Seifert surgery on knots via Reidemeister torsion and
Casson-Walker-Lescop invariant III

Abstract

For a knot $K$ in a homology 3-sphere $\Sigma$, let $M$ be the result of $2/q$-surgery on $K$, and let $X$ be the universal abelian covering of $M$. Our first theorem is that if the first homology of $X$ is finite cyclic and $M$ is a Seifert fibered space with $N \geq 3$ singular fibers, then $N \geq 4$ if and only if the first homology of the universal abelian covering of $X$ is infinite. Our second theorem is that under an appropriate assumption on the Alexander polynomial of $K$, if $M$ is a Seifert fibered space, then $q = \pm 1$ (i.e. integral surgery).

1 Introduction

It is conjectured that Seifert surgeries on non-trivial knots are integral (except some cases), and that the resultant Seifert fibered spaces have three singular fibers (for example, see [DMM]). We [KMS1, KMS2] have studied the $2/q$-Seifert surgeries. One reason why the coefficients are $2/q$ is that we started from the following shown in [Kd1]:

Theorem 1.1 ([Kd1, Theorem 1.4]) Let $K$ be a knot in a homology 3-sphere $\Sigma$ such that the Alexander polynomial of $K$ is $t^2 - 3t + 1$. The only surgeries on $K$ that may produce a Seifert fibered space with base $S^2$ and with $H_1 \neq \{0\}, \mathbb{Z}$ have coefficients $2/q$ and $3/q$, and produce Seifert fibered space with three singular fibers. Moreover (1) if the coefficient is $2/q$, then the set of multiplicities is $\{2\alpha, 2\beta, 5\}$ where $\gcd(\alpha, \beta) = \gcd(\alpha, 5) = \gcd(\beta, 5) = 1$, and (2) if the coefficient is $3/q$, then the set of multiplicities is $\{3\alpha, 3\beta, 4\}$ where $\gcd(\alpha, \beta) = \gcd(\alpha, 2) = \gcd(\beta, 2) = 1$.

In this paper, we continue to study the $2/q$-Seifert surgeries, where we replace the condition on the Alexander polynomial with a condition on the first homology of the double branched covering. We note that the results below are related to the conjectures mentioned above.

(1) Let $\Sigma$ be a homology 3-sphere, and let $K$ be a knot in $\Sigma$. Then $\Delta_K(t)$ denotes the Alexander polynomial of $K$, $a_2(K)$ denotes the Conway's $a_2$-term of $K$, and $\Sigma(K; p/r)$ denotes the result of $p/r$-surgery on $K$.

(2) The first author [Kd2] introduced the norm of polynomials and homology lens spaces: Let $\zeta_d$ be a primitive $d$-th root of unity. For an element $\alpha$ of $\mathbb{Q}(\zeta_d)$, $N_d(\alpha)$ denotes the norm of $\alpha$.

Keywords: Reidemeister torsion, Casson-Walker-Lescop invariant, Seifert fibered space.
associated to the algebraic extension $\mathbb{Q}(\zeta_d)$ over $\mathbb{Q}$. Let $f(t)$ be a Laurent polynomial over $\mathbb{Z}$. We define $|f(t)|_d$ by
\[
|f(t)|_d = |N_d(f(\zeta_d))| = \prod_{i \in (\mathbb{Z}/d\mathbb{Z})^\times} \left| f(\zeta_d^i) \right|.
\]
Let $X$ be a homology lens space with $H_1(X) \cong \mathbb{Z}/p\mathbb{Z}$. Then there exists a knot $K$ in a homology 3-sphere $\Sigma$ such that $X = \Sigma(K; p/r)$ ([BL, Lemma 2.1]). We define $|X|_d$ and $\|X\|_d$ by
\[
|X|_d = |\Delta_K(t)|_d \quad \text{and} \quad \|X\|_d = \prod_{d', d' \geq 1} |X|_{d'},
\]
where $d$ is a divisor of $p$. Then both $|X|_d$ and $\|X\|_d$ are topological invariants of $X$ (Refer to [Kd2] for details).

(3) Let $X$ be a closed oriented 3-manifold. Then $\lambda(X)$ denotes the Lescop invariant of $X$ ([L]). Note that $\lambda(S^3) = 0$.

## 2 Results

Let $K$ be a knot in a homology 3-sphere $\Sigma$. For an odd integer $q$, let $M$ be the result of $2/q$-surgery on $K$: $M = \Sigma(K; 2/q)$. Let $\pi : X \to M$ be the universal abelian covering of $M$ (i.e. the covering associated to $\text{Ker}(\pi_1(M) \to H_1(M))$). Since $H_1(M) \cong \mathbb{Z}/2\mathbb{Z}$, $\pi$ is the 2-fold unbranched covering.

Let $\Sigma_2$ be the double branched covering space of $\Sigma$ branched along $K$, and $\overline{K}$ the lifted knot of $K$ in $\Sigma_2$. Since $\overline{K}$ is null-homologous in $\Sigma_2$, and $X$ is the result of $1/q$-surgery on $\overline{K}$, we have $H_1(X) \cong H_1(\Sigma_2)$.

\[
\begin{align*}
\overline{K} & \subset \Sigma_2 \twoheadrightarrow X = \Sigma_2(\overline{K}; 1/q) \\
K & \subset \Sigma \twoheadrightarrow M = \Sigma(K; 2/q)
\end{align*}
\]

Assume that $H_1(\Sigma_2) \cong \mathbb{Z}/m\mathbb{Z}$ with $m \geq 3$. Then $H_1(X) \cong \mathbb{Z}/m\mathbb{Z}$. Hence $|X|_d$ is defined for each divisor $d$ of $m$, and so is $\|X\|_d$.

We then have the following.

**Theorem 2.1** Let $K$ be a knot in a homology 3-sphere $\Sigma$. With the notation above, we assume that $H_1(\Sigma_2) \cong \mathbb{Z}/m\mathbb{Z}$ with $m \geq 3$, and $M = \Sigma(K; 2/q)$ is a Seifert fibered space with $N$ singular fibers where $N \geq 3$. Then the following hold.

1. $N \geq 4$ if and only if $\|X\|_m = 0$.

2. If $m$ is a power of a prime, then $N = 3$ and the set of multiplicities is $\{2\alpha, 2\beta, m\}$, where $\alpha$, $\beta$ and $m$ are pairwise coprime.
Theorem 2.2 Let $K$ be a knot in a homology 3-sphere $\Sigma$. We assume the following.

(2.1) $\lambda(\Sigma) = 0$.
(2.2) $|\Delta_K(-1)| = 5$.
(2.3) $|q| \geq 3$, $\sqrt{|X|} > 4\{qa_2(K)\}^2$.

Then $M = \Sigma(K; 2/q)$ is not a Seifert fibered space.

3 Proof of Theorem 2.1

Since $H_1(M) \cong \mathbb{Z}/2\mathbb{Z}$, the base surface of $M$ is $S^2$. As noted in Section 2, $H_1(X) \cong H_1(\Sigma_2) \cong \mathbb{Z}/m\mathbb{Z}$. Hence $\|X\|_m$ is defined, and also we have

$$\|M\|_2 = |M|_2 = |\Delta_K(-1)| = |H_1(\Sigma_2)| = m \geq 3.$$ 

Hence, by [Kd1, Theorem 1.3 (2)], we may assume that $M$ has a framed link presentation as in Figure 1, where $\gcd(p_1, p_2) \geq 2$, $p_k \geq 2$ for $k = 1, \ldots, N$, and $\gcd(p_i, p_j) = 1$ for $1 \leq i < j \leq N$ and $\{i, j\} \neq \{1, 2\}$.

![Figure 1](image1.png)

Figure 1: A framed link presentation of $M = \Sigma(K; 2/q)$

Since $H_1(M) \cong \mathbb{Z}/2\mathbb{Z}$, we have $\gcd(p_1, p_2) = 2$ by [Kd1, Theorem 1.2 (1)]. Hence we may assume that $M$ has a framed link presentation as in Figure 2, where $\alpha$, $\beta$, $p_3, \ldots, p_N$ are pairwise coprime and $p_3, \ldots, p_N$ are all odd.

![Figure 2](image2.png)

Figure 2: A framed link presentation of $M = \Sigma(K; 2/q)$

Hence, as in [KMS1], we see that $X$ has a framed link presentation as in Figure 3.
Hence, by [Kd1, Theorem 1.3], we have (1).

Moreover, by [Kd1, Theorem 1.2 (3)], we have $|M| = p_3 \cdots p_N$, and hence $p_3 \cdots p_N = m$. Therefore if $m$ is a power of a prime, we have $N = 3$ and $p_3 = m$. This completes the proof. □

4 Proof of Theorem 2.2

Suppose that $M = \Sigma(K; 2/q)$ is a Seifert fibered space. Recall that $|H_1(\Sigma_2)| = |\Delta_K(-1)| = 5$. Then, by Theorem 2.1 (2), we may assume that $M$ has a framed link presentation as in Figure 4, where $1 \leq \alpha < \beta$ and $\gcd(\alpha, \beta) = 1$.

Since $\Delta_K(-1) \equiv \pm 3 \pmod{8}$ according to (2.2), [Le] Theorem 10.7, p108] implies that $a_2(K) \neq 0$.

As shown in [Kd1, Theorem 1.2 (3)], $\sqrt{|X|_5} = (\alpha \beta)^2$. By (2.1) and [Le, 1.5 T2], we have $\lambda(M) = qa_2(K)$. By substituting in $\sqrt{|X|_5} > 4\{qa_2(K)\}^2$, we have $(\alpha \beta)^2 > 4\{\lambda(M)\}^2$. Hence we have $|\lambda(M)| < (\alpha \beta)/2$. The remaining part of the proof goes parallel to the proof of [KMS2, Theorem 2.1]. This completes the proof. □
