Characterization and Enumeration of Complementary Dual Abelian Codes*

Arunwan Boripan†, Somphong Jitman‡, and Patanee Udomkavanich§

March 8, 2024

Abstract

Abelian codes and complementary dual codes form important classes of linear codes that have been extensively studied due to their rich algebraic structures and wide applications. In this paper, a family of abelian codes with complementary dual in a group algebra $\mathbb{F}_{p^\nu}[G]$ has been studied under both the Euclidean and Hermitian inner products, where p is a prime, ν is a positive integer, and G is an arbitrary finite abelian group. Based on the discrete Fourier transform decomposition for semi-simple group algebras and properties of ideas in local group algebras, the characterization of such codes have been given. Subsequently, the number of complementary dual abelian codes in $\mathbb{F}_{p^\nu}[G]$ has been shown to be independent of the Sylow p-subgroup of G and it has been completely determined for every finite abelian group G. In some cases, a simplified formula for the enumeration has been provided as well. The known results for cyclic complementary dual codes can be viewed as corollaries.

1 Introduction

Abelian codes form an important class of linear codes that has been extensively studied for both theoretical and practical reasons (see, for example, [3], [6], [7], [12], [13], [20], and [21]). Moreover, this class of codes contains the classical cyclic codes which can be efficiently encoded and decoded using shift registers. Linear complementary dual (LCD) codes introduced in [14] constitute another interesting class of linear codes. It has been shown that LCD codes are asymptotically good and they can be suitably applied for the two-user binary adder channel in [14]. In [22], it has been shown that LCD codes meet the Gilbert-Varshamov bound.

§P. Udomkavanich is with the Department of Mathematics and Computer Science, Faculty of Science, Chulalongkorn University, Bangkok 10330, Thailand. pattanee.u@chula.ac.th

LCD codes are also useful in information protection from side-channel attacks and hardware Trojan horses (see [4], [5], [8], [10], [16], and [17]). In [9], LCD codes have been applied in constructing good entanglement-assisted quantum error correcting codes. It is therefore of natural interest to study algebraic structured codes with complementary dual. Cyclic codes with complementary dual have been studied in [23]. Necessary and sufficient conditions for cyclic codes to be complementary dual with respect to the Euclidean inner product have been given in [23].

In this paper, we focus on a more general setup. Precisely, abelian codes with complementary dual are studied under both the Euclidean and Hermitian inner products. We focus on the characterization and enumeration of such codes. Based on the discrete Fourier transform decomposition for semi-simple group algebras, the group algebra $\mathbb{F}_{p^\nu}[G]$ can be view as a product of local group algebras for all finite abelian groups G. The complementary dual abelian codes and the direct summand ideals in each local component are characterized. The characterization and enumeration of complementary dual abelian codes can be obtained through the discrete Fourier transform decomposition and the characterization of ideals in local group algebras mentioned above. A simplified formula for the enumeration is given as well in the case where the underlying group is a cyclic group or a q-group, where q is a prime such that $q \neq p$.

The paper is organized as follows. Basic properties of group algebras and abelian codes are recalled in Section 2. Complementary dual abelian codes in some local group algebras are studied in Section 3. Based on the results in Section 3, it is shown that the characterization and enumeration of Euclidean complementary dual abelian codes over finite fields of characteristics p are independent of the Sylow p-subgroup of G. The complete characterization and enumeration of Euclidean complementary dual abelian codes are given in Section 4. The analogous results for Hermitian complementary dual abelian codes are given in Section 5.

2 Preliminaries

Let R be a commutative ring with identity and let G be a finite abelian group, written additively. Denote by $R[G]$ the *group ring* of G over R. The elements in $R[G]$ will be written as $\sum_{g\in G} \alpha_g Y^g$, where $\alpha_g \in R$. The addition and the multiplication in $R[G]$ are given as in the usual polynomial rings over R with the indeterminate Y, where the indices are computed additively in G. The homomorphism $\epsilon : R[G] \to R$ defined by

$$\sum_{g\in G} \alpha_g Y^g \mapsto \sum_{g\in G} \alpha_g \tag{1}$$

is called an *augmentation map* and the kernel $\Delta_R(G) := \ker(\epsilon)$ is called an *augmentation ideal* of $R[G]$.

For a prime p and a positive integer ν, let $\mathbb{F}_{p^\nu}$ denote the finite field of order p^ν. In the case where $R = \mathbb{F}_{p^\nu}$, the group ring $\mathbb{F}_{p^\nu}[G]$ is called a *group algebra*. An *abelian code* in $\mathbb{F}_{p^\nu}[G]$ is defined to be an ideal in $\mathbb{F}_{p^\nu}[G]$ (see [12] and [13]). The *Euclidean inner product* between $u = \sum_{g\in G} u_g Y^g$ and $v = \sum_{g\in G} v_g Y^g$ in $\mathbb{F}_{p^\nu}[G]$ is defined to be $\langle u, v\rangle_{\mathrm{E}} := \sum_{g\in G} u_g v_g$. The *Euclidean dual* of an abelian code C in $\mathbb{F}_{p^\nu}[G]$ is defined to be $C^{\perp_{\mathrm{E}}} := \{v \in \mathbb{F}_{p^\nu}[G] \mid \langle c, v\rangle_{\mathrm{E}} = 0 \text{ for all } c \in C\}$. An abelian code C

in $\mathbb{F}_{p^\nu}[G]$ is said to be *Euclidean complementary dual* if $C \cap C^{\perp_{\mathrm{E}}} = \{0\}$. In $\mathbb{F}_{p^{2\nu}}[G]$, the *Hermitian inner product* between $u = \sum_{g\in G} u_g Y^g$ and $v = \sum_{g\in G} v_g Y^g$ $\mathbb{F}_{p^{2\nu}}[G]$ is defined to be $\langle u, v\rangle_{\mathrm{H}} := \sum_{g\in G} u_g v_g^{p^\nu}$. The *Hermitian dual* of an abelian code C in $\mathbb{F}_{p^{2\nu}}[G]$ is defined to be $C^{\perp_{\mathrm{H}}} := \{v \in \mathbb{F}_{p^{2\nu}}[G] \mid \langle c, v\rangle_{\mathrm{H}} = 0 \text{ for all } c \in C\}$. An abelian code C in $\mathbb{F}_{p^{2\nu}}[G]$ is said to be *Hermitian complementary dual* if $C \cap C^{\perp_{\mathrm{H}}} = \{0\}$.

For positive integers i and j with $\gcd(i, j) = 1$, let $\mathrm{ord}_j(i)$ denote the multiplicative order of i modulo j. Let P denote the Sylow p-subgroup of G. Then $G \cong A \times P$, where A is a subgroup G such that $|A| = [G : P]$ and $p \nmid |A|$. For each $a \in A$, denote by $\mathrm{ord}(a)$ the additive order of a in A. A *p^ν-cyclotomic class* of A containing $a \in A$, denoted by $S_{p^\nu}(a)$, is defined to be the set

$$S_{p^\nu}(a) := \{p^{\nu i} \cdot a \mid i = 0, 1, \dots\} = \{p^{\nu i} \cdot a \mid 0 \le i < \mathrm{ord}_{\mathrm{ord}(a)}(p^\nu)\},$$

where $p^{\nu i} \cdot a := \sum_{j=1}^{p^{\nu i}} a$ in A.

First, we consider the decomposition of $\mathcal{R} := \mathbb{F}_{p^\nu}[A]$. In this case, $\mathcal{R}$ is semi-simple (see [2]) which can be decomposed using the Discrete Fourier Transform in [20] (see [13] and [12] for more details). For completeness, the decomposition used in this paper is summarized as follows.

An *idempotent* in $\mathcal{R}$ is a nonzero element e such that $e^2 = e$. It is called *primitive* if for every other idempotent f, either $ef = e$ or $ef = 0$. The primitive idempotents in $\mathcal{R}$ are induced by the p^ν-cyclotomic classes of A (see [7, Proposition II.4]). Let $\{a_1, a_2, \dots, a_t\}$ be a complete set of representatives of p^ν-cyclotomic classes of A and let e_i be the primitive idempotent induced by $S_{p^\nu}(a_i)$ for all $1 \le i \le t$. From [20], $\mathcal{R}$ can be decomposed as

$$\mathcal{R} = \bigoplus_{i=1}^{t} \mathcal{R}e_i. \tag{2}$$

It is well known (see [12] and [13]) that $\mathcal{R}e_i \cong \mathbb{F}_{p^{\nu s_i}}$, where $s_i = |S_{p^\nu}(a_i)|$ provided that e_i is induced by $S_{p^\nu}(a_i)$, and hence,

$$\mathbb{F}_{p^\nu}[A \times P] \cong \bigoplus_{i=1}^{t} (\mathcal{R}e_i)[P] \cong \prod_{i=1}^{t} \mathbb{F}_{p^{\nu s_i}}[P]. \tag{3}$$

Therefore, every abelian code C in $\mathbb{F}_{p^\nu}[A \times P]$ can be viewed as

$$C \cong \prod_{i=1}^{t} C_i, \tag{4}$$

where C_i is an abelian code in $\mathbb{F}_{p^{\nu s_i}}[P]$ for all $i = 1, 2, \dots, t$.

The goal of this paper is to characterize and enumerate complementary dual abelian codes in $\mathbb{F}_{p^\nu}[G]$ for all finite abelian groups G, primes p, and positive integers ν . The characterization of each component in the decomposition (3) is given in Section 3. Combining the results in Sections 2 and 3, the characterization and enumeration of complementary dual abelian codes in $\mathbb{F}_{p^\nu}[G]$ are given in Sections 4-5.

3 Abelian Codes in some Local Group Algebras

In this section, we focus on complementary dual abelian codes and direct summand ideals in each component $\mathbb{F}_{p^\nu}[P]$ in the decomposition (3).

For a finite commutative ring R with identity, the *Jacobson radical* of R, denoted by $Jac(R)$, is defined to be the intersection of all maximal ideals of R. The ring R is said to be *local* if it has a unique maximal ideal and it is called a *chain ring* if its ideals are linearly ordered by inclusion. A finite commutative chain ring R with maximal ideal M is said to have *nilpotency index* e if e is the smallest positive integer such that $M^e = 0$. The following facts are well known.

Proposition 3.1. *A finite commutative ring R with identity is a local ring if and only if the set of all non-invertible elements in R forms a maximal ideal.*

Proposition 3.2. *A finite commutative local ring R is a chain ring if and only if its maximal ideal is principal.*

A local group ring has been characterized in the following lemma.

Lemma 3.3 ([18, Theorem])**.** *Let R be a commutative ring with identity and let G be a finite abelian group. Then $R[G]$ is local if and only if R is local, G is a p-group and $p \in Jac(R)$, where $Jac(R)$ is the Jacobson radical of R.*

From Lemma 3.3, a group algebra $\mathbb{F}_{p^\nu}[P]$ is local for all p-groups P. More properties of a local group algebra $\mathbb{F}_{p^\nu}[P]$ can be deduced as follows.

Proposition 3.4. *Let p be a prime and let ν be a positive integer. Let P be a finite abelian p-group. Then the following statements holds.*

1. *$\mathbb{F}_{p^\nu}[P]$ is a local group algebra with maximal ideal $\Delta_{\mathbb{F}_{p^\nu}}(P)$.*
2. *$\mathbb{F}_{p^\nu}[\mathbb{Z}_{p^k}]$ is a finite chain ring with nilpotency index p^k for all positive integers k. .*

Proof. Since $\mathbb{F}_{p^\nu}$ is a field of characteristic p, $\mathbb{F}_{p^\nu}$ is local and $p \in \{0\} = Jac(\mathbb{F}_{p^\nu})$. By Lemma 3.3, $\mathbb{F}_{p^\nu}[P]$ is local. Using the map ϵ defined in (1) and the first isomorphism for rings, we have

$$\mathbb{F}_{p^\nu} \cong \mathbb{F}_{p^\nu}[P]/\ker(\epsilon) \cong \mathbb{F}_{p^\nu}[P]/\Delta_{\mathbb{F}_{p^\nu}}(P),$$

and hence, $\Delta_{\mathbb{F}_{p^\nu}}(P)$ is the maximal ideal of $\mathbb{F}_{p^\nu}[P]$. This completes the proof of 1.

It is not difficult to see that the maximal ideal $\Delta_{\mathbb{F}_{p^\nu}}(\mathbb{Z}_{p^k}) \cong \langle Y-1\rangle$ is principal. By Proposition 3.2, $\mathbb{F}_{p^\nu}[\mathbb{Z}_{p^k}]$ is a finite chain ring. Since $(Y-1)^{p^k} = 0$ and $(Y-1)^{p^k-1} \neq 0$, $\mathbb{F}_{p^\nu}[\mathbb{Z}_{p^k}]$ has nilpotency index p^k. This completes the proof of 2. □

Corollary 3.5. *Let p be a prime and let ν be a positive integer. Then $\mathbb{F}_{p^\nu}[\mathbb{Z}_{p^k}]$ contains $p^k + 1$ ideals.*

Proof. The statement follows from Proposition 3.4. Precisely, the ideals in $\mathbb{F}_{p^\nu}[\mathbb{Z}_{p^k}]$ are of the form $\langle (Y-1)^i\rangle$ for all $0 \leq i \leq p^k$. □

The characterizations of the Euclidean and Hermitian complementary dual abelian codes and the direct summands in a local group algebra $\mathbb{F}_{p^\nu}[P]$ are given in the following theorems.

Theorem 3.6. *Let p be a prime and let $\nu \geq 1$ be an integer. Let P be a finite abelian p-group. Then $\{0\}$ and $\mathbb{F}_{p^\nu}[P]$ are the only Euclidean complementary dual abelian codes in $\mathbb{F}_{p^\nu}[P]$.*

Proof. Clearly, $\{0\}$ and $\mathbb{F}_{p^\nu}[P]$ are Euclidean complementary dual abelian codes in $\mathbb{F}_{p^\nu}[P]$. Assume that there exists a Euclidean abelian code C in $\mathbb{F}_{p^\nu}[P]$ such that $\{0\} \subsetneq C \subsetneq \mathbb{F}_{p^\nu}[P]$. By Proposition 3.4, $\mathbb{F}_{p^\nu}[P]$ is local with maximal ideal $\Delta_{\mathbb{F}_{p^\nu}}(P)$. Then $C \subseteq \Delta_{\mathbb{F}_{p^\nu}}(P)$. It follows that $\Delta_{\mathbb{F}_{p^\nu}}(P)^{\perp_{\mathrm{E}}} \subseteq C^{\perp_{\mathrm{E}}} \subseteq \Delta_{\mathbb{F}_{p^\nu}}(P)$ which implies $\Delta_{\mathbb{F}_{p^\nu}}(P)^{\perp_{\mathrm{E}}} \subseteq C \subseteq \Delta_{\mathbb{F}_{p^\nu}}(P)$. Hence, $\{0\} \neq \Delta_{\mathbb{F}_{p^\nu}}(P)^{\perp_{\mathrm{E}}} \subseteq C \cap C^{\perp_{\mathrm{E}}} \subseteq \Delta_{\mathbb{F}_{p^\nu}}(P)$. Consequently, C is not Euclidean complementary dual. Therefore, the ideals $\{0\}$ and $\mathbb{F}_{p^\nu}[P]$ are the only Euclidean complementary dual abelian codes in $\mathbb{F}_{p^\nu}[P]$. □

It is not difficult to see that the proof of Theorem 3.6 is independent of the inner product. Hence, we have the following corollary.

Corollary 3.7. *Let p be a prime and let ν be a positive integer. Let P be a finite abelian p-group. Then $\{0\}$ and $\mathbb{F}_{p^{2\nu}}[P]$ are the only Hermitian complementary dual abelian codes in $\mathbb{F}_{p^{2\nu}}[P]$.*

Theorem 3.8. *Let p be a prime and let ν be a positive integer. Let P be a finite abelian p-group. Then ideals $\{0\}$ and $\mathbb{F}_{p^\nu}[P]$ are the only direct summands in $\mathbb{F}_{p^\nu}[P]$.*

Proof. Let $\{0\} \subsetneq C \subsetneq \mathbb{F}_{p^\nu}[B]$ be an ideal in $\mathbb{F}_{p^\nu}[P]$. Suppose that C is a direct summand. Then there exist an ideal C' in $\mathbb{F}_{p^\nu}[P]$ such that $C \cap C' = \{0\}$ and $C + C' = \mathbb{F}_{p^\nu}[P]$. Since $\Delta_{\mathbb{F}_{p^\nu}}(P)$ is the maximal ideal in $\mathbb{F}_{p^\nu}[P]$, we have $C' \subseteq \Delta_{\mathbb{F}_{p^\nu}}(P)$. Hence, $C + C' \subseteq \Delta_{\mathbb{F}_{p^\nu}}(P) \subsetneq \mathbb{F}_{p^\nu}[P]$, a contradiction. Therefore, the ideals $\{0\}$ and $\mathbb{F}_{p^\nu}[P]$ are the only direct summands in $\mathbb{F}_{p^\nu}[P]$. □

The next corollary follows immediately.

Corollary 3.9. *Let p be a prime and let ν be a positive integer. Let P be a finite abelian p-group. Then the following statements hold.*

1. *The number of Euclidean complementary dual abelian codes in $\mathbb{F}_{p^\nu}[P]$ is 2.*
2. *The number of direct summand ideals in $\mathbb{F}_{p^\nu}[P]$ is 2.*
3. *The number of Hermitian complementary dual abelian codes in $\mathbb{F}_{p^{2\nu}}[P]$ is 2.*
4. *The number of direct summand ideals in $\mathbb{F}_{p^{2\nu}}[P]$ is 2.*

4 Euclidean Complementary Dual Abelian Codes

In this section, we focus on characterization and enumeration of Euclidean complementary dual abelian codes in $\mathbb{F}_{p^\nu}[G]$, where p is a prime, ν is a positive integer, and G is an arbitrary finite abelian group.

4.1 Characterization

For a finite abelian group G, write $G = A \times P$, where $p \nmid |A|$ and P is the Sylow p-subgroup of G. Based on the results in Section 3, the characterization and enumeration of complementary dual abelian codes in $\mathbb{F}_{p^\nu}[G]$ are given and they are shown to be independent of P.

The decomposition of $\mathbb{F}_{p^\nu}[A]$ in [12] plays a vital role in the study of Euclidean complementary dual abelian codes in $\mathbb{F}_{p^\nu}[G]$ and it is recalled as follows. A p^ν-cyclotomic class $S_{p^\nu}(a)$ is said to be of *type I* if $S_{p^\nu}(a) = S_{p^\nu}(-a)$, or *type II* if $S_{p^\nu}(-a) \neq S_{p^\nu}(a)$. Without loss of generality, the representatives $a_1, a_2, \ldots, a_t$ of p^ν-cyclotomic classes of A can be chosen such that $\{a_j | j = 1, 2, \ldots, r_I\}$ and $\{a_{r_I+l}, a_{r_I+r_{II}+l} = -a_{r_I+l} \mid l = 1, 2, \ldots, r_{II}\}$ are sets of representatives of p^ν-cyclotomic classes of A of types I and II, respectively, where $t = r_I + 2r_{II}$. Assume the notations used in Section 2, we have $s_i = |S_{p^\nu}(a_i)|$ for all $1 \leq i \leq t$ and $s_{r_I+l} = s_{r_I+r_{II}+l}$ for all $1 \leq l \leq r_{II}$.

Rearranging the terms in the decomposition of $\mathcal{R}$ in (3) based on these 2 types of cyclotomic classes (see [12]), we have

$$\mathbb{F}_{p^\nu}[A \times P] \cong \left(\prod_{j=1}^{r_I} \mathbb{K}_j[P] \right) \times \left(\prod_{l=1}^{r_{II}} (\mathbb{L}_l[P] \times \mathbb{L}_l[P]) \right), \tag{5}$$

where $\mathbb{K}_j \cong \mathbb{F}_{p^{\nu s_j}}$ for all $j = 1, 2, \ldots, r_I$ and $\mathbb{L}_l \cong \mathbb{F}_{p^{\nu s_{r_I+l}}}$ for all $l = 1, 2, \ldots, r_{II}$.

From (5), it follows that an abelian code C in $\mathbb{F}_{p^\nu}[A \times P]$ can be viewed as

$$C \cong \left(\prod_{j=1}^{r_I} C_j \right) \times \left(\prod_{l=1}^{r_{II}} \left(D_l \times D'_l \right) \right), \tag{6}$$

where C_j, D_s and D'_s are abelian codes in $\mathbb{K}_j[P]$, $\mathbb{L}_l[P]$ and $\mathbb{L}_l[P]$, respectively, for all $j = 1, 2, \ldots, r_I$ and $l = 1, 2, \ldots, r_{II}$.

From [12, Section II.D], the Euclidean dual of C in (6) is of the form

$$C^{\perp_{\mathrm{E}}} \cong \left(\prod_{j=1}^{r_I} C_j^{\perp_{\mathrm{H}}} \right) \times \left(\prod_{l=1}^{r_{II}} \left((D'_l)^{\perp_{\mathrm{E}}} \times D_l^{\perp_{\mathrm{E}}} \right) \right), \tag{7}$$

where $\perp_{\mathrm{H}} := \perp_{\mathrm{E}}$ if $\mathbb{K}_j \cong \mathbb{F}_{p^k}$.

The characterization of a Euclidean complementary dual abelian code in $\mathbb{F}_{p^\nu}[G]$ is given in the following proposition.

Proposition 4.1. *Let p be a prime and let ν be a positive integer. Let A be finite abelian group such that $p \nmid |A|$ and let P be a finite abelian p-group. Then an abelian code C in $\mathbb{F}_{p^\nu}[A \times P]$ decomposed as in (6) is Euclidean complementary dual if and only if the following statements hold.*

1. *C_j is Hermitian complementary dual for all $1 \leq j \leq r_I$.*
2. *$D_l \cap (D'_l)^{\perp_{\mathrm{E}}} = \{0\}$ and $D'_l \cap D_l^{\perp_{\mathrm{E}}} = \{0\}$ for all $1 \leq l \leq r_{II}$.*

Proof. The result can be deduced directly from (6) and (7). □

Corollary 4.2. *Let p be a prime and let ν be a positive integer. Let A be finite abelian group such that $p \nmid |A|$ and let P be a finite abelian p-group. Then an abelian code C in $\mathbb{F}_{p^\nu}[A \times P]$ decomposed as in (6) is Euclidean complementary dual if and only if the following statements hold.*

1. *$C_j \in \{\{0\}, \mathbb{K}_j[P]\}$ for all $1 \leq j \leq r_I$.*
2. *$(D_l, D_l') \in \{(\{0\}, \mathbb{L}_j[P]), (\mathbb{L}_j[P], \{0\})\}$ for all $1 \leq l \leq r_{II}$.*

Proof. From Proposition 4.1, C_j is Hermitian complementary dual for all $1 \leq j \leq r_I$ and D_l is a direct summand for all $1 \leq l \leq r_{II}$. By Corollary 3.7, $C_j \in \{\{0\}, \mathbb{K}_j[P]\}$ for all $1 \leq j \leq r_I$. By Theorem 3.8, $D_l \in \{\{0\}, \mathbb{L}_l[P]\}$ for all $1 \leq l \leq r_{II}$, and hence, the result follows. □

From Corollary 4.2, it is not difficult to see that the number of Euclidean complementary dual abelian codes in $\mathbb{F}_{p^\nu}[A \times P]$ is independent of P and it is determined in the following corollary.

Corollary 4.3. *Let p be a prime and let ν be a positive integer. Let A be finite abelian group such that $p \nmid |A|$ and let P be a finite abelian p-group. If $\mathbb{F}_{p^\nu}[A \times P]$ decomposed as in (5), then the number of Euclidean complementary dual abelian codes in $\mathbb{F}_{p^\nu}[A \times P]$ is*

$$2^{r_I + r_{II}}$$

Proof. From the characterization in Corollary 4.2, the number of choices of C_j is 2^{r_I} and the number of choices of (D_l, D_l') is $2^{r_{II}}$. Hence, the number of Euclidean complementary dual abelian codes in $\mathbb{F}_{p^\nu}[A \times P]$ is $2^{r_I + r_{II}}$ as desired. □

4.2 Enumerations

As discussed in Corollary 4.3, the number of Euclidean complementary dual abelian codes in $\mathbb{F}_{p^\nu}[A \times P]$ is independent of P. Here, it is sufficient to determined the number $r_I + r_{II}$ from the group algebra $\mathbb{F}_{p^\nu}[A]$.

Let χ be a function defined by

$$\chi(d, p^\nu) = \begin{cases} 1 & \text{if there exists a positive integer } i \text{ such that } d|(p^{\nu i} + 1), \\ 0 & \text{otherwise.} \end{cases} \tag{8}$$

The following lemma is a straightforward generalization of the case where $p = 2$ (see [12, Lemma 4.5]).

Lemma 4.4. *Let p be a prime and let ν be a positive integer. Let A be a finite abelian group such that $p \nmid |A|$ and let $a \in A$. Then $S_{p^\nu}(a)$ is of type I if and only if $\chi(\mathrm{ord}(a), p^\nu) = 1$.*

The value $r_I + r_{II}$ of the group algebra $\mathbb{F}_{p^\nu}[A]$ is determined in the following proposition.

Proposition 4.5. *Let p be a prime and let ν be a positive integer. Let A be a finite abelian group of exponent N. If $p \nmid N$, then*

$$r_I + r_{II} = \sum_{d|N} \chi(d, p^\nu) \frac{\mathcal{N}_A(d)}{\mathrm{ord}_d(p^\nu)} + \frac{1}{2} \sum_{d|N} (1 - \chi(d, p^\nu)) \frac{\mathcal{N}_A(d)}{\mathrm{ord}_d(p^\nu)},$$

where $\mathcal{N}_A(d)$ denotes the number of elements of order d in A determined in [1].

Proof. Using the arguments similar to those in [13, Remark 2.5], for each $d|N$, the elements of order d in A are partitioned into p^ν-cyclotomic classes of the same size $\frac{\mathcal{N}_A(d)}{\mathrm{ord}_d(p^\nu)}$. By Lemma 4.4, it follows that

$$r_I = \sum_{d|N} \chi(d,p^\nu)\frac{\mathcal{N}_A(d)}{\mathrm{ord}_d(p^\nu)} \text{ and } r_{I\!I} = \frac{1}{2}\sum_{d|N}(1-\chi(d,p^\nu))\frac{\mathcal{N}_A(d)}{\mathrm{ord}_d(p^\nu)}.$$

Hence, the result follows. □

In the case where A is a cyclic group of order n with $p \nmid n$, it follows that the exponent of A is n and $\mathcal{N}_A(d) = \Phi(d)$ for all divisors d of n, where $\Phi(d)$ denotes the Euler totient phi function. Hence, the following corollary can be deduced.

Corollary 4.6. *Let p be a prime and let ν be a positive integer. Let n be a positive integer such that $p \nmid n$. Then the number of Euclidean complementary dual cyclic codes of length np^k over $\mathbb{F}_{p^\nu}$ equals the number of Euclidean complementary dual cyclic codes of length n over $\mathbb{F}_{p^\nu}$ for all integers $k \geq 0$ which is*

$$2^{\sum_{d|n}\chi(d,p^\nu)\frac{\Phi(d)}{\mathrm{ord}_d(p^\nu)}+\frac{1}{2}\sum_{d|n}(1-\chi(d,p^\nu))\frac{\Phi(d)}{\mathrm{ord}_d(p^\nu)}}.$$

From Proposition 4.5, for an arbitrary finite abelian group A with $p \nmid |A|$, we have $r_I + r_{I\!I} \geq 1$. Hence, there exist at least two Euclidean complementary dual abelian codes in $\mathbb{F}_{p^\nu}[A]$.

In Table 2, the number $r_I + r_{I\!I}$ for group algebras $\mathbb{F}_2[A]$ is given for abelian groups A of odd order less than 50.

In the following subsections, a simplified formula for (8) is given for some families of finite abelian q-groups, where q is a prime such that $p \neq q$. Let $A \cong (\mathbb{Z}_{q^k})^s$, where k and s are positive integers, and q is prime such that $\gcd(p,q) = 1$. For each $0 \leq i \leq k$, define

$$A_{q^i} := \{a \in A | \, \mathrm{ord}(a) = q^i\}.$$

Clearly, $A_1, A_q, \ldots, A_{q^k}$ are pair-wise disjoint and $A = A_1 \cup A_q \cup \cdots \cup A_{q^k}$. For each $1 \leq i \leq k$, it is not difficult to see that $A_{q^i} = \left(q^{k-i}\mathbb{Z}_{q^k}\right)^s \setminus \left(q^{k-(i-1)}\mathbb{Z}_{q^k}\right)^s$. Consequently, we have $|A_1| = 1$ and

$$|A_{q^i}| = q^{is} - q^{(i-1)s}$$

for all $i = 1, 2, \ldots, k$. Note that $|S_{p^\nu}(a)| = \mathrm{ord}_{\mathrm{ord}(a)}(p^\nu) = \mathrm{ord}_{q^i}(p^\nu)$ for all $a \in A_{q^i}$.

4.2.1 $A = (\mathbb{Z}_{2^k})^s$ and p is an odd prime

Here, we consider the case where p is odd and $q = 2$, i.e., $A \cong (\mathbb{Z}_{2^k})^s$. Clearly, $A_1 = \{0\}$ and $S_{p^\nu}(0)$ is of type I. For an element $a \in A_2$, we have $\mathrm{ord}(a) = 2$ which implies that $a = -a$. Hence, $S_{p^\nu}(a) = S_{p^\nu}(-a)$ is of type I and its cardinality is 1. In general, we have the following characterizations of the p^ν-cyclotomic classes of type I in A.

Lemma 4.7. *For each $i \in \{0, 1, 2, \ldots, k\}$, let $a \in A_{2^i}$. Then one of the following statements holds.*

1. *If $i \in \{0, 1\}$, then $S_{p^\nu}(a)$ is of type I and size 1.*

Order of A	A	$r_I + r_{II}$
3	$\mathbb{Z}_3$	2
5	$\mathbb{Z}_5$	2
7	$\mathbb{Z}_7$	2
9	$\mathbb{Z}_3 \times \mathbb{Z}_3$	5

Table 1: The number $r_I + r_{II}$ for group algebra $\mathbb{F}_2[A]$

2. If $i \geq 2$, then $S_{p^\nu}(a)$ is of type I if and only if $ord_{2^i}(p^\nu) = 2$.

Proof. The first statement follows from the discussion above. To prove the second statement, assume that $i \geq 2$. Assume that $S_{p^\nu}(a)$ is of type I. Then $-a \in S_{p^\nu}(a)$. Then $p^{\nu j} \cdot a = -a$ for some integer $j \geq 1$. Since $i \geq 2$, we have $4|(p^{\nu j}+1)$. If j is even, then $p^{\nu j} \equiv 1 \bmod 4$ which implies that $(p^{\nu j}+1) \equiv 2 \bmod 4$, a contradiction. It follows that j is odd. Since $p^{\nu j}+1 = (p^{\nu j}+1)\left(\sum_{i=0}^{j-1}(-1)^i p^{\nu(j-1-i)}\right)$ and $\sum_{i=0}^{j-1}(-1)^i p^{\nu(j-1-i)}$ is odd, we have $2^i|(p^\nu+1)$. Hence, $p^\nu \equiv -1 \bmod 2^i$ which implies that $\mathrm{ord}_{2^i}(p^\nu) = 2$.

Conversely, assume that $ord_{2^i}(p^\nu) = 2$. Then $p^{2\nu} \cdot a = a$ and $p^\nu \cdot a \neq a$ which implies that $p^\nu \cdot a = -a$. Hence, $S_{p^\nu}(a)$ is a p^ν-cyclotomic class of type I. □

Proposition 4.8. *Let $0 \leq r' \leq k$ be the largest integer such that $2^{r'}|(p^\nu+1)$ and let $a \in A$. Then $S_{p^\nu}(a)$ is of type I if and only if $a \in A_{2^i}$ for some $0 \leq i \leq r'$.*

Equivalently, $a \in A$ is of type II if and only if $a \in A_{2^i}$ for some $i > r'$.

Proof. Assume that $i > r'$. Then $2^i \nmid (p^\nu + 1)$ which implies that $ord_{2^i}(p^\nu) > 2$. By Lemma 4.7, $S_{p^\nu}(a)$ is not of type I.

Conversely, assume that $a \in A_{2^i}$ for some $0 \leq i \leq r'$. From Lemma 4.7, if $i \in \{0, 1\}$, then $S_{p^\nu}(a)$ is of type I. Assume that $2 \leq i \leq r'$. Then $2^i \geq 4$ and $2^i | (p^\nu + 1)$ which implies that $ord_{2^i}(p^\nu) = 2$. By Lemma 4.7, it follows that $S_{p^\nu}(a)$ is of type I. □

Using Proposition 4.8, A_{2^i} contains p^ν-cyclotomic classes of type I for all $i = 0, 1, \ldots, r'$ and the rest of the sets A_{2^j} contain p^ν-cyclotomic classes of type II, for $j = r' + 1, \ldots, k$. Since $ord_{2^i}(p^\nu) = 1$ for all $i \in \{0, 1\}$ and $ord_{2^i}(p^\nu) = 2$ for all $2 \leq i \leq r'$, we have

$$r_I = \sum_{i=0}^{r'} \frac{|A_{2^i}|}{ord_{2^i}(p^\nu)} = |A_1| + |A_2| + \sum_{i=2}^{r'} \frac{|A_{2^i}|}{2} = 2^s + \frac{2^{r's} - 2^s}{2}$$

and

$$r_{II} = \sum_{i=r'+1}^{k} \frac{|H_{2^i}|}{2ord_{2^i}(p^\nu)} = \sum_{i=r'+1}^{k} \frac{2^{is} - 2^{(i-1)s}}{2ord_{2^i}(p^\nu)}.$$

Hence, the number of Euclidean complementary dual abelian codes in $\mathbb{F}_{p^\nu}[(\mathbb{Z}_{2^k})^s]$ follows immediately from Corollary 4.3.

4.2.2 $A = (\mathbb{Z}_{q^k})^s$, where q is an odd prime and $\gcd(q, p) = 1$

In this part, we focus on the case where $A = (\mathbb{Z}_{q^k})^s$, where q is an odd prime and $\gcd(q, p) = 1$. Note that $S_{p^\nu}(0) = \{0\} = A_1$ is of type I.

Next, we characterize the type of p^ν-cyclotomic classes of elements in A_q in terms of $\mathrm{ord}_q(p^\nu)$.

Lemma 4.9 ([15, Proposition 4]). *Let q be an odd prime and let i be a positive integer. If p is a prime such that $q \neq p$, then $\mathrm{ord}_{q^i}(p) = \mathrm{ord}_q(p)q^j$ for some $j \geq 0$.*

Proposition 4.10. *Let $a \in A_q$. Then $S_{p^\nu}(a)$ is of type I if and only if $\mathrm{ord}_q(p^\nu)$ is even. Equivalently, $S_{p^\nu}(a)$ is of type II if and only if $\mathrm{ord}_q(p^\nu)$ is odd.*

Proof. The first implication follows from [11, Remark 3.1].

Conversely, assume that $\mathrm{ord}_q(p^\nu) = 2j$ is even, where j is a positive integer. Then $a = p^{\nu \mathrm{ord}_q(p^\nu)} \cdot a = p^{2\nu j} \cdot a$, i.e., $(p^{\nu j} - 1)(p^{\nu j} + 1) \cdot a = 0$. Since $\mathrm{ord}_q(p^\nu) = 2j$, we have $q \nmid (p^{\nu j} - 1)$, and hence, $(p^{\nu j} + 1) \cdot a = 0$. This implies that $-a = p^{\nu j} \cdot a \in S_{p^\nu}(a)$. Therefore, $S_{p^\nu}(a)$ is of type I as desired. □

Next, we show that all p^ν-cyclotomic classes of elements in $A \setminus \{0\}$ are of the same type.

Proposition 4.11. *Let $a \in A_q$ and $b \in A_{q^i}$, for any given $1 \leq i \leq k$. Then, $S_{p^\nu}(a)$ is of type I if and only if $S_{p^\nu}(b)$ is of type I. Equivalently, $S_{p^\nu}(a)$ is of type II if and only if $S_{p^\nu}(b)$ is of type II.*

Proof. Assume that $S_{p^\nu}(a)$ is of type I. By Proposition 4.10, it follows that $\mathrm{ord}_q(p^\nu)$ is even. By Lemma 4.9, $\mathrm{ord}_{q^i}(p^\nu) = \mathrm{ord}_q(p^\nu)q^j$ for some positive integer j. Then $q^i|(p^{\nu \mathrm{ord}_q(p^\nu)q^j}-1)$ and $q^i \nmid (p^{\nu\frac{\mathrm{ord}_q(p^\nu)}{2}q^j}-1)$. If $q|(p^{\nu\frac{\mathrm{ord}_q(p^\nu)}{2}q^j}-1)$, then $\mathrm{ord}_q(p^\nu)|\frac{\mathrm{ord}_q(p^\nu)}{2}q^j$ which is impossible since q is odd. Hence, we have $q^i|(p^{\nu\frac{\mathrm{ord}_q(p^\nu)}{2}q^j}+1)$. Consequently, $-b = p^{\nu\frac{\mathrm{ord}_q(p^\nu)}{2}q^j} \cdot b$ which means that $S_{p^\nu}(b)$ is of type I.

Conversely, assume that $S_{p^\nu}(b)$ is of type I. By [11, Remark 3.1], $\mathrm{ord}_{q^i}(p^\nu)$ is even. By Lemma 4.9, it follows that $\mathrm{ord}_{q^i}(p^\nu) = \mathrm{ord}_q(p^\nu)q^j$ for some positive integer j. Hence, $\mathrm{ord}_q(p^\nu)$ is even. By Proposition 4.10, we have that $S_{p^\nu}(a)$ is of type I. □

Combining Propositions 4.10 and 4.11, the next corollary follows immediately.

Corollary 4.12. *Let a be a non-zero element in $A \cong (\mathbb{Z}_{q^k})^s$. Then $S_{p^\nu}(a)$ is of type I if and only if $\mathrm{ord}_q(p^\nu)$ is even. Equivalently, $S_{p^\nu}(a)$ is of type II if and only if $\mathrm{ord}_q(p^\nu)$ is odd.*

If $\mathrm{ord}_q(p^\nu)$ is even, then $S_{p^\nu}(a)$ is of type I for all $a \in A \setminus \{0\}$. Hence, by Corollary 4.12, it can be deduced that

$$r_I = A_1 + \sum_{i=1}^{k} \frac{|\ A_{q^i}\ |}{\mathrm{ord}_{q^i}(p^\nu)} = 1 + \sum_{i=1}^{k} \frac{q^{is} - q^{(i-1)s}}{\mathrm{ord}_{q^i}(p^\nu)} \text{ and } r_{II} = 0.$$

On the other hand, if $\mathrm{ord}_q(p^\nu)$ is odd, then $S_q(a)$ is of type II for all $a \in A \setminus \{0\}$. Hence, by Corollary 4.12, we have

$$r_I = |A_1| = 1 \text{ and } r_{II} = \sum_{i=1}^{k} \frac{|\ A_{q^i}\ |}{2\mathrm{ord}_{q^i}(p^\nu)} = \sum_{i=1}^{k} \frac{q^{is} - q^{(i-1)s}}{2\mathrm{ord}_{q^i}(p^\nu)}.$$

In both cases, the number of Euclidean complementary dual abelian codes in $\mathbb{F}_{p^\nu}[(\mathbb{Z}_{q^k})^s]$ follows immediately from Corollary 4.3.

5 Hermitian Complementary Dual Abelian Codes

Note that the Hermitian inner product is defined over a finite field of square order. To study Hermitian complementary abelian codes, it suffices to focus on a group algebra $\mathbb{F}_{p^{2\nu}}[G]$, where p is a prime, ν is a positive integer, and G is a finite abelian group.

5.1 Characterization

For a finite abelian group G, write $G = A \times P$, where $p \nmid |A|$ and P is a p-group. In this section, the characterization and enumeration of Hermitian complementary dual abelian codes in $\mathbb{F}_{p^{2\nu}}[G]$ are given and they are shown to be independent of P.

The decomposition of $\mathbb{F}_{p^{2\nu}}[A]$ in [13] is key to study Hermitian complementary dual abelian codes in $\mathbb{F}_{p^{2\nu}}[G]$ and it is recalled as follows. For each $a \in A$, the $p^{2\nu}$-cyclotomic class $S_{p^{2\nu}}(a)$ is said to be of *type I′* if $S_{p^{2\nu}}(a) = S_{p^\nu}(-p^\nu a)$ or *type II′* if $S_{p^{2\nu}}(a) \neq S_{p^{2\nu}}(-p^\nu a)$. Without loss of generality, the representatives $a_1, a_2, \ldots, a_t$ of $p^{2\nu}$-cyclotomic classes of A can be chosen such that $\{a_j | j = 1, 2, \ldots, r_{I'}\}$ and

$\{a_{r_{I'}+l}, a_{r_I+r_{II'}+l} = -p^\nu a_{r_{I'}+l} \mid l = 1, 2, \ldots, r_{II'}\}$ are sets of representatives of $p^{2\nu}$-cyclotomic classes of A of types I' and II', respectively, where $t = r_{I'} + 2r_{II'}$. Assume the notations used in Section 2, we have $s_i = |S_{p^{2\nu}}(a_i)|$ for all $1 \leq i \leq t$ and $s_{r_{I'}+l} = s_{r_{I'}+r_{II'}+l}$ for all $1 \leq l \leq r_{II'}$.

Rearranging the terms in the decomposition of $\mathcal{R}$ in (3) based on the 2 types of cyclotomic classes mentioned above (see [13]), we have

$$\mathbb{F}_{p^{2\nu}}[A \times P] \cong \left(\prod_{j=1}^{r_{I'}} \mathbb{K}_j[P]\right) \times \left(\prod_{l=1}^{r_{II'}} (\mathbb{L}_l[P] \times \mathbb{L}_l[P])\right), \tag{9}$$

where $\mathbb{K}_j \cong \mathbb{F}_{p^{2\nu s_j}}$ for all $j = 1, 2, \ldots, r_{I'}$ and $\mathbb{L}_l \cong \mathbb{F}_{p^{2\nu s_{r_{I'}+l}}}$ for all $l = 1, 2, \ldots, r_{II'}$.

From (9), it follows that an abelian code C in $\mathbb{F}_{p^{2\nu}}[A \times P]$ can be viewed as

$$C \cong \left(\prod_{j=1}^{r_{I'}} C_j\right) \times \left(\prod_{l=1}^{r_{II'}} (D_l \times D'_l)\right), \tag{10}$$

where C_j, D_s and D'_s are abelian codes in $\mathbb{K}_j[P]$, $\mathbb{L}_l[P]$ and $\mathbb{L}_l[P]$, respectively, for all $j = 1, 2, \ldots, r_{I'}$ and $l = 1, 2, \ldots, r_{II'}$.

From [13, Section II.D], the Hermitian dual of C in (10) is of the form

$$C^{\perp_{\mathrm{H}}} \cong \left(\prod_{j=1}^{r_{I'}} C_j^{\perp_{\mathrm{H}}}\right) \times \left(\prod_{l=1}^{r_{II'}} \left((D'_l)^{\perp_{\mathrm{E}}} \times D_l^{\perp_{\mathrm{E}}}\right)\right). \tag{11}$$

The characterization of Hermitian complementary dual abelian codes in $\mathbb{F}_{p^{2\nu}}[G]$ is given in the following proposition.

Proposition 5.1. *Let p be a prime and let ν be a positive integer. Let A be a finite abelian group such that $p \nmid |A|$ and let P be a finite abelian p-group. Then an abelian code C in $\mathbb{F}_{p^{2\nu}}[A \times P]$ decomposed as in (10) is Hermitian complementary dual if and only if the following statements hold.*

1. *C_j is Hermitian complementary dual for all $1 \leq j \leq r_{I'}$.*
2. *$D_l \cap (D'_l)^{\perp_{\mathrm{E}}} = \{0\}$ and $D'_l \cap D_l^{\perp_{\mathrm{E}}} = \{0\}$ for all $1 \leq l \leq r_{II'}$.*

Proof. The result can be deduced directly from (10) and (11). □

Corollary 5.2. *Let p be a prime and let ν be a positive integer. Let A be a finite abelian group such that $p \nmid |A|$ and let P be a finite abelian p-group. Then an abelian code C in $\mathbb{F}_{p^{2\nu}}[A \times P]$ decomposed as in (10) is Hermitian complementary dual if and only if the following statements hold.*

1. *$C_j \in \{\{0\}, \mathbb{K}_j[P]\}$ for all $1 \leq j \leq r_{I'}$.*
2. *$(D_l, D'_l) \in \{(\{0\}, \mathbb{L}_j[P]), (\mathbb{L}_j[P], \{0\})\}$ for all $1 \leq l \leq r_{II'}$.*

Proof. By Proposition 5.1, C_j is Hermitian complementary dual for all $1 \leq j \leq r_{I'}$ and D_l is a direct summand for all $1 \leq l \leq r_{II'}$. By Corollary 3.7, we have $C_j \in \{\{0\}, \mathbb{K}_j[P]\}$ for all $1 \leq j \leq r_{I'}$. By Theorem 3.8, $D_l \in \{\{0\}, \mathbb{L}_j[P]\}$ for all $1 \leq l \leq r_{II'}$. Hence, the result follows. □

The number of Hermitian complementary dual abelian codes in $\mathbb{F}_{p^{2\nu}}[A \times P]$ is independent of P and determined in the following corollary.

Corollary 5.3. *Let p be a prime and let ν be a positive integer. Let A be a finite abelian group such that $p \nmid |A|$ and let P be a finite abelian p-group. If $\mathbb{F}_{p^{2\nu}}[A \times P]$ decomposed as in (9), then the number of Hermitian complementary dual abelian codes in $\mathbb{F}_{p^{2\nu}}[A \times P]$ is*

$$2^{r_{I'}+r_{II'}}$$

Proof. From the characterization in Corollary 5.2, the number of choices of C_j is $2^{r_{I'}}$ and the number of choices of (D_l, D_l') is $2^{r_{II'}}$. Hence, the number of Hermitian complementary dual abelian codes in $\mathbb{F}_{p^{2\nu}}[A \times P]$ is $2^{r_I+r_{II}}$ as desired. □

5.2 Enumerations

As discussed in Corollary 5.3, the number of Hermitian complementary dual abelian codes in $\mathbb{F}_{p^{2\nu}}[A \times P]$ is independent of P. It is therefore sufficient to determined the number $r_{I'} + r_{II'}$ from the semi-simple group algebra $\mathbb{F}_{p^{2\nu}}[A]$.

Let λ be a function defined by

$$\lambda(d, p^\nu) = \begin{cases} 1 & \text{if there exists an odd positive integer } i \text{ such that } d|(p^{\nu i}+1), \\ 0 & \text{otherwise.} \end{cases} \tag{12}$$

The following lemma is a straightforward generalization of the case where $p = 2$ (see [13, Lemma 3.5].)

Lemma 5.4. *Let p be a prime and let ν be a positive integer. Let A be a finite abelian group such that $p \nmid |A|$ and let $a \in A$. Then $S_{p^\nu}(a)$ is of type I' if and only if $\lambda(\mathrm{ord}(a), p^\nu) = 1$.*

Proposition 5.5. *Let p be a prime and let ν be a positive integer. Let A be a finite abelian group of exponent N. If $p \nmid N$, then*

$$r_{I'} + r_{II'} = \sum_{d|N} \lambda(d, p^\nu) \frac{\mathcal{N}_A(d)}{\mathrm{ord}_d(p^\nu)} + \frac{1}{2} \sum_{d|N} (1 - \lambda(d, p^\nu)) \frac{\mathcal{N}_A(d)}{\mathrm{ord}_d(p^\nu)},$$

where $\mathcal{N}_A(d)$ denotes the number of elements of order d in A determined in [1].

Proof. Using the argument similar to those in [13, Remark 2.5], for each $d|N$, the elements of order d in A are partitioned into $p^{2\nu}$-cyclotomic classes of the same size $\frac{\mathcal{N}_A(d)}{\mathrm{ord}_d(p^{2\nu})}$. By Lemma 5.4, it follows that

$$r_{I'} = \sum_{d|N} \lambda(d, p^\nu) \frac{\mathcal{N}_A(d)}{\mathrm{ord}_d(p^\nu)} \text{ and } r_{II'} = \frac{1}{2} \sum_{d|N} (1 - \lambda(d, p^\nu)) \frac{\mathcal{N}_A(d)}{\mathrm{ord}_d(p^\nu)}.$$

Hence, the result follows. □

In the case where A is a cyclic group of order n with $p \nmid n$, the exponent of A is n and $\mathcal{N}_A(d) = \Phi(d)$ for all divisors d of n, where $\Phi(d)$ denotes the Euler totient phi function. The next corollary follows.

Corollary 5.6. *Let p be a prime and let ν be a positive integer. Let n be a positive integer such that $p \nmid n$. Then the number of Hermitian complementary dual cyclic codes of length np^k over $\mathbb{F}_{p^{2\nu}}$ equals the number of Hermitian complementary dual cyclic codes of length n over $\mathbb{F}_{p^{2\nu}}$ for all integers $k \geq 0$ which is equal to*

$$2^{\sum_{d|n} \lambda(d,p^\nu)\frac{\Phi(d)}{\mathrm{ord}_d(p^\nu)} + \frac{1}{2}\sum_{d|n}(1-\lambda(d,p^\nu))\frac{\Phi(d)}{\mathrm{ord}_d(p^\nu)}}.$$

From Proposition 5.5, for an arbitrary finite abelian group A with $p \nmid |A|$, we have $r_{I'} + r_{II'} \geq 1$. Hence, there exist at least two Hermitian complementary dual abelian codes in $\mathbb{F}_{p^\nu}[A]$.

In Table 2, the number $r_{I'} + r_{II'}$ for group algebras $\mathbb{F}_4[A]$ is given for finite abelian groups A of odd order less than 50.

Order of A	A	$r_{I'} + r_{II'}$

Table 2: The number $r_{I'} + r_{II'}$ for group algebras $\mathbb{F}_4[A]$

From the properties of elements in $A = (\mathbb{Z}_{2^k})^s$ discussed in [19, Sections 2 and 3], a simplified formula for (12) is given for some families of finite abelian groups.

Example 5.7. *Let p be an odd prime and let $A = (\mathbb{Z}_{2^k})^s$ for some positive integers s and k. Let γ be the largest integer $0 \leq \gamma \leq k$ such that $2^\gamma | (p^\nu + 1)$. From [19, Remark 2.7], we have*

$$r_{I'} = 2^{\gamma s} \text{ and } r_{II'} = \sum_{i=\gamma+1}^{k} \frac{2^{is} - 2^{(i-1)s}}{2\mathrm{ord}_{2^i}(p^{2\nu})}.$$

Then $r_{I'} + r_{II'} = 2^{\gamma s} + \sum_{i=\gamma+1}^{k} \frac{2^{is}-2^{(i-1)s}}{2\mathrm{ord}_{2^i}(p^{2\nu})}$, and hence, the number of Hermitian complementary dual abelian codes in $\mathbb{F}_{p^{2\nu}}[(\mathbb{Z}_{2^k})^s]$ is

$$2^{2^{\gamma s} + \sum_{i=\gamma+1}^{k} \frac{2^{is}-2^{(i-1)s}}{2\mathrm{ord}_{2^r}(p^{2\nu})}}.$$

Example 5.8. *Let p be a prime and let q be an odd prime such that $\gcd(q, p) = 1$. Let $A = (\mathbb{Z}_{q^k})^s$ for some positive integers s and k. From [19, Corollary 3.12], we have the following two cases.*
Case I: *There exists $a \in A \setminus \{0\}$ such that $S_{p^\nu}(h)$ is of type I'. By [19, Corollary 3.12], we have that that $S_{p^{2\nu}}(a)$ is of type I' for all $a \in A$ and*

$$r_{I'} = 1 + \sum_{i=1}^{k} \frac{q^{is} - q^{(i-1)s}}{\mathrm{ord}_{q^i}(p^{2\nu})} \text{ and } r_{II'} = 0.$$

In this case, we have $r_{I'} + r_{II'} = r_{I'}$, and hence, the number of Hermitian complementary dual abelian codes in $\mathbb{F}_{p^{2\nu}}[(\mathbb{Z}_{q^k})^s]$ is

$$2^{1 + \sum_{i=1}^{k} \frac{q^{is}-q^{(i-1)s}}{\mathrm{ord}_{q^i}(p^{2\nu})}}.$$

Case II: *There exists $a \in A \setminus \{0\}$ such that $S_{p^{2\nu}}(a)$ is of type II'. By [19, Corollary 3.12] , we have that $S_{p^{2\nu}}(a)$ is of type II' for all $a \in A \setminus \{0\}$, and hence,*

$$r_{I'} = 1 \text{ and } r_{II'} = \sum_{i=1}^{k} \frac{q^{is} - q^{(i-1)s}}{2\mathrm{ord}_{q^i}(p^{2\nu})}.$$

In this case, we have

$$r_{I'} + r_{II'} = 1 + \sum_{i=1}^{k} \frac{q^{is} - q^{(i-1)s}}{2\mathrm{ord}_{q^i}(p^{2\nu})},$$

and hence, the number of Hermitian complementary dual abelian codes in $\mathbb{F}_{p^{2\nu}}[(\mathbb{Z}_{q^k})^s]$ is

$$2^{1 + \sum_{i=1}^{k} \frac{q^{is}-q^{(i-1)s}}{2\mathrm{ord}_{q^i}(p^{2\nu})}}.$$

6 Conclusion and Remarks

In this paper, a family of abelian codes with complementary dual in group algebras $\mathbb{F}_{p^\nu}[G]$ has been investigated under both the Euclidean and Hermitian inner products. The characterization of such codes have been given. Subsequently, the number of complementary dual abelian codes in $\mathbb{F}_{p^\nu}[G]$ has been shown to be independent of the Sylow p-subgroup of G and it has been completely determined for every finite

abelian group G, prime p, and positive integer ν. A simplified formula for the enumeration has been provided in the case where G is a cyclic group or a q-group with $p \neq q$.

For application purpose, it is of natural interest to continue the study on the efficiency of codes in this family. Hence, the determination of their minimum distances is an interesting problem as well.
