H = C(T) \). \( \square \)
Remark 72. The proof of item (b) of Lemma 71 can be done in a different way. Let $\theta$ be a congruence of an algebra $H \in \text{hI}S_0$, and let $a, b \in H$. Straightforward computations show that $F^c(a) \lor F^c(b) = F^c(a \land b)$, where $\lor$ is the supremum in the lattice of congruent filters of $H$. On the other hand, it follows from general results from universal algebra that $\theta_H((x, y), (z, w)) = \theta_H(x, y) \lor \theta_H(z, w)$, where $\lor$ is the supremum in the lattice of congruences of $H$. In [21] it was proved that $1/\theta_H(x, y) = F^c(x \leftrightarrow y)$. Then

$$1/\theta_H((x, y), (z, w)) = 1/\theta_H(x, y) \lor 1/\theta_H(z, w) = F^c(x \leftrightarrow y) \lor F^c(z \leftrightarrow w) = F^c((x \leftrightarrow y) \land (z \leftrightarrow w)).$$

Let $T \in \text{KlhS}_0$ or $T \in \text{KhBDL}$. For every $x, y \in T$ we define the following binary term:

$$q(x, y) = ((x \lor c) \leftrightarrow (y \lor c)) \land ((\sim x \lor c) \leftrightarrow (\sim y \lor c)).$$

In the proof of the following corollary we will use Remark 70 and Lemma 71.

Corollary 73. Let $T \in \text{KlhS}_0$ or $T \in \text{KhBDL}$. Let $x, y, z, w \in T$.

(a) $(x, w) \in \theta_T(x, y)$ if and only if $q(z, w) \in F^c(q(x, y))$.

(b) If $T \in \text{Kls}_0$ or $T \in \text{KSH}$ then $(z, w) \in \theta_T(x, y)$ if and only if $q(x, y) \leq q(z, w)$.

Proof. The condition $(z, w) \in \theta_T(x, y)$ is equivalent to the conditions

$$(z \lor c, w \lor c) \in \theta_{C(T)}((x \lor c, y \lor c), (x \lor c, y \lor c)), \quad (\sim z \lor c, \sim w \lor c) \in \theta_{C(T)}((x \lor c, y \lor c), (x \lor c, y \lor c)),$$

which are equivalent to

$$(z \lor c) \leftrightarrow (w \lor c) \in 1/\theta_{C(T)}((x \lor c, y \lor c), (\sim x \lor c, \sim y \lor c)), \quad (\sim z \lor c) \leftrightarrow (\sim w \lor c) \in 1/\theta_{C(T)}((x \lor c, y \lor c), (\sim x \lor c, \sim y \lor c)),$$

which happens if and only if

$$q(z, w) \in 1/\theta_{C(T)}((x \lor c, y \lor c), (\sim x \lor c, \sim y \lor c)).$$

But this last fact is equivalent to say that $q(z, w) \in F^c(q(x, y))$.

If $T \in \text{Kls}_0$ or $T \in \text{KSH}$, then $F^c(q(x, y))$ is equal to the filter generated by $\{q(x, y)\}$, so $(z, w) \in \theta_T(x, y)$ if and only if $q(x, y) \leq q(z, w)$. \qed
