UNIQUENESS OF POWER OF A MEROMORPHIC FUNCTION
WITH ITS DIFFERENTIAL POLYNOMIAL

BIKASH CHAKRABORTY

Abstract. In this paper, taking the question of Zhang and Lü [23] into the back-
ground, we present one theorem which will improve and extend some recent results
related to the Brück Conjecture.

1. Introduction

Throughout this paper, we use the standard notations of the Nevanlinna theory of
meromorphic functions as explained in [13].

Let \( f \) and \( g \) be a two non-constant meromorphic functions defined in the open
complex plane \( \mathbb{C} \). If for some \( a \in \mathbb{C} \cup \{\infty\} \), \( f \) and \( g \) have the same set of \( a \)-points
with the same multiplicities, then we say that \( f \) and \( g \) share the value \( a \) counting
 multiplicities (in short, CM) and if we do not consider the multiplicities, then \( f \) and \( g \)
are said to share the value \( a \) ignoring multiplicities (in short, IM). If \( a = \infty \), then the
zeros of \( f - a \) means the poles of \( f \).

A meromorphic function \( a = a(z)(\not\equiv 0, \infty) \) is called a small function with respect
to \( f \) provided that \( T(r, a) = S(r, f) \) as \( r \rightarrow \infty \), \( r \not\in E \), where \( E \) is a set of positive
real numbers with finite Lebesgue measure. If \( a = a(z) \) is a small function, then we
say that \( f \) and \( g \) share \( a \) IM (resp. CM) according to \( f - a \) and \( g - a \) share 0 IM (resp.
CM).

The subject on sharing values between entire functions with its derivatives was first
studied by Rubel and Yang [21]. In 1977, they proved the following result:

Theorem A. [21] Let \( f \) be a non-constant entire function. If \( f \) and \( f' \) share two
distinct finite numbers \( a, b \) CM, then \( f = f' \).

In 1979, Mues and Steinmetz obtained the same result but in relax sharing environ-
ment as follows:

Theorem B. [20] Let \( f \) be a non-constant entire function. If \( f \) and \( f' \) share two
distinct values \( a, b \) IM, then \( f' = f \).

Subsequently, similar considerations have been made with respect to higher deriva-
tives and more general differential expressions as well. Above theorems motivate re-
searchers to study the relation between an entire function and its derivative counterpart

2010 Mathematics Subject Classification: 30D35.
Key words and phrases: Meromorphic function, differential polynomial, small function, Brück
Conjecture.
for one CM shared value. In this direction, in 1996, the following famous conjecture was proposed by Brück ([9]):

**Conjecture:** Let \( f \) be a non-constant entire function such that the hyper order \( \rho_2(f) \) of \( f \) is not a positive integer or infinite, where

\[
\rho_2(f) = \limsup_{r \to \infty} \frac{\log \log T(r, f)}{\log r}.
\]

If \( f \) and \( f' \) share a finite value \( a \) CM, then \( \frac{f'}{f-a} = c \), where \( c \) is a non-zero constant.

In recent years, many results have been published concerning the above conjecture (see, [2, 3, 4, 5, 6, 8, 10, 11, 13, 17, 18]). Next we recall the following definitions:

**Definition 1.1.** ([15]) Let \( p \) be a positive integer and \( a \in \mathbb{C} \cup \{\infty\} \).

(i) \( N(r, a; f \ | \geq p) \) (resp. \( \overline{N}(r, a; f \ | \geq p) \)) denotes the counting function (resp. reduced counting function) of those \( a \)-points of \( f \) whose multiplicities are not less than \( p \).

(ii) \( N(r, a; f \ | \leq p) \) (resp. \( \overline{N}(r, a; f \ | \leq p) \)) denotes the counting function (resp. reduced counting function) of those \( a \)-points of \( f \) whose multiplicities are not greater than \( p \).

**Definition 1.2.** ([23]) For \( a \in \mathbb{C} \cup \{\infty\} \) and a positive integer \( p \), we define

\[
N_p(r, a; f) = \overline{N}(r, a; f) + \overline{N}(r, a; f \ | \geq 2) + \ldots + \overline{N}(r, a; f \ | \geq p).
\]

**Definition 1.3.** ([23]) For \( a \in \mathbb{C} \cup \{\infty\} \) and a positive integer \( p \), we put

\[
\delta_p(a, f) = 1 - \limsup_{r \to \infty} \frac{N_p(r, a; f)}{T(r, f)}.
\]

Thus

\[
0 \leq \delta(a, f) \leq \delta_p(a, f) \leq \delta_{p-1}(a, f) \leq \ldots \leq \delta_2(a, f) \leq \delta_1(a, f) = \Theta(a, f) \leq 1.
\]

**Definition 1.4.** ([4]) For two positive integers \( n, p \) we define

\[
\mu_p = \min \{n, p\} \text{ and } \mu_p^* = p + 1 - \mu_p.
\]

Then clearly

\[
N_p(r, 0; f^n) \leq \mu_p N_{\mu_p^*}(r, 0; f).
\]

**Definition 1.5.** ([8]) Let \( z_0 \) be a zero of \( f - a \) of multiplicity \( p \) and a zero of \( g - a \) of multiplicity \( q \).

i) We denote by \( \overline{N}_L(r, a; f) \), the counting function of those \( a \)-points of \( f \) and \( g \) where \( p > q \geq 1 \),

ii) by \( N_E^1(r, a; f) \), we denote the counting function of those \( a \)-points of \( f \) and \( g \) where \( p = q = 1 \) and

iii) by \( \overline{N}_E^2(r, a; f) \), we denote the counting function of those \( a \)-points of \( f \) and \( g \) where \( p = q \geq 2 \), each point in these counting functions is counted only once.

Similarly, we can define \( \overline{N}_L(r, a; g) \), \( N_E^1(r, a; g) \), \( \overline{N}_E^2(r, a; g) \).

**Definition 1.6.** ([13]) Let \( k \) be a non-negative integer or infinity and \( a \in \mathbb{C} \cup \{\infty\} \).

By \( E_k(a; f) \), we mean the set of all \( a \)-points of \( f \), where an \( a \)-point of multiplicity \( m \) is counted \( m \) times if \( m \leq k \) and \( k + 1 \) times if \( m > k \).

If \( E_k(a; f) = E_k(a; g) \), then we say that \( f \) and \( g \) share the value \( a \) with weight \( k \).
Thus we note that \( f \) and \( g \) share a value \( a \) — IM (resp. CM) if and only if \( f \) and \( g \) share \((a, 0)\) (resp. \((a, \infty)\)).

With the notion of weighted sharing of values Lahiri-Sarkar ([15]) improved the result of Zhang ([22]). In ([23]), Zhang further extended the result of Lahiri-Sarkar ([15]) and replaced the concept of value sharing by small function sharing.

In 2008, Zhang and Lü ([24]) further considered the uniqueness of the \( n \)-th power of a meromorphic function sharing a small function with its \( k \)-th derivative and proved the following theorem:

**Theorem C.** ([24]) Let \( k(\geq 1), n(\geq 1) \) be integers and \( f \) be a non-constant meromorphic function. Also, let \( a(z)(\not\equiv 0, \infty) \) be a small function with respect to \( f \). Suppose \( f^n - a \) and \( f^{(k)} - a \) share \((0, l)\). If \( l = \infty \) and

\[(1.1) \quad (3 + k)\Theta(\infty, f) + 2\Theta(0, f) + \delta_{2+k}(0, f) > 6 + k - n,\]

or, \( l = 0 \) and

\[(1.2) \quad (6 + 2k)\Theta(\infty, f) + 4\Theta(0, f) + 2\delta_{2+k}(0, f) > 12 + 2k - n,\]

then \( f^n \equiv f^{(k)} \).

In the same paper, Zhang and Lü ([24]) posed the following question:

**Question 1.1.** What will happen if \( f^n \) and \([f^{(k)}]^s\) share a small function?

In 2010, Chen and Zhang ([11]) gave an answer to the above question, but unfortunately there were some gaps in the proof of the theorems in ([11]). To rectify the gaps in ([11]) as well as to answer the question of Zhang and Lü ([24]), in 2010, Banerjee and Majumder ([8]) proved two theorems, one of which further improved Theorem C whereas the other answers the Question 1.1.

**Theorem D.** ([8]) Let \( k(\geq 1), n(\geq 1) \) be integers and \( f \) be a non-constant meromorphic function. Also, let \( a(z)(\not\equiv 0, \infty) \) be a small function with respect to \( f \). Suppose \( f^n - a \) and \( f^{(k)} - a \) share \((0, l)\). If \( l \geq 2 \) and

\[(1.3) \quad (3 + k)\Theta(\infty, f) + 2\Theta(0, f) + \delta_{2+k}(0, f) > 6 + k - n,\]

or, \( l = 1 \) and

\[(1.4) \quad \left(\frac{7}{2} + k\right)\Theta(\infty, f) + \frac{5}{2}\Theta(0, f) + \delta_{2+k}(0, f) > 7 + k - n,\]

or, \( l = 0 \) and

\[(1.5) \quad (6 + 2k)\Theta(\infty, f) + 4\Theta(0, f) + \delta_{2+k}(0, f) + \delta_{1+k}(0, f) > 12 + 2k - n,\]

then \( f^n = f^{(k)} \).
Theorem E. \([8]\) Let \(k(\geq 1), n(\geq 1), m(\geq 2)\) be integers and \(f\) be a non-constant meromorphic function. Also, let \(a(z)(\neq 0, \infty)\) be a small function with respect to \(f\). Suppose \(f^n - a\) and \([f^{(k)}]^m - a\) share \((0, l)\). If \(l = 2\) and

\[
(1.6) \quad (3 + 2k) \Theta(\infty, f) + 2 \Theta(0, f) + 2\delta_{1+k}(0, f) > 7 + 2k - n,
\]

or, \(l = 1\) and

\[
(1.7) \quad \left(\frac{7}{2} + 2k\right) \Theta(\infty, f) + \frac{5}{2} \Theta(0, f) + 2\delta_{1+k}(0, f) > 8 + 2k - n,
\]

or, \(l = 0\) and

\[
(1.8) \quad (6 + 3k) \Theta(\infty, f) + 4 \Theta(0, f) + 3\delta_{1+k}(0, f) > 13 + 3k - n,
\]

then \(f^n \equiv [f^{(k)}]^m\).

It can be easily proved that Theorem D is a better result than Theorem E for \(m = 1\) case. Also, it is observed that in Theorem E, the conditions (1.6)-(1.8) are independent of \(m\).

Very recently, in order to improve the results of Zhang (23), Li and Huang (16) obtained the following theorem.

Theorem F. \([16]\) Let \(k(\geq 1), l(\geq 0)\) be integers and \(f\) be a non-constant meromorphic function. Also, let \(a(z)(\neq 0, \infty)\) be a small function with respect to \(f\). Suppose \(f - a\) and \(f^{(k)} - a\) share \((0, l)\). If \(l \geq 2\) and

\[
(1.9) \quad (3 + k)\Theta(\infty, f) + \delta_2(0, f) + \delta_{2+k}(0, f) > k + 4,
\]

or, \(l = 1\) and

\[
(1.10) \quad \left(\frac{7}{2} + k\right) \Theta(\infty, f) + \frac{1}{2} \Theta(0, f) + \delta_2(0, f) + \delta_{2+k}(0, f) > k + 5,
\]

or, \(l = 0\) and

\[
(1.11) \quad (6 + 2k)\Theta(\infty, f) + 2\Theta(0, f) + \delta_2(0, f) + \delta_{1+k}(0, f) + \delta_{2+k}(0, f) > 2k + 10,
\]

then \(f \equiv f^{(k)}\).

In view of Lemma 3.1 stated latter on, we see that Theorem F is better than Theorem D for \(n = 1\) case. Now, we recall the following definition.

Definition 1.7. \([13]\) Let \(n_{0j}, n_{1j}, \ldots, n_{kj}\) be non-negative integers. The expression

\[
M_j[f] = (f)^{n_{0j}}(f^{(1)})^{n_{1j}} \cdots (f^{(k)})^{n_{kj}}
\]
is called a *differential monomial* generated by $f$ of degree $d_{M_j} = d(M_j) = \sum_{i=0}^{k} n_{ij}$ and weight $\Gamma_{M_j} = \sum_{i=0}^{k} (i+1)n_{ij}$. The sum

$$P[f] = \sum_{j=1}^{t} b_j M_j[f]$$

is called a *differential polynomial* generated by $f$ of degree $d(P) = \max \{d(M_j) : 1 \leq j \leq t \}$ and weight $\Gamma = \Gamma_P = \max \{\Gamma_{M_j} : 1 \leq j \leq t \}$, where $T(r,b_j) = S(r,f)$ for $j = 1, 2, \ldots, t$.

The numbers $d(P) = \min \{d(M_j) : 1 \leq j \leq t \}$ and $k$ (the highest order of the derivative of $f$ in $P[f]$) are called respectively the lower degree and order of $P[f]$.

The differential polynomial $P[f]$ is said to be homogeneous if $d(P) = d$, otherwise $P[f]$ is called a non-homogeneous differential polynomial.

Also, we define $Q := \max \{\Gamma_{M_j} - d(M_j) : 1 \leq j \leq t \}$; and for the sake of convenience for a differential monomial $M[f]$, we denote by $\lambda = \Gamma_M - d_M$.

Recently Charak and Lal (10) considered the possible extension of Theorem D in the direction of the question of Zhang and L"u (24) up to differential polynomial.

**Theorem G.** (10) Let $f$ be a non-constant meromorphic function and $n$ be a positive integer and $a(z) \not\equiv 0, \infty$ be a small function with respect to $f$. Let $P[f]$ be a non-constant differential polynomial in $f$. Suppose $f^n$ and $P[f]$ share $(a, l)$. If $l \geq 2$ and

$$3 + Q) \Theta(\infty, f) + 2 \Theta(0, f) + \overline{d}(P)\delta(0, f) > Q + 5 + 2d(P) - \overline{d}(P) - n,$$

or, $l = 1$ and

$$\left(\frac{7}{2} + Q\right) \Theta(\infty, f) + \frac{5}{2} \Theta(0, f) + \overline{d}(P)\delta(0, f) > Q + 6 + 2d(P) - \overline{d}(P) - n,$$

or, $l = 0$ and

$$6 + 2Q) \Theta(\infty, f) + 4 \Theta(0, f) + 2\overline{d}(P)\delta(0, f) > 2Q + 4d(P) - 2d(P) + 10 - n,$$

then $f^n \equiv P[f]$.

Clearly, this is a supplementary result corresponding to Theorem D because by putting $P[f] = f^{(k)}$ in Theorem G one can’t obtain Theorem D, rather in this case a set of stronger conditions are obtained as a particular case of Theorem F. So the following question is natural:

**Question 1.2.** Is it possible to improve Theorem D in the direction of Theorem F up to differential monomial so that the result give a positive answer to the question of Zhang and L"u?

To answer the above question, recently Banerjee and Chakraborty (11) obtained the following Theorem:
**Theorem H.** Let \( k \geq 1 \), \( n \geq 1 \) be integers and \( f \) be a non-constant meromorphic function. Also, let \( M[f] \) be a differential monomial of degree \( d_M \) and weight \( \Gamma_M \) and \( k \) is the highest derivative in \( M[f] \). Let \( a(z) \neq 0, \infty \) be a small function with respect to \( f \). Suppose \( f^n - a \) and \( M[f] - a \) share \((0, l)\). If \( l \geq 2 \) and

\[
(1.15) \quad (3 + \lambda) \Theta(\infty, f) + \mu_2 \delta_{\mu_2}(0, f) + d_M \delta_{2+k}(0, f) > 3 + \Gamma_M + \mu_2 - n,
\]

or \( l = 1 \) and

\[
(1.16) \quad \left(\frac{7}{2} + \lambda\right) \Theta(\infty, f) + \frac{1}{2} \Theta(0, f) + \mu_2 \delta_{\mu_2}(0, f) + d_M \delta_{2+k}(0, f) > 4 + \Gamma_M + \mu_2 - n,
\]

or \( l = 0 \) and

\[
(1.17) \quad (6+2\lambda) \Theta(\infty, f) + 2 \Theta(0, f) + \mu_2 \delta_{\mu_2}(0, f) + d_M \delta_{2+k}(0, f) + d_M \delta_{1+k}(0, f) > 8 + 2 \Gamma_M + \mu_2 - n,
\]

then \( f^n \equiv M[f] \).

In the same paper the following question was asked:

**Question 1.3.** Is it possible to extend Theorem H up to differential polynomial instead of differential monomial?

To seek the possible answer of Question 1.3 is the motivation of this paper.

2. **Main Result**

**Theorem 2.1.** Let \( k \geq 1 \), \( n \geq 1 \) be integers and \( f \) be a non-constant meromorphic function. Let \( P[f] \) be a homogeneous differential polynomial of degree \( d_P \) and weight \( \Gamma_P \) such that \( \Gamma_P > (k+1)d_P - 2 \), where \( k \) is the highest derivative in \( P[f] \). Also, let \( a(z) \neq 0, \infty \) be a small function with respect to \( f \). Suppose \( f^n - a \) and \( P[f] - a \) share \((0, l)\). If \( l \geq 2 \) and

\[
(2.1) \quad \left(\Gamma_P - d_P + 3\right) \Theta(\infty, f) + \mu_2 \delta_{\mu_2}(0, f) + d_P \delta_{2+\Gamma_P - d_P}(0, f)
\]

\[
> \Gamma_P + \mu_2 + 3 - n,
\]

or, \( l = 1 \) and

\[
(2.2) \quad \left(\Gamma_P - d_P + \frac{7}{2}\right) \Theta(\infty, f) + \frac{1}{2} \Theta(0, f) + \mu_2 \delta_{\mu_2}(0, f) + d_P \delta_{2+\Gamma_P - d_P}(0, f)
\]

\[
> \Gamma_P + \mu_2 + 4 - n,
\]

or, \( l = 0 \) and

\[
(2.3) \quad \left(2(\Gamma_P - d_P) + 6\right) \Theta(\infty, f) + 2 \Theta(0, f) + \mu_2 \delta_{\mu_2}(0, f) + d_P \delta_{1+\Gamma_P - d_P}(0, f)
\]

\[
+ d_P \delta_{2+\Gamma_P - d_P}(0, f) > 2 \Gamma_P + \mu_2 + 8 - n,
\]

then \( f^n \equiv P[f] \).
Remark 2.1. If \( P[f] \) be a non-constant differential monomial, then \( \overline{d}(P) = \overline{d}(P) \).

Thus our Theorem extends, generalizes Theorem H.

From the above discussion, the following question is obvious:

**Question 2.1.** Is it possible to extend Theorem 2.1 up to an arbitrary differential polynomial?

### 3. Lemmas

In this section, we present some lemmas which will be needed in this sequel. Let \( F, G \) be two non-constant meromorphic functions and \( H \) be another meromorphic function which is defined as follows:

\[
(3.1) \quad H = \left( \frac{F''}{F^2} - \frac{2F'}{F} \right) - \left( \frac{G''}{G^2} - \frac{2G'}{G} \right).
\]

**Lemma 3.1.** \( \square \) If \( f \) is a non-constant meromorphic function, then

\[
1 + \delta_2(0, f) \geq 2\Theta(0, f).
\]

**Lemma 3.2.** \( \square \) If \( F \) and \( G \) share \((1, l)\), \( \overline{N}(r, \infty; F) = \overline{N}(r, \infty; G) \) and \( H \neq 0 \), then

\[
N(r, \infty; H) \leq \overline{N}(r, \infty; F) + \overline{N}(r, 0; F) + \overline{N}(r, 0; G) + \overline{N}_0(r, 0; F') + \overline{N}_0(r, 0; G') + \overline{N}_L(r, 1; F) + \overline{N}_L(r, 1; G) + S(r, F) + S(r, G).
\]

**Lemma 3.3.** \( \square \) Let \( F \) and \( G \) share \((1, 1)\). Then

\[
 \overline{N}_L(r, 1; F) \leq \frac{1}{2} \overline{N}(r, \infty; F) + \frac{1}{2} \overline{N}(r, 0; F) + S(r, F) \text{ if } l \geq 1,
\]

and

\[
 \overline{N}_L(r, 1; F) \leq \overline{N}(r, \infty; F) + \overline{N}(r, 0; F) + S(r, F) \text{ if } l = 0.
\]

Similar expressions also hold for \( G \).

**Lemma 3.4.** \( \square \) Let \( F \) and \( G \) share \((1, l)\) and \( H \neq 0 \). Then

\[
\overline{N}(r, 1; F) + \overline{N}(r, 1; G) \leq N(r, \infty; H) + \overline{N}_E^2(r, 1; F) + \overline{N}_L(r, 1; F) + \overline{N}_L(r, 1; G) + \overline{N}(r, 1; G) + S(r, F) + S(r, G).
\]

**Lemma 3.5.** Let \( f \) be a non-constant meromorphic function and \( a(z) \) be a small function of \( f \). Also, let \( F = \frac{f^n}{a} \) and \( G = \frac{P}{a} \). If \( F \) and \( G \) share \((1, \infty)\), then one of the following cases hold:

i) \( T(r) \leq N_2(r, 0; F) + N_2(r, 0; G) + N(r, \infty; F) + N(r, \infty; G) + N_L(r, \infty; F) + N_L(r, \infty; G) + S(r) \),

ii) \( F \equiv G \),

iii) \( FG \equiv 1 \),

where \( T(r) = \max\{T(r, F), T(r, G)\} \) and \( S(r) = o(T(r)) \), \( r \in I \), \( I \) is a set of infinite linear measure of \( r \in (0, \infty) \).

**Proof.** Let \( z_0 \) be a pole of \( f \) which is not a pole or zero of \( a(z) \). Then \( z_0 \) is a pole of \( F \) and \( G \) simultaneously. Thus \( F \) and \( G \) share those pole of \( f \) which is not zero or pole of \( a(z) \). Clearly

\[
N(r, \infty; H) \leq \overline{N}(r, 0; F \geq 2) + \overline{N}(r, 0; G \geq 2) + \overline{N}_L(r, \infty; F) + \overline{N}_L(r, \infty; G) + S(r, F) + S(r, G).
\]
Rest of the proof can be carried out in the line of proof of Lemma 2.13 of (I). So we omit the details.

**Lemma 3.6.** Let \( p, n \) be two positive integers. Then for \( \varepsilon > 0 \)
\[
N_p(r, 0; f^n) \leq (n - n \delta_p(0, f) + \varepsilon)T(r, f).
\]

**Proof.** we see that
\[
N_p(r, 0; f^n) \leq nN_p(r, 0; f^n).
\]

Rest part of the proof is obvious.

**Lemma 3.7.** \((\text{[17]})\) \( N(r, \infty; P[f]) \leq \overline{d}(P)N(r, \infty; f) + (\Gamma_P - \overline{d}(P))N(r, \infty; f) \).

**Lemma 3.8.** \((\text{[19]})\) Let \( f \) be a non-constant meromorphic function and let
\[
R(f) = \frac{\sum_{i=0}^{n} a_i f^i}{\sum_{j=0}^{m} b_j f^j}
\]
be an irreducible rational function in \( f \) with constant coefficients \( \{a_i\} \) and \( \{b_j\} \) where \( a_n \neq 0 \) and \( b_m \neq 0 \). Then
\[
T(r, R(f)) = pT(r, f) + S(r, f),
\]
where \( p = \max\{n, m\} \).

**Lemma 3.9.** \((\text{[7, 12]}\)\) Let \( f \) be a meromorphic function and \( P[f] \) be a differential polynomial. Then
\[
m\left(r, \frac{P[f]}{\overline{d}(P)}\right) \leq (\overline{d}(P) - \overline{d}(P))m \left(r, \frac{1}{f}\right) + S(r, f).
\]

**Lemma 3.10.** \((\text{[2, 3]})\) Let \( P[f] \) be a differential polynomial generated by a non-constant meromorphic function \( f \). Then
\[
N \left(r, \infty; \frac{P[f]}{\overline{d}(P)}\right) \leq \left(\Gamma_P - \overline{d}(P)\right)N(r, \infty; f) + (\overline{d}(P) - \overline{d}(P)) N(r, 0; f \geq k + 1)
\]
\[
+ QN(r, 0; f \geq k + 1) + \overline{d}(P)N(r, 0; f \leq k) + S(r, f).
\]

**Lemma 3.11.** Let \( f \) be a non-constant meromorphic function and \( a(z) \) be a small function in \( f \). Let us define \( F = \frac{F}{a}, G = \frac{P[f]}{a}. \) Then \( FG \neq 1 \).

**Proof.** On contrary, assume that \( FG \equiv 1 \), i.e., \( P[f]f^n = (a(z))^2 \). Then
\[
N(r, 0; f \geq k + 1) = S(r, f).
\]
Now applying Lemmas 3.9, 3.10 and the first fundamental theorem, we get
\[
(n + \overline{d}(P))T(r, f) = T \left( r, \frac{P[f]}{\overline{d}(P)} \right) + S(r, f)
\]
\[
\leq (\overline{d}(P) - \overline{d}(P)) [T(r, f) - \left\{ N(r, 0; f \mid \leq k + 1) \right\}] + (\Gamma_P - \overline{d}(P)) N(r, 0; f \mid \geq k + 1) + \overline{d}(P) N(r, 0; f \mid \leq k) + S(r, f)
\]
\[
\leq (\overline{d}(P) - \overline{d}(P)) T(r, f) + \overline{d}(P) N(r, 0; f \mid \leq k) + (\Gamma_P - \overline{d}(P)) N(r, \infty; f) + S(r, f)
\]
\[
\leq \overline{d}(P) T(r, f) + (\Gamma_P - \overline{d}(P)) N(r, \infty; (a(z))^2) + S(r, f)
\]
\[
\leq \overline{d}(P) T(r, f) + S(r, f),
\]
which is a contradiction. 

Lemma 3.12. For the differential polynomial \( P[f] \),
\[
N(r, 0; P[f]) \leq (\Gamma_P - \overline{d}(P)) N(r, \infty; f) + \overline{d}(P) N(r, 0; f)
\]
\[
+ (\overline{d}(P) - \overline{d}(P)) \left( m(r, \frac{1}{f}) + T(r, f) \right) + S(r, f).
\]

Proof. From Lemma 3.9, it is clear that
\[
(3.2) \quad \overline{d}(P) m(r, \frac{1}{f}) \leq m(r, \frac{1}{P[f]}) + S(r, f).
\]

Now using Lemmas 3.7, 3.9 and inequality (3.2), we have
\[
N(r, 0; P[f])
\]
\[
= T(r, P[f]) - m(r, \frac{1}{P}) + O(1)
\]
\[
\leq T(r, P[f]) - \overline{d}(P) m(r, \frac{1}{f}) + S(r, f)
\]
\[
\leq (\overline{d}(P) - \overline{d}(P)) m(r, \frac{1}{f}) + \overline{d}(P) m(r, f) + \overline{d}(P) N(r, \infty; f)
\]
\[
+ (\Gamma_P - \overline{d}(P)) N(r, \infty; f) - \overline{d}(P) m(r, \frac{1}{f}) + S(r, f)
\]
\[
\leq (\Gamma_P - \overline{d}(P)) N(r, \infty; f) + (\overline{d}(P) - \overline{d}(P)) \left( m(r, \frac{1}{f}) + T(r, f) \right)
\]
\[
+ \overline{d}(P) N(r, 0; f) + S(r, f).
\]

Hence the proof is completed. 

Lemma 3.13. Let \( j \) and \( p \) be two positive integers satisfying \( j \geq p + 1 \). Let \( P[f] \) be a differential polynomial with \( \Gamma_P > (k + 1) \overline{d}(P) - (p + 1) \). Then
\[
N_{j+\Gamma_P-\overline{d}(P)}(r, 0; f; f^d(P)) \leq N_{j}(r, 0; P[f]).
\]

Proof. Let \( z_0 \) be a zero of \( f \) of order \( t \). If \( t \overline{d}(P) < j + \Gamma_P - \overline{d}(P) \), then the proof is obvious. So we assume that \( t \overline{d}(P) \geq j + \Gamma_P - \overline{d}(P) \). Now we consider two cases:
**Case-I** Let us assume that \( t \geq k + 1 \). Then \( z_0 \) is a zero of \( P[f] \) of order at least
\[
\min_j \{ n_0 t + n_{t-1} + \ldots + n_{t-k} \}
\]
\[
= \min_j \{ tdM_j - (\Gamma_M - dM_j) \}
\]
\[
= (t+1)d(P) - \max_j \{ \Gamma_M \}
\]
\[
\geq (j + \Gamma_P - d(P)) + d(P) - \Gamma_P \geq j.
\]
So the proof is clear.

**Case-II** Next we assume that \( t \leq k \). Then
\[
k d(P) \geq td(P) \geq p + 1 + \Gamma_P - d(P),
\]
which is a contradiction as \( \Gamma_P > (k + 1)d(P) - (p + 1) \).

**Lemma 3.14.** Let \( j \) and \( p \) be two positive integer satisfying \( j \geq p + 1 \). Let \( P[f] \) homogeneous differential polynomial with \( \Gamma_P > (k + 1)d(P) - (p + 1) \). Then
\[
N_p(r, 0; P[f]) \leq N_{p+\Gamma_P - d(P)}(r, 0; f^{d(P)}) + (\Gamma_P - d(P))N(r, \infty; f) + S(r, f).
\]

**Proof.** From Lemmas 3.12, 3.13 we have
\[
N_p(r, 0; P[f]) \leq (\Gamma_P - d(P))N(r, \infty; f) + N(r, 0; f^{d(P)}) - \sum_{j=p+1}^{\infty} N_{\gamma}(r, 0, P[f]) + S(r, f)
\]
\[
\leq (\Gamma_P - d(P))N(r, \infty; f) + N_{p+\Gamma_P - d(P)}(r, 0; f^{d(P)})
\]
\[
+ \sum_{j=p+\Gamma_P - d(P)+1}^{\infty} N_{\gamma}(r, 0; f^{d(P)}) - \sum_{j=p+1}^{\infty} N_{\gamma}(r, 0; P[f]) + S(r, f)
\]
\[
\leq (\Gamma_P - d(P))N(r, \infty; f) + N_{p+\Gamma_P - d(P)}(r, 0; f^{d(P)}) + S(r, f).
\]
This completes the proof.

4. **Proof of the theorem**

**Proof.** Suppose that
\[
F = \frac{f^n}{a(z)} \quad \text{and} \quad G = \frac{P[f]}{a(z)}.
\]
Then \( F - 1 = \frac{f^n - a(z)}{a(z)} \), \( G - 1 = \frac{P[f] - a(z)}{a(z)} \). Since \( f^n \) and \( P[f] \) share \( (a, l) \), it follows that \( F \) and \( G \) share \( (1, l) \) except the zeros and poles of \( a(z) \). Now we consider the following two cases.

**Case 1.** First we assume that \( H \neq 0 \).

**Subcase-1.1.** If \( l \geq 1 \), then using the second fundamental theorem and Lemmas 3.4.
and $3.21$ we get

$$T(r, F) + T(r, G)$$

$$\leq \overline{N}(r, \infty; F) + \overline{N}(r, \infty; G) + \overline{N}(r, 0; F) + \overline{N}(r, 0; G) + N(r, \infty; H)$$

$$+ \overline{N}^2_E(r, 1; F) + \overline{N}_L(r, 1; F) + \overline{N}_L(r, 1; G) + \overline{N}(r, 1; G)$$

$$- \overline{N}_0(r, 0; F') - \overline{N}_0(r, 0; G') + S(r, f)$$

(4.1) \quad \leq 2\overline{N}(r, \infty; F) + \overline{N}(r, \infty; G) + N_2(r, 0; F) + N_2(r, 0; G) + \overline{N}_E^2(r, 1; F)$$

$$+ 2\overline{N}_L(r, 1; F) + 2\overline{N}_L(r, 1; G) + \overline{N}(r, 1; G) + S(r, f).$$

**Subcase-1.1.1.** If $l \geq 2$, then using the inequality (4.1), we get

$$T(r, F) + T(r, G)$$

$$\leq 2\overline{N}(r, \infty; F) + \overline{N}(r, \infty; G) + N_2(r, 0; F) + N_2(r, 0; G) + \overline{N}_E^2(r, 1; F)$$

$$+ 2\overline{N}_L(r, 1; F) + 2\overline{N}_L(r, 1; G) + \overline{N}(r, 1; G) + S(r, f)$$

$$\leq 2\overline{N}(r, \infty; F) + \overline{N}(r, \infty; G) + \mu_2 N_{\mu_2}(r, 0; f) + N_2(r, 0; G) + \overline{N}(r, 1; G)$$

$$+ S(r, f).$$

i.e., for any $\varepsilon > 0$, in view of Lemma 3.14, the above inequality becomes

$$n T(r, f)$$

$$\leq (\Gamma_P - d(P) + 3) \overline{N}(r, \infty; f) + \mu_2 N_{\mu_2}(r, 0; f) + N_{2+\Gamma_P-d(P)}(r, 0; f)$$

$$\leq \{(\Gamma_P - d(P) + 3) - (\Gamma_P - d(P) + 3) \Theta(\infty, f) + \mu_2 - \mu_2 \delta_{\mu_2}(0, f)$$

$$+ d(P) - d(P) \delta_{2+\Gamma_P-d(P)}(0, f) + \varepsilon\} T(r, f) + S(r, f).$$

i.e.,

$$(\Gamma_P - d(P) + 3) \Theta(\infty, f) + \mu_2 \delta_{\mu_2}(0, f) + d(P) \delta_{2+\Gamma_P-d(P)}(0, f) \leq \Gamma_P + \mu_2 + 3 - n,$$

which contradicts to the condition (2.1) of Theorem 2.1

**Subcase-1.1.2.** If $l = 1$, then using the inequality (4.1) and Lemma 3.3, we get

$$T(r, F) + T(r, G)$$

$$\leq 2\overline{N}(r, \infty; F) + \overline{N}(r, \infty; G) + N_2(r, 0; F) + N_2(r, 0; G) + \overline{N}_E^2(r, 1; F)$$

$$+ 2\overline{N}_L(r, 1; F) + 2\overline{N}_L(r, 1; G) + \overline{N}(r, 1; G) + S(r, f)$$

$$\leq \frac{5}{2} \overline{N}(r, \infty; F) + \overline{N}(r, \infty; G) + \frac{1}{2} \overline{N}(r, 0; F) + \mu_2 N_{\mu_2}(r, 0; f) + N_2(r, 0; G)$$

$$+ \overline{N}_E^2(r, 1; F) + \overline{N}_L(r, 1; F) + 2\overline{N}_L(r, 1; G) + \overline{N}(r, 1; G) + S(r, f)$$

$$\leq \frac{5}{2} \overline{N}(r, \infty; F) + \overline{N}(r, \infty; G) + \frac{1}{2} \overline{N}(r, 0; F) + \mu_2 N_{\mu_2}(r, 0; f) + N_2(r, 0; G)$$

$$+ N(r, 1; G) + S(r, f).$$
i.e., for any $\varepsilon > 0$, in view of Lemma 3.14 the above inequality becomes

\[
T(r, f) + T(r, G) \\
\leq \frac{2}{3} \left( (\Gamma_P - d(P) + \frac{7}{2})N(r, \infty; f) + \frac{1}{2} \sum_{j=1}^{\infty} (\Gamma_P - d(P) + \frac{7}{2}) \Theta(\infty, f) + \frac{1}{2} \sum_{j=1}^{\infty} (\Gamma_P - d(P) + \frac{7}{2}) \Theta(0, f) + \mu_2 N_{\mu_2^*}(0, f) + d(P) \delta_{2+\Gamma_P-\frac{d(P)}{2}}(0, f) + \varepsilon T(r, f) + S(r, f) \right)
\]

which contradicts to the condition (2.2) of Theorem 2.1.

**Subcase-1.2.** If $l = 0$, then applying the second fundamental theorem and Lemmas 3.2 3.3 3.4 we get

\[
T(r, f) + T(r, G) \\
\leq \frac{2}{3} \left( (\Gamma_P - d(P) + \frac{7}{2})N(r, \infty; f) + \frac{1}{2} \sum_{j=1}^{\infty} (\Gamma_P - d(P) + \frac{7}{2}) \Theta(\infty, f) + \frac{1}{2} \sum_{j=1}^{\infty} (\Gamma_P - d(P) + \frac{7}{2}) \Theta(0, f) + \mu_2 N_{\mu_2^*}(0, f) + d(P) \delta_{2+\Gamma_P-\frac{d(P)}{2}}(0, f) + \varepsilon T(r, f) + S(r, f) \right)
\]

i.e., for any $\varepsilon > 0$, in view of Lemma 3.14 the above inequality becomes

\[
n T(r, f) \\
\leq \frac{2}{3} \left( (\Gamma_P - d(P) + \frac{7}{2})N(r, \infty; f) + \frac{1}{2} \sum_{j=1}^{\infty} (\Gamma_P - d(P) + \frac{7}{2}) \Theta(\infty, f) + \frac{1}{2} \sum_{j=1}^{\infty} (\Gamma_P - d(P) + \frac{7}{2}) \Theta(0, f) + \mu_2 N_{\mu_2^*}(0, f) + d(P) \delta_{2+\Gamma_P-\frac{d(P)}{2}}(0, f) + \varepsilon T(r, f) + S(r, f) \right)
\]

i.e.,

\[
(2(\Gamma_P - d(P)) + 6) \Theta(\infty, f) + 2 \Theta(0, f) + \mu_2 \delta_{\mu_2^*}(0, f) + 6) \Theta(0, f) + \mu_2 N_{\mu_2^*}(0, f) + d(P) \delta_{2+\Gamma_P-\frac{d(P)}{2}}(0, f) + \varepsilon T(r, f) + S(r, f).
\]
which contradicts to the condition (2.3) of Theorem 2.1.

**Case 2.** Next we assume that $H \equiv 0$. Then on integration of (3.1), we get,

$$
\frac{1}{G-1} \equiv \frac{A}{F-1} + B,
$$

where $A(\neq 0)$ and $B$ are complex constants. Clearly $F$ and $G$ share $(1, \infty)$. Also, by construction of $F$ and $G$, $F$ and $G$ share $(\infty, 0)$. So using Lemma 3.14 and condition (2.1) of Theorem 2.1, we obtain

$$
N_2(r, 0; F) + N_2(r, 0; G) + N_r(\infty, 0; F) + N_r(\infty, 0; G) + S(r)
\leq \mu_2 N_{\mu_2}(r, 0; f) + N_{2+\Gamma_P-\delta(P)}(r, 0; f) + (\Gamma_P - \delta(P) + 3) N_r(\infty, 0; f) + S(r)
\leq \{\Gamma_P + \mu_2 + 3\} - (\Gamma_P - \delta(P) + 3) \Theta(\infty, f) - \mu_2 \delta(P)(0, f) - (\Gamma_P - \delta(P) + 3) \Theta(0, f)
- \delta(P) \delta_2(0, f) + \varepsilon\} T(r, f) + S(r)
< T(r, F) + S(r),
$$

where $\varepsilon > 0$ is any small quantity. Hence using Lemma 3.5 and Lemma 3.11 we can conclude that $F \equiv G$, i.e.,

$$
f^n \equiv P[f].$$

Hence the proof is completed. \qed
