## 1. Introduction

The representation of the mathematical constants $\pi$ and its powers by series, products and integrals have attracted the attention of researchers for a long time. The classic result for $\pi, \pi^{2}, \pi^{3}, \pi^{4}, \pi^{5}, \pi^{6}$ in terms of a series of powers of integers was presented by Leibnitz and Euler as

$$
\begin{align*}
& \pi=4 \sum_{k=0}^{\infty} \frac{(-1)^{k}}{(2 k+1)}  \tag{1}\\
& \pi^{2}=6 \sum_{k=1}^{\infty} \frac{1}{k^{2}}  \tag{2}\\
& \pi^{3}=32 \sum_{k=0}^{\infty} \frac{(-1)^{k}}{(2 k+1)^{3}} \quad, \quad \pi^{4}=90 \sum_{k=1}^{\infty} \frac{1}{k^{4}}  \tag{3}\\
& \pi^{5}=\frac{1536}{5} \sum_{k=0}^{\infty} \frac{(-1)^{k}}{(2 k+1)^{5}} \quad, \quad \pi^{6}=945 \sum_{k=1}^{\infty} \frac{1}{k^{6}} \tag{4}
\end{align*}
$$

Borwein[5] had described very elegantly the history of $\pi$ along with its selected useful formulas in terms of series representation. Alzer and Koumandos[2] presented a series representation for $\pi$ as

$$
\begin{equation*}
\pi=4 \sum_{k=0}^{\infty} \frac{1}{(1+\mu)^{k+1}} \quad \sum_{m=0}^{k}\binom{k}{m} \frac{(-1)^{m} \mu^{k-m}}{(2 m+1)} \tag{5}
\end{equation*}
$$

where they introduced a positive parameter $\mu$, on the lines of modifying the Amore's technique[3] to obtain one-parameter family of series representation of mathematical constants. Further, in case of mathematical constants involving $\pi$, series representations were given by Alzer etal.[1] in terms of digamma function. Recently, Blagouchine[4] obtained new series expansions for generalized Euler constants containing polynomials in $\pi^{-2}$ with rational coefficients.
Alzer etal.[1] gave series representation for $\pi^{2}$ as

$$
\begin{equation*}
\pi^{2}=4 \sum_{k=1}^{\infty} \frac{\mu_{k} h_{k}}{k} \tag{6}
\end{equation*}
$$

where $\mu_{\mathrm{n}}$ denotes the normalized binomial mid-coefficient defined by

$$
\begin{equation*}
\mu_{\mathrm{k}}=\frac{1.3 .5 . . . . . . . .(2 k-1)}{2.4 .6 . . . . . . . . . ~} 2 k \tag{7}
\end{equation*}
$$

$$
\begin{equation*}
\mathrm{h}_{\mathrm{k}}=\sum_{n=1}^{k} \frac{1}{(2 n-1)} \tag{8}
\end{equation*}
$$

Kolbig [6] gave an interesting relation as

$$
\begin{equation*}
\pi^{2}=2 \sum_{k=1}^{\infty} \frac{\sigma_{k}}{k} \tag{9}
\end{equation*}
$$

where

$$
\begin{array}{ll}
\sigma_{\mathrm{n}}=\mathrm{p}_{\mathrm{n}} \sum_{k=1}^{n} \frac{1}{(4 k-1)}+\mathrm{q}_{\mathrm{n}} & \sum_{k=1}^{n} \frac{1}{(4 k-3)} \\
\mathrm{p}_{\mathrm{n}}=\prod_{k=1}^{n} \frac{(4 k-1)}{4 k} \quad, \quad \mathrm{q}_{\mathrm{n}}=\prod_{k=1}^{n} \frac{(4 k-3)}{4 k} \tag{11}
\end{array}
$$

Yet another series representation for $\pi^{2}$ were given by Alzer etal.[1] as

$$
\begin{equation*}
\pi^{2}=3 \sum_{k=1}^{\infty} \frac{\mu_{k} H_{k}}{k} \tag{12}
\end{equation*}
$$

where

$$
\begin{equation*}
\mathrm{H}_{\mathrm{n}}=\sum_{k=1}^{n} \frac{1}{k} \tag{13}
\end{equation*}
$$

In this paper, the series representations for $\pi, \pi^{3}$ and $\pi^{5}$ are presented where the series involves the application of Euler numbers $\mathrm{E}_{2 \mathrm{k}}$, defined as

$$
\begin{equation*}
\sum_{m=1}^{\infty} \frac{(-1)^{m+1}}{(2 m-1)^{2 k+1}}=\frac{\pi^{2 k+1}}{2^{2 k+2}(2 k)!}\left|E_{2 k}\right| \tag{14}
\end{equation*}
$$

with $\mathrm{E}_{0}=1$ giving $\mathrm{E}_{2}=-1, \mathrm{E}_{4}=5, \mathrm{E}_{6}=-61, \mathrm{E}_{8}=1385, \mathrm{E}_{10}=-50521, \mathrm{E}_{12}=2702765, \ldots \ldots$ and the series $\sum_{j=0}^{k-1}\left[-\frac{1}{(2 m-1)^{2} \pi^{2}}\right]^{j} \frac{1}{(2 k-2 j-1)!}$ for integers $\mathrm{j}, \mathrm{k} \geq 0$.

Further, the series representations for $\pi^{2}, \pi^{4}$ and $\pi^{6}$ are presented where the series involves the application of Bernoulli numbers $\mathrm{B}_{2 \mathrm{k}}$, defined as

$$
\begin{equation*}
\sum_{m=1}^{\infty} \frac{1}{(m)^{2 k}}=(-1)^{\mathrm{k}-1} \frac{(2 \pi)^{2 k}}{2(2 k)!} \mathrm{B}_{2 \mathrm{k}}, \mathrm{k}=1,2, \ldots \ldots \tag{15}
\end{equation*}
$$

with $\mathrm{B}_{0}=1$ giving $\mathrm{B}_{1}=-\frac{1}{2}, \mathrm{~B}_{2}=\frac{1}{6}, \mathrm{~B}_{4}=-\frac{1}{30}, \mathrm{~B}_{6}=\frac{1}{42}, \mathrm{~B}_{8}=-\frac{1}{30}, \mathrm{~B}_{10}=\frac{5}{66}, \mathrm{~B}_{12}=-\frac{691}{2730}, \ldots \ldots$ and the series $\sum_{j=0}^{k-1}\left[-\frac{1}{(m)^{2} \pi^{2}}\right]^{j} \frac{1}{(2 k-2 j-1)!}$ for integers $\mathrm{j}, \mathrm{k} \geq 0$.
