December 25, 2021

## Abstract

A new test of normality based on a standardised empirical process is introduced in this article. The first step is to introduce a Cramér–von Mises type statistic with weights equal to the inverse of the standard normal density function supported on a symmetric interval  $[-a_n, a_n]$  depending on the sample size  $n$ . The sequence of end points  $a_n$  tends to infinity, and is chosen so that the statistic goes to infinity at the speed of  $\ln \ln n$ . After subtracting the mean, a suitable test statistic is obtained, with the same asymptotic law as the well-known Shapiro–Wilk statistic. The performance of the new test is described and compared with three other well-known tests of normality, namely, Shapiro–Wilk, Anderson–Darling and that of del Barrio–Matrán, Cuesta Albertos, and Rodríguez Rodríguez, by means of power calculations under many alternative hypotheses.

**Keywords:** empirical process, normality tests, Cramér–von–Mises statistic. 60G10

## 1 Definitions and notation

In this section we will introduce some definitions and notation to be used throughout this paper. The notation  $:=$  means a definition. Given  $X_1, X_2, \dots, X_n$  iid, we define  $\bar{X}_n := \frac{X_1 + X_2 + \dots + X_n}{n}$  the sample mean,  $S_n^2 := \frac{1}{n} \sum_{i=1}^n (X_i - \bar{X}_n)^2$  the sample variance, and  $Y_i := \frac{X_i - \bar{X}_n}{S_n}$  for  $i = 1, 2, \dots, n$ , and we define the standardised empirical process  $\hat{b}_n(x) := \frac{1}{\sqrt{n}} \sum_{i=1}^n (1_{\{Y_i \leq x\}} - \phi(x))$  for all  $x \in \mathbb{R}$ . Also we write  $F_n(x) := \frac{1}{n} \sum_{i=1}^n 1_{\{X_i \leq x\}}$  for the empirical distribution, and  $b_n(x) := \frac{1}{\sqrt{n}} \sum_{i=1}^n (1_{\{X_i \leq x\}} - \phi(x))$ .

We write  $\varphi(x) := \frac{1}{\sqrt{2\pi}} e^{\frac{-x^2}{2\sigma^2}}$  and  $\phi(x) := \int_{-\infty}^x \varphi(t) dt$  for the density and distribution functions of  $N(0, 1)$ . The notation  $\xrightarrow{P}$ ,  $\xrightarrow{a.s.}$  and  $\xrightarrow{w}$  means convergence in probability, almost surely and in distribution, respectively. Throughout this paper, we write  $a_n$  for the sequence  $a_n := \phi^{-1}(1 - 1/n)$ .

## 2 Introduction

In the present paper, we study the Cramér–von Mises statistic to test normality when the weight function is  $\psi(t) = \frac{1}{\varphi^2(\phi^{-1}(t))}$  and we integrate over the interval  $(-a_n, a_n)$  instead of over all the real line. The main contribution of this paper is that we will obtain the asymptotic distribution of this ‘truncated’ kind of Cramér–von-Mises statistic and we will prove that its limit distribution is equivalent to that of the Shapiro–Wilk test. Also, for fixed sample sizes, we will simulate the behaviour of its power, for a wide class of alternative hypotheses, and we will see that its performance is comparable to that of the Shapiro–Wilk and Anderson–Darling tests, improving them in many cases.

Given  $X_1, X_2, \dots, X_n$  iid with distribution  $F$  when the null hypothesis is  $F = F_0$  for a certain  $F_0$  (fixed), Cramér (1928) postulated the statistic

$n \int_{-\infty}^{+\infty} (F_n(x) - F_0(x))^2 dx$ , and more generally von Mises (1931) took

$n \int_{-\infty}^{+\infty} (F_n(x) - F_0(x))^2 \rho(x) dx$  when  $\rho$  is some non-negative weight function. Later Smirnov (1936,1937) proposed working with the statistic

$n \int_{-\infty}^{+\infty} (F_n(x) - F_0(x))^2 \psi(F_0(x)) dF_0(x)$ , for certain  $\psi$ . Nowadays all these statistics (varying  $\psi$ ) are called Cramér–von Mises statistics. The two most popular cases are when  $\psi(t) = 1$  (because of its simplicity and similarity with the original Cramér statistic), i.e.  $w_n^2 := n \int_{-\infty}^{+\infty} (F_n(x) - F_0(x))^2 dF_0(x)$ , which is called the Cramér–von Mises statistic; and when  $\psi(t) = \frac{1}{t(1-t)}$ , proposed by Anderson and Darling (1954), i.e.  $A_n^2 := n \int_{-\infty}^{+\infty} \frac{(F_n(x) - F_0(x))^2}{F_0(x)(1-F_0(x))} dF_0(x)$ . In this case, the quadratic difference  $(F_n(x) - F_0(x))^2$  is normalized by dividing it by its expected value, and this is called the Anderson–Darling statistic.

$A_n^2$  has the advantage of being generally more powerful than  $w_n^2$ , for a wide class of alternative hypotheses, see, for instance, Stephens (1986).

When the null hypothesis is that the distribution lies in a certain parametric family, i.e.,  $F(x) = F(x, \theta)$  for certain  $\theta$ , then it is natural to extend the Cramér–von Mises statistics used for a simple hypothesis in the form

$$n \int_{-\infty}^{+\infty} (F_n(x) - F(x, \hat{\theta}))^2 \psi(F(x, \hat{\theta})) dF(x, \hat{\theta})$$

where  $\hat{\theta}$  is a suitable estimator of  $\theta$ . Then we obtain  $\hat{A}_n^2 := n \int_{-\infty}^{+\infty} \frac{(F_n(x) - F(x, \hat{\theta}))^2}{F(x, \hat{\theta})(1 - F(x, \hat{\theta}))} dF(x, \hat{\theta})$  and  $\hat{w}_n^2 := n \int_{-\infty}^{+\infty} (F_n(x) - F(x, \hat{\theta}))^2 dF(x, \hat{\theta})$ . Again, generally,  $\hat{A}_n^2$  performs better than  $\hat{w}_n^2$ .

The general study of empirical processes when parameters are estimated was conducted by Durbin (1973). He used the theory of weak convergence in  $D[0, 1]$ . Durbin's results give the asymptotic distribution of a wide class of Cramér–von Mises statistics and many others.

Normality tests are a particular case of goodness of fit tests. Many tests of normality have been designed. Stephens (1986), for instance, provides a good summary. The theory of tests for normality was initiated by Pearson (1895, 1930), Fisher (1930) and Williams (1935), with the  $\sqrt{\beta_1}$  and  $\beta_2$  tests (third and fourth standardised moments). Of course, the performance and the asymptotic distribution of the classical Kolmogorov–Smirnov,  $\chi^2$ , Cramér–von Mises, Anderson–Darling and many other tests of normality, have been extensively studied. Further, with the Shapiro–Wilk (1965) test for normality, there began the development of correlation and regression tests; see, for instance, Lockhart and Stephens (1998) for a good review of this subject. In the normal case, the Cramér–von Mises statistics are  $n \int_{-\infty}^{+\infty} (F_n(t) - \phi\left(\frac{t - \bar{X}_n}{S_n}\right))^2 \psi\left(\phi\left(\frac{t - \bar{X}_n}{S_n}\right)\right) \varphi\left(\frac{t - \bar{X}_n}{S_n}\right) dt$ .

In the normal case, there have also been extensively studied, both theoretically and empirically, the statistics  $\hat{w}_n^2$  and  $\hat{A}_n^2$ .

In Csörgő and Faraway (1996) the authors find an exact and asymptotic distribution for  $w_n^2$ . In Pettitt and Stephens (1976) the authors modified the Cramér–von Mises statistic to allow them to test the normality of censored samples. The asymptotic theory for this is found in Pettitt (1976). Stephens (1974), found that in the case of the normality tests  $\hat{w}_n^2$  and  $\hat{A}_n^2$ , especially the latter, are comparable in terms of power with the Shapiro–Wilk test.

The paper is organized as follows. In Section 3, we will examine the reasons for taking this particular weight function  $\psi$ . In Section 4 we will find the asymptotic distribution of the proposed test and give a proof that it is equivalent to the asymptotic distribution of the Shapiro–Wilk test. Our concluding remarks are in section 5. In Appendix 1 we will calculate the power of this test under certain alternative hypotheses, and we will compare it with other tests, like the Shapiro–Wilk, Anderson–Darling, and others. In Appendix 2 we give indications for calculating the statistic and in Appendix 3 we give tables with their critical values for different possible levels of significance and for different values of sample size  $n$ .

### 3 Test Aims and Approach

Given  $X_1, X_2, \dots, X_n$  iid random variables with distribution  $F$ , we want to test  $H_0 : F(x) = \phi\left(\frac{x-\mu}{\sigma}\right)$  for certain  $\mu$  and  $\sigma$ . In del Barrio et al. (1999), a test of goodness of fit for normal distributions based on the Wasserstein distance is presented, and they prove that that test statistic has an asymptotic distribution equivalent to that of the Shapiro–Wilk test (1965). This limiting distribution is  $\int_{-\infty}^{+\infty} \frac{b^2(x) - \mathbb{E}b^2(x)}{\varphi(x)} dx - \left(\int_{-\infty}^{+\infty} xb(x)dx\right)^2 - \left(\int_{-\infty}^{+\infty} b(x)dx\right)^2$  where  $\{b(x)\}_{x \in \mathbb{R}}$  is a  $\phi$ –Brownian bridge. The first summand of this decomposition allows us to propose  $T_n^* := \int_{-a_n}^{a_n} \frac{\widehat{b}_n^2(x)}{\varphi(x)} dx$  to test normality. Although  $\int_{-\infty}^{+\infty} \frac{\widehat{b}_n^2(x)}{\varphi(x)} dx < +\infty$  for each  $n$ , Kalemkerian (2016) proves that  $\int_{-a_n}^{a_n} \frac{\mathbb{E}(\widehat{b}_n^2(x))}{\varphi(x)} dx = \ln(\ln n) + c_n$ , where  $\{c_n\}$  is a convergent sequence. This result is similar to the equality  $\int_{-a_n}^{a_n} \frac{\mathbb{E}b^2(x)}{\varphi(x)} dx = \ln(\ln n) + \ln 2 + \gamma + o(1)$  where  $\gamma$  is Euler's constant, proved in de Wet and Venter (1972). Then  $\int_{-a_n}^{a_n} \frac{\widehat{b}_n^2(x)}{\varphi(x)} dx$  goes to infinity as  $n \rightarrow \infty$ . Hence we cannot expect  $T_n^*$  to converge. So if we follow the ideas of del Barrio et al. (1999), we can propose studying

$$\int_{-a_n}^{a_n} \frac{\widehat{b}_n^2(x) - \mathbb{E}\widehat{b}_n^2(x)}{\varphi(x)} dx \text{ or } \int_{-a_n}^{a_n} \frac{\widehat{b}_n^2(x) - \mathbb{E}b^2(x)}{\varphi(x)} dx$$

as a test statistic with the intention of obtaining an asymptotic distribution, which means that the rejection zone is

$$\left\{ \int_{-a_n}^{a_n} \frac{\widehat{b}_n^2(x) - \mathbb{E}\widehat{b}_n^2(x)}{\varphi(x)} dx \geq c \right\} \text{ or } \left\{ \int_{-a_n}^{a_n} \frac{\widehat{b}_n^2(x) - \mathbb{E}b^2(x)}{\varphi(x)} dx \geq c \right\}.$$

Then for fixed  $n$ , we propose  $\int_{-a_n}^{a_n} \frac{\widehat{b}_n^2(x)}{\varphi(x)} dx$  instead  $\int_{-a_n}^{a_n} \frac{\widehat{b}_n^2(x) - \mathbb{E}\widehat{b}_n^2(x)}{\varphi(x)} dx$  or  $\int_{-a_n}^{a_n} \frac{\widehat{b}_n^2(x) - \mathbb{E}b^2(x)}{\varphi(x)} dx$  to test normality. Finally, if  $t = S_n x + \overline{X_n}$ , then  $\widehat{b}_n(x) = \sqrt{n} \left( F_n(t) - \phi\left(\frac{t-\overline{X_n}}{S_n}\right) \right)$ , so  $T_n^* = \int_{-a_n}^{a_n} \frac{\widehat{b}_n^2(x)}{\varphi(x)} dx = \frac{n}{S_n} \int_{\overline{X_n}-a_n S_n}^{\overline{X_n}+a_n S_n} \frac{\left(F_n(t)-\phi\left(\frac{t-\overline{X_n}}{S_n}\right)\right)^2}{\varphi\left(\frac{t-\overline{X_n}}{S_n}\right)} dt$ . Then, estimating  $\mu$  by  $\overline{X_n}$  and  $\sigma$  by  $S_n$ , it follows that  $T_n^*$  can be seen as a kind of Cramér–von Mises statistic to test normality when the weight function is  $\psi(t) = \frac{1}{\varphi^2(\phi^{-1}(t))}$  and integrated over the interval  $(-a_n, a_n)$  instead of over all the real line.

### 4 Asymptotic distribution of the TCVM test statistic

In this section, given  $X_1, X_2, \dots, X_n$  iid, we propose  $\{T_n \geq c\}$  to test normality, where  $T_n := \int_{-a_n}^{a_n} \frac{\widehat{b}_n^2(x) - \mathbb{E}b^2(x)}{\varphi(x)} dx$ , and we will obtain the asymptotic distribution of  $T_n$  under  $H_0$ . Since  $\widehat{b}_n(x)$  is invariant under changes of location and scale, to test normality, we

may assume (if the null hypothesis is true) that  $X_1, X_2, \dots, X_n$  are independent  $N(0, 1)$ . We can express  $\hat{b}_n(x)$  and  $b_n(x)$  (defined in Section 1) as

$$\hat{b}_n(x) = b_n(x_n) + \sqrt{n}(\phi(x_n) - \phi(x))$$

where  $x_n = S_n x + \bar{X}_n$ . Then, given  $x$ ,  $\hat{b}_n(x)$  converges to  $b(x)$  with  $\{b(x)\}_{x \in \mathbb{R}}$  being the Brownian bridge associated with  $\phi$ , the asymptotic limit of the processes  $\{b_n(x)\}_{x \in \mathbb{R}}$ . Moreover, Kalemkerian (2016) proved that

$$\int_{-a_n}^{a_n} \frac{\mathbb{E}(\hat{b}_n^2(x))}{\varphi(x)} dx = \ln(\ln n) + c_n \text{ where } \{c_n\} \text{ converges.}$$

Hence, our test statistic goes to infinity. In Lemma 4 we give meaning to the expression  $\int_{-\infty}^{+\infty} \frac{b^2(x) - \mathbb{E}(b^2(x))(1 - \phi(x))}{\varphi(x)} dx$ , therefore recalling that  $\mathbb{E}(b^2(x)) = \phi(x)(1 - \phi(x))$ , it is reasonable to assume that if we subtract from our statistic its expected value or an equivalent quantity, we should find a non-trivial asymptotic distribution of the sequence

$$T_n = \int_{-a_n}^{a_n} \frac{\hat{b}_n^2(x) - \mathbb{E}(b^2(x))}{\varphi(x)} dx.$$

Indeed, in the following theorem, we summarize the main result of this section.

**Theorem 1.**  $T_n$  converges in law to

$$\int_{-\infty}^{+\infty} \frac{b^2(x) - \mathbb{E}(b^2(x))}{\varphi(x)} dx - \left( \int_{-\infty}^{+\infty} xdb(x) \right)^2 - \left( \int_{-\infty}^{+\infty} x^2 db(x) \right)^2 + c,$$

where  $c$  is a constant and  $\{b(x)\}_{x \in \mathbb{R}}$  is a  $\phi$ -Brownian bridge.

To obtain this result, we use the Skorokhod construction (Skorokhod, 1956). Thus, there exists a triangular array of row independent random variables  $X_{n1}, \dots, X_{nn}$  and  $\{b(x)\}_{x \in \mathbb{R}}$  a  $\phi$ -Brownian bridge, all defined on the same sample space, such that  $\|b_n - b\| \xrightarrow{a.s.} 0$  where  $\|f\| = \sup_{x \in \mathbb{R}} |f(x)|$  and  $\{b_n(x)\}_{x \in \mathbb{R}}$  are the empirical processes associated to  $X_{n1}, \dots, X_{nn}$ . To simplify the notation, we will continue to write  $X_1, \dots, X_n$  instead  $X_{n1}, \dots, X_{nn}$  throughout the rest of this paper.

Theorem 1 follows from the following succession of lemmas and propositions.

We begin by noting that

$$\hat{b}_n^2(x) = b_n^2(x_n) + n(\phi(x_n) - \phi(x))^2 + 2\sqrt{n}b_n(x_n)(\phi(x_n) - \phi(x)), \quad (1)$$

adding and subtracting the expression  $\mathbb{E}(b_n^2(x_n))$  to the numerator of the integrand in  $T_n$ , we obtain the following decomposition

$$T_n = H_n + I_n + J_n \quad (2)$$

where

$$H_n := \int_{-a_n}^{a_n} \frac{b_n^2(x_n) - \mathbb{E}(b_n^2(x_n))}{\varphi(x)} dx,$$

$$I_n := \int_{-a_n}^{a_n} \frac{n(\phi(x_n) - \phi(x))^2 + 2\sqrt{n}b_n(x_n)(\phi(x_n) - \phi(x))}{\varphi(x)} dx,$$

$$J_n := \int_{-a_n}^{a_n} \frac{\mathbb{E}(b_n^2(x_n)) - \mathbb{E}(b^2(x))}{\varphi(x)} dx.$$

**Lemma 1.**

$$\frac{x\varphi(x)}{1+x^2} \leq \phi(-x) \leq \frac{\varphi(x)}{x} \text{ for all } x > 0. \quad (3)$$

*Proof.*  $\varphi(x) = \int_x^{+\infty} t\varphi(t) dt \geq x \int_x^{+\infty} \varphi(t) dt = x(1 - \phi(x)).$  Then, the second inequality in (3) is true. For the other inequality, observe that  $1 - \phi(x) = \int_x^{+\infty} \varphi(t) dt = \int_x^{+\infty} t\varphi(t) \frac{1}{t} dt.$  If we integrate by parts, we obtain that  $1 - \phi(x) = \frac{\varphi(x)}{x} - \int_x^{+\infty} \frac{\varphi(t)}{t^2} dt \geq \frac{\varphi(x)}{x} - \frac{1-\phi(x)}{x^2},$  then  $1 - \phi(x) \geq \frac{x\varphi(x)}{1+x^2}.$   $\square$

**Lemma 2.**  $\frac{a_n^p}{n^q} \rightarrow 0$  for all  $p, q > 0.$

*Proof.* From the previous lemma, we obtain that if  $x \rightarrow +\infty$ , then  $\phi(-x) \sim \frac{\varphi(x)}{x}$ , where  $f(x) \sim g(x)$  means that  $\frac{f(x)}{g(x)} \rightarrow 1$  when  $x \rightarrow +\infty$ . Then

$$\frac{a_n^p}{n^q} = \phi^q(-a_n) a_n^p \sim \varphi^q(a_n) a_n^{p-1} \rightarrow 0.$$

$\square$

**Lemma 3.** For any  $\{b(x)\}_{x \in \mathbb{R}}$   $\phi$ -Brownian bridge, it holds that

$$\int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} \frac{\mathbb{COV}(b^2(x); b^2(y))}{\varphi(x)\varphi(y)} dxdy < +\infty. \quad (4)$$

*Proof.* We use that if  $(X, Y)$  are centered Gaussian random variables in  $\mathbb{R}^2$ , then  $\mathbb{COV}(X^2, Y^2) = 2(\mathbb{COV}(X, Y))^2$ . Then

$$\begin{aligned} \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} \frac{\mathbb{COV}(b^2(x); b^2(y))}{\varphi(x)\varphi(y)} dxdy &= 2 \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} \frac{\phi^2(x \wedge y)(1 - \phi(x \vee y))^2}{\varphi(x)\varphi(y)} dxdy = \\ &4 \int_{-\infty}^{+\infty} dx \int_{-\infty}^x \frac{\phi^2(y)(1 - \phi(x))^2}{\varphi(x)\varphi(y)} dy = 4 \int_{-\infty}^{+\infty} \frac{(1 - \phi(x))^2}{\varphi(x)} dx \int_{-\infty}^x \frac{\phi^2(y)}{\varphi(y)} dy. \end{aligned}$$

If  $x \rightarrow -\infty$ , then

$$\begin{aligned} \frac{(1 - \phi(x))^2}{\varphi(x)} \int_{-\infty}^x \frac{\phi^2(y)}{\varphi(y)} dy &\leq \frac{(1 - \phi(x))^2}{\varphi(x)} \int_{-\infty}^x \frac{\varphi(y)}{y^2} dy \leq \\ &\frac{1}{\varphi(x)} \frac{\phi(x)}{x^2} \leq \frac{1}{|x^3|}. \end{aligned}$$

If  $x \rightarrow +\infty$ , then

$$\frac{(1 - \phi(x))^2}{\varphi(x)} \int_{-\infty}^x \frac{\phi^2(y)}{\varphi(y)} dy \leq \frac{(1 - \phi(x))^2}{\varphi(x)} \left[ \int_{-\infty}^1 \frac{\phi^2(y)}{\varphi(y)} dy + \int_1^x \frac{\phi^2(y)}{\varphi(y)} dy \right].$$

To complete the proof, it is enough to observe that

$$\begin{aligned} \frac{(1 - \phi(x))^2}{\varphi(x)} \int_1^x \frac{\phi^2(y)}{\varphi(y)} dy &\leq \frac{\varphi(x)}{x^2} \int_1^x \frac{dy}{\varphi(y)} \leq \\ \frac{\varphi(x)}{x^2} \int_1^x \frac{y dy}{\varphi(y)} &= \frac{1 - e^{-(x^2-1)/2}}{x^2} \leq \frac{1}{x^2}. \end{aligned}$$

□

**Lemma 4.** Define the sequence

$$W_n := \int_{-a_n}^{a_n} \frac{b^2(x) - \mathbb{E}(b^2(x))}{\varphi(x)} dx = \int_{-a_n}^{a_n} \frac{b^2(x) - \phi(x)(1 - \phi(x))}{\varphi(x)} dx. \quad (5)$$

Then exists a random variable  $Y$  in  $L^2$  such that  $\mathbb{E}(W_n - Y)^2 \rightarrow 0$ .

*Proof.* We will demonstrate that  $\{W_n\}$  is an  $L^2$ -Cauchy sequence.

$$\begin{aligned} \mathbb{E}(W_n W_m) &= \int_{-a_n}^{a_n} \int_{-a_m}^{a_m} \mathbb{E} \left( \frac{b^2(x) - \phi(x)(1 - \phi(x))}{\varphi(x)} \frac{b^2(y) - \phi(y)(1 - \phi(y))}{\varphi(y)} \right) dx dy = \\ &\int_{-a_n}^{a_n} \int_{-a_m}^{a_m} \frac{\mathbb{E}(b^2(y)b^2(x)) - \phi(x)\phi(y)(1 - \phi(x))(1 - \phi(y))}{\varphi(x)\varphi(y)} dx dy \end{aligned}$$

which goes to

$$\int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} \frac{\mathbb{COV}(b^2(y)b^2(x))}{\varphi(x)\varphi(y)} dx dy < +\infty$$

for  $n, m \rightarrow +\infty$ .

Then  $\mathbb{E}(W_n - W_m)^2 = \mathbb{E}(W_n^2 + W_m^2 - 2W_n W_m) \rightarrow 0$ , and  $\{W_n\}$  is an  $L^2$ -Cauchy sequence. □

From now, we call  $Y := \int_{-\infty}^{+\infty} \frac{b^2(x) - \phi(x)(1 - \phi(x))}{\varphi(x)} dx$ .

**Lemma 5.** There exist  $Z_1$  and  $Z_2$  centered, independent Gaussian random variables such that

$$(\sqrt{n}X_n, \sqrt{n}(S_n - 1)) \xrightarrow{P} (Z_1, Z_2).$$

*Proof.* We define  $Y_n := \sup_{x \in \mathbb{R}} \frac{|b_n(x) - b(x)|}{\sqrt{\varphi(x)}}$ , and we will apply theorem 1.1 of Shorack & Wellner (1982) to  $q(t) = \sqrt{\varphi(\phi^{-1}(t))}$ . Set  $\|f\| = \sup_{x \in [0,1]} |f(x)|$ , and  $B_n(t) := b_n(\phi^{-1}(t))$ ,  $B(t) := b(\phi^{-1}(t))$ . Then  $Y_n = \left\| \frac{B_n - B}{q} \right\|$ . Using Lemma 2, that  $\frac{q^2(t)}{t \ln(-\ln t)} \rightarrow +\infty$  for  $t \rightarrow 0$ , then  $Y_n \xrightarrow{P} 0$ .

$$\int_{-\infty}^{+\infty} |x|^\alpha |b_n(x) - b(x)| dx \leq Y_n \int_{-\infty}^{+\infty} |x|^\alpha \sqrt{\varphi(x)} dx \xrightarrow{P} 0 \text{ for all } \alpha > 0. \text{ Then,}$$

$$\sqrt{n} \bar{X}_n = \sqrt{n} \int_{-\infty}^{+\infty} x d(F_n(x) - \phi(x)) = \int_{-\infty}^{+\infty} x d b_n(x) \xrightarrow{P} \int_{-\infty}^{+\infty} x d b(x) := Z_1.$$

$$\sqrt{n}(S_n - 1) = \frac{\sqrt{n}(S_n^2 - 1)}{S_n + 1} = \frac{1}{S_n + 1} \left( \int_{-\infty}^{+\infty} x^2 d b_n(x) - \sqrt{n} \bar{X}_n^2 \right) \xrightarrow{P} \frac{1}{2} \int_{-\infty}^{+\infty} x^2 d b(x) := Z_2.$$

Observe that  $Z_1, Z_2$  are centered Gaussian random variables, and  $\mathbb{V}(Z_1) = 1$ ,  $\mathbb{V}(Z_2) = 1/2$ .

As  $\sqrt{n} \bar{X}_n$  and  $S_n$  are independent for all  $n$ , it follows that  $Z_1$  and  $Z_2$  are independent too.  $\square$

### Lemma 6.

$$\mathbb{E}(b_n^2(x)b_n^2(y)) = \mathbb{E}(b^2(x)b^2(y)) + \frac{p(x,y)}{n}$$

where

$$p(x,y) = \phi(x \wedge y)(1 - \phi(x \vee y)) \frac{1 + 6\phi(x \vee y)\phi(x \wedge y) - 2\phi(x \vee y) - 4\phi(x \wedge y)}{n}$$

and  $\{b(x)\}_{x \in \mathbb{R}}$  is any  $\phi$ -Brownian motion.

*Proof.* For simplicity in notation, we will call  $z = \phi(x \wedge y)$  and  $t = \phi(x \vee y)$ .

$$\mathbb{E}(b_n^2(x)b_n^2(y)) = n^2 \mathbb{E}(F_n(x) - \phi(x))^2 (F_n(y) - \phi(y))^2 =$$

$$n^2 \mathbb{E}(F_n^2(x) - 2F_n(x)\phi(x) + \phi^2(x)) (F_n^2(y) - 2F_n(y)\phi(y) + \phi^2(y)) \quad (6)$$

To calculate (6) we will use that  $\mathbb{E}(F_n(x)) = \phi(x)$  and  $\mathbb{E}(F_n^2(x)) = \frac{\phi(x)(1-\phi(x))}{n} + \phi^2(x)$  for all  $x$ , and the formulas for  $\mathbb{E}(F_n(x)F_n(y))$ ,  $\mathbb{E}(F_n^2(x)F_n(y))$  and  $\mathbb{E}(F_n^2(x)F_n^2(y))$  that we will obtain. First, we observe that

$$n^2 \mathbb{E}(F_n(x)F_n(y)) = \sum_{i,j=1}^n P(X_i \leq x, X_j \leq y) = nz + n(n-1)zt. \quad (7)$$

If we define  $I := -2\phi(y)\mathbb{E}(F_n^2(x)\phi(y)) - 2\phi(x)\mathbb{E}(F_n^2(y)\phi(x))$  then (6) (after some calculation) is equal to

$$n^2 \mathbb{E}F_n^2(x)F_n^2(y) + n^2 I + 5nz^2t + nzt^2 + (3n^2 - 6n)z^2t^2.$$

If we proceed similarly to (7), we obtain that

$$n^2 \mathbb{E}(F_n^2(x)F_n(y)) = \frac{1}{n} \sum_{i,j,k=1}^n P(X_i \leq x, X_j \leq x, X_k \leq y) =$$

$$(n-1)(n-2)\phi^2(x)\phi(y) + (n-1)\phi(x)\phi(y) + 2(n-1)\phi(x \wedge y)\phi(x) + \phi(x \wedge y),$$

and

$$n^2 \mathbb{E}(F_n^2(x)F_n^2(y)) = \frac{1}{n^2} \sum_{i,j,k,l=1}^n P(X_i \leq x, X_j \leq x, X_k \leq y, X_l \leq y)$$

$$\frac{n-1}{n} (4z^2 + 3zt + 5(n-2)z^2t + (n-2)zt^2 + (n^2 - 5n + 6)z^2t^2) + z/n$$

Then

$$n^2 I = -4(n^2 - 3n + 2)z^2t^2 + (10 - 10n)z^2t + (2 - 2n)zt^2 - 2z^2 - 2zt.$$

Finally,  $\mathbb{E}(b_n^2(x)b_n^2(y))$  is equal to

$$\begin{aligned} & -5tz^2 - t^2z + 3t^2z^2 + tz + 2z^2 + z(t-1) \frac{2t+4z-6tz-1}{n} = \\ & \mathbb{E}(b^2(x)b^2(y)) + z(t-1) \frac{2t+4z-6tz-1}{n}. \end{aligned} \quad (8)$$

where  $\{b(x)\}_{x \in \mathbb{R}}$  is any  $\phi$ -Brownian motion.  $\square$

### Lemma 7.

$$\int_{-a_n}^{a_n} \frac{b_n^2(x) - \phi(x)(1 - \phi(x))}{\varphi(x)} dx \xrightarrow{P} \int_{-\infty}^{+\infty} \frac{b^2(x) - \phi(x)(1 - \phi(x))}{\varphi(x)} dx. \quad (9)$$

*Proof.* We decompose

$$\int_{-a_n}^{a_n} \frac{b_n^2(x) - \phi(x)(1 - \phi(x))}{\varphi(x)} dx := Y_{n,\delta} + Z_{n,\delta} + W_{n,\delta}$$

where  $Y_{n,\delta} := \int_{-\delta}^{\delta} \frac{b_n^2(x) - \phi(x)(1 - \phi(x))}{\varphi(x)} dx$ ,  $Z_{n,\delta} := \int_{-a_n}^{-\delta} \frac{b_n^2(x) - \phi(x)(1 - \phi(x))}{\varphi(x)} dx$  and  $W_{n,\delta} := \int_{\delta}^{a_n} \frac{b_n^2(x) - \phi(x)(1 - \phi(x))}{\varphi(x)} dx$ . We will prove that  $\lim_{\delta \rightarrow +\infty} \lim_{n \rightarrow +\infty} Y_{n,\delta} = Y$ ,  $\lim_{\delta \rightarrow +\infty} \lim_{n \rightarrow +\infty} Z_{n,\delta} = 0$  and  $\lim_{\delta \rightarrow +\infty} \lim_{n \rightarrow +\infty} W_{n,\delta} = 0$  in probability.

Indeed

$$\begin{aligned} \lim_{\delta \rightarrow +\infty} \lim_{n \rightarrow +\infty} Y_{n,\delta} &= \lim_{\delta \rightarrow +\infty} \int_{-\delta}^{\delta} \frac{b^2(x) - \phi(x)(1 - \phi(x))}{\varphi(x)} dx = \\ & \int_{-\infty}^{+\infty} \frac{b^2(x) - \phi(x)(1 - \phi(x))}{\varphi(x)} dx. \end{aligned}$$

To prove that  $\lim_{\delta \rightarrow +\infty} \lim_{n \rightarrow +\infty} W_{n,\delta} = 0$  in probability, it is enough to show that  $\lim_{\delta \rightarrow +\infty} \lim_{n \rightarrow +\infty} \mathbb{E}(W_{n,\delta}^2) = 0$ .

$$\mathbb{E}(W_{n,\delta}^2) = \mathbb{E}\left(\int_{\delta}^{a_n} \frac{b_n^2(x) - \phi(x)(1 - \phi(x))}{\varphi(x)} dx \int_{\delta}^{a_n} \frac{b_n^2(y) - \phi(y)(1 - \phi(y))}{\varphi(y)} dy\right) =$$

$$\int_{\delta}^{a_n} \int_{\delta}^{a_n} \frac{\mathbb{E}(b_n^2(x)b_n^2(y)) - \phi(x)(1-\phi(x))\phi(y)(1-\phi(y))}{\varphi(x)\varphi(y)} dx dy \quad (10)$$

Then, using Lemma 6 we obtain that (10) is equal to

$$\int_{\delta}^{a_n} \int_{\delta}^{a_n} \frac{\mathbb{C}\mathbb{O}\mathbb{V}(b^2(x), b^2(y))}{\varphi(x)\varphi(y)} dx dy + \frac{1}{n} \int_{\delta}^{a_n} \int_{\delta}^{a_n} \frac{p(x, y)}{\varphi(x)\varphi(y)} dx dy.$$

From Lemma 3 we obtain that

$$\lim_{\delta \rightarrow +\infty} \lim_{n \rightarrow +\infty} \int_{\delta}^{a_n} \int_{\delta}^{a_n} \frac{\mathbb{C}\mathbb{O}\mathbb{V}(b^2(x), b^2(y))}{\varphi(x)\varphi(y)} dx dy = 0.$$

Finally, we will show that  $\lim_{n \rightarrow +\infty} \frac{1}{n} \int_{\delta}^{a_n} \int_{\delta}^{a_n} \frac{p(x, y)}{\varphi(x)\varphi(y)} dx dy = 0$  for all  $\delta > 0$ . Indeed, for certain  $c > 0$ ,

$$\frac{1}{n} \int_{\delta}^{a_n} \int_{\delta}^{a_n} \frac{|p(x, y)|}{\varphi(x)\varphi(y)} dx dy \leq \frac{c}{n} \int_{\delta}^{a_n} \int_{\delta}^{a_n} \frac{\phi(x \wedge y)(1 - \phi(x \vee y))}{\varphi(x)\varphi(y)} dx dy.$$

Then, applying L'Hôpital rule, we obtain that

$$\begin{aligned} & \lim_{n \rightarrow +\infty} \frac{1}{n} \int_{\delta}^{a_n} \int_{\delta}^{a_n} \frac{\phi(x \wedge y)(1 - \phi(x \vee y))}{\varphi(x)\varphi(y)} dx dy = \\ & \lim_{n \rightarrow +\infty} \frac{\partial}{\partial n} \left( \int_{\delta}^{a_n} \int_{\delta}^{a_n} \frac{\phi(x \wedge y)(1 - \phi(x \vee y))}{\varphi(x)\varphi(y)} dx dy \right) = \\ & \lim_{n \rightarrow +\infty} \frac{2}{n^2 \varphi^2(a_n)} \int_{\delta}^{a_n} \frac{\phi(x)(1 - \phi(a_n))}{\varphi(x)} dx = \lim_{n \rightarrow +\infty} \frac{2}{n^3 \varphi^2(a_n)} \int_{\delta}^{a_n} \frac{\phi(x)}{\varphi(x)} dx = 0. \end{aligned}$$

The case  $\lim_{\delta \rightarrow +\infty} \lim_{n \rightarrow +\infty} Z_{n,\delta} = 0$  is solved similarly.  $\square$

In the next lemmas and propositions, we will use the following equalities:

$$\phi(x_n) - \phi(x) = \varphi(c_n)(x_n - x) \text{ for } c_n \in (x_n \wedge x, x_n \vee x). \quad (11)$$

$$\frac{\varphi^2(c_n)}{\varphi^2(x)} = e^{x^2 - c_n^2} = 1 + e^{d_n} (x^2 - c_n^2) \text{ for } |d_n| \leq |x^2 - c_n^2|. \quad (12)$$

$$\frac{\varphi(c_n)}{\varphi(x)} = e^{\frac{x^2 - c_n^2}{2}} = 1 + e^{d'_n} \frac{(x^2 - c_n^2)}{2} \text{ for } |d'_n| \leq \frac{|x^2 - c_n^2|}{2}. \quad (13)$$

Observe that if  $x \in (-a_n, a_n)$ , then  $|d_n| \leq |x^2 - x_n^2| \leq \frac{Aa_n^2}{\sqrt{n}}$  for certain random variable  $A$ , and  $|d'_n| \leq \frac{|x^2 - x_n^2|}{2} \leq \frac{A'a_n^2}{\sqrt{n}}$  for certain random variable  $A'$ .

In the next proposition, we prove that the term  $H_n$  in decomposition (2) converges in law.

**Proposition 1.**

$$H_n = \int_{-a_n}^{a_n} \frac{b_n^2(x_n) - \mathbb{E}(b_n^2(x_n))}{\varphi(x)} dx \xrightarrow{P} \int_{-\infty}^{+\infty} \frac{b^2(x) - \mathbb{E}(b^2(x))}{\varphi(x)} dx.$$

*Proof.* Since

$$\int_{-a_n}^{a_n} \frac{b_n^2(x_n) - \mathbb{E}(b_n^2(x_n))}{\varphi(x_n)} dx = \frac{1}{S_n} \int_{-S_n a_n + \bar{X}_n}^{S_n a_n + \bar{X}_n} \frac{b_n^2(t) - \mathbb{E}(b_n^2(t))}{\varphi(t)} dt$$

converges in probability (by Lemma 7) to  $\int_{-\infty}^{+\infty} \frac{b^2(x) - \mathbb{E}(b^2(x))}{\varphi(x)} dx$ ,

$$H_n = \int_{-a_n}^{a_n} \frac{b_n^2(x_n) - \mathbb{E}(b_n^2(x_n))}{\varphi(x_n)} \frac{\varphi(x_n)}{\varphi(x)} dx$$

and due to (13) (with  $c_n = x_n$ ) and Lemma 3 we obtain that  $H_n$  converges in probability to  $\int_{-\infty}^{+\infty} \frac{b^2(x) - \mathbb{E}(b^2(x))}{\varphi(x)} dx$ .  $\square$

**Lemma 8.**

$$\int_{-a_n}^{a_n} \frac{n(\phi(x_n) - \phi(x))^2}{\varphi(x)} dx = n(S_n - 1)^2 \alpha_n + n\bar{X}_n^2 \beta_n + Y_n$$

where  $\alpha_n = \int_{-a_n}^{a_n} x^2 \varphi(x) dx$ ,  $\beta_n = \int_{-a_n}^{a_n} \varphi(x) dx$  and  $\mathbb{E}(|Y_n|) \rightarrow 0$ .

*Proof.* Using (11) and (12), we obtain that

$$\begin{aligned} \int_{-a_n}^{a_n} \frac{n(\phi(x_n) - \phi(x))^2}{\varphi(x)} dx &= \int_{-a_n}^{a_n} \frac{n\varphi^2(c_n)(x_n - x)^2}{\varphi^2(x)} \varphi(x) dx = \\ &\int_{-a_n}^{a_n} n(x_n - x)^2 \varphi(x) dx + \int_{-a_n}^{a_n} ne^{d_n} (x^2 - c_n^2)(x_n - x)^2 \varphi(x) dx. \\ &\int_{-a_n}^{a_n} n(x_n - x)^2 \varphi(x) dx = \int_{-a_n}^{a_n} n((S_n - 1)x + \bar{X}_n)^2 \varphi(x) dx = \\ &n(S_n - 1)^2 \alpha_n + n\bar{X}_n^2 \beta_n. \end{aligned}$$

Define  $Y_n := \int_{-a_n}^{a_n} ne^{d_n} (x^2 - c_n^2)(x_n - x)^2 \varphi(x) dx$ . Then, using that  $|d_n| \leq \frac{Aa_n^2}{\sqrt{n}}$  and Lemma 3,

$$\mathbb{E}(|Y_n|) \leq \mathbb{E}\left(\int_{-a_n}^{a_n} ne^{d_n} |x^2 - c_n^2|(x_n - x)^2 \varphi(x) dx\right) \leq \frac{a_n^2}{\sqrt{n}} \mathbb{E}\left(Ae^{\frac{Aa_n^2}{\sqrt{n}}}\right) \rightarrow 0.$$

$\square$

**Lemma 9.**

$$\int_{-a_n}^{a_n} \frac{n(\phi(x_n) - \phi(x))^2}{\varphi(x)} dx \xrightarrow{P} Z_1^2 + Z_2^2.$$

*Proof.* This follows directly from Lemma 8 and Lemma 5.  $\square$

**Lemma 10.**

$$\int_{-a_n}^{a_n} \frac{\sqrt{n}b_n(x_n)(\phi(x_n) - \phi(x))}{\varphi(x)} dx = \sqrt{n} \frac{(S_n - 1)}{S_n^2} Z'_n + \sqrt{n} \frac{\bar{X}_n}{S_n^2} Z''_n + Y'_n$$

where  $Z'_n = \int_{\bar{X}_n - a_n S_n}^{\bar{X}_n + a_n S_n} tb_n(t) dt$ ,  $Z''_n = \int_{\bar{X}_n - a_n S_n}^{\bar{X}_n + a_n S_n} b_n(t) dt$  and  $\mathbb{E}(|Y'_n|) \rightarrow 0$ .

*Proof.* Using (11) and (13), observe that

$$\begin{aligned} \int_{-a_n}^{a_n} \frac{\sqrt{n}b_n(x_n)(\phi(x_n) - \phi(x))}{\varphi(x)} dx &= \int_{-a_n}^{a_n} \frac{\sqrt{n}b_n(x_n)\varphi(c_n)(x_n - x)}{\varphi(x)} dx = \\ \int_{-a_n}^{a_n} \sqrt{n}b_n(x_n)(x_n - x) dx + \frac{1}{2} \int_{-a_n}^{a_n} \sqrt{n}b_n(x_n)e^{d'_n}(x^2 - c_n^2)(x_n - x) dx. \\ \sqrt{n} \int_{-a_n}^{a_n} b_n(x_n)(x_n - x) dx &= \frac{\sqrt{n}}{S_n^2} \int_{-S_n a_n + \bar{X}_n}^{S_n a_n + \bar{X}_n} b_n(t) [(S_n - 1)t + \bar{X}_n] dt = \\ \frac{\sqrt{n}(S_n - 1)}{S_n^2} \int_{-S_n a_n + \bar{X}_n}^{S_n a_n + \bar{X}_n} tb_n(t) dt + \frac{\sqrt{n}\bar{X}_n}{S_n^2} \int_{-S_n a_n + \bar{X}_n}^{S_n a_n + \bar{X}_n} b_n(t) dt. \end{aligned}$$

Define  $Y'_n := \frac{1}{2} \int_{-a_n}^{a_n} \sqrt{n}b_n(x_n)e^{d'_n}(x^2 - c_n^2)(x_n - x) dx$ . Then working similarly to Lemma 8, we obtain that  $\mathbb{E}(|Y'_n|) \rightarrow 0$ .  $\square$

**Lemma 11.**

$$\int_{-a_n}^{a_n} \frac{\sqrt{n}b_n(x_n)(\phi(x_n) - \phi(x))}{\varphi(x)} dx \xrightarrow{P} -Z_1^2 - Z_2^2.$$

*Proof.*

$$Z'_n = \int_{\bar{X}_n - a_n S_n}^{\bar{X}_n + a_n S_n} tb_n(t) dt = \int_{-\infty}^{+\infty} tb_n(t) dt + \varepsilon_n$$

where  $\varepsilon_n \xrightarrow{P} 0$ .

Integrating by parts and using Lemma 5, we obtain that

$$Z'_n = -\frac{1}{2} \int_{-\infty}^{+\infty} t^2 db_n(t) + \varepsilon_n \xrightarrow{P} -Z_2.$$

Analogously  $Z''_n \xrightarrow{P} -Z_1$ , and the result of the lemma it follows directly from Lemma 10.  $\square$

**Proposition 2.**

$$I_n = \int_{-a_n}^{a_n} \frac{n(\phi(x_n) - \phi(x))^2 + 2\sqrt{n}b_n(x_n)(\phi(x_n) - \phi(x))}{\varphi(x)} dx \xrightarrow{P} -Z_1^2 - Z_2^2.$$

*Proof.* This follows directly from lemmas 9 and 11.  $\square$

Finally, to prove that the term  $J_n$  in decomposition (2) converges, we need the following lemma.

**Lemma 12.** *The sequence*

$$\int_{-a_n}^{a_n} \frac{\mathbb{E}(\widehat{b}_n^2(x)) - \mathbb{E}(b^2(x))}{\varphi(x)} dx$$

*converges.*

*Proof.* By symmetry it is enough to take the integral between 1 and  $a_n$ . By using the results in section 3 of Kalemkerian (2016), one gets

$$\begin{aligned} \int_1^{a_n} \frac{\mathbb{E}(\widehat{b}_n^2(x)) - \mathbb{E}(b^2(x))}{\varphi(x)} dx &= \frac{1}{2} \ln \ln n + c_n - \int_1^{a_n} \frac{\phi(x)(1 - \phi(x))}{\varphi(x)} dx = \\ &\quad \int_1^{a_n} \left( \frac{1}{x} - \frac{\phi(x)(1 - \phi(x))}{\varphi(x)} \right) dx + c'_n. \end{aligned}$$

where  $\{c_n\}$  and  $\{c'_n\}$  are convergent sequences.

Define  $f(x) := \frac{1-\phi(x)}{\varphi(x)} - \frac{1}{x}$ , and apply L'Hôpital rule twice to show

$$\frac{f(x)}{\frac{1}{x^2}} \xrightarrow{x \rightarrow +\infty} 0.$$

$\square$

**Proposition 3.** *The sequence*

$$J_n = \int_{-a_n}^{a_n} \frac{\mathbb{E}(b_n^2(x_n)) - \mathbb{E}(b^2(x))}{\varphi(x)} dx$$

*converges.*

*Proof.* We will see that

$$\int_{-a_n}^{a_n} \frac{\mathbb{E}(b_n^2(x_n)) - \mathbb{E}(\widehat{b}_n^2(x))}{\varphi(x)} dx \text{ and } \int_{-a_n}^{a_n} \frac{\mathbb{E}(\widehat{b}_n^2(x)) - \mathbb{E}(b^2(x))}{\varphi(x)} dx \text{ are convergent.}$$

The second term converges due to Lemma 12. Observe that from (2) one gets

$$\int_{-a_n}^{a_n} \frac{\mathbb{E}(b_n^2(x_n)) - \mathbb{E}(\widehat{b}_n^2(x))}{\varphi(x)} dx = -\mathbb{E}(I_n) \rightarrow 3/2 \tag{14}$$

due to lemmas 8 and 10.  $\square$

Note that the constant appearing in Theorem 1 is unknown. As seen in Lemma 12 and Proposition 3, one gets

$$c = \lim J_n = \lim \int_{-a_n}^{a_n} \frac{\mathbb{E}(\hat{b}_n^2(x)) - \mathbb{E}(b^2(x))}{\varphi(x)} dx + 3/2.$$

In Table 2, we present the results, from  $m = 1000$  simulations, the estimated values of the constant  $c$  for different values of  $n$ .

Table 2. Estimated values of constant  $c$  for different values of  $n$ .

$n$	500	1000	10000	20000	50000	100000
$c$	0.0258	0.009137	-0.022793	-0.01752	0.002268	0.00093

## 5 Conclusions

This paper has presented a test of normality with  $\mu$  and  $\sigma$  unknown, based on the statistic  $\int_{-a_n}^{a_n} \frac{\hat{b}_n^2(x)}{\varphi(x)} dx$ , which is a type of Cramér–von Mises statistic, except that it is integrated over a particular interval, which is a function of the sample size. This statistic was inspired by del Barrio et al. (1999). We analysed its asymptotic behavior, which has a limit distribution equivalent to that of S–W statistic. A comparative study of its behaviour over a wide range of alternative hypotheses found that the test proposed here is often better than the tests of Shapiro–Wilks and Anderson–Darling, which are two tests that have very good performance as tests of normality.

## 6 Appendix 1. Performance of the proposed test

We present a table, for sample size of  $n = 50$ , where we compare the performance of our test, namely the Truncated Cramér–von Mises test (TCVM), with the following four tests: 1) the non-truncated Cramér–von Mises test, which integrates over all the real line (CVM); 2) the test proposed by del Barrio, Matrán-Cuesta, and Rodríguez (BCMR); 3) the Anderson–Darling test (AD) and 4) the Shapiro–Wilks test (SW).

The power of these tests was compared based on 10,000 replications. We chose the level of significance  $\alpha = 0.05$  and the empirical critical values were obtained after 50,000 replications.

The list of 35 alternative hypotheses considered in the present section are borrowed from Gan and Koelher (1990) and are a summary of a total of 69.

We use the notation of Gan and Koelher (1990), and the alternative hypotheses are considered in the same order as in the cited reference.

LoConN( $p, a$ ) indicates a mixture of  $N(0; 1)$  with probability  $1-p$  and  $N(a; 1)$  with probability  $p$ . ScConN( $p, a$ ) indicates the mixture of  $N(0; 1)$  with probability  $1-p$  and  $N(0; a)$  with probability  $p$ . TruncN( $a; b$ ) is  $N(0; 1)$  truncated to the interval  $(a; b)$ . SB( $a; b$ ) is the Johnson bounded distribution with parameters  $a, b$ , and SU( $a; b$ ) is the Johnson unbounded distribution with parameters  $a, b$ . Triangle I( $a$ ) is the distribution with density  $f(x) = 1/a - |x|/a^2$  for  $|x| \leq a$ , and Triangle II( $a$ ) is the distribution with density

Table 1. Powers under 35 alternative hypotheses at the 5% level,  $n = 50$ .

$$f(x) = 2/a - 2x/a^2 \text{ for } 0 \leq x \leq a.$$

For others values of  $n$ , the comparision was similar to the one presented here. The 35 alternative hypotheses are ordered in 13 types of distributions. Type 1 includes symmetric bimodal distributions with low skewness. Type 2 includes symmetric multimodal distributions with low tails. Type 3 includes distributions with slightly heavier tails than

the normal distribution. Types 4, 5 and 6 are contaminations of the normal distribution. Type 7 includes symmetrical distributions with high skewness. The remaining types are asymmetrical distributions. Types 8 and 9 are distributions with low skewness with opposite signs. Types 10, 11 and 12 are bimodal distributions with positive coefficients of symmetry. Type 13 contains distributions with extreme values of coefficients of skewness or symmetry. In the following graphs, we compare the powers (at the 5% level) of our test (TCVM), Anderson–Darling (AD) and Shapiro–Wilk (SW), for sample sizes  $n = 20$  and  $n = 50$ , when the alternative hypotheses are in the lambda Tukey family. The critical values were obtained by simulations, with 50,000 replications. The various powers, presented in the graphs, were found by simulations, with 10,000 replications.

Figure 1:  $\text{Tukey}(d)$  alternative,  $n = 20$  and  $n = 50$ .

In Figure 1, the alternative hypotheses belong to Tukey’s family, for sample sizes  $n = 20$  and  $n = 50$ . In Figure 2, the alternative hypotheses belong to the  $\text{LoConN}(0.3, p)$  family, for  $n = 20$  and  $n = 50$ . We see that for distribution Type 1, the TCVM powers are close to the AD that are the best. For distribution Type 2, TCVM is the test with the best performance, and CVM performs badly. In Types 3, 4, 5 and 6, the performance is the opposite (CVM is the best test while TCVM performs badly). We can see that in many cases, TCVM is better than the others. Besides, in several of the cases in which TCVM performs badly, CVM is competitive with SW, AD and BCMR. Taking into account all 35 alternative hypotheses, we can see that in many cases, TCVM is better than the others, but under some alternative hypotheses, like symmetrical distributions with high skewness (Type 7), and contaminations in the variance of normal distributions (Types 4, 5 and 6), TCVM performs badly. However, in Figure 2 (contaminations in the mean of normal distributions), TCVM performs very well. It should be noted that in most cases, either TCVM or CVM results in the best test.

Figure 2: LoConN(0.3,  $p$ ) alternative,  $n = 20$  and  $n = 50$ .

## 7 Appendix 2. Computing the statistic $T_n^*$ .

$$T_n^* = \int_{-a_n}^{a_n} \frac{\widehat{b}_n^2(x)}{\varphi(x)} dx = \int_{-a_n}^{a_n} \frac{\frac{1}{n} (\sum_{i=1}^n \mathbf{1}_{\{Y_i \leq x\}})^2 - 2\phi(x) \sum_{i=1}^n \mathbf{1}_{\{Y_i \leq x\}} + n\phi^2(x)}{\varphi(x)} dx = \\ \frac{1}{n} \int_{-a_n}^{a_n} \frac{(\sum_{i=1}^n \mathbf{1}_{\{Y_i \leq x\}})^2}{\varphi(x)} dx - 2 \int_{-a_n}^{a_n} \frac{\phi(x) \sum_{i=1}^n \mathbf{1}_{\{Y_i \leq x\}}}{\varphi(x)} dx + n \int_{-a_n}^{a_n} \frac{\phi^2(x)}{\varphi(x)} dx.$$

Then, given  $X_1, X_2, \dots, X_n$ , the calculation of the statistic  $T_n^*$  can be summarized in the following steps.

**Step 1.** Compute  $\bar{X}_n$ ,  $S_n$  and delete all data such that  $X_i \leq \bar{X}_n - a_n S_n$  or  $X_i \geq \bar{X}_n + a_n S_n$  where the values of  $a_n$  are shown in ninth column of Appendix 2.

**Step 2.** Define  $k := \#\{j : X_j \leq \bar{X}_n - a_n S_n\}$  and call  $\tilde{X}_1, \tilde{X}_2, \dots, \tilde{X}_m$  to the values that resulted from step 1, and sort them:  $\tilde{X}_{1:m} \leq \tilde{X}_{2:m} \leq \dots \leq \tilde{X}_{m:m}$ .

**Step 3.** Compute  $\tilde{Y}_0 = -a_n$ ,  $\tilde{Y}_{m+1} = a_n$ ,  $\tilde{Y}_j = \frac{\tilde{X}_{j:m} - \bar{X}_n}{S_n}$  for  $j = 1, 2, \dots, m$ .

**Step 4.** Compute  $A_j = \int_{\tilde{Y}_j}^{\tilde{Y}_{j+1}} \frac{dx}{\varphi(x)}$  and  $B_j = \int_{\tilde{Y}_j}^{\tilde{Y}_{j+1}} \frac{\phi(x) dx}{\varphi(x)}$  for  $j = 0, 1, 2, \dots, m$  (for example in R you can use the “integrate” function to compute  $A_j$  and  $B_j$  values).

**Step 5.** Compute  $T_n^* = \frac{1}{n} \sum_{j=0}^m (j+k)^2 A_j - 2 \sum_{j=0}^m (j+k) B_j + C_n$ , where  $C_n := n \int_{-a_n}^{a_n} \frac{\phi^2(x)}{\varphi(x)} dx$  and their values for different sample sizes are shown in the last column of Appendix 2.

**Step 6.** The critical values for rejection the null hypothesis for different levels of significance are in Appendix 3. When  $T_n^*$  is greater than the critical value, we must reject the hypothesis of normality.

## 8 Appendix 3. Tables

In this section we present a table with critical values of  $T_n^*$  for different values of  $n$ . The values were obtained by simulation from 50000 replications. From columns 2 to 8, we find the levels of significance of the test. In columns 9 and 10, we find the values of  $a_n$  and  $C_n$  respectively.
