ULTRAFILTER EXTENSIONS DO NOT PRESERVE ELEMENTARY EQUIVALENCE

DENIS I. SAVELIEV, SAHARON SHELAH

ABSTRACT. We show that there exist models $M_1$ and $M_2$ such that $M_1$ elementarily embeds into $M_2$ but their ultrafilter extensions $\beta(M_1)$ and $\beta(M_2)$ are not elementarily equivalent.

1. Introduction

The ultrafilter extension of a first-order model is a model in the same vocabulary, the universe of which consists of all ultrafilters on the universe of the original model, and which extends the latter in a canonical way. This construction was introduced in [1]. The article [2] is an expanded version of [1]; it contains a list of problems, one of which is solved here.

The main precursor of the general construction was the ultrafilter extension of semigroups, called often the Čech–Stone compactification of semigroups. This particular case was discovered in 1970s and became since then an important tool for getting various Ramsey-theoretic results in combinatorics, algebra, and dynamics; the textbook [3] is a comprehensive treatise of this area. For theory of ultrafilters and for model theory we refer the reader to the standard textbooks [4] and [5], respectively.

Recall the construction of ultrafilter extensions and related basic facts.

Definition 1. For a set $M$, an ultrafilter $D$ on $M$, and a formula $\varphi(x,\ldots)$ with parameters $x,\ldots$, we let

$$(\forall^D x) \varphi(x,\ldots) \text{ if and only if } \{a \in M : \varphi(a,\ldots)\} \in D.$$ 

It is easy to see that the ultrafilter quantifier is self-dual: it coincides with $(\exists^D x)$, defined as $\neg(\forall^D x) \neg$, since $D$ is ultra. Note also that if $D$ is the principal ultrafilter given by some $a \in M$, then $(\forall^D x) \varphi(x,\ldots)$ is reduced to $\varphi(a,\ldots)$, and that, e.g., $(\forall^{D_1} x_1)(\forall^{D_2} x_2) \varphi(x_1,x_2,\ldots)$ means $\{a_1 \in M : \{a_2 \in M : \varphi(a_1,a_2,\ldots)\} \in D_2\} \in D_1$.

Paper 1132 on Shelah’s list.
Definition 2. Let $\mathcal{M}$ be a model in a vocabulary $\tau$ with the universe $M$. Define the model $\beta(\mathcal{M})$ and the function $j_M$ as follows:

(a) the universe of $\beta(\mathcal{M})$ is $\beta(M)$, the set of ultrafilters on $M$,
(b) $j_M : M \to \beta(M)$ is such that for all $a \in M$, $j_M(a)$ is the principal ultrafilter on $M$ given by $a$, i.e., $j_M(a) = \{A \subseteq M : a \in A\}$,
(c) if $P \in \tau$ is an $n$-ary predicate symbol (other than the equality symbol), let

$$P^{\beta(\mathcal{M})} = \{(D_1, \ldots, D_n) : (\forall D_1 x_1) \ldots (\forall D_n x_n) P^\mathcal{M}(x_1, \ldots, x_n)\},$$

(d) if $F \in \tau$ is an $n$-ary function symbol, let

$$F^{\beta(\mathcal{M})}(D_1, \ldots, D_n) = D \text{ if and only if } (\forall A \subseteq M) (A \in D \iff (\forall D_1 x_1) \ldots (\forall D_n x_n) F^\mathcal{M}(x_1, \ldots, x_n) \in A).$$

The model $\beta(\mathcal{M})$ is the ultrafilter extension of the model $\mathcal{M}$, and $j_M$ is the natural embedding of $\mathcal{M}$ into $\beta(\mathcal{M})$.

The using of words “extension” and “embedding” is easily justified:

Proposition 1. If $\mathcal{M}$ is a model in a vocabulary $\tau$, then

(a) $\beta(\mathcal{M})$ is also a model in $\tau$, and
(b) $j_M$ isomorphically embeds $\mathcal{M}$ into $\beta(\mathcal{M})$.

Proof. See [1], [2]. □

The following result, called the First Extension Theorem in [2], shows that the ultrafilter extension lifts certain relationships between models.

Theorem 1. Let $\mathcal{M}_1$ and $\mathcal{M}_2$ be two models in the same vocabulary with the universes $M_1$ and $M_2$, respectively, and let $h$ be a mapping of $M_1$ into $M_2$ and $\tilde{h}$ its (unique) continuous extension of $\beta(\mathcal{M}_1)$ into $\beta(\mathcal{M}_2)$:

$$\beta(\mathcal{M}_1) \xrightarrow{\tilde{h}} \beta(\mathcal{M}_2)$$

$$\begin{array}{ccc}
\mathcal{M}_1 & \xrightarrow{j_{\mathcal{M}_1}} & \beta(\mathcal{M}_1) \\
\downarrow h & & \Downarrow j_{\mathcal{M}_2} \\
\mathcal{M}_2 & \xrightarrow{j_{\mathcal{M}_2}} & \beta(\mathcal{M}_2)
\end{array}$$

If $h$ is a homomorphism (epimorphism, isomorphic embedding) of $\mathcal{M}_1$ into $\mathcal{M}_2$, then $\tilde{h}$ is a homomorphism (epimorphism, isomorphic embedding) of $\beta(\mathcal{M}_1)$ into $\beta(\mathcal{M}_2)$.

Proof. See [1], [2]. □

Actually Theorem [1] is a special case of a stronger result, called the Second Extension Theorem in [2]. Here we omit its precise formulation, which involves topological concepts, and note only that it generalizes the standard topological fact stating that the Čech–Stone compactification is the largest one, to the case when the underlying discrete space $M$ carries
an arbitrary first-order structure. This confirms that the construction of ultrafilter extensions given in Definition 2 is canonical in a certain sense.

Theorem 1 holds also for certain other relationships between models (e.g., for so-called homotopies and isotopies, see [1], [2]). A natural task is a characterization of such relationships. In particular, one can ask whether elementary embeddings or elementary equivalence lift under ultrafilter extensions. This task was posed in [2] (see Problem 5.1 there and comments before it).

In this note, we answer this particular question in the negative. In fact, we establish a slightly stronger result:

**Theorem 2 (the Main Theorem).** There exist models $M_1$ and $M_2$ in the same vocabulary such that $M_1$ elementarily embeds into $M_2$ but their ultrafilter extensions $\beta(M_1)$ and $\beta(M_2)$ are not elementarily equivalent:

$$\beta(M_1) \not\equiv \beta(M_2)$$

$$j_{M_1} \quad \not\equiv \quad j_{M_2}$$

$$M_1 \quad \not\equiv \quad M_2$$

Of course, it follows that neither elementary embeddings nor elementary equivalence are preserved under ultrafilter extensions. The construction of such models $M_1$ and $M_2$ will be provided in the next section.

We conclude this section with the following natural questions on possible general results in this direction.

**Problem 1.** Characterize (or at least, provide interesting necessary or sufficient conditions on) theories $T$ such that the implication

$$M_1 \equiv M_2 \Rightarrow \beta(M_1) \equiv \beta(M_2)$$

holds for all $M_1, M_2 \models T$.

**Problem 2.** The same question for elementary embeddings.

2. Proof of the Main Theorem

First we define a vocabulary $\tau$ and construct two specific models $M_1$ and $M_2$ in $\tau$. Then we shall show that these models are as required.

**Definition 3.** Let $\tau$ be the vocabulary consisting of two unary predicate symbols $P_1$ and $P_2$, two binary predicate symbols $R_1$ and $R_2$, and one binary function symbol $F$.

**Definition 4.** Let $M_1$ be a model in $\tau$ having the universe $M_1$ and defined as follows:

(a) $M_1 = N \sqcup \mathcal{P}(N)$, the disjoint sum of $N$ and $\mathcal{P}(N)$ (which we shall identify with their disjoint copies),
(b) $P_1^{M_1} = N$,
(c) $P_2^{M_1} = \mathcal{P}(N)$,
Proposition 2. Assume \( \lambda \geq 2^{\aleph_0} \). Then there exists a model \( \mathcal{M}_2 \) in \( \tau \) such that \( \mathcal{M}_1 \prec \mathcal{M}_2 \) and \( |P_1^{\mathcal{M}_2}| = |P_2^{\mathcal{M}_2}| = \lambda \).

Proof. Let \( \mathcal{M}_3 \) be \( \lambda \)-saturated and \( \mathcal{M}_1 \prec \mathcal{M}_3 \). By the \( \lambda \)-saturatedness, for each \( i \in \{1, 2\} \) we have \( |P_i^{\mathcal{M}_3}| \geq \lambda \), so we can pick \( A_i \subseteq P_i^{\mathcal{M}_3} \) with \( |A_i| = \lambda \).

By the downward Löwenheim–Skolem Theorem, there exists a model \( \mathcal{M}_2 \) with the universe \( M_2 \) such that:

(a) \( \mathcal{M}_2 \prec \mathcal{M}_3 \),
(b) \( M_1 \cup A_1 \cup A_2 \subseteq M_2 \),
(c) \( |M_2| = \lambda \),

whence it follows that \( \mathcal{M}_2 \) is a required model.

Alternatively, we can use a version of the upward Löwenheim–Skolem Theorem by picking two sets of constants, \( C_1 \) and \( C_2 \), with \( |C_1| = |C_2| = \lambda \) and adding to the elementary diagram of \( \mathcal{M}_1 \) the formulas \( P_i(c_i) \) for all \( c_i \in C_i, \ i \in \{1, 2\} \). The obtained theory is consistent (by compactness), so extract its submodel of cardinality \( \lambda \) (by the downward Löwenheim–Skolem Theorem) and reduce it to the required model \( \mathcal{M}_2 \) in the original vocabulary \( \tau \).

Clearly, this observation is of a general character; a similar argument allows to get, for any model, its elementary extension in which all predicate symbols are interpreted by relations of the same cardinality.

To simplify reading, we slightly shorthand the notation for the ultrafilter extensions of the models \( \mathcal{M}_1 \) and \( \mathcal{M}_2 \) as follows:

Definition 5. For \( \ell \in \{1, 2\} \), let

(a) \( \mathcal{N}_\ell = \beta(M_\ell) \),
(b) \( N_\ell = \beta(M_\ell) \),
(c) \( j_{\ell} = j_{M_\ell} \).

It is easy to observe the following:

(a) \( P_1^{N_{\ell}} \) consists of all ultrafilters \( D \) on \( M_\ell \) such that \( P_1^{M_\ell} \in D \) (so for \( \ell = 1 \) this means \( N \in D \)), and \( P_1^{N_{\ell}} \setminus \{ j_{\ell}(n) : n \in P_1^{M_\ell} \} \) consists of all such non-principal ultrafilters,

(b) \( P_2^{N_{\ell}} \) consists of all ultrafilters \( D \) on \( M_\ell \) such that \( P_2^{M_\ell} \in D \) (so for \( \ell = 1 \) this means \( \mathcal{P}(N) \in D \)), and \( P_2^{N_{\ell}} \setminus \{ j_{\ell}(A) : A \in P_2^{M_\ell} \} \) consists of all such non-principal ultrafilters.

Now we are going to construct a specific sentence \( \psi \) which will be satisfied in \( N_1 \) but not in \( N_2 \). First we define two auxiliary formulas \( \varphi_1 \) and \( \varphi_2 \).

**Definition 6.** For \( i \in \{1, 2\} \), let \( \varphi_i(x) \) be the following formula in \( \tau \):

\[
P_i(x) \land \forall y \left( P_i(y) \rightarrow F(x,y) = F(y,x) \right).
\]

Thus \( \varphi_i(x) \) means that \( x \) is in the center in a sense. Actually, only \( \varphi_2 \) will be used to construct \( \psi \).

**Proposition 3.** Assume \( i, \ell \in \{1, 2\} \). For every \( D \in N_\ell \),

\[
N_\ell \models \varphi_i(D) \text{ if and only if } D \in \{ j_{\ell}(a) : a \in P_i^{M_\ell} \}.
\]

**Proof.** This follows from the four lemmas below.

**Lemma 1.** If \( D \notin P_i^{N_\ell} \) then \( N_\ell \models \neg \varphi_i(D) \).

**Proof.** By the first conjunct in \( \varphi_i \). \( \square \)

**Lemma 2.** If \( D_1 \in P_i^{N_\ell} \) and \( D_2 = j_{\ell}(a) \) for some \( a \in P_i^{M_\ell} \), then

\[
N_\ell \models F(D_1, D_2) = F(D_2, D_1).
\]

**Proof.** We must check that \( F^{N_\ell}(D_1, D_2) = F^{N_\ell}(D_2, D_1) \). It suffices to show that, for any \( A \subseteq P_i^{M_\ell} \), the following equivalence holds:

\[
A \in F^{N_\ell}(D_1, D_2) \iff A \in F^{N_\ell}(D_2, D_1).
\]

By Definition 2 we have

\[
A \in F^{N_\ell}(D_1, D_2) \iff (\forall^{D_1} x_1) (\forall^{D_2} x_2) F^{M_\ell}(x_1, x_2) \in A.
\]

But \( D_2 = j_{\ell}(a) \) for an \( a \in P_i^{M_\ell} \), i.e., \( D_2 \) is a principal ultrafilter given by \( a \). Hence \( \forall^{D_2} x_2 \) is reduced by replacing the bounded occurrence of the variable \( x_2 \) with \( a \) (as we have noted after Definition 1), whence we get

\[
A \in F^{N_\ell}(D_1, D_2) \iff (\forall^{D_1} x_1) F^{M_\ell}(x_1, a) \in A.
\]

Similarly we get

\[
A \in F^{N_\ell}(D_2, D_1) \iff (\forall^{D_1} x_1) F^{M_\ell}(a, x_1) \in A.
\]

Since \( a \in P_i^{M_\ell} \), we have \( F^{M_\ell}(a, b) = F^{M_\ell}(b, a) \) for all \( b \in P_i^{M_\ell} \) by Definition 1(f)(a). And since \( P_i^{M_\ell} \subseteq D_1 \), the required equivalence follows. \( \square \)
Lemma 3. If $D_1 \in P_1^{N_1} \setminus \{j_1(n) : n \in P_1^{M_1}\}$, then there exists $D_2 \in P_1^{N_1}$ such that

$$F^{N_1}(D_1, D_2) \neq F^{N_1}(D_2, D_1).$$

Proof. Actually we shall prove a bit stronger assertion: if $D_1, D_2 \in P_1^{N_1} \setminus \{j_1(n) : n \in P_1^{M_1}\}$ are such that $D_1 \neq D_2$, then

$$F^{N_1}(D_1, D_2) \neq F^{N_1}(D_2, D_1).$$

So assume that $D_1, D_2$ are distinct non-principal ultrafilters on $M_1$ such that $N \in D_1 \cap D_2$. By $D_1 \neq D_2$, there is $A_1 \in \mathcal{P}(N)$ such that $A_1 \in D_1$ and $A_2 = N \setminus A_1 \in D_2$. Let

$$B_1 = \{F^{M_1}(n_1, n_2) : n_1 \in A_1 \land n_2 \in A_2 \land (n_1, n_2) \in R_2^{M_1}\},$$

$$B_2 = \{F^{M_1}(n_1, n_2) : n_1 \in A_1 \land n_2 \in A_2 \land (n_2, n_1) \in R_2^{M_1}\}.$$ 

Recall that $R_2^{M_1} \cap (N \times N)$ is the usual order $<$ on $N$, so the last conjuncts in the definition of $B_1$ and $B_2$ mean just $n_1 < n_2$ and $n_2 < n_1$, respectively.

Now our stronger assertion clearly follows from claims (a)–(c) below:

(a) $B_1 \cap B_2 = \emptyset$,
(b) $B_1 \in F^{N_1}(D_1, D_2)$,
(c) $B_2 \in F^{N_1}(D_2, D_1)$.

It remains to verify these claims.

For (a), note that if there is some $c \in B_1 \cap B_2$, then:

(a) since $c \in B_1$, we can find $n_1 < n_2$ such that $F^{M_1}(n_1, n_2) = c$,

$$n_1 \in A_1, n_2 \in A_2,$$

(b) since $c \in B_2$, we can find $m_2 < m_1$ such that $F^{M_1}(m_1, m_2) = c$,

$$m_1 \in A_1, m_2 \in A_2.$$ 

So, since by Definition 4(e), $F^{M_1}$ is an unordered pairing function, we conclude $\{n_1, n_2\} = \{m_1, m_2\}$. However, then $n_1 < n_2$ and $m_2 < m_1$ imply

$$n_1 = m_2 \text{ and } n_2 = m_1,$$

which contradicts to $n_1 \in A_1, m_2 \in A_2$.

For (b), note that $\{n_1, n_2\} \in D_2$ because of $A_2 \in D_2$ and $D_2$ is non-principal. It follows $\{\forall D_2 n_2\} F(n_1, n_2) \in B_1$. But $A_1 \in D_1$, so we get

$$\{\forall D_1 n_1\} \{\forall D_2 n_2\} F(n_1, n_2) \in B_1.$$ 

By Definition 4(d), this gives claim (b).

For (c), argue similarly. $\square$

The fourth lemma (and its proof) generalizes the previous one.

Lemma 4. If $i, \ell \in \{1, 2\}$ and $D_1 \in P_1^{N_1} \setminus \{j_{i}(a) : a \in P_1^{M_1}\}$, then there exists $D_2 \in P_1^{N_1}$ such that

$$F^{N_1}(D_1, D_2) \neq F^{N_1}(D_2, D_1).$$

Proof. Let $D_1$ be a non-principal ultrafilter on $P_1^{M_i}$. It follows from Definition 4(e) and $M_1 < \mathcal{M}_2$ that $P_2^{M_i}$ is a linear order on $P_1^{M_i}$. One of the two following possibilities occurs:
(a) there is an initial segment $I$ of the linearly ordered set $(P_i^M, R_2^M)$ such that $I \in D_1$ but if $I_1 \subset I$ is another initial segment of the set then $I_1 \notin D_1$ (this $I$ necessarily has no last element);

(b) there is a final segment $J$ of the linearly ordered set $(P_i^M, R_2^M)$ such that $J \in D_1$ but if $J_1 \subset J$ is another final segment of the set then $J_1 \notin D_1$ (this $J$ necessarily has no first element).

To see, notice the following general facts. If $(X, <)$ is a linearly ordered set, for any ultrafilter $D$ on $X$ define the initial segment $I_D$ and the final segment $J_D$ of $(X, <)$ as follows:

$$I_D = \bigcap \{ I \in D : I \text{ is an initial segment of } (X, <) \},$$

$$J_D = \bigcap \{ J \in D : J \text{ is a final segment of } (X, <) \}.$$

As easy to see, if $D$ is principal then $I_D \cap J_D = \{ x \}$ for $\{ x \} \in D$; and if $D$ is non-principal then $(I_D, J_D)$ is a cut and either $I_D$ or $J_D$, but not both, is in $D$. Furthermore, if $I_D$ is in $D$, then so are all final segments of $I_D$, $S \cap I_D$ is cofinal in $I_D$ for all $S \in D$, and $I_D$ does not have a greatest element whenever $D$ is non-principal; and symmetrically for $J_D$ in $D$. (More details related to ultrafilter extensions of linearly ordered sets can be found in [6].)

In our situation, $D_1$ is non-principal, so we have either $I_D \in D_1$, in which case we get possibility (a) with $I = I_D$, or $J_D \in D_1$, in which case we get possibility (b) with $J = J_D$.

For (a), choose an ultrafilter $D_2$ on $P_i^M$ such that

$(\alpha)$ $I \in D_2$,

$(\beta)$ if $I_1 \subset I$ is an initial segment of $(P_i^M, R_2^M)$ then $I_1 \notin D_2$,

$(\gamma)$ $D_2 \neq D_1$.

Now we can repeat the proof of Lemma [8] mutatis mutandis, i.e., we can find $A_1 \in D_1 \setminus D_2$ such that $A_1 \subseteq I$ and $A_2 = I \setminus A_1 \in D_2$, then define

$$B_1 = \{ P^M(a_1, a_2) : a_1 \in A_1 \land a_2 \in A_2 \land (a_1, a_2) \in P_2^M \},$$

$$B_2 = \{ P^M(a_1, a_2) : a_1 \in A_1 \land a_2 \in A_2 \land (a_2, a_1) \in P_2^M \},$$

etc.

For (b), the proof is symmetric: we only replace $I$ with $J$, initial segments with final ones, and $xR_2^M y$ with $yR_2^M x$. \qed

These four lemmas complete the proof of Proposition [3]. \qed

Now everything is ready in order to provide a sentence $\psi$ having the required property.

**Definition 7.** Let $\psi$ be the following sentence in $\tau$:

$$(\forall x_1)(\forall x_2) (P_i(x_1) \land P_i(x_2) \land x_1 \neq x_2 \rightarrow (\exists y) \varphi_2(y) \land R_1(x_1, y) \land \neg R_1(x_2, y)).$$
Proposition 4. Let $\ell \in \{1, 2\}$. Then

$$N_\ell \models \psi \text{ if and only if } \ell = 1.$$  

Proof. 1. First we show that $N_1 \models \psi$.

Let $D_1, D_2$ satisfy the antecedent of $\psi$, i.e., $D_1, D_2 \in P^{N_1}_1$ and $D_1 \neq D_2$. We should find $b \in N_1$ such that

$$N_1 \models \varphi_2(b) \land R_1(D_1, b) \land \neg R_1(D_2, b).$$

Since $D_1, D_2$ are distinct ultrafilters on $M_1$ such that $P^{M_1}_1 \subseteq D_1 \cap D_2$, we can choose $A_1 \subseteq P^{M_1}_1$ such that $A_1 \in D_1$ and $A_1 \notin D_2$. Then $A_1 \in P^{M_1}_1$ clearly follows from Definition 4(b),(c). So $b = j_1(A_1) \in P^{N_1}_2$, and hence, by the “if” part of Proposition 3, $N_1 \models \varphi_2(b)$.

It remains to show the conjunction

$$(D_1, b) \in R^{N_1}_1 \text{ and } (D_2, b) \notin R^{N_1}_1.$$  

To this end, note that for any ultrafilter $D$ concentrated on $P^{M_1}_1$ and any $A \in P^{M_1}_2$, by Definition 2(c), the formula $(D, j_1(A)) \in P^{N_1}_1$ means

$$(v^D n)(v^j(A) B) (n, B) \in R^{M_1}_1.$$  

Recalling that $R^{M_1}_1$ is the membership relation (Definition 4(d)) and reducing $(v^j(A) B)$, we see that the latter formula is equivalent to $(v^D n) n \in A$, and so, to $A \in D$. Since we have $A_1 \in D_1$ and $A_1 \notin D_2$, this gives the required conjunction.

2. Now we show that $N_2 \models \neg \psi$.

Define a function $G$ from $P^{N_2}_1$ into $P(P^{M_2}_2)$ as follows:

$$G(D) = \{ b \in P^{M_2}_2 : \{ a \in P^{M_2}_1 : (a, b) \in R^{M_2}_1 \} \in D \}.$$  

Recall that $|P^{M_2}_1| = |P^{M_2}_2| = \lambda$ (Proposition 2). Therefore,

$$|\mathrm{dom}(G)| = |\mathbf{\beta}(P^{M_2}_2)| = |\mathbf{\beta}(\lambda)| = 2^{2^\lambda} > 2^\lambda,$$

while

$$|\mathrm{ran}(G)| \leq |P(P^{M_2}_2)| = |P(\lambda)| = 2^\lambda,$$

whence we conclude that $G$ is not one-to-one.

Take $S \in P(P^{M_2}_2)$ such that $|G^{-1}(S)| > 1$, pick $D_1, D_2 \in G^{-1}(S)$ such that $D_1 \neq D_2$, and show that $D_1, D_2$ witness the failure of the sentence $\psi$.

Note that $N_2$ satisfies the antecedent of $\psi$, i.e.,

$$N_2 \models P_1(D_1) \land P_1(D_2) \land D_1 \neq D_2,$$

by the condition $D_1, D_2 \in G^{-1}(S) \subseteq P^{N_2}_1$. So to finish, it suffices to show

$$N_2 \models \neg (\exists y) \varphi_2(y) \land R_1(D_1, y) \land \neg R_1(D_2, y).$$

Toward a contradiction, assume that there is $b \in N_2$ such that

$$N_2 \models \varphi_2(b) \land R_1(D_1, b) \land \neg R_1(D_2, b).$$
But since $N_2 \models \varphi_2(b)$, by the “only if” part of Proposition 3 we see that $b = j_2(A)$ for some $A \in P^{M_2}$. So we obtain

$$R^{N_2}_1(D_1, j_2(A)) \text{ and } \neg R^{N_2}_1(D_2, j_2(A))$$

By Definition 2(c), $R^{N_2}_1(D_1, j_2(A))$ means $(\forall D_1 a) (\forall j_2(A) b) (a, b) \in R^{M_2}_1$, whence reducing $(\forall j_2(A) b)$ we get $(\forall D_1 a) (a, A) \in R^{M_2}_1$, i.e.,

$$\{a \in P^{M_2}_1 : (a, A) \in R^{M_2}_1\} \in D_1.$$  

Similarly, $R^{N_2}_1(D_2, j_2(A))$ is equivalent to $\{a \in P^{M_2}_1 : (a, A) \in R^{M_2}_1\} \in D_2$, and hence, $\neg R^{N_2}_1(D_2, j_2(A))$ is equivalent to

$$\{a \in P^{M_2}_1 : (a, A) \in R^{M_2}_1\} \notin D_2.$$

Therefore, $A \in G(D_1)$ and $A \notin G(D_2)$, which, however, contradicts to the choice of $D_1, D_2$.

This completes the proof. \hfill \Box

So we have constructed two models $\mathcal{M}_1, \mathcal{M}_2$ in $\tau$ with

$$\mathcal{M}_1 \prec \mathcal{M}_2$$

and a $\tau$-sentence $\psi$ such that $\mathcal{N}_1 = \beta(\mathcal{M}_1) \models \psi$ and $\mathcal{N}_2 = \beta(\mathcal{M}_2) \models \neg \psi$, thus witnessing

$$\beta(\mathcal{M}_1) \not\equiv \beta(\mathcal{M}_2).$$

This proves the Main Theorem (Theorem 2).
