We investigated the form factors of the B_c meson into P -wave orbitally excited charmonium using the nonrelativistic QCD effective theory. Through the analytic computation, the next-to-leading order relativistic corrections to the form factors were obtained, and the asymptotic expressions were studied in the infinite bottom quark mass limit. Employing the general form factors, we discussed the exclusive decays of the B_c meson into P -wave orbitally excited charmonium and a light meson. We found that the relativistic corrections lead to a large correction for the form factors, which makes the branching ratios of the decay channels $\mathcal{B}(B_c^\pm \rightarrow \chi_{cJ}(h_c) + \pi^\pm(K^\pm))$ larger. These results are useful for the phenomenological analysis of the B_c meson decays into P -wave charmonium, which shall be tested in the LHCb experiments.

I. INTRODUCTION

The B_c meson is composed of two different heavy flavors, which has attracted more attentions from both the theoretical and experimental aspects in recent years. Because two different heavy quarks are hard to produce with a strong coupling suppressed factor α_s^2 in the electron-positron collider, the precisely studies of the B_c meson properties have to refer to hadron-hadron colliders, exemplified by the discovery of the B_c meson in the Tevatron [1].

The cross section of the B_c meson at the Large Hadron Collider (LHC) is expected at the level of dozens of nb [2], so a large number of the B_c meson events can be produced and reconstructed at the LHCb experiments. LHC provides a solid platform to precisely investigate the production and decay properties of the B_c meson. Through the precise analysis of the production and decay events, one can obtain more information on the hadronization mechanism of the heavy quarkonium and B_c meson, and also test the nonrelativistic QCD (NRQCD) effective theory [3].

In literatures, the B_c meson spectra are calculated in the framework of the QCD-motivated relativistic quark model based on the quasi-potential approach [4], where many higher excited states with different spin, orbital and radial quantum numbers were predicted. An excited state with the mass of $6842 \pm 4 \pm 5$ MeV has been observed by the ATLAS Collaboration recently [5], which can be regarded as the possible candidate of the $B_c(2S)$ state.

From a theoretical point of view, the form factors of the B_c meson into a charmonium have been investigated in many works. Some schemes are employed such as the perturbative QCD (PQCD) approach [6–9], QCD sum rules (QCD SR) [10–13], Light-cone sum rules (LCSR) [14], the relativistic quark model (RQM) [15–18], the non-relativistic constituent quark model (NCQM) [19], the light-front quark model (LFQM) [20–22], NRQCD approach [23–32]. It is realized that the decay rates of B_c exclusive decays to a charmonium and a light meson such as $B_c \rightarrow J/\psi + \pi$ and $B_c \rightarrow J/\psi + K$ depend mainly on the form factors at the maximum momentum recoil point. The careful investigation of the form factors is important to precisely predict these decay rates. In NRQCD approach, the relativistic corrections to the form factors of the B_c meson into S -wave charmonium have been computed in Ref. [32], where the relativistic corrections can bring about additional 15%–30% contributions and thus can not be ignored. However, the relativistic corrections to the form factors of the B_c meson into P -wave charmonium have not been studied yet.

On the other hand, the first evidence for the B_c meson decays into P -wave charmonium was observed by the LHCb Collaboration in 2016 [33]. Through the analysis of $B_c^+ \rightarrow K^+ K^- \pi^+$ decays with the data corresponding to an integrated luminosity of 3 fb^{-1} collected in pp collisions at centre-of-mass energies of 7 TeV and 8 TeV, the LHCb Collaboration have found the evidence for the decay $B_c^+ \rightarrow \chi_{c0} \pi^+$ at a significance of 4 standard deviations. Along with the accumulation of data at LHC, the experimental studies of the B_c meson decays into P -wave charmonium will become accessible. Future measurements in these experiments will definitely improve the degree of accuracy of the form factors of the B_c meson into P -wave charmonium.

There are also some works on the relativistic corrections to the light cone distribution amplitudes of the B_c meson [34, 35]. The recent works on the B_c two-body and quasi-two-body decays can be found in Refs. [36–41]. In this paper, we will calculate the relativistic corrections to the form factors of the B_c meson decays into P -wave charmonia, i.e. h_c and χ_{cJ} with $J = 0, 1, 2$. Then we will employ the form factors into the phenomenological analysis of the exclusive B_c two-body decays.

The paper is organized as the following. In Sec. II, we will give the formulae for the form factors of B_c into P -wave charmonium. In Sec. III, we will give the analytic expressions of the relativistic corrections to the form factors of B_c into P -wave charmonium. Then the form factors will be investigated in the heavy bottom quark limit. In Sec. IV, we will give the branching ratios of $B_c \rightarrow h_c + \pi$, $B_c \rightarrow h_c + K$, $B_c \rightarrow \chi_{cJ} + \pi$, and $B_c \rightarrow \chi_{cJ} + K$. We will summarize and conclude in the end.

II. FORM FACTORS OF B_c INTO P -WAVE CHARMONIUM

A. NRQCD effective theory

The NRQCD Lagrangian is written as [3]:

$$\begin{aligned} \mathcal{L}_{\text{NRQCD}} = & \psi^\dagger \left(iD_t + \frac{\mathbf{D}^2}{2m_Q} \right) \psi + \frac{c_F}{2m} \psi^\dagger \boldsymbol{\sigma} \cdot g_s \mathbf{B} \psi \\ & + \psi^\dagger \frac{\mathbf{D}^4}{8m_Q^3} \psi + \frac{c_D}{8m_Q^2} \psi^\dagger (\mathbf{D} \cdot g_s \mathbf{E} - g_s \mathbf{E} \cdot \mathbf{D}) \psi \\ & + \frac{ic_S}{8m_Q^2} \psi^\dagger \boldsymbol{\sigma} \cdot (\mathbf{D} \times g_s \mathbf{E} - g_s \mathbf{E} \times \mathbf{D}) \psi \\ & + (\psi \rightarrow i\sigma^2 \chi^*, A_\mu \rightarrow -A_\mu^T) + \mathcal{L}_{\text{light}}, \end{aligned} \quad (1)$$

where the Lagrangian for the light quarks and gluons is denoted as $\mathcal{L}_{\text{light}}$, which is identical to the related Lagrangian in QCD. m_Q is the heavy quark mass. The coefficients c_D , c_F , and c_S can be perturbatively calculated through the matching techniques between NRQCD and QCD.

The NRQCD effective theory has been established for a long time by Bodwin, Braaten, and Lepage [3], and has successfully achieved the factorization formulae for the heavy quarkonium in many production and decay processes. However, the precise calculation of the short-distance coefficients of the NRQCD long-distance matrix elements (LDMEs) in these processes is still a challenging topic.

In NRQCD effective theory, the decay width (cross section) of a heavy quarkonium H is generally factorized

as [3]

$$\Gamma_H = \sum_n \frac{C_n(\mu)}{m_Q^{d_n-3}} \langle H | \mathcal{O}_n(\mu) | H \rangle, \quad (2)$$

$$\sigma_H = \sum_n \frac{C'_n(\mu)}{m_Q^{d'_n-2}} \langle 0 | \mathcal{O}_n^H(\mu) | 0 \rangle, \quad (3)$$

where $\langle H | \mathcal{O}_n(\mu) | H \rangle$ and $\langle 0 | \mathcal{O}_n^H(\mu) | 0 \rangle$ are the NRQCD LDMEs, which involve nonperturbative information below the scale m_Q . The short-distance coefficients $C_n(\mu)$ include the effects of order m_Q or larger. The NRQCD operators $\mathcal{O}_n(\mu)$ annihilate a heavy quark-antiquark pair, while $\mathcal{O}_n^H(\mu)$ generate a heavy quark-antiquark pair.

The leading order NRQCD decay operators for S -wave heavy quarkonium can be written as

$$\mathcal{O}(^1S_0^{[1]}) = \psi^\dagger \chi \chi^\dagger \psi, \quad (4)$$

$$\mathcal{O}(^3S_0^{[1]}) = \psi^\dagger \boldsymbol{\sigma} \chi \cdot \chi^\dagger \boldsymbol{\sigma} \psi. \quad (5)$$

The leading order NRQCD production operators for P -wave quarkonium are

$$\mathcal{O}^H(^1P_1^{[1]}) = \chi^\dagger \left(-\frac{i}{2} \overleftrightarrow{D}^2 \right) \psi (a_H^\dagger a_H) \psi^\dagger \left(-\frac{i}{2} \overleftrightarrow{D}^2 \right) \chi, \quad (6)$$

$$\mathcal{O}^H(^3P_0^{[1]}) = \frac{1}{3} \chi^\dagger \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \cdot \boldsymbol{\sigma} \right) \psi (a_H^\dagger a_H) \psi^\dagger \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \cdot \boldsymbol{\sigma} \right) \chi, \quad (7)$$

$$\begin{aligned} \mathcal{O}^H(^3P_1^{[1]}) = & \frac{1}{2} \chi^\dagger \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \times \boldsymbol{\sigma} \right) \psi (a_H^\dagger a_H) \\ & \times \psi^\dagger \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \times \boldsymbol{\sigma} \right) \chi, \end{aligned} \quad (8)$$

$$\mathcal{O}^H(^3P_2^{[1]}) = \chi^\dagger \left(-\frac{i}{2} \overleftrightarrow{D}^2 \sigma^j \right) \psi (a_H^\dagger a_H) \psi^\dagger \left(-\frac{i}{2} \overleftrightarrow{D}^2 \sigma^j \right) \chi. \quad (9)$$

The next-to-leading order relativistic correction decay operators for S -wave heavy quarkonium are

$$\mathcal{P}(^1S_0^{[1]}) = \frac{1}{2} \left[\psi^\dagger \chi \cdot \chi^\dagger \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \right)^2 \psi + h.c. \right], \quad (10)$$

$$\mathcal{P}(^3S_1^{[1]}) = \frac{1}{2} \left[\psi^\dagger \boldsymbol{\sigma} \chi \cdot \chi^\dagger \boldsymbol{\sigma} \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \right)^2 \psi + h.c. \right], \quad (11)$$

where the $h.c.$ denotes the related complex conjugate term.

The next-to-leading order relativistic correction pro-

duction operators for P -wave heavy quarkonium are

$$\mathcal{P}^H(^1P_1^{[1]}) = \frac{1}{2} \left[\chi^\dagger \left(-\frac{i}{2} \overleftrightarrow{D}^i \right) \psi(a_H^\dagger a_H) \psi^\dagger \left(-\frac{i}{2} \overleftrightarrow{D}^i \right) \times \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \right)^2 \chi + h.c. \right], \quad (12)$$

$$\mathcal{P}^H(^3P_0^{[1]}) = \frac{1}{2} \left[\frac{1}{3} \chi^\dagger \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \cdot \boldsymbol{\sigma} \right) \psi(a_H^\dagger a_H) \psi^\dagger \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \cdot \boldsymbol{\sigma} \right) \times \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \right)^2 \chi + h.c. \right], \quad (13)$$

$$\mathcal{P}^H(^3P_1^{[1]}) = \frac{1}{2} \left[\frac{1}{2} \chi^\dagger \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \times \boldsymbol{\sigma} \right) \psi(a_H^\dagger a_H) \times \psi^\dagger \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \times \boldsymbol{\sigma} \right) \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \right)^2 \chi + h.c. \right], \quad (14)$$

$$\mathcal{P}^H(^3P_2^{[1]}) = \frac{1}{2} \left[\chi^\dagger \left(-\frac{i}{2} \overleftrightarrow{D}^i \sigma^j \right) \psi(a_H^\dagger a_H) \psi^\dagger \left(-\frac{i}{2} \overleftrightarrow{D}^i \sigma^j \right) \times \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \right)^2 \chi + h.c. \right]. \quad (15)$$

B. Covariant projection method

The B_c meson has two different heavy flavors, thus we introduce two heavy quarks Q and Q' . And the heavy quarkonium can be described when $Q' = Q$. Let p_1 and p_2 represent the momenta for the heavy quark Q and anti-quark $\bar{Q}'$, respectively. The momenta can be decomposed as

$$p_1 = \alpha P_H - k, \quad (16)$$

$$p_2 = \beta P_H + k, \quad (17)$$

where $P_H = p_1 + p_2$ being the heavy quarkonium momentum, k being a half of the relative momentum between the quark pair, and $\alpha + \beta = 1$.

In the rest frame of the heavy quarkonium H , the explicit expressions are

$$P_H^\mu = (E_1 + E_2, 0), \quad (18)$$

$$k^\mu = (0, \mathbf{k}), \quad (19)$$

$$p_1^\mu = (E_1, -\mathbf{k}), \quad (20)$$

$$p_2^\mu = (E_2, \mathbf{k}), \quad (21)$$

where the heavy quark on-shell conditions being $E_1 = \sqrt{m_1^2 - k^2}$, $E_2 = \sqrt{m_2^2 - k^2}$ and $k^2 = -\mathbf{k}^2$ with the heavy quark masses m_1 and m_2 , $\alpha = \sqrt{m_1^2 - k^2} / (\sqrt{m_1^2 - k^2} + \sqrt{m_2^2 - k^2})$, and $\beta = 1 - \alpha$.

The Dirac spinors for the heavy quark Q and anti-quark $\bar{Q}'$ are

$$u_1(p_1, \lambda) = \sqrt{\frac{E_1 + m_1}{2E_1}} \begin{pmatrix} \xi_\lambda \\ \frac{\vec{\sigma} \cdot \vec{p}_1}{E_1 + m_1} \xi_\lambda \end{pmatrix}, \quad (22)$$

$$v_2(p_2, \lambda) = \sqrt{\frac{E_2 + m_2}{2E_2}} \begin{pmatrix} \frac{\vec{\sigma} \cdot \vec{p}_2}{E_2 + m_2} \xi_\lambda \\ \xi_\lambda \end{pmatrix}. \quad (23)$$

The short-distance coefficients of NRQCD LDMEs will be obtained in principle through the matching techniques. For a certain process, one usually extract the short-distance coefficients using the covariant projection method. The corresponding projection operators are

$$\begin{aligned} \Pi_{S=0,1}(k) &= -i \sum_{\lambda_1, \lambda_2} u_b(p_1, \lambda_1) \bar{v}_c(p_2, \lambda_2) \langle \frac{1}{2} \lambda_1 \frac{1}{2} \lambda_2 | SS_z \rangle \otimes \frac{\mathbf{1}_c}{\sqrt{N_c}} \\ &= \frac{i}{4\sqrt{2E_1 E_2} \omega} (\alpha \not{p}_H - \not{k} + m_1) \frac{\not{p}_H + E_1 + E_2}{E_1 + E_2} \Gamma_S(\beta \not{p}_H + \not{k} - m_2) \otimes \frac{\mathbf{1}_c}{\sqrt{N_c}}, \end{aligned} \quad (24)$$

where $\omega = \sqrt{E_1 + m_1} \sqrt{E_2 + m_2}$. For the spin-singlet combination, we have the spin $S = 0$ and $\Gamma_{S=0} = \gamma^5$. For the spin-triplet combination, we have the spin $S = 1$ and $\Gamma_{S=1} = \not{\epsilon}_H^* = \epsilon_\mu^*(p_H) \gamma^\mu$.

In the nonrelativistic bound-state picture, the heavy quarkonium can be described by the nonrelativistic wave function. For P -wave charmonium, one has to expand the amplitude to the first order in k . Thus the amplitude

can be obtained by [42]

$$\begin{aligned} \mathcal{M}(B_c \rightarrow {}^{2S+1}P_J(c\bar{c}) + X) &= \sum_{L_z, S_z} \langle 1L_z; SS_z | JJ_z \rangle \int \frac{d^4 k}{(2\pi)^3} k^\alpha \delta(k^0 - \frac{|\vec{k}|^2}{m_H}) \psi^*(k)_H \\ &\quad \times \text{Tr}[\mathcal{O}_\alpha(0) \Pi_S(0) + \mathcal{O}(0) \Pi_{S,\alpha}(0)], \end{aligned} \quad (25)$$

where

$$\mathcal{O}_\alpha(0) = \frac{\partial \mathcal{O}(k)}{\partial k^\alpha} \Big|_{k=0}, \quad \Pi_{S,\alpha}(0) = \frac{\partial \Pi_S(k)}{\partial k^\alpha} \Big|_{k=0}. \quad (26)$$

After integrating the zero-component k^0 of the momentum, the integral is proportional to the derivative of the radial wave function at the origin

$$\int \frac{d^3k}{(2\pi)^3} k^\alpha \psi^*(k)_H = i\varepsilon^{*\alpha}(L_z) \sqrt{\frac{3}{4\pi}} \mathcal{R}'(0)_H, \quad (27)$$

where the derivative of the radial wave function at the origin can be related to the derivative of wave functions at the origin of P -wave charmonia by $\psi'(0)_H = \sqrt{\frac{1}{4\pi}} \mathcal{R}'(0)_H$.

C. Form factors

P -wave orbitally excited charmonia include the spin-singlet $h_c(^1P_1)$, the scalar $\chi_{c0}(^3P_0)$, the axial-vector meson $\chi_{c1}(^3P_1)$, and the tensor meson $\chi_{c2}(^3P_2)$. Thus the form factors of the B_c meson into P -wave orbitally excited charmonium can be defined accordingly.

The form factors of the B_c meson into $h_c(^1P_1)$ are defined as

$$\begin{aligned} \langle h_c(p, \varepsilon^*) | \bar{c} \gamma^\mu b | B_c(P) \rangle &= -i[2m_{h_c} A_0^{h_c}(q^2) \frac{\varepsilon^* \cdot q}{q^2} q^\mu \\ &\quad - A_2^{h_c}(q^2) \frac{\varepsilon^* \cdot q}{m_{B_c} + m_{h_c}} (P^\mu + p^\mu - \frac{m_{B_c}^2 - m_{h_c}^2}{q^2} q^\mu) \\ &\quad + (m_{B_c} + m_{h_c}) A_1^{h_c}(q^2) (\varepsilon^{*\mu} - \frac{\varepsilon^* \cdot q}{q^2} q^\mu)], \end{aligned} \quad (28)$$

$$\langle h_c(p, \varepsilon^*) | \bar{c} \gamma^\mu \gamma^5 b | B_c(P) \rangle = \frac{2V^{h_c}(q^2)}{m_{B_c} + m_{h_c}} \epsilon^{\mu\nu\rho\sigma} \varepsilon_\nu^* p_\rho P_\sigma, \quad (29)$$

where the momentum transfer is defined as $q = P - p$ with the B_c meson momentum P and the final charmonium momentum p . The polarization vector or tensor of the final charmonium is denoted as ε^* . There are only two form factors for the B_c meson into the scalar meson, which are defined as

$$\begin{aligned} \langle \chi_{c0}(p) | \bar{c} \gamma^\mu \gamma^5 b | B_c(P) \rangle &= [f_0^{\chi_{c0}}(q^2) \frac{m_{B_c}^2 - m_{\chi_{c0}}^2}{q^2} q^\mu \\ &\quad + f_+^{\chi_{c0}}(q^2) (P^\mu + p^\mu - \frac{m_{B_c}^2 - m_{\chi_{c0}}^2}{q^2} q^\mu)] (-i) \end{aligned} \quad (30)$$

The form factors for the B_c meson into the axial-vector meson can be written as

$$\begin{aligned} \langle \chi_{c1}(p, \varepsilon^*) | \bar{c} \gamma^\mu b | B_c(P) \rangle &= -i[2m_{\chi_{c1}} A_0^{\chi_{c1}}(q^2) \frac{\varepsilon^* \cdot q}{q^2} q^\mu \\ &\quad - A_2^{\chi_{c1}}(q^2) \frac{\varepsilon^* \cdot q}{m_{B_c} + m_{\chi_{c1}}} (P^\mu + p^\mu - \frac{m_{B_c}^2 - m_{\chi_{c1}}^2}{q^2} q^\mu) \\ &\quad + (m_{B_c} + m_{\chi_{c1}}) A_1^{\chi_{c1}}(q^2) (\varepsilon^{*\mu} - \frac{\varepsilon^* \cdot q}{q^2} q^\mu)], \end{aligned} \quad (31)$$

$$\langle \chi_{c1}(p, \varepsilon^*) | \bar{c} \gamma^\mu \gamma^5 b | B_c(P) \rangle = \frac{2V^{\chi_{c1}}(q^2)}{m_{B_c} + m_{\chi_{c1}}} \epsilon^{\mu\nu\rho\sigma} \varepsilon_\nu^* p_\rho P_\sigma. \quad (32)$$

The form factors for the B_c meson into the tensor meson can be written as

$$\begin{aligned} \langle \chi_{c2}(p, \varepsilon^*) | \bar{c} \gamma^\mu \gamma^5 b | B_c(P) \rangle &= [2m_{\chi_{c2}} A_0^{\chi_{c2}}(q^2) \frac{\varepsilon^{*\alpha\beta} q_\beta}{q^2} q^\mu \\ &\quad - A_2^{\chi_{c2}}(q^2) \frac{\varepsilon^{*\alpha\beta} q_\beta}{m_{B_c} + m_{\chi_{c2}}} (P^\mu + p^\mu - \frac{m_{B_c}^2 - m_{\chi_{c2}}^2}{q^2} q^\mu) \\ &\quad + (m_{B_c} + m_{\chi_{c2}}) A_1^{\chi_{c2}}(q^2) (\varepsilon^{*\mu\alpha} - \frac{\varepsilon^{*\alpha\beta} q_\beta}{q^2} q^\mu)] \frac{-iP_\alpha}{m_{B_c}}, \end{aligned} \quad (33)$$

$$\begin{aligned} \langle \chi_{c2}(p, \varepsilon^*) | \bar{c} \gamma^\mu b | B_c(P) \rangle &= \frac{2V^{\chi_{c2}}(q^2)}{m_{B_c}(m_{B_c} + m_{\chi_{c2}})} \epsilon^{\mu\nu\rho\sigma} \varepsilon_{\nu\alpha}^* p_\rho P_\sigma P_\alpha. \end{aligned} \quad (34)$$

The above definitions of the form factors bring about two benefits. On the one hand, the decay amplitudes can be described according to these form factors and then become simple. On the other hand, the form factors in the above formulae are dimensionless parameters, which have more wide utilizations in different processes.

The polarization summation for the 3P_J states are

$$\begin{aligned} \sum_{L_z, S_z} \varepsilon^{*\alpha}(L_z) \varepsilon^{*\beta}(S_z) \langle 1L_z; 1S_z | 00 \rangle &= \frac{1}{\sqrt{3}} \left(-g^{\alpha\beta} + \frac{p_H^\alpha p_H^\beta}{m_H^2} \right), \end{aligned} \quad (35)$$

$$\begin{aligned} \sum_{L_z, S_z} \varepsilon^{*\alpha}(L_z) \varepsilon^{*\beta}(S_z) \langle 1L_z; 1S_z | 1J_z \rangle &= \frac{-i\epsilon^{\alpha\beta\gamma\delta} p_{H,\delta} \varepsilon_\gamma^*(p_H, J_z)}{\sqrt{2}m_H}, \end{aligned} \quad (36)$$

$$\begin{aligned} \sum_{L_z, S_z} \varepsilon^{*\alpha}(L_z) \varepsilon^{*\beta}(S_z) \langle 1L_z; 1S_z | 2J_z \rangle &= \varepsilon^{*\alpha\beta}(p_H, J_z), \end{aligned} \quad (37)$$

where $\varepsilon_\gamma^*(p_H, J_z)$ is the spin-1 polarization vector with $\varepsilon_\gamma^*(p_H, J_z) p_H^\gamma = 0$ and $\varepsilon^{*\alpha\beta}(p_H, J_z)$ is the polarization tensor for the spin-2 system with $\varepsilon^{*\alpha\beta}(p_H, J_z) p_{H,\beta} = 0$ which is symmetric under the exchange $\alpha \leftrightarrow \beta$.

The five components ($J_z = 0, \pm 1, \pm 2$) of the spin-2 polarization tensor for the $\chi_{c2}(^3P_2)$ state can be constructed via the spin-1 polarization vector as

$$\begin{aligned} \varepsilon^{\alpha\beta}(\pm 2) &= \varepsilon^\alpha(\pm) \varepsilon^\beta(\pm), \\ \varepsilon^{\alpha\beta}(\pm 1) &= \frac{1}{\sqrt{2}} [\varepsilon^\alpha(\pm) \varepsilon^\beta(0) + \varepsilon^\alpha(0) \varepsilon^\beta(\pm)], \\ \varepsilon^{\alpha\beta}(0) &= \frac{1}{\sqrt{6}} [\varepsilon^\alpha(+) \varepsilon^\beta(-) + \varepsilon^\alpha(-) \varepsilon^\beta(+)] \\ &\quad + \sqrt{\frac{2}{3}} \varepsilon^\alpha(0) \varepsilon^\beta(0), \end{aligned} \quad (38)$$

where the explicit structures of the ε in the initial hadron rest frame can be written as

$$\begin{aligned}\varepsilon^\alpha(\pm) &= \frac{1}{\sqrt{2}}(0, \mp 1, -i, 0), \\ \varepsilon^\alpha(0) &= \frac{1}{m_{\chi_{c2}}}(|\mathbf{p}_{\chi_{c2}}|, 0, 0, p_{\chi_{c2}}^0).\end{aligned}\quad (39)$$

The sum over polarization for a spin-1 system is defined as $\Theta^{\alpha\beta}$

$$\sum_{J_z} \varepsilon^\alpha(p_H, J_z) \varepsilon^{*\beta}(p_H, J_z) = \Theta^{\alpha\beta}, \quad (40)$$

with

$$\Theta^{\alpha\beta} = -g^{\alpha\beta} + \frac{p_H^\alpha p_H^\beta}{m_H^2}. \quad (41)$$

The sum over polarization for a spin-2 system is

$$\begin{aligned}& \sum_{J_z} \varepsilon^{\alpha\beta}(p_H, J_z) \varepsilon^{*\alpha'\beta'}(p_H, J_z) \\ &= \frac{1}{2} \left(\Theta^{\alpha\alpha'} \Theta^{\beta\beta'} + \Theta^{\alpha\beta'} \Theta^{\beta\alpha'} \right) - \frac{1}{3} \Theta^{\alpha\beta} \Theta^{\alpha'\beta'}.\end{aligned}\quad (42)$$

The Taylor expansion of the amplitudes in powers of k^μ is adopted in order to calculate the relativistic corrections to the form factors

$$\begin{aligned}\mathcal{M}(k) &= \mathcal{M}(0) + \frac{\partial \mathcal{M}(k)}{\partial k^\mu} \Big|_{k=0} k^\mu \\ &+ \frac{1}{2!} \frac{\partial^2 \mathcal{M}(k)}{\partial k^\mu \partial k^\nu} \Big|_{k=0} k^\mu k^\nu \\ &+ \frac{1}{3!} \frac{\partial^3 \mathcal{M}(k)}{\partial k^\mu \partial k^\nu \partial k^\rho} \Big|_{k=0} k^\mu k^\nu k^\rho + \dots\end{aligned}\quad (43)$$

FIG. 1: Feynman diagrams for the form factors of the B_c meson decays into P -wave charmonium.

According to the Feynman diagrams calculation in Fig. 1, the leading order (LO) results at $\mathcal{O}(\alpha_s v^0)$ of the form factors can be obtained. They are

$$V^{h_c}(q^2)|_{LO} = \frac{8\sqrt{2}\pi(z+1)^{3/2}(3z+1)C_F\alpha_s\psi(0)_{B_c}\psi'(0)_{h_c}}{z^{5/2}m_b^4(y-z+1)^2(y+z-1)^2}, \quad (44)$$

$$A_0^{h_c}(q^2)|_{LO} = -\frac{16\sqrt{2}\pi(z^2-1)(-y^2(3z+2)+5z^3+8z^2+9z+2)C_F\alpha_s\psi(0)_{B_c}\psi'(0)_{h_c}}{z^2\sqrt{z(z+1)}m_b^4((z-1)^2-y^2)^3}, \quad (45)$$

$$A_1^{h_c}(q^2)|_{LO} = \frac{8\sqrt{2}\pi(z+1)^{3/2}(-y^2+5z^2+2z+1)C_F\alpha_s\psi(0)_{B_c}\psi'(0)_{h_c}}{z^{5/2}m_b^4(y^2-(z-1)^2)^2(3z+1)}, \quad (46)$$

$$A_2^{h_c}(q^2)|_{LO} = -\frac{8\sqrt{2}\pi\sqrt{z+1}(3z+1)(y^2(1-3z)+15z^3+17z^2+17z-1)C_F\alpha_s\psi(0)_{B_c}\psi'(0)_{h_c}}{z^{5/2}m_b^4((z-1)^2-y^2)^3}, \quad (47)$$

$$f_+^{\chi_{c0}}(q^2)|_{LO} = -\frac{8\sqrt{\frac{2}{3}}\pi\sqrt{z(z+1)}(-y^4+2y^2(-2z^2+z+5)+9z^4+6z^3-6z-9)C_F\alpha_s\psi(0)_{B_c}\psi'(0)_{\chi_{c0}}}{z^3m_b^4((z-1)^2-y^2)^3}, \quad (48)$$

$$f_0^{\chi_{c0}}(q^2)|_{LO} = -\frac{8\sqrt{6}\pi(z(z+1))^{3/2}(-y^2(5z+3)+9z^3+9z^2+11z+3)C_F\alpha_s\psi(0)_{B_c}\psi'(0)_{\chi_{c0}}}{z^4(3z^2-2z-1)m_b^4(y^2-(z-1)^2)^2}, \quad (49)$$

$$A_0^{\chi_{c1}}(q^2)|_{LO} = -\frac{16\pi(z-1)(z+1)^{3/2}C_F\alpha_s\psi(0)_{B_c}\psi'(0)_{\chi_{c1}}}{z^{5/2}m_b^4(y^2-(z-1)^2)^2}, \quad (51)$$

$$A_1^{\chi_{c1}}(q^2)|_{LO} = \frac{8\pi\sqrt{z+1}(-y^2(9z+5)+25z^3+35z^2+31z+5)C_F\alpha_s\psi(0)_{B_c}\psi'(0)_{\chi_{c1}}}{z^{5/2}m_b^4(y^2-(z-1)^2)^2(3z+1)}, \quad (52)$$

$$A_2^{\chi_{c1}}(q^2)|_{LO} = -\frac{8\pi\sqrt{z+1}(3z+1)(y^2(z+5)+11z^3-3z^2-3z-5)C_F\alpha_s\psi(0)_{B_c}\psi'(0)_{\chi_{c1}}}{z^{5/2}m_b^4((z-1)^2-y^2)^3}, \quad (53)$$

$$V^{\chi_{c2}}(q^2)|_{LO} = \frac{96\sqrt{2}\pi\sqrt{z+1}(3z+1)^3C_F\alpha_s\psi(0)_{B_c}\psi'(0)_{\chi_{c2}}}{z^{3/2}((1-z)^2-y^2)^3m_b^4}, \quad (54)$$

$$A_0^{\chi_{c2}}(q^2)|_{LO} = \frac{96\sqrt{2}\pi(z+1)^{7/2}C_F\alpha_s\psi(0)_{B_c}\psi'(0)_{\chi_{c2}}}{z^{3/2}m_b^4((z-1)^2-y^2)^3}, \quad (55)$$

$$A_1^{\chi_{c2}}(q^2)|_{LO} = \frac{32\sqrt{2}\pi\left(\frac{1}{z}+1\right)^{3/2}(-y^2(5z+3)+9z^3+17z^2+19z+3)C_F\alpha_s\psi(0)_{B_c}\psi'(0)_{\chi_{c2}}}{m_b^4((z-1)^2-y^2)^3(3z+1)}, \quad (56)$$

$$A_2^{\chi_{c2}}(q^2)|_{LO} = \frac{32\sqrt{2}\pi\left(\frac{1}{z}+1\right)^{3/2}(z+3)(3z+1)C_F\alpha_s\psi(0)_{B_c}\psi'(0)_{\chi_{c2}}}{m_b^4((z-1)^2-y^2)^3}, \quad (57)$$

where the heavy quark ratio z is defined as $z = m_c/m_b$, and the parameter y is related to the recoil momentum fraction with $y = \sqrt{q^2/m_b^2}$. Note that we adopt the vacuum-saturation approximation, the NRQCD LDMEs can be estimated as $\langle H|\mathcal{O}_n|H\rangle \simeq \langle H|\psi^\dagger\mathcal{K}'_n\chi|0\rangle\langle 0|\chi^\dagger\mathcal{K}_n\psi|H\rangle$ with $\mathcal{O}_n = \psi^\dagger\mathcal{K}'_n\chi\chi^\dagger\mathcal{K}_n\psi$. On the other hand, the vacuum expectations of the production operators $\mathcal{O}_n^H$ can be estimated as $\langle 0|\mathcal{O}_n^H|0\rangle = \langle 0|\chi^\dagger\mathcal{K}'_n\psi\sum_m(|H_J, m\rangle\langle H_J, m|)\psi^\dagger\mathcal{K}_n\chi|0\rangle \simeq (2J+1)\langle H|\mathcal{O}_n|H\rangle$ with the angular momentum J of heavy quarkonium. The wave function at the origin of the B_c meson is defined as [32]

$$\psi(0)_{B_c} = \frac{1}{\sqrt{2N_c}}\langle 0|\chi_b^\dagger\psi_c|B_c\rangle. \quad (58)$$

The derivative of wave functions at the origin of P -wave charmonia are related to the nonperturbative matrix elements [3]

$$\psi'(0)_{h_c}\varepsilon^{*i} = \frac{1}{\sqrt{2N_c}}\langle h_c(\varepsilon^*)|\psi^\dagger(-\frac{i}{2}\overleftrightarrow{D}^i)\chi|0\rangle. \quad (59)$$

$$\psi'(0)_{\chi_{c0}} = \frac{1}{\sqrt{3}}\frac{1}{\sqrt{2N_c}}\langle \chi_{c0}|\psi^\dagger(-\frac{i}{2}\overleftrightarrow{\mathbf{D}}\cdot\boldsymbol{\sigma})\chi|0\rangle. \quad (60)$$

$$\psi'(0)_{\chi_{c1}}\varepsilon^{*i} = \frac{1}{\sqrt{2}}\frac{1}{\sqrt{2N_c}}\langle \chi_{c1}(\varepsilon^*)|\psi^\dagger(-\frac{i}{2}\overleftrightarrow{\mathbf{D}}\times\boldsymbol{\sigma})^i\chi|0\rangle. \quad (61)$$

$$\psi'(0)_{\chi_{c2}}\varepsilon^{*ij} = \frac{1}{\sqrt{2N_c}}\langle \chi_{c2}(\varepsilon^*)|\psi^\dagger(-\frac{i}{2}\overleftrightarrow{D}^i\sigma^j)\chi|0\rangle. \quad (62)$$

III. RELATIVISTIC CORRECTIONS TO THE FORM FACTORS OF B_c INTO P -WAVE CHARMONIUM

In this section, we will calculate the relativistic corrections to the form factors. Since both the B_c meson and the final charmonium are bound states composed of two heavy quarks, the relativistic corrections will include two parts: one from the corrections ordered by the charm quark relative velocity in the charmonium; the other from the corrections ordered by the heavy quark relative velocity in the B_c meson.

In the following, we will define a half of the reduced heavy quark relative momentum as $k = m_{red}v = m_b m_c v / (m_b + m_c)$ inside the B_c meson, and the masses of the B_c meson can be written as $m_{B_c} = \sqrt{m_c^2 - k^2} + \sqrt{m_b^2 - k^2}$. For P -wave charmonium, we will define a half of the charm quark relative momentum as $k' = m_c v' / 2$

inside the charmonium, and the masses of the P -wave charmonium can be written as $m_{h_c} \simeq m_{\chi_{c0}} \simeq m_{\chi_{c1}} \simeq m_{\chi_{c2}} = 2\sqrt{m_c^2 - k'^2}$. Note that the mass corrections of the B_c meson and the charmonium will contribute to the relativistic corrections of the form factors.

A. Calculation steps

For clarity, we will divide the relativistic corrections into two steps. Firstly, we define the new form factors which do not depend explicitly on the masses of the heavy quarkonium and the B_c meson as follows [28]

$$\langle H(p, \varepsilon^*) | \bar{c} \gamma^\mu b | B_c(P) \rangle = -i[a_0^H \varepsilon^{*\mu} + a_+^H \varepsilon^* \cdot qp^\mu + a_-^H \varepsilon^* \cdot qP^\mu], \quad (63)$$

$$\langle H(p, \varepsilon^*) | \bar{c} \gamma^\mu \gamma^5 b | B_c(P) \rangle = g^H \epsilon^{\mu\nu\rho\sigma} \varepsilon_\nu^* p_\rho P_\sigma. \quad (64)$$

The above formulae can be directly employed for the h_c and χ_{c1} . For the tensor χ_{c2} , the related formulae can be obtained by the replacements $\varepsilon_\nu^* \rightarrow \varepsilon_{\nu\beta}^*(\chi_{c2})P_\beta$, $\varepsilon^* \cdot q \rightarrow \varepsilon^{\alpha\beta*}(\chi_{c2})q_\alpha P_\beta$, and $\bar{c} \gamma^\mu b \leftrightarrow \bar{c} \gamma^\mu \gamma^5 b$. For the scalar χ_{c0} , the new form factors are defined as

$$\langle \chi_{c0}(p) | \bar{c} \gamma^\mu \gamma^5 b | B_c(P) \rangle = -i[f_p^{\chi_{c0}}(P^\mu + p^\mu) + f_m^{\chi_{c0}}(P^\mu - p^\mu)]. \quad (65)$$

The form factors in the Section II can be obtained according to the above form factors. For the h_c and χ_{c1} , we have

$$V^H = \frac{m_{B_c} + m_H}{2} g^H, \quad (66)$$

$$A_0^H = \frac{1}{2m_H} a_0^H + \frac{q^2}{4m_H} (a_-^H - a_+^H) + \frac{m_{B_c}^2 - m_H^2}{4m_H} (a_-^H + a_+^H), \quad (67)$$

$$A_1^H = \frac{1}{m_{B_c} + m_H} a_0^H, \quad (68)$$

$$A_2^H = -\frac{m_{B_c} + m_H}{2} (a_-^H + a_+^H). \quad (69)$$

The form factors of χ_{c2} in the Section II can be obtained through the above transformation plus a factor m_{B_c} .

The form factors of χ_{c0} in the Section II can be expressed as

$$f_0^{\chi_{c0}} = f_p^{\chi_{c0}} + \frac{q^2}{m_{B_c}^2 - m_H^2} f_m^{\chi_{c0}}, \quad (70)$$

$$f_+^{\chi_{c0}} = f_p^{\chi_{c0}}. \quad (71)$$

Thus, the relativistic corrections of the form factors in the Section II will be obtained by the two steps. The first step is to calculate the relativistic corrections from the new defined form factors which do not explicitly depend the B_c meson and P -wave charmonium masses. The second step is to calculate the relativistic corrections from the meson masses in the transformation formulae in Eqs. (66-71).

B. The direct relativistic corrections to the form factors of B_c into spin-singlet h_c and spin-triplet χ_{cJ}

In this subsection, we will study the relativistic corrections contributions from the new defined form factors which do not explicitly depend the meson masses. Performing the Taylor expansion of the amplitudes in powers of k^μ and extracting the quadratic terms in the series, one then obtain the relativistic corrections at the $\mathcal{O}(|\mathbf{k}|^2)$ level.

Normally, one can obtain the short-distance coefficients of the NRQCD relativistic operator matrix elements after performing the relativistic corrections. To estimate the magnitude of the matrix elements of the relativistic corrections operators, the following estimation formula can be adopted

$$\langle 0 | \chi_b^\dagger \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \right)^2 \psi_c | B_c \rangle \simeq |\mathbf{k}|^2 \langle 0 | \chi_b^\dagger \psi_c | B_c \rangle, \quad (72)$$

where $|\mathbf{k}|^2$ can be also expressed by the heavy quark relative velocity and heavy quark mass.

Thus the contributions to the form factors of B_c transitions into spin-singlet h_c from the B_c relativistic correction operators become

$$\begin{aligned} A_0^{h_c}(q^2)|_{RC1} &= A_0^{h_c}(q^2)|_{LO} \frac{|\mathbf{k}|^2}{m_b^2} \left[\frac{-15z^7 + 519z^6 + 1215z^5 + 1573z^4 + 1263z^3 + 689z^2 + 129z + 3}{24z^2((z-1)^2 - y^2)(-y^2(3z+2) + 5z^3 + 8z^2 + 9z + 2)} \right. \\ &\quad + \frac{y^2(12z^6 - 211z^5 - 137z^4 + 74z^3 + 186z^2 + 105z + 3)}{12(z-1)z^2((z-1)^2 - y^2)(-y^2(3z+2) + 5z^3 + 8z^2 + 9z + 2)} \\ &\quad \left. - \frac{y^4(9z^4 - 44z^3 + 52z^2 + 84z + 3)}{24(z-1)z^2((z-1)^2 - y^2)(-y^2(3z+2) + 5z^3 + 8z^2 + 9z + 2)} \right], \end{aligned} \quad (73)$$

$$V^{h_c}(q^2)|_{RC1} = V^{h_c}(q^2)|_{LO} \frac{|\mathbf{k}|^2 y^2 (-3z^2 + 38z - 3) + 3z^4 - 60z^3 + 82z^2 - 28z + 3}{m_b^2 24z^2(y-z+1)(y+z-1)}, \quad (74)$$

$$A_1^{h_c}(q^2)|_{RC1} = A_1^{h_c}(q^2)|_{LO} \frac{|\mathbf{k}|^2}{m_b^2} \left[\frac{-15z^6 + 462z^5 + 59z^4 + 372z^3 + 119z^2 + 30z - 3}{24z^2((z-1)^2 - y^2)(-y^2 + 5z^2 + 2z + 1)} - \frac{y^2(y^2(3z^2 - 38z + 3) - 18z^4 + 284z^3 + 24z^2 + 68z - 6)}{24z^2((z-1)^2 - y^2)(-y^2 + 5z^2 + 2z + 1)} \right], \quad (75)$$

$$A_2^{h_c}(q^2)|_{RC1} = A_2^{h_c}(q^2)|_{LO} \frac{|\mathbf{k}|^2}{m_b^2} \left[\frac{-45z^7 + 1553z^6 + 2747z^5 + 3249z^4 + 2305z^3 + 955z^2 - 15z + 3}{24z^2((z-1)^2 - y^2)(y^2(1-3z) + 15z^3 + 17z^2 + 17z - 1)} - \frac{y^2(y^2(9z^3 + 43z^2 + 79z - 3) - 54z^5 + 574z^4 + 916z^3 + 572z^2 - 94z + 6)}{24z^2((z-1)^2 - y^2)(y^2(1-3z) + 15z^3 + 17z^2 + 17z - 1)} \right]. \quad (76)$$

Next, we will study the relativistic corrections to the form factors of B_c transitions into spin-triplet χ_{cJ} . When one expands the amplitudes in powers of k^μ , the relativistic corrections to the form factors at the $\mathcal{O}(|\mathbf{k}|^2)$ level from the B_c meson can be obtained.

We can get the estimations of the relativistic corrections of the form factors according to the above formula

in Eq. 72, which can be also related to the LO form factors.

Using the estimation formula in Eq. 72, the results of relativistic corrections from the B_c meson to the form factors of B_c transitions into spin-triplet χ_{cJ} can be written as

$$f_+^{\chi_{c0}}(q^2)|_{RC1} = f_+^{\chi_{c0}}(q^2)|_{LO} \frac{|\mathbf{k}|^2}{m_b^2} \left[\frac{-27z^8 + 918z^7 + 1338z^6 + 574z^5 - 220z^4 - 926z^3 - 1066z^2 - 566z - 25}{24z^2((z-1)^2 - y^2)(-y^4 + 2y^2(-2z^2 + z + 5) + 9z^4 + 6z^3 - 6z - 9)} + \frac{y^6(-3z^2 + 2z + 11) - 3y^4(3z^4 + 38z^3 + 156z^2 + 154z + 1)}{24z^2((z-1)^2 - y^2)(-y^4 + 2y^2(-2z^2 + z + 5) + 9z^4 + 6z^3 - 6z - 9)} + \frac{y^2(39z^6 - 490z^5 - 231z^4 + 708z^3 + 1209z^2 + 1030z + 39)}{24z^2((z-1)^2 - y^2)(-y^4 + 2y^2(-2z^2 + z + 5) + 9z^4 + 6z^3 - 6z - 9)} \right], \quad (77)$$

$$f_0^{\chi_{c0}}(q^2)|_{RC1} = f_0^{\chi_{c0}}(q^2)|_{LO} \frac{|\mathbf{k}|^2}{m_b^2} \left[\frac{-81z^7 + 2727z^6 + 4851z^5 + 5787z^4 + 4765z^3 + 2789z^2 + 641z + 25}{72z^2((z-1)^2 - y^2)(-y^2(5z + 3) + 9z^3 + 9z^2 + 11z + 3)} - \frac{y^2(y^2(45z^3 - 267z^2 - 265z - 25) - 126z^5 + 2250z^4 + 3604z^3 + 2660z^2 + 906z + 50)}{72z^2((z-1)^2 - y^2)(-y^2(5z + 3) + 9z^3 + 9z^2 + 11z + 3)} \right], \quad (78)$$

$$V^{\chi_{c1}}(q^2)|_{RC1} = V^{\chi_{c1}}(q^2)|_{LO} \frac{|\mathbf{k}|^2}{m_b^2} \left[\frac{-33z^7 + 1151z^6 + 2411z^5 + 3019z^4 + 2493z^3 + 1437z^2 + 313z - 39}{24z^2(y-z+1)(y+z-1)(y^2(7z+5) - 11z^3 - 15z^2 - 17z - 5)} - \frac{y^2(3y^2(7z^3 - 33z^2 - 19z + 13) - 54z^5 + 938z^4 + 1572z^3 + 1220z^2 + 370z - 78)}{24z^2(y-z+1)(y+z-1)(y^2(7z+5) - 11z^3 - 15z^2 - 17z - 5)} \right], \quad (79)$$

$$A_0^{\chi_{c1}}(q^2)|_{RC1} = A_0^{\chi_{c1}}(q^2)|_{LO} \frac{|\mathbf{k}|^2 y^2 (3z^3 - 50z^2 + 43z + 8) - 3z^5 + 92z^4 - 174z^3 + 28z^2 - 63z - 8}{m_b^2 24(z-1)z^2((z-1)^2 - y^2)}, \quad (80)$$

$$A_1^{\chi_{c1}}(q^2)|_{RC1} = A_1^{\chi_{c1}}(q^2)|_{LO} \frac{|\mathbf{k}|^2}{m_b^2} \left[\frac{-75z^7 + 2003z^6 + 4029z^5 + 4771z^4 + 4151z^3 + 2353z^2 + 215z - 39}{24z^2((z-1)^2 - y^2)(-y^2(9z+5) + 25z^3 + 35z^2 + 31z + 5)} - \frac{y^2(y^2(27z^3 - 95z^2 - 35z + 39) + 2(-51z^5 + 617z^4 + 1062z^3 + 750z^2 + 125z - 39))}{24z^2((z-1)^2 - y^2)(-y^2(9z+5) + 25z^3 + 35z^2 + 31z + 5)} \right], \quad (81)$$

$$A_2^{\chi_{c1}}(q^2)|_{RC1} = A_2^{\chi_{c1}}(q^2)|_{LO} \frac{|\mathbf{k}|^2}{m_b^2} \left[\frac{-33z^7 + 949z^6 - 97z^5 + 109z^4 + 53z^3 - 713z^2 - 307z + 39}{24z^2((z-1)^2 - y^2)(y^2(z+5) + 11z^3 - 3z^2 - 3z - 5)} \right. \\ \left. + \frac{y^2(3y^2(z^3 - 37z^2 - 41z + 13) + 30z^5 + 98z^4 + 884z^3 + 940z^2 + 430z - 78)}{24z^2((z-1)^2 - y^2)(y^2(z+5) + 11z^3 - 3z^2 - 3z - 5)} \right]. \quad (82)$$

$$V^{\chi_{c2}}(q^2)|_{RC1} = V^{\chi_{c2}}(q^2)|_{LO} \frac{y^2(-9z^2 + 90z - 17) + 9z^4 - 324z^3 - 34z^2 - 148z + 17}{72z^2(y - z + 1)(y + z - 1)}, \quad (83)$$

$$A_0^{\chi_{c2}}(q^2)|_{RC1} = A_0^{\chi_{c2}}(q^2)|_{LO} \frac{|\mathbf{k}|^2}{m_b^2} \frac{(y^2(-9z^2 + 108z + 13) + 9z^4 - 342z^3 - 124z^2 - 202z - 13)}{72z^2((z-1)^2 - y^2)}, \quad (84)$$

$$A_1^{\chi_{c2}}(q^2)|_{RC1} = A_1^{\chi_{c2}}(q^2)|_{LO} \frac{|\mathbf{k}|^2}{m_b^2} \left[\frac{-27z^7 + 945z^6 + 2433z^5 + 3229z^4 + 2655z^3 + 1411z^2 + 123z - 17}{24z^2((z-1)^2 - y^2)(-y^2(5z+3) + 9z^3 + 17z^2 + 19z + 3)} \right. \\ \left. + \frac{-27z^7 + 945z^6 + 2433z^5 + 3229z^4 + 2655z^3 + 1411z^2 + 123z - 17}{24z^2((z-1)^2 - y^2)(-y^2(5z+3) + 9z^3 + 17z^2 + 19z + 3)} \right], \quad (85)$$

$$A_2^{\chi_{c2}}(q^2)|_{RC1} = A_2^{\chi_{c2}}(q^2)|_{LO} \frac{|\mathbf{k}|^2}{m_b^2} \frac{y^2(3z^3 - 85z^2 - 95z + 17) - 3z^5 + 115z^4 + 330z^3 + 238z^2 + 105z - 17}{24z^2(z+3)((z-1)^2 - y^2)}. \quad (86)$$

Next, we will study the relativistic corrections contributions from the charm quark relative velocity inside the P -wave charmonium. Performing the Taylor expansion of the amplitudes in powers of k'^μ and extracting the quadratic terms in the series, one then obtain the relativistic corrections at the $\mathcal{O}(|\mathbf{k}'|^2)$ level.

The magnitudes of the matrix elements of the P -wave charmonium relativistic corrections operators are estimated as

$$\langle h_c(\varepsilon^*) | \psi^\dagger \left(-\frac{i}{2} \overleftrightarrow{D}^i \right) \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \right)^2 \chi | 0 \rangle \\ \simeq |\mathbf{k}'|^2 \langle h_c(\varepsilon^*) | \psi^\dagger \left(-\frac{i}{2} \overleftrightarrow{D}^i \right) \chi | 0 \rangle. \quad (87)$$

$$\langle \chi_{c0} | \psi^\dagger \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \cdot \boldsymbol{\sigma} \right) \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \right)^2 \chi | 0 \rangle \\ \simeq |\mathbf{k}'|^2 \langle \chi_{c0} | \psi^\dagger \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \cdot \boldsymbol{\sigma} \right) \chi | 0 \rangle. \quad (88)$$

$$\langle \chi_{c1}(\varepsilon^*) | \psi^\dagger \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \times \boldsymbol{\sigma} \right)^i \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \right)^2 \chi | 0 \rangle \\ \simeq |\mathbf{k}'|^2 \langle \chi_{c1}(\varepsilon^*) | \psi^\dagger \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \times \boldsymbol{\sigma} \right)^i \chi | 0 \rangle. \quad (89)$$

$$\langle \chi_{c2}(\varepsilon^*) | \psi^\dagger \left(-\frac{i}{2} \overleftrightarrow{D}^i \sigma^j \right) \left(-\frac{i}{2} \overleftrightarrow{\mathbf{D}} \right)^2 \chi | 0 \rangle \\ \simeq |\mathbf{k}'|^2 \langle \chi_{c2}(\varepsilon^*) | \psi^\dagger \left(-\frac{i}{2} \overleftrightarrow{D}^i \sigma^j \right) \chi | 0 \rangle. \quad (90)$$

Thus the contributions to the form factors of B_c transitions into spin-singlet h_c from the P -wave charmonium relativistic corrections operators become

$$V^{h_c}(q^2)|_{RC'1} = V^{h_c}(q^2)|_{LO} \frac{|\mathbf{k}'|^2}{m_b^2} \frac{2(y^2 - 9z^2 + 14z - 1)}{3z^2((z-1)^2 - y^2)}, \quad (91)$$

$$A_0^{h_c}(q^2)|_{RC'1} = A_0^{h_c}(q^2)|_{LO} \frac{|\mathbf{k}'|^2}{m_b^2} \left[\frac{-161z^5 + 166z^4 + 540z^3 + 818z^2 + 229z + 8}{6z^2((z-1)^2 - y^2)(-y^2(3z+2) + 5z^3 + 8z^2 + 9z + 2)} \right. \\ \left. + \frac{2y^2(49z^4 - 107z^3 + 59z^2 + 111z + 8) - y^4(z^2 + z + 8)}{6(z-1)z^2((z-1)^2 - y^2)(-y^2(3z+2) + 5z^3 + 8z^2 + 9z + 2)} \right], \quad (92)$$

$$A_1^{h_c}(q^2)|_{RC'1} = A_1^{h_c}(q^2)|_{LO} \frac{|\mathbf{k}'|^2 - 2y^4 + 4y^2(2z^2 - 6z + 1) - 70z^4 + 64z^3 + 48z^2 + 24z - 2}{m_b^2 3z^2((z-1)^2 - y^2)(-y^2 + 5z^2 + 2z + 1)}, \quad (93)$$

$$A_2^{h_c}(q^2)|_{RC'1} = A_2^{h_c}(q^2)|_{LO} \frac{|\mathbf{k}'|^2}{m_b^2} \left[\frac{2(y^4(1-3z) - 119z^5 + 161z^4 + 326z^3 + 430z^2 + z + 1)}{3z^2((z-1)^2 - y^2)(y^2(1-3z) + 15z^3 + 17z^2 + 17z - 1)} \right. \\ \left. - \frac{4y^2(3z^3 + 57z^2 - z + 1)}{3z^2((z-1)^2 - y^2)(y^2(1-3z) + 15z^3 + 17z^2 + 17z - 1)} \right]. \quad (94)$$

The contributions to the form factors of B_c transitions into spin-triplet χ_{cJ} from the P -wave charmonium relativistic corrections operators become

$$f_+^{\chi_{c0}}(q^2)|_{RC'1} = f_+^{\chi_{c0}}(q^2)|_{LO} \frac{|\mathbf{k}'|^2}{m_b^2} \left[\frac{-5y^6 - 189z^6 + 532z^5 + 719z^4 + 176z^3 - 479z^2 - 772z + 13}{6z^2((z-1)^2 - y^2)(-y^4 + 2y^2(-2z^2 + z + 5) + 9z^4 + 6z^3 - 6z - 9)} \right. \\ \left. + \frac{y^4(25z^2 - 80z + 23) + y^2(41z^4 - 460z^3 - 82z^2 + 852z - 31)}{6z^2((z-1)^2 - y^2)(-y^4 + 2y^2(-2z^2 + z + 5) + 9z^4 + 6z^3 - 6z - 9)} \right], \quad (95)$$

$$f_0^{\chi_{c0}}(q^2)|_{RC'1} = f_0^{\chi_{c0}}(q^2)|_{LO} \frac{|\mathbf{k}'|^2}{m_b^2} \left[\frac{-567z^6 + 840z^5 + 3529z^4 + 4776z^3 + 3515z^2 + 720z - 13}{18z^2(z+1)((z-1)^2 - y^2)(-y^2(5z+3) + 9z^3 + 9z^2 + 11z + 3)} \right. \\ \left. - \frac{y^2(y^2(3z^2 + 48z + 13) - 122z^4 + 1104z^3 + 2084z^2 + 672z - 26)}{18z^2(z+1)((z-1)^2 - y^2)(-y^2(5z+3) + 9z^3 + 9z^2 + 11z + 3)} \right], \quad (96)$$

$$V^{\chi_{c1}}(q^2)|_{RC'1} = V^{\chi_{c1}}(q^2)|_{LO} \frac{|\mathbf{k}'|^2}{m_b^2} \left[\frac{y^4(9z+3) - 227z^5 + 447z^4 + 1058z^3 + 1422z^2 + 497z + 3}{6z^2(y-z+1)(y+z-1)(y^2(7z+5) - 11z^3 - 15z^2 - 17z - 5)} \right. \\ \left. + \frac{y^2(45z^3 - 261z^2 - 253z - 3)}{3z^2(y-z+1)(y+z-1)(y^2(7z+5) - 11z^3 - 15z^2 - 17z - 5)} \right], \quad (97)$$

$$A_0^{\chi_{c1}}(q^2)|_{RC'1} = A_0^{\chi_{c1}}(q^2)|_{LO} \frac{|\mathbf{k}'|^2}{m_b^2} \frac{y^2(6z^2 - 15z - 1) - 74z^4 + 75z^3 + 33z^2 - 35z + 1}{6(z-1)z^2(z+1)((z-1)^2 - y^2)}, \quad (98)$$

$$A_1^{\chi_{c1}}(q^2)|_{RC'1} = A_1^{\chi_{c1}}(q^2)|_{LO} \frac{|\mathbf{k}'|^2}{m_b^2} \left[\frac{-y^4(z-3) - 449z^5 + 1183z^4 + 2678z^3 + 2494z^2 + 491z + 3}{6z^2((z-1)^2 - y^2)(-y^2(9z+5) + 25z^3 + 35z^2 + 31z + 5)} \right. \\ \left. - \frac{y^2(15z^3 + 385z^2 + 245z + 3)}{3z^2((z-1)^2 - y^2)(-y^2(9z+5) + 25z^3 + 35z^2 + 31z + 5)} \right], \quad (99)$$

$$A_2^{\chi_{c1}}(q^2)|_{RC'1} = A_2^{\chi_{c1}}(q^2)|_{LO} \frac{|\mathbf{k}'|^2}{m_b^2} \left[-\frac{y^4(39z+3) + 347z^5 - 1057z^4 - 34z^3 + 254z^2 + 487z + 3}{6z^2((z-1)^2 - y^2)(y^2(z+5) + 11z^3 - 3z^2 - 3z - 5)} \right. \\ \left. - \frac{y^2(63z^3 + 75z^2 - 263z - 3)}{3z^2((z-1)^2 - y^2)(y^2(z+5) + 11z^3 - 3z^2 - 3z - 5)} \right]. \quad (100)$$

$$V^{\chi_{c2}}(q^2)|_{RC'1} = V^{\chi_{c2}}(q^2)|_{LO} \frac{|\mathbf{k}'|^2}{m_b^2} \frac{4(y^2(3z+2) + 13z^3 - 21z^2 - 40z - 2)}{9z^2(z+1)(y-z+1)(y+z-1)}, \quad (101)$$

$$A_0^{\chi_{c2}}(q^2)|_{RC'1} = A_0^{\chi_{c2}}(q^2)|_{LO} \frac{|\mathbf{k}'|^2 - (y^2(15z^2 + 21z + 16) + 49z^4 - 27z^3 - 253z^2 - 153z - 16)}{m_b^2 9z^2(z+1)^2((z-1)^2 - y^2)}, \quad (102)$$

$$A_1^{\chi_{c2}}(q^2)|_{RC'1} = A_1^{\chi_{c2}}(q^2)|_{LO} \frac{|\mathbf{k}'|^2}{m_b^2} \left[\frac{4(y^4(3z+2) + 2(-8z^5 + 16z^4 + 67z^3 + 99z^2 + 25z + 1))}{3z^2((z-1)^2 - y^2)(-y^2(5z+3) + 9z^3 + 17z^2 + 19z + 3)} - \frac{4y^2(3z^3 + 64z^2 + 53z + 4)}{3z^2((z-1)^2 - y^2)(-y^2(5z+3) + 9z^3 + 17z^2 + 19z + 3)} \right], \quad (103)$$

$$A_2^{\chi_{c2}}(q^2)|_{RC'1} = A_2^{\chi_{c2}}(q^2)|_{LO} \frac{|\mathbf{k}'|^2 - 4(y^2(z+2) + 11z^3 + 9z^2 - 30z - 2)}{m_b^2 3z^2(z+3)((z-1)^2 - y^2)}. \quad (104)$$

C. The corrections from the masses of B_c meson and P -wave charmonium

Through the transformation formulae in Eqs. (66-71), one can easily get the relativistic corrections from the B_c meson and P -wave charmonium masses. The relativistic corrections of the h_c and χ_{c1} form factors from the B_c meson mass are

$$V^H(q^2)|_{RC2} = \frac{z+1}{2z(3z+1)} \frac{|\mathbf{k}|^2}{m_b^2} V^H(q^2)|_{LO}, \quad (105)$$

$$A_0^H(q^2)|_{RC2} = -\frac{(z+1)^2}{4z^2(3z+1)} \frac{|\mathbf{k}|^2}{m_b^2} A_2^H(q^2)|_{LO}, \quad (106)$$

$$A_1^H(q^2)|_{RC2} = -\frac{z+1}{2z(3z+1)} \frac{|\mathbf{k}|^2}{m_b^2} A_1^H(q^2)|_{LO}, \quad (107)$$

$$A_2^H(q^2)|_{RC2} = \frac{z+1}{2z(3z+1)} \frac{|\mathbf{k}|^2}{m_b^2} A_2^H(q^2)|_{LO}, \quad (108)$$

here H only denotes h_c or χ_{c1} .

The relativistic corrections of the χ_{c2} form factors from the B_c meson mass are

$$V^{\chi_{c2}}(q^2)|_{RC2} = \frac{-1}{(z+1)(3z+1)} \frac{|\mathbf{k}|^2}{m_b^2} V^{\chi_{c2}}|_{LO}, \quad (109)$$

$$A_0^{\chi_{c2}}(q^2)|_{RC2} = \frac{-(5z^2 + 2z + 1)}{8z^2(z+1)(3z+1)} \frac{|\mathbf{k}|^2}{m_b^2} A_2^{\chi_{c2}}|_{LO}, \quad (110)$$

$$A_1^{\chi_{c2}}(q^2)|_{RC2} = \frac{-(2z+1)}{z(z+1)(3z+1)} \frac{|\mathbf{k}|^2}{m_b^2} A_1^{\chi_{c2}}|_{LO}, \quad (111)$$

$$A_2^{\chi_{c2}}(q^2)|_{RC2} = \frac{-1}{(z+1)(3z+1)} \frac{|\mathbf{k}|^2}{m_b^2} A_2^{\chi_{c2}}|_{LO}. \quad (112)$$

The relativistic corrections of the χ_{c0} form factors from the B_c meson mass are

$$f_0^{\chi_{c0}}(q^2)|_{RC2} = \frac{(z+1)^2}{(z-1)z(3z+1)} \frac{|\mathbf{k}|^2}{m_b^2} \times (f_0^{\chi_{c0}}(q^2)|_{LO} - f_+^{\chi_{c0}}(q^2)|_{LO}), \quad (113)$$

$$f_+^{\chi_{c0}}(q^2)|_{RC2} = 0. \quad (114)$$

The relativistic corrections of the P -wave charmonium form factors from the P -wave charmonium mass are

$$V^H(q^2)|_{RC'2} = \frac{1}{z(3z+1)} \frac{|\mathbf{k}'|^2}{m_b^2} V^H(q^2)|_{LO}, \quad (115)$$

$$A_1^H(q^2)|_{RC'2} = -\frac{1}{z(3z+1)} \frac{|\mathbf{k}'|^2}{m_b^2} A_1^H(q^2)|_{LO}, \quad (116)$$

$$A_2^H(q^2)|_{RC'2} = \frac{1}{z(3z+1)} \frac{|\mathbf{k}'|^2}{m_b^2} A_2^H(q^2)|_{LO}, \quad (117)$$

here H only denotes h_c , χ_{c1} or χ_{c2} , and

$$A_0^H(q^2)|_{RC'2} = \frac{|\mathbf{k}'|^2}{m_b^2} \left[\frac{(5z^2 + 2z + 1)}{2(z-1)z^2(3z+1)} A_0^H(q^2)|_{LO} + \frac{(3z+1)A_1^H(q^2)|_{LO} + (z-1)A_2^H(q^2)|_{LO}}{-3z^3 + 2z^2 + z} \right]. \quad (118)$$

For χ_{c0} , we have

$$f_0^{\chi_{c0}}(q^2)|_{RC'2} = -\frac{4}{(z-1)(3z+1)} \frac{|\mathbf{k}'|^2}{m_b^2} \times (f_0^{\chi_{c0}}(q^2)|_{LO} - f_+^{\chi_{c0}}(q^2)|_{LO}), \quad (119)$$

$$f_+^{\chi_{c0}}(q^2)|_{RC'2} = 0. \quad (120)$$

D. The heavy bottom quark limit

Since $z = m_c/m_b \approx 0.3$ is small, it is convenient to study the form factor in the heavy bottom quark limit. In the heavy bottom quark limit $m_b \rightarrow \infty$ and $z = m_c/m_b \rightarrow 0$, one can obtain the relations among form factors. In this limit, the form factors at the maxi-

TABLE I: The form factors of the B_c meson into P -wave charmonium at $q^2 = 0$ in different approaches. In NRQCD approach, the scale is set at the heavy quark mass m_b , and we adopt $m_b = (4.7 \pm 0.1)\text{GeV}$ and $m_c = (1.5 \pm 0.1)\text{GeV}$. The first column uncertainty is from the choice of m_b , while the second column uncertainty is from the choice of m_c .

mum recoil point with $q^2 = 0$ become

$$V^{h_c}(0)|_{LO}^{m_b \rightarrow \infty} = \frac{8\sqrt{2}\pi C_F \alpha_s \psi(0)_{B_c} \psi'(0)_{h_c}}{z^{5/2} m_b^4}, \quad (121)$$

$$V^{\chi_{c1}}(0)|_{LO}^{m_b \rightarrow \infty} = \frac{40\pi C_F \alpha_s \psi(0)_{B_c} \psi'(0)_{\chi_{c1}}}{z^{5/2} m_b^4}, \quad (122)$$

$$V^{\chi_{c2}}(0)|_{LO}^{m_b \rightarrow \infty} = \frac{96\sqrt{2}\pi C_F \alpha_s \psi(0)_{B_c} \psi'(0)_{\chi_{c2}}}{z^{3/2} m_b^4}, \quad (123)$$

$$A_2^H(0)|_{LO}^{m_b \rightarrow \infty} = A_1^H(0)|_{LO}^{m_b \rightarrow \infty} = V^H(0)|_{LO}^{m_b \rightarrow \infty}, \quad (124)$$

where H denotes one of the charmonia h_c , χ_{c1} and χ_{c2} . From the above formulae, the form factors are not independent in the heavy quark limit and their relations become simple.

The form factors of χ_{c0} at the maximum recoil point in the heavy bottom quark limit become

$$f_+^{\chi_{c0}}(0)|_{LO}^{m_b \rightarrow \infty} = \frac{24\sqrt{6}\pi C_F \alpha_s \psi(0)_{B_c} \psi'(0)_{\chi_{c0}}}{z^{5/2} m_b^4}, \quad (125)$$

$$f_0^{\chi_{c0}}(0) = f_+^{\chi_{c0}}(0), \quad (126)$$

where the last formulae is valid for all orders.

The relativistic corrections bring about the similar relations, which are in consistent with the predictions of the heavy quark effect theory [43] and the large energy effective theory [44]. In the heavy quark limit, the form factors can be expressed by several simple parameters. Some form factors become identical. The form factors considering the relativistic corrections become

$$V^{h_c}(0)|_{RC1}^{m_b \rightarrow \infty} = -\frac{1}{8} \frac{|\mathbf{k}|^2}{z^2 m_b^2} V^{h_c}(0)|_{LO}^{m_b \rightarrow \infty}, \quad (127)$$

$$V^{\chi_{c1}}(0)|_{RC1}^{m_b \rightarrow \infty} = -\frac{13}{40} \frac{|\mathbf{k}|^2}{z^2 m_b^2} V^{\chi_{c1}}(0)|_{LO}^{m_b \rightarrow \infty}, \quad (128)$$

$$V^{\chi_{c2}}(0)|_{RC1}^{m_b \rightarrow \infty} = -\frac{17}{72} \frac{|\mathbf{k}|^2}{z^2 m_b^2} V^{\chi_{c2}}(0)|_{LO}^{m_b \rightarrow \infty}, \quad (129)$$

$$f_+^{\chi_{c0}}(0)|_{RC1}^{m_b \rightarrow \infty} = \frac{25}{216} \frac{|\mathbf{k}|^2}{z^2 m_b^2} f_+^{\chi_{c0}}(0)|_{LO}^{m_b \rightarrow \infty}, \quad (130)$$

and

$$V^{h_c}(0)|_{RC'1}^{m_b \rightarrow \infty} = -\frac{2}{3} \frac{|\mathbf{k}'|^2}{z^2 m_b^2} V^{h_c}(0)|_{LO}^{m_b \rightarrow \infty}, \quad (131)$$

$$V^{\chi_{c1}}(0)|_{RC'1}^{m_b \rightarrow \infty} = \frac{1}{10} \frac{|\mathbf{k}'|^2}{z^2 m_b^2} V^{\chi_{c1}}(0)|_{LO}^{m_b \rightarrow \infty}, \quad (132)$$

$$V^{\chi_{c2}}(0)|_{RC'1}^{m_b \rightarrow \infty} = \frac{8}{9} \frac{|\mathbf{k}'|^2}{z^2 m_b^2} V^{\chi_{c2}}(0)|_{LO}^{m_b \rightarrow \infty}, \quad (133)$$

$$f_+^{\chi_{c0}}(0)|_{RC'1}^{m_b \rightarrow \infty} = \frac{104}{3\sqrt{3}} \frac{|\mathbf{k}'|^2}{z^2 m_b^2} f_+^{\chi_{c0}}(0)|_{LO}^{m_b \rightarrow \infty}, \quad (134)$$

$$A_2^H(0)|_{RC^{(\prime)1}}^{m_b \rightarrow \infty} = A_1^H(0)|_{RC^{(\prime)1}}^{m_b \rightarrow \infty} = V^H(0)|_{RC^{(\prime)1}}^{m_b \rightarrow \infty}, \quad (135)$$

IV. PHENOMENOLOGICAL DISCUSSIONS

We obtained the relativistic corrections to the form factors of B_c into P -wave charmonium in the last section. Before employing the form factors, we first summarize and give the values of the form factors at the maximum recoil point. And then we will employ the form factors

into the exclusive two-body decays $B_c \rightarrow h_c + \pi$, $B_c \rightarrow h_c + K$, $B_c \rightarrow \chi_{cJ} + \pi$, and $B_c \rightarrow \chi_{cJ} + K$.

The values of the related parameters are adopted as follows [45]

$$\begin{aligned} m_{B_c} &= 6.276 \text{ GeV}, \quad m_{h_c} = 3.525 \text{ GeV}, \\ m_{\chi_{c0}} &= 3.415 \text{ GeV}, \quad m_{\chi_{c1}} = 3.511 \text{ GeV}, \\ m_{\chi_{c2}} &= 3.556 \text{ GeV}, \quad G_F = 1.16637 \times 10^{-5} \text{ GeV}^{-2}. \end{aligned}$$

The strong coupling constant is set at the Z-boson point with $\alpha_s(m_Z) = 0.1185$ where $m_Z = 91.1876 \text{ GeV}$ [45], so one can run the coupling to other scales. In the paper, we will set the scale to the bottom quark mass, and we have $\alpha_s(m_b = 4.7 \text{ GeV}) = 0.218$ at two-loop evolution with active flavor $n_f = 5$. The Cabibbo-Kobayashi-Maskawa matrix-elements are set as $|V_{ud}| = 0.974$, $|V_{cb}| = (40.5 \pm 1.5) \times 10^{-3}$ and $|V_{us}| = 0.2248$ [45]. The decay constants of the light mesons are set as $f_\pi = 130.4 \text{ MeV}$ and $f_K = 156.1 \text{ MeV}$.

The heavy quark mass is adopted as $m_c = 1.5 \pm 0.1 \text{ GeV}$ [46, 47] and $m_b = 4.7 \pm 0.1 \text{ GeV}$ [48]. This choice of the heavy quark masses is from the nonrelativistic approximation, since the heavy quark relativistic velocity is small in the heavy quarkonium. For the ground state of the B_c family, we have $m_{B_c} = \sqrt{m_c^2 - k^2} + \sqrt{m_b^2 - k^2} \simeq m_c + m_b + \frac{k^2}{2m_c} + \frac{k^2}{2m_b}$. For heavy quarkonium, we have $m_H = 2\sqrt{m_Q^2 - k'^2} \simeq 2m_Q + \frac{k'^2}{2m_Q}$.

To evaluate the contributions from the relativistic correction operators, one should estimate the magnitude of the quark relative momentum in the B_c meson and P -wave charmonium. Employing $\mathbf{k} = m_{red} \mathbf{v}$, we have $|\mathbf{k}|^2 = m_{red}^2 |\mathbf{v}|^2 = m_b^2 m_c^2 |\mathbf{v}|^2 / (m_b + m_c)^2$. The reduced quark relative velocity squared in the B_c meson is adopted as $|\mathbf{v}|^2 \simeq 0.186$ in Ref. [32]. Employing $\mathbf{k}' = m_c \mathbf{v}' / 2$, we have $|\mathbf{k}'|^2 = m_c^2 |\mathbf{v}'|^2 / 4$. The charm quark relative velocity squared in the P -wave charmonium is adopted as $|\mathbf{v}'|^2 \simeq 0.2$.

The wave functions at the origin of heavy quarkonium and the B_c meson have been evaluated in the QCD-motivated Buchmuller-Tye potential [49, 50]

$$\psi(0)_{B_c} = \frac{1}{\sqrt{4\pi}} R(0)_{B_c} = 0.3615, \quad (136)$$

$$\psi'(0)_{h_c} = \frac{\sqrt{3}}{\sqrt{4\pi}} R'(0)_{h_c} = 0.1338, \quad (137)$$

$$\psi'(0)_{\chi_{cJ}} = \frac{\sqrt{3}}{\sqrt{4\pi}} R'(0)_{\chi_{cJ}} = 0.1338. \quad (138)$$

Inputting the values of the related parameters in the form factors, we obtained the LO and relativistic correction values of the form factors at the maximum recoil point with $q^2 = 0$, which have been given in Tab. I. Comparing to the predictions of the form factors in LFQM and QCD SR, the NRQCD results are consistent with

FIG. 2: Typical Feynman diagrams for the B_c meson decays into P -wave charmonium and a light meson.

LFQM results plus an additional enhancement factor. Extrapolating the form factors to the minimum momentum recoil region where the strong interaction among gluons and quarks becomes nonperturbative, the pole model are generally adopted in many literatures [12, 20, 32]. Let us denote anyone of the form factors as $F^H(q^2)$. Thus the q^2 distribution of the form factor can be parametrized as

$$F^H(q^2) = \frac{F^H(0)}{1 - \frac{q^2}{m_{\text{pole}}^2} - \beta \frac{q^4}{m_{\text{pole}}^4}}, \quad (139)$$

where the effective pole mass m_{pole} is usually set to the value between the heavy quark mass and the initial hadron mass. The free parameter β is usually dependent on the certain transition channel.

Through the study of $B_c^+ \rightarrow K^+ K^- \pi^+$ using a dataset of integrated luminosities of 3 fb^{-1} at centre-of-mass energies of 7 TeV and 8 TeV, the LHCb Collaboration have observed the evidence of the decay $B_c^+ \rightarrow \chi_{c0} \pi^+$ for the first time. It is also the first time to observe the B_c decays to P -wave charmonium in experiment. The data give $\frac{\sigma(B_c^+)}{\sigma(B^+)} \times \mathcal{B}(B_c^+ \rightarrow \chi_{c0} \pi^+) = (9.8_{-3.0}^{+3.4}(\text{stat}) \pm 0.8(\text{syst})) \times 10^{-6}$ with a significance of 4.0 standard deviations.

In the following, we will employ the form factors into the exclusive B_c two-body decays into a P -wave charmonium and a light meson such as π and K . In weak effective theory, the decay amplitudes of $B_c^+ \rightarrow h_c(\chi_{c1}) + \pi^+$ can be factorized as [30]

$$\begin{aligned}
\mathcal{M}(B_c^+ \rightarrow h_c(\chi_{c1}) + \pi^+) &= \sum_i \frac{G_F}{\sqrt{2}} V_{cb}^* V_{ud} C_i(\mu) \langle h_c(\chi_{c1}) + \pi^+ | \mathcal{O}_i | B_c^+ \rangle \\
&= \frac{G_F}{\sqrt{2}} V_{cb}^* V_{ud} [C_0(\mu) \langle h_c(\chi_{c1}) + \pi^+ | \mathcal{O}_0 | B_c^+ \rangle + C_8(\mu) \langle h_c(\chi_{c1}) + \pi^+ | \mathcal{O}_8 | B_c^+ \rangle] \\
&= \frac{G_F}{\sqrt{2}} V_{cb}^* V_{ud} (C_0(\mu) \langle h_c(\chi_{c1}) | \bar{b} \gamma^\mu (1 - \gamma_5) c | B_c^+ \rangle \langle \pi^+ | \bar{u} \gamma_\mu (1 - \gamma_5) d | 0 \rangle \\
&\quad + C_8(\mu) \langle h_c(\chi_{c1}) + \pi^+ | \mathcal{O}_8 | B_c^+ \rangle), \tag{140}
\end{aligned}$$

where $\mathcal{O}_0$ is the color-singlet weak effective four-fermion operator, and $\mathcal{O}_8$ is the color-octet weak effective four-fermion operator. $C_i(\mu)$ is the corresponding Wilson coefficients. In contrast to the conventional four-fermion operators $\mathcal{O}_{1,2}(\mu)$, this operator basis is very convenient in the calculation.

$$\begin{aligned}
\mathcal{O}_0 &= \bar{d}_\alpha \gamma^\mu (1 - \gamma_5) u_\alpha \bar{c}_\beta \gamma_\mu (1 - \gamma_5) b_\beta, \tag{141} \\
\mathcal{O}_8 &= \bar{d}_\alpha T_{\alpha\beta}^A \gamma^\mu (1 - \gamma_5) u_\beta \bar{c}_\rho T_{\rho\lambda}^A \gamma_\mu (1 - \gamma_5) b_\lambda. \tag{142}
\end{aligned}$$

Using the Fierz rearrangement relation

$$T_{\alpha\beta}^A T_{\rho\lambda}^A = -\frac{1}{6} \delta_{\alpha\beta} \delta_{\rho\lambda} + \frac{1}{2} \delta_{\alpha\lambda} \delta_{\rho\beta}, \tag{143}$$

The relations among the operators $\mathcal{O}_{0,8}(\mu)$ and $\mathcal{O}_{1,2}(\mu)$ can be obtained by

$$\mathcal{O}_0 = \mathcal{O}_1, \quad \mathcal{O}_8 = -\frac{1}{6} \mathcal{O}_1 + \frac{1}{2} \mathcal{O}_2. \tag{144}$$

Consequently, for the Wilson coefficients, we have

$$C_0 = C_1 + C_2/3, \quad C_8 = 2C_2, \tag{145}$$

where the explicit expression can be found in Ref. [30].

In Fig. 2, the color-singlet operator contributes to the sub-figure (a) while the color-octet operator contributes to the sub-figure (b). Here we ignored the light meson mass for simplification. Through the numerical calculations, the color-octet operator contribution at leading order is small, which is around 5% of the color-singlet operator contribution. The color-singlet operator contributions dominate the decay amplitudes, which correspond to the factorizable diagrams. The color-singlet operator matrix element of $B_c^+ \rightarrow h_c(\chi_{c1}) + \pi^+$ is

$$\begin{aligned}
&\langle h_c(\chi_{c1}) + \pi^+ | \mathcal{O}_0 | B_c^+ \rangle \\
&= 2f_\pi A_0^{h_c(\chi_{c1})}(0) m_{h_c(\chi_{c1})} \varepsilon_{h_c(\chi_{c1})}^* \cdot q \\
&= f_\pi A_0^{h_c(\chi_{c1})}(0) (m_{B_c}^2 - m_{h_c(\chi_{c1})}^2), \tag{146}
\end{aligned}$$

Similarly, the color-singlet operator matrix element of $B_c^+ \rightarrow \chi_{c0} + \pi^+$ can be written as

$$\langle \chi_{c0} + \pi^+ | \mathcal{O}_0 | B_c^+ \rangle = f_\pi f_0^{\chi_{c0}}(0) (m_{B_c}^2 - m_{\chi_{c0}}^2). \tag{147}$$

And, the color-singlet operator matrix element of $B_c^+ \rightarrow \chi_{c2} + \pi^+$ is

$$\begin{aligned}
&\langle \chi_{c2} + \pi^+ | \mathcal{O}_0 | B_c^+ \rangle \\
&\approx \frac{2}{m_{B_c}} f_\pi A_0^{\chi_{c2}}(0) m_{\chi_{c2}} \varepsilon_{\chi_{c2}}^{*\alpha\beta} P_\alpha P_\beta \\
&= f_\pi A_0^{\chi_{c2}}(0) \frac{(m_{B_c}^2 - m_{\chi_{c2}}^2)^2}{2m_{\chi_{c2}} m_{B_c}}. \tag{148}
\end{aligned}$$

The decay width can be written as

$$\Gamma(B_c \rightarrow H + \pi) = \frac{|\mathbf{p}|}{8\pi m_{B_c}^2} |\mathcal{M}(B_c \rightarrow H + \pi)|^2, \tag{149}$$

with the final charmonium momentum $|\mathbf{p}| = (m_{B_c}^2 - m_H^2)/(2m_{B_c})$ in the B_c meson rest frame.

Using the above results of the form factors, we can easily evaluate the branching ratios of the exclusive two-body decays $B_c \rightarrow h_c + \pi$, $B_c \rightarrow h_c + K$, $B_c \rightarrow \chi_{cJ} + \pi$, and $B_c \rightarrow \chi_{cJ} + K$. The branching ratios are given in Tab. II. Compared with the results of LFQM and QCD SR, our results of the branching ratios are larger. From the table, one can easily get the branching ratio of $\mathcal{B}(B_c^\pm \rightarrow \chi_{c0} + \pi^\pm) = (6.47_{-1.26}^{+1.75+0.64}) \times 10^{-3}$. Using the data $\frac{\sigma(B_c^+)}{\sigma(B^+)} \times \mathcal{B}(B_c^+ \rightarrow \chi_{c0} \pi^+) = (9.8_{-3.0}^{+3.4}(\text{stat}) \pm 0.8(\text{syst})) \times 10^{-6}$ observed by the LHCb Collaboration, the cross section ratio $\frac{\sigma(B_c^+)}{\sigma(B^+)}$ can be extracted around $(1.1 - 2.0) \times 10^{-3}$, which is also useful to study the total cross section of B_c meson at LHC [51]. Considering the current experiment environment and the possible decay events, the channels $B_c^\pm \rightarrow \chi_{c0} + K^\pm$ and $B_c^\pm \rightarrow h_c + \pi^\pm$ have the potential to be reconstructed in addition to $B_c^\pm \rightarrow \chi_{c0} + \pi^\pm$.

V. CONCLUSION

We obtained the relativistic corrections to the form factors of B_c into P -wave charmonium at the $\mathcal{O}(|\mathbf{k}|^2)$ and $\mathcal{O}(|\mathbf{k}'|^2)$ level, where k is a half of reduced heavy quark relative momentum inside the B_c meson and k' is a half of quark relative momentum inside the P -wave charmonium. The heavy quark relative momenta are small

TABLE II: The exclusive two-body decays of the B_c meson into P -wave charmonium and a light meson. The form factors in Tab. I are employed, the lifetime of the B_c meson is $0.507 \times 10^{-12} s$ [45]. In NRQCD approach, the relativistic corrections are included in the form factors. The scale is set at the heavy quark mass m_b , and we adopt $m_b = (4.7 \pm 0.1) \text{ GeV}$ and $m_c = (1.5 \pm 0.1) \text{ GeV}$. The first column uncertainty is from the choice of m_b , while the second column uncertainty is from the choice of m_c .

Branching ratios (10^{-3})	NRQCD LO+RC	LFQM [21]	QCD SR [13]
$\mathcal{B}(B_c^\pm \rightarrow h_c + \pi^\pm)$	$9.73^{+2.75+1.43}_{-2.00-0.90}$	0.90	0.002
$\mathcal{B}(B_c^\pm \rightarrow \chi_{c0} + \pi^\pm)$	$6.47^{+1.75+0.64}_{-1.26-0.38}$	0.53	1.07
$10^2 \times \mathcal{B}(B_c^\pm \rightarrow \chi_{c1} + \pi^\pm)$	$6.38^{+0.77+0.77}_{-1.41-0.72}$	4	0.2
$\mathcal{B}(B_c^\pm \rightarrow \chi_{c2} + \pi^\pm)$	$4.37^{+1.58+1.58}_{-1.09-1.06}$	0.57	
$10 \times \mathcal{B}(B_c^\pm \rightarrow h_c + K^\pm)$	$7.42^{+0.21+0.10}_{-0.15-0.06}$	0.7	0.002
$10 \times \mathcal{B}(B_c^\pm \rightarrow \chi_{c0} + K^\pm)$	$4.94^{+1.33+0.49}_{-0.96-0.29}$	0.4	0.8
$10^3 \times \mathcal{B}(B_c^\pm \rightarrow \chi_{c1} + K^\pm)$	$4.87^{+0.59+0.59}_{-1.07-0.55}$	3	0.2
$10 \times \mathcal{B}(B_c^\pm \rightarrow \chi_{c2} + K^\pm)$	$3.33^{+1.23+1.21}_{-0.83-0.81}$	0.4	

quantities compared with the heavy quark mass. The analytic expressions of the form factors are given in the paper, and we have studied the asymptotic behaviour of the form factors in the heavy bottom quark limit, i.e., $m_b \rightarrow \infty$. In this limit, the form factors are not independent and some of them become identical, which reduces the degree of freedom of the form factors.

The values of the form factors in the maximum momentum recoil point with $q^2 = 0$ are also given. In the weak effective theory, we obtained the decay amplitudes for the decay channels $B_c \rightarrow h_c + \pi$, $B_c \rightarrow h_c + K$, $B_c \rightarrow \chi_{cJ} + \pi$, and $B_c \rightarrow \chi_{cJ} + K$, where the factorizable diagrams dominate the contribution in the heavy bottom quark limit. Our results are consistent with the experimental observation. Using the LHCb data $\frac{\sigma(B_c^+)}{\sigma(B^+)} \times \mathcal{B}(B_c^+ \rightarrow \chi_{c0} \pi^+) =$

$(9.8^{+3.4}_{-3.0}(\text{stat}) \pm 0.8(\text{syst})) \times 10^{-6}$, the cross section ratio $\frac{\sigma(B_c^+)}{\sigma(B^+)}$ can be extracted around $(1.1 - 2.0) \times 10^{-3}$ at $\sqrt{s} = 7 - 8 \text{ TeV}$. The predictions of the branching ratios of the exclusive two-body B_c decays into P -wave charmonium and a light meson can be tested by future LHCb experiments.
