Self-Conjugate-Reciprocal Irreducible Monic Factors of $x^n - 1$ over Finite Fields and Their Applications

Arunwan Boripan, Somphong Jitman and Patanee Udomkavanich

Abstract

Self-reciprocal and self-conjugate-reciprocal polynomials over finite fields have been of interest due to their rich algebraic structures and wide applications. Self-reciprocal irreducible monic factors of $x^n - 1$ over finite fields and their applications have been quite well studied. In this paper, self-conjugate-reciprocal irreducible monic (SCRIM) factors of $x^n - 1$ over finite fields of square order have been focused on. The characterization of such factors is given together the enumeration formula. In many cases, recursive formulas for the number of SCRIM factors of $x^n - 1$ have been given as well. As applications, Hermitian complementary dual codes over finite fields and Hermitian self-dual cyclic codes over finite chain rings of prime characteristic have been discussed.

Keywords: complementary dual cyclic codes, self-dual cyclic codes, self-reciprocal polynomials, self-conjugate-reciprocal polynomials

MSC: 11T71, 11T60, 94B05

1 Introduction

A non-zero polynomial $f(x)$ over a finite field $\mathbb{F}_q$ whose constant term is a unit is said to be self-reciprocal if $f(x)$ equals its reciprocal polynomial $f^*(x) := x^{\deg(f(x))} f(0)^{-1} f\left(\frac{1}{x}\right)$. A polynomial is said to be self-reciprocal irreducible monic (SRIM) if it is self-reciprocal, irreducible and monic. Due to their rich algebraic structures and wide applications, SRIM and self-reciprocal polynomials over finite fields have been studied and applied in various...
branches of Mathematics and Engineering. In [5], SRIM polynomials have been characterized up to their degrees. The orders and the number of SRIM polynomials of a given degree over finite fields have been determined in [13]. SRIM factors of $x^n - 1$ were used for characterizing and enumerating Euclidean self-dual cyclic codes over finite fields in [6] and characterizing Euclidean complementary dual cyclic codes over finite fields in [12]. Recently, the enumeration of simple root Euclidean self-dual cyclic codes over finite chain rings has been given in terms of SRIM factors of $x^n - 1$ over finite fields in [1].

Here, we focus on an extension of SRIM polynomials over finite fields. Over a finite field $F_{q^2}$ of square order, the conjugate of a polynomial $f(x) = \sum_{i=0}^{n} f_i x^i$ over $F_{q^2}$ is defined to be $\overline{f(x)} = \overline{f_0} + \overline{f_1} x + \cdots + \overline{f_n} x^n$, where $\overline{\cdot} : F_{q^2} \rightarrow F_{q^2}$ is the field automorphism given by $\alpha \mapsto \alpha^q$ for all $\alpha \in F_{q^2}$. A polynomial $f(x)$ over $F_{q^2}$ (with $f(0) \neq 0$) is said to be self-conjugate-reciprocal if $f(x)$ equals its conjugate-reciprocal polynomial $f^\dagger(x) := \overline{f^*(x)}$. If, in addition, $f(x)$ is monic and irreducible, it is said to be self-conjugate-reciprocal irreducible monic (SCRIM). Characterization of monic irreducible polynomials over $F_{q^2}$ to be SCRIM have been given together with the enumeration of SCRIM polynomials of a fixed degree in [2]. Some properties of SCRIM factors of $x^n - 1$ over $F_{2^l}$ have been studied and used in the characterization and enumeration of Hermitian self-dual cyclic codes in [7].

In this paper, we focus on SCRIM factors of $x^n - 1$ over finite fields $F_{q^2}$, where $q$ is an arbitrary prime power. The characterization and enumeration of such polynomials are given in Section 2. In Section 3, SCRIM factors of $x^n - 1$ over finite fields $F_{q^2}$ are applied in coding theory. Precisely, Hermitian self-dual cyclic codes over finite chain rings of prime characteristic and Hermitian complementary dual cyclic codes are characterized and enumerated in terms of SCRIM factors of $x^n - 1$ over $F_{q^2}$.

2 SCRIM Factors of $x^n - 1$ over Finite Fields

In this section, the SCRIM factors of $x^n - 1$ over $F_{q^2}$ are investigated in the case where $q$ is an arbitrary prime power and $n$ is a positive integer such that $\gcd(n, q) = 1$. The characterization of such factors is given in Subsection 3.1 and the enumeration is provided in Subsection 3.2.

2.1 Characterization of SCRIM Factors of $x^n - 1$ over $F_{q^2}$

Observe that for every monic polynomial $f(x)$ in $F_{q^2}[x]$ with $f(0) \neq 0$, we have $(f^\dagger(x))^\dagger = f(x)$. Therefore, for a monic irreducible polynomial $f(x) \in F_{q^2}[x]$, either $f(x)$ is SCRIM or $f(x)$ and $f^\dagger(x)$ form a pair of distinct polynomials. In the latter case, $f(x)$ and $f^\dagger(x)$ are called a conjugate-reciprocal irreducible monic (CRIM) polynomial pair.

Let $q$ be a prime power and let $n$ be a positive integer such that $\gcd(g, n) = 1$. Denote by $\Omega_{q^2,n}$ and $\Lambda_{q^2,n}$ the set of SCRIM factors of $x^n - 1$ and the set of pairs of CRIM polynomial
pairs in the factorization of $x^n - 1$ in $\mathbb{F}_{q^2}[x]$, respectively. Then $x^n - 1$ can be factorized into a product of irreducible monic polynomials in $\mathbb{F}_{q^2}[x]$ of the following form

$$x^n - 1 = \prod_{i=1}^{\lfloor \Omega_{q^2,n} \rfloor} f_i(x) \prod_{j=1}^{\lfloor \Lambda_{q^2,n} \rfloor} \left( g_j(x) g_j'(x) \right),$$

(2.1)

where $f_i(x)$ is a SCRIM polynomial and $g_j(x)$ and $g_j'(x)$ are a CRIM polynomial pair for all $1 \leq i \leq \lfloor \Omega_{q^2,n} \rfloor$ and $1 \leq j \leq \lfloor \Lambda_{q^2,n} \rfloor$.

For each coprime positive integers $i$ and $j$, the multiplicative order of $j$ modulo $i$, denoted by $\text{ord}_i(j)$, is defined to be the smallest positive integer $s$ such that $j^s \equiv 1 \mod i$. For a positive integer $i$ and nonnegative integer $s$, denote by $2^s \| i$ if $s$ is the largest integer such that $i$ is divisible by $2^s$, i.e., $2^s | i$ but $2^{s+1} \nmid i$.

For each $0 \leq i < n$, the cyclotomic coset of $q^2 \bmod n$ containing $i$ is defined to be the set

$$C_{l_{q^2,n}}(i) = \{ iq^2 \mod n \mid j = 0, 1, 2, \ldots \}.$$

It is not difficult to see that $C_{l_{q^2,n}}(i) = \{ iq^2 \mod n \mid 0 \leq j < \text{ord}_i(q^2) \}$ and $|C_{l_{q^2,n}}(i)| = \text{ord}_i(q^2)$.

For a primitive $n$th root of unity $\alpha$ in some extension field of $\mathbb{F}_{q^2}$ and for each $0 \leq i < n$, it is well known (see [9]) that

$$f(x) = \prod_{j \in C_{l_{q^2,n}}(i)} (x - \alpha^j)$$

is the minimal polynomial of $\alpha^i$ and it is a monic irreducible factor of $x^n - 1$ over $\mathbb{F}_{q^2}$.

We have the following property.

**Lemma 2.2** ([2, Lemma 3.2]). Let $n$ be a positive integer such that $\gcd(q,n) = 1$ and let $\alpha$ be a primitive $n$th root of unity. Let $0 \leq i < n$ and let $f(x)$ be the minimal polynomial of $\alpha^i$. Then $f(x)$ is SCRIM if and only if $C_{l_{q^2,n}}(i) = C_{l_{q^2,n}}(-qi)$.

Using the analysis similar to those in [11, Section 4], the set of SCRIM factors of $x^n - 1$ over $\mathbb{F}_{q^2}$ is

$$\Omega_{q^2,n} = \bigcup_{d|n, \lambda(q,d)=1} \left\{ \prod_{j \in C_{l_{q^2,n}}(i)} (x - \alpha^j) \mid 0 \leq i < n \text{ and } \text{ord}_i(q^2) = d \right\}$$

(2.3)

and the set of pairs of CRIM polynomial pairs in the factorization of $x^n - 1$ over $\mathbb{F}_{q^2}$ is

$$\Lambda_{q^2,n} = \bigcup_{d|n, \lambda(q,d)=0} \left\{ \left( \prod_{j \in C_{l_{q^2,n}}(i)} (x - \alpha^j), \prod_{j \in C_{l_{q^2,n}}(-i)} (x - \alpha^j) \right) \mid 0 \leq i < n \text{ and } \text{ord}_i(q^2) = d \right\},$$

(2.4)
where \( \alpha \) is a primitive \( n \)th root of unity and

\[
\lambda(q, i) = \begin{cases} 
1 & \text{if there exists an odd positive integer } e \text{ such that } i | (q^e + 1), \\
0 & \text{if } i \nmid (q^e + 1) \text{ for all odd positive integers } e.
\end{cases}
\]

Hence, the number of SCRIM factors of \( x^n - 1 \) over \( \mathbb{F}_{q^2} \) is

\[
|\Omega_{q^2,n}| = \sum_{d|n} \lambda(q, d) \frac{\phi(d)}{\text{ord}_d(q^2)}
\tag{2.5}
\]

and the number of pairs of CRIM polynomial pairs in the factorization of \( x^n - 1 \) over \( \mathbb{F}_{q^2} \) is

\[
|\Lambda_{q^2,n}| = \sum_{d|n} (1 - \lambda(q, d)) \frac{\phi(d)}{2^{\text{ord}_d(q^2)}}. \tag{2.6}
\]

The number of monic irreducible factors of \( x^n - 1 \) over \( \mathbb{F}_{q^2} \) is

\[
\sum_{d|n} \frac{\phi(d)}{\text{ord}_d(q^2)} = |\Omega_{q^2,n}| + 2|\Lambda_{q^2,n}|.
\]

Next, we focus on the following extreme cases where \( x - 1 \) is the only SCRIM factor of \( x^n - 1 \) over \( \mathbb{F}_{q^2} \) and where all the factors of \( x^n - 1 \) over \( \mathbb{F}_{q^2} \) are SCRIM.

**Theorem 2.7.** Let \( l \) be an odd prime such that \( l \nmid q \). Then all monic irreducible factors of \( x^l - 1 \) over \( \mathbb{F}_{q^2} \) are SCRIM if and only if \( \text{ord}_l(q^2) \) is odd but \( \text{ord}_l(q) \) is even.

**Proof.** Assume that all monic irreducible factors of \( x^l - 1 \) are SCRIM. Then \( Cl_{q^2,l}(i) = Cl_{q^2,l}(-qi) \) for all \( 0 \leq i < l \) by Lemma 2.2. Let \( 0 < h < l \) and \( v_1 = \text{ord}_l(q^2) \). Then \( Cl_{q^2,l}(h) = Cl_{q^2,l}(-qh) \). Precisely, there exists an integer \( j \geq 0 \) such that

\[
h \equiv (-qh)(q^{2j}) \mod l \tag{2.8}
\]

It follows that \(-qh \equiv h(q^{2(j+1)}) \mod l\) and hence \( h \equiv hq^{2(j+1)} \mod l \). Since \( l \) is odd prime and \( 0 < h < l \), we have \( q^{2(j+1)} \equiv 1 \mod l \). Hence, \( v_1 | (2j + 1) \) which implies that \( v_l \) is odd. It is not difficult to verify that \( \text{ord}_l(q) \in \{v_l, 2v_l\} \). Suppose that \( \text{ord}_l(q) = v_l \). Since \( v_l | (2j + 1) \), we have \( h \equiv q^{2j+1}h \mod l \). From (2.8), it can be concluded that \( h(-q^{2j+1}) \equiv hq^{2k+1} \mod l \). It follows that \( 2hq^{2j+1} \equiv 0 \mod l \). Since \( l \nmid 2q^{2j+1} \), we have \( l|h \). This is a contradiction because \( 0 < h < l \). Therefore, \( \text{ord}_l(q) = 2v_l \) as desired.

Conversely, assume that \( \text{ord}_l(q^2) = v_l \) is odd and \( \text{ord}_l(q) = 2v_l \). Let \( 0 \leq h < l \). Then \( q^{v_l} \equiv -1 \mod l \) which implies that \( hq^{v_l} \equiv -h \mod l \) and \( hq^{v_l+1} \equiv -hq \mod l \). Since \( v_l \) is odd, \( v_l + 1 \) is even and \( hq^{2(v_l+1)} \equiv -hq \mod l \). Consequently, \( Cl_{q^2,l}(h) = Cl_{q^2,l}(-qh) \). By Lemma 2.2 all monic irreducible factors of \( x^l - 1 \) over \( \mathbb{F}_{q^2} \) are SCRIM as desired. \( \square \)

**Proposition 2.9.** Let \( l \) be an odd prime coprime to \( q \). Then either all monic irreducible factors of \( x^l - 1 \) over \( \mathbb{F}_{q^2} \) are SCRIM or \( x - 1 \) is the only SCRIM factor of \( x^l - 1 \) over \( \mathbb{F}_{q^2} \).
Proof. Assume that \( x^l - 1 \) contains more than one SCRIM factor in \( \mathbb{F}_{q^2}[x] \). By Lemma 2.2 there exists an integer \( 0 < h < l \) such that \( Cl_{q^2,l}(h) = Cl_{q^2,l}(-qh) \). Then there exists an integer \( j \geq 0 \) such that \( h \equiv (-qh)(q^{2j}) \mod l \). Hence, \( h(1 + q^{2j+1}) \equiv 0 \mod l \). Since \( l \) is prime and \( 0 < h < l \), it follows that \( (1 + q^{2j+1}) \equiv 0 \mod l \). Equivalently, \( -q^{2j+1} \equiv 1 \mod l \). Thus, \( i \equiv (-qi)q^{2j} \mod l \) for all \( 0 \leq i < l \). Therefore, \( Cl_{q^2,l}(i) = Cl_{q^2,l}(-qi) \) for all \( 0 \leq i < l \). Hence, all monic irreducible factors of \( x^l - 1 \) over \( \mathbb{F}_{q^2} \) are SCRIM.

\[
\text{Corollary 2.10. Let } n \text{ be an odd positive integer coprime to } q. \text{ Then } x - 1 \text{ is the only SCRIM factor of } x^n - 1 \text{ over } \mathbb{F}_{q^2} \text{ if and only if for each prime divisor } l \text{ of } n, \text{ ord}_l(q^2) \text{ is even or ord}_l(q) \text{ is odd.}
\]

Proof. Assume that there exists a prime divisor \( l \) of \( n \) such that \( \text{ord}_l(q^2) \) is odd and \( \text{ord}_l(q) \) is even. Then by Theorem 2.7 all monic irreducible factors of \( x^l - 1 \) over \( \mathbb{F}_{q^2} \) are SCRIM. Since \( (x^l - 1)|(x^n - 1) \), \( x^n - 1 \) contains more than one SCRIM factor over \( \mathbb{F}_{q^2} \).

Conversely, assume that for each prime divisor \( l \) of \( n \), \( \text{ord}_l(q^2) \) is even or \( \text{ord}_l(q) \) is odd. By Theorem 2.7 and Proposition 2.9 \( x - 1 \) is the only SCRIM factor of \( x^l - 1 \) over \( \mathbb{F}_{q^2} \). Suppose that \( x^n - 1 \) contains more than one SCRIM factor over \( \mathbb{F}_{q^2} \). By Lemma 2.2 there exists an integer \( 0 < i < n \) such that \( Cl_{q^2,n}(i) = Cl_{q^2,n}(-qi) \). Then there exists a prime divisor \( l \) of \( n \) such that \( Cl_{q^2,l}(0) \neq Cl_{q^2,l}(i) = Cl_{q^2,l}(-qi) \) which implies that \( x^l - 1 \) contains more than one SCRIM factor over \( \mathbb{F}_{q^2} \), a contradiction. Therefore, \( x - 1 \) is the only SCRIM factor of \( x^n - 1 \) over \( \mathbb{F}_{q^2} \) as desired.

The following lemmas from [10] are useful.

\[
\text{Lemma 2.11 ([10] Proposition 4]). Let } q \text{ be a prime power and let } l \text{ be an odd prime such that } l \nmid q. \text{ Let } r \text{ be a positive integer. Then } \text{ord}_{p^r}(q) = \text{ord}_l(q)p^i \text{ for some } i \geq 0.
\]

\[
\text{Lemma 2.12 ([10] Lemma 1]). Let } a_1, a_2, \ldots, a_t \text{ be positive integers. Then the system of congruences}
\]

\[
x \equiv a_1 \pmod{2a_1}, \quad x \equiv a_2 \pmod{2a_2}, \quad \ldots, \quad x \equiv a_t \pmod{2a_t}
\]

\[
\text{has a solution } x \text{ if and only if there exists } s \geq 0 \text{ such that } 2^s || a_i \text{ for all } i = 1, 2, \ldots, t.
\]

Some characterizations of SCRIM factors of \( x^n - 1 \) over \( \mathbb{F}_{q^2} \) are given in the next theorem.

\[
\text{Theorem 2.13. Let } n \text{ be an odd integer coprime to } q. \text{ Then the following statements are equivalent.}
\]

1) All monic irreducible factors of \( x^n - 1 \) over \( \mathbb{F}_{q^2} \) are SCRIM.

2) For each prime divisor \( l \) of \( n \), all monic irreducible factors of \( x^l - 1 \) over \( \mathbb{F}_{q^2} \) are SCRIM.

3) For each prime divisor \( l \) of \( n \), \( \text{ord}_l(q^2) \) is odd but \( \text{ord}_l(q) \) is even.
Proof. To prove 1) $\Rightarrow$ 2), assume that all monic irreducible factors of $x^n - 1$ over $\mathbb{F}_{q^2}$ are SCRIM. Let $l$ be a prime divisor of $n$. Since $(x^l - 1)|(x^n - 1)$, all monic irreducible factors of $x^l - 1$ over $\mathbb{F}_{q^2}$ are SCRIM as desired.

From Theorem 2.7, we have 2) $\Rightarrow$ 3.

To prove 3) $\Rightarrow$ 1), assume that $\text{ord}_l(q^2)$ is odd but $\text{ord}_l(q)$ is even for all prime divisors $l$ of $n$. Since $\text{ord}_l(q) \in \{\text{ord}_l(q^2), 2\text{ord}_l(q^2)\}$, we have $2|\text{ord}_l(q)$. Assume that $n = l_1^{r_1}l_2^{r_2} \ldots l_t^{r_t}$, where $l_1, l_2, \ldots, l_t$ are distinct primes and $r_i \geq 1$ for all $1 \leq i \leq t$. Then $2|\text{ord}_l(q)$ for every prime $l_i$ dividing $n$. Then, by Lemma 2.11, we have $2|\text{ord}_{l_i}(q)$ for all $i = 1, 2, \ldots, t$.

By Lemma 2.12, there exists an integer $c$ such that $c \equiv \frac{\text{ord}_{l_i}(q)}{2} (\text{mod} \text{ord}_{l_i}(q))$ for all $i = 1, 2, \ldots, t$. Since $\frac{\text{ord}_{l_i}(q)}{2}$ is odd, $c$ is an odd integer. Thus $q^c \equiv -1 (\text{mod} l_i^r)$ for all $i = 1, 2, \ldots, t$ which implies that $q^c \equiv -1 (\text{mod} n)$. Then $c + 1$ is odd and $(q^2)^{c + 1} \equiv q^c + 1 \equiv -q (\text{mod} n)$. Consequently, $Cl_{q^2,n}(h) = Cl_{q^2,n}(qh)$ for all $0 \leq h < n$. By Lemma 2.2, every monic irreducible factor of $x^n - 1$ over $\mathbb{F}_{q^2}$ is SCRIM.

### 2.2 Enumeration of SCRIM Factors of $x^n - 1$ over $\mathbb{F}_{q^2}$

First, note that the number of SCRIM factors of $x^n - 1$ over $\mathbb{F}_{q^2}$ can be determined using (2.5). However, the said formula is not easily computed. The purpose of this subsection is to determined recursive formulas for $|\Omega_{q^2,n}|$ which may reduce the complexity in the computation.

First, we focus on the case where $n$ is even and determine the number $|\Omega_{q^2,n}|$ of CRIM factors of $x^n - 1$ over $\mathbb{F}_{q^2}$ in terms of $|\Omega_{q^2,n'}|$ and $m$, where $n'$ is the odd positive integer such that $n = 2^mn'$.

**Theorem 2.14.** Let $n$ be a positive integer relatively prime to $q$ such that $n = 2^mn'$ where $n'$ is odd and $m \geq 0$. Let $r$ be the positive integer such that $2^r||(q + 1)$. Then the number of SCRIM factors of $x^n - 1$ over $\mathbb{F}_{q^2}$ is

$$|\Omega_{q^2,n}| = \begin{cases} 2^m|\Omega_{q^2,n'}| & \text{if } 0 \leq m \leq r, \\ 2^r|\Omega_{q^2,n'}| & \text{if } m > r. \end{cases}$$

In particular, if $n' = 1$, then $|\Omega_{q^2,n'}| = 1$ and

$$|\Omega_{q^2,2^m}| = \begin{cases} 2^m & \text{if } 0 \leq m \leq r, \\ 2^r & \text{if } m > r. \end{cases}$$

**Proof.** We consider the following two cases.

**Case 1:** $1 \leq m \leq r$. Let $0 \leq i < n'$ be integer such that $Cl_{q^2,n'}(i) = Cl_{q^2,n'}(-qi)$. Claim that the monic irreducible polynomials defined corresponding to $Cl_{q^2,2m,n'}(i), Cl_{q^2,2m,n'}(i + n'), Cl_{q^2,2m,n'}(i + 2n'), \ldots, Cl_{q^2,2m,n'}(i + (2^m - 1)n')$ are the distinct SCRIM factors of $x^n - 1$ over $\mathbb{F}_{q^2}$. Consider the following steps.
Step I: Show that $Cl_{q^2,2^{m+n}'}(i) = Cl_{q^2,2^{m+n}'}(-qi)$. Since $Cl_{q^2,n'}(i) = Cl_{q^2,n'}(-qi)$, there exists an integer $j \geq 0$ such that,

$$i \equiv (-qi)q^{2j} \equiv -iq^{2j+1} \mod n'. \quad (2.15)$$

Since $2^m|2^r$ and $2^r|(q+1)$, we have $2^m|(q+1)$. Precisely, $q = 2^m k - 1$ for some positive integer $k$. Then

$$q^{2j+1} + 1 = (2^m k - 1)^{2j+1} + 1$$
$$= (2^m k - 1)^{2j+1} + 1^{2j+1}$$
$$= (2^m k - 1 + 1) \sum_{t=0}^{2j} (-1)^t (2^m k - 1)^{2j-t}$$
$$= 2^m k \sum_{t=0}^{2j} (-1)^t (2^m k - 1)^{2j-t}$$

It follows that $1 \equiv -q^{2j+1} \mod 2^m$. Together with (2.15), we have $i \equiv (-qi)q^{2j} \mod 2^m n'$. Consequently, $Cl_{q^2,2^{m+n}'}(i) = Cl_{q^2,2^{m+n}'}(-qi)$.

Step II: Show that $Cl_{q^2,2^{m+n}'}(i + kn') = Cl_{q^2,2^{m+n}'}(-q(i + kn'))$ for all $1 \leq k \leq 2^m - 1$. Let $1 \leq k \leq 2^m - 1$ be an integer. Since $1 + q^{2j+1} \equiv 0 \mod 2^m$ and $n'|kn'$, we have $kn'(1 + q^{2j+1}) \equiv 0 \mod 2^m n'$. It follows that

$$(i + kn') + q^{2j+1}(i + kn') \equiv (1 + q^{2j+1})(i + kn') \mod 2^m n'$$
$$\equiv i(1 + q^{2j+1}) + kn'(1 + q^{2j+1}) \mod 2^m n'$$
$$\equiv 0 \mod 2^m n'$$

and hence, $(i + kn') \equiv -q(i + kn')q^{2j} \mod 2^m n'$. As desired, we have $Cl_{q^2,2^{m+n}'}(i + kn') = Cl_{q^2,2^{m+n}'}(-q(i + kn'))$ for all $1 \leq k \leq 2^m - 1$.

Step III: Show that $Cl_{q^2,2^{m+n}'}(i + kn') \neq Cl_{q^2,2^{m+n}'}(i + hn')$ for all $0 \leq k < h \leq 2^m - 1$. Suppose that there exist integers $0 \leq k < h \leq 2^m - 1$ such that

$$Cl_{q^2,2^{m+n}'}(i + kn') = Cl_{q^2,2^{m+n}'}(i + hn').$$

Then there exists an integer $j$ such that $i + kn' \equiv -q(i + hn')q^{2j} \mod 2^m n'$ which implies that $i + kn' \equiv -q(i + hn')q^{2j} \mod 2^m$. It follows that

$$i(1 + q^{2j+1}) + n'(k + hq^{2j+1}) \equiv 0 \mod 2^m. \quad (2.16)$$

Since $2^m|(1 + q^{2j+1})$, we have $2^m|i(1 + q^{2j+1})$ and hence $2^m|n'(k + hq^{2j+1})$ by (2.16). Since $n'$ is odd, it can be concluded that $2^m|(k + hq^{2j+1})$. Since $k < h$, we have have $h = k + a$ for some positive integer $d \leq 2^m - 1$. Hence,

$$k + hq^{2j+1} = k + (k + a)q^{2j+1} = k(q^{2j+1} + 1) + aq^{2j+1}.$$
Since $2^m|(k + hq^{2j+1})$ and $2^m|(q^{2j+1} + 1)$, it can be deduced that $2^m|aq^{2j+1}$. Since $q$ is odd, $2^m|a$, a contradiction. Hence, the sets $Cl_{q^2,2mn'}(i), Cl_{q^2,2mn'}(i+n'), Cl_{q^2,2mn'}(i+2n'), \ldots, Cl_{q^2,2mn'}(i+(2^m-1)n')$ are distinct.

**Step IV:** Show that for each $0 \leq h < 2^m n'$, if $Cl_{q^2,2mn'}(h) = Cl_{q^2,2mn'}(-qh)$, then $Cl_{q^2,2mn'}(h) = Cl_{q^2,2mn'}(i + kn')$ for some integers $0 \leq k \leq 2^m - 1$ and $0 \leq i < n'$ such that $Cl_{q^2,2mn'}(i) = Cl_{q^2,2mn'}(q i)$. Let $0 \leq h < 2^m n'$ be such that $Cl_{q^2,2mn'}(h) = Cl_{q^2,2mn'}(-qh)$. Then $Cl_{q^2,2mn'}(h) = Cl_{q^2,2mn'}(i + kn')$ for some for some integers $0 \leq k \leq 2^m - 1$ and $0 \leq i < n'$. It follow that $i + kn' \equiv -q(i + kn')q^{2j}\mod 2^m n'$ for some integer $j \geq 0$. Hence,

$$(i + iq^{2j+1}) + kn'(1 + q^{2j+1}) \equiv 0 \mod 2^m n'$$

which implies that

$$(i + iq^{2j+1}) + kn'(1 + q^{2j+1}) \equiv 0 \mod n'.$$

We have $i + iq^{2j+1} \equiv 0 \mod n'$ and hence $Cl_{q^2}(i)\mod n' = Cl_{q^2}(-qi)\mod n'$.

Therefore, the monic irreducible polynomials defined corresponding to the cyclotomic cosets $Cl_{q^2,2mn'}(i), Cl_{q^2,2mn'}(i + n'), Cl_{q^2,2mn'}(i + 2n'), \ldots, Cl_{q^2,2mn'}(i + (2^m - 1)n')$ are the distinct SCRIM factors of $x^n - 1$. Hence, $|\Omega_{q^2,n}| = 2^m|\Omega_{q^2,n'}|$ as desired.

**Case 2:** $m > r$. Let $k = m - r > 0$. We prove that $|\Omega_{q^2,2mn'}| = |\Omega_{q^2,2^{r+k}n'}| = 2^r|\Omega_{q^2,n'}|$. Since $(x^{2n'} - 1)|(x^{2^{r+k}n'} - 1)$, it is sufficient to show that every SCRIM factor of $x^{2^{r+k}n'} - 1$ is a divisor of $x^{2n'} - 1$. Suppose that there exists a SCRIM factor $f(x)$ of $x^{2^{r+k}n'} - 1$ such that $f(x) \nmid (x^{2n'} - 1)$. Then $f(x) \neq x - 1$. Let $\alpha$ be a primitive $2^{r+k}n'$th root of unity. Then $f(x)$ is the minimal polynomial of $\alpha^i$ for some $0 < i < 2^{r+k}n'$. Suppose that $i$ is even. Then $i = 2i'$ for some $i' \in \mathbb{N}$ and $(\alpha^{i'})^{2^{r+k-1}n'} = (\alpha^{i'})^{2^{r+k-1}n'} = (\alpha^{i'})^{2^{r+k}n'} = (\alpha^{r+k}n')^{i'} = 1$. Applying the above expression recursively, we have $(\alpha^{i'})^{2^{r+k}n'} = (\alpha^{i'})^{2^{r+k}n'} = \cdots = (\alpha^{i'})^{2^{r+k}n'} = 1$. It follows that ord$(\alpha^i)|2^n n'$ which implies that $f(x)|(x^{2^n n'} - 1)$, a contradiction. Hence, $i$ must be odd. Since $f(x)$ is SCRIM, $|Cl_{q^2,2^{r+k}n'}(i)|$ is odd by [2] Theorem 3.3. It follows that $d := \sum_{j \in Cl_{q^2,2^{r+k}+1}(i)} j$ is odd. Since

$$f(0) = \prod_{j \in Cl_{q^2,2^{r+k}+1}(i)} \alpha^j = \alpha^d,$$

it can be concluded that

$$1 = f(0)^{\text{ord}_{q^2}(f(0))} = (\alpha^d)^{\text{ord}_{q^2}(f(0))}.$$

Since $\alpha$ is a primitive $2^{r+k}n'$th root of unity, we have $2^{r+k}n'|\text{ord}_{q^2}(f(0))$. Since $d$ is odd, it is implies that $2^{r+k}|\text{ord}_{q^2}(f(0))$.

Since $f(x) = f^\dagger(x)$, it follows that $f(0)^{-q} = f(0)$. Equivalently, $f(0)^q+1 = 1$ which implies that ord$_q(f(0))|(q + 1)$. Hence, $2^{r+k}|(q + 1)$, a contradiction. Hence, there are no SCRIM polynomials $f(x)$ such that $f(x) \mid (x^{2^{r+k}n'} - 1)$ but $f(x) \nmid (x^{2n'} - 1)$. Therefore, $|\Omega_{2mn'}| = |\Omega_{2^{r}n'}|$. In the case where $n' = 1$, it is obvious that $|\Omega_{q^2,n'}| = 1$. Hence, the result follows. \[\square\]
Next, we focus on the case where \( n = n_1n_2 \) is odd and \( x - 1 \) is only the SCRIM factor \( x^{n_1} - 1 \) and \( x^{n_2} - 1 \) over \( \mathbb{F}_{q^2} \).

**Theorem 2.17.** Let \( n_1 \) and \( n_2 \) be coprime odd integers relatively prime to \( q \). If \( x - 1 \) is only the SCRIM factor \( x^{n_1} - 1 \) and \( x^{n_2} - 1 \) over \( \mathbb{F}_{q^2} \), then it is the only SCRIM factor of \( x^{n_1n_2} - 1 \) over \( \mathbb{F}_{q^2} \).

**Proof.** Let \( 0 \leq h < n_1n_2 \) such that \( \text{Cl}_{q^2,n_1n_2}(h) = \text{Cl}_{q^2,n_1n_2}(-qh) \). Then there exist \( i \in \mathbb{N} \) such that \( hq^{2i} \equiv -hq \mod n_1n_2 \). Since \( \gcd(q, n_1) = 1 \) and \( \gcd(q, n_2) = 1 \),

\[
hq^{2i} \equiv -hq \mod n_1 \quad \text{and} \quad hq^{2i} \equiv -hq \mod n_2.
\]

Since \( x - 1 \) is only the SCRIM factor \( x^{n_1} - 1 \) and \( x^{n_2} - 1 \) over \( \mathbb{F}_{q^2} \), we have \( h \equiv 0 \mod n_1 \) and \( h \equiv 0 \mod n_2 \). Since \( n_1 \) and \( n_2 \) are coprime, we have \( h = 0 \). Hence, \( x^{n_1n_2} - 1 \) contains only one SCRIM over \( \mathbb{F}_{q^2} \). \( \square \)

The next corollary follows immediately.

**Corollary 2.18.** Let \( n_1 \) and \( n_2 \) be coprime odd integers relatively prime to \( q \). If \( x - 1 \) is only the SCRIM factor \( x^{n_1} - 1 \) and \( x^{n_2} - 1 \) over \( \mathbb{F}_{q^2} \), then the number of SCRIM factors of \( x^{n_1n_2} - 1 \) over \( \mathbb{F}_{q^2} \) is \( |\Omega_{q^2,n_1n_2}| = |\Omega_{q^2,n_1}|\Omega_{q^2,n_2} = 1 \).

In the following theorem, we focus on the case where \( n = n_1n_2 \) is odd and all irreducible factors of \( x^{n_1} - 1 \) over \( \mathbb{F}_{q^2} \) are SCRIM and \( x - 1 \) is the only SCRIM factor of \( x^{n_2} - 1 \) over \( \mathbb{F}_{q^2} \).

**Theorem 2.19.** Let \( n_1 \) and \( n_2 \) be coprime odd integers relatively prime to \( q \). If all irreducible factors of \( x^{n_1} - 1 \) over \( \mathbb{F}_{q^2} \) are SCRIM and \( x - 1 \) is the only SCRIM factor of \( x^{n_2} - 1 \) over \( \mathbb{F}_{q^2} \), then the number of SCRIM factors of \( x^{n_1n_2} - 1 \) over \( \mathbb{F}_{q^2} \) is \( |\Omega_{q^2,n_1}| \).

**Proof.** Assume that all irreducible factors of \( x^{n_1} - 1 \) over \( \mathbb{F}_{q^2} \) are SCRIM and \( x - 1 \) is the only SCRIM factor of \( x^{n_2} - 1 \) over \( \mathbb{F}_{q^2} \). By Lemma 2.22, \( \text{Cl}_{q^2,n_1}(h) = \text{Cl}_{q^2,n_1}(-qh) \) for all \( 0 \leq h < n_1 \) and \( \text{Cl}_{q^2,n_2}(k) \neq \text{Cl}_{q^2,n_2}(-qk) \) for all \( 0 < k < n_2 \). It suffices to prove the following steps.

**Step I:** Show that \( \text{Cl}_{q^2,n_1n_2}(hn_2) = \text{Cl}_{q^2,n_1n_2}(-qh\text{n}_2) \) for all \( 0 \leq h < n_1 \). Let \( 0 \leq h < n_1 \). Since \( \text{Cl}_{q^2,n_1}(h) = \text{Cl}_{q^2,n_1}(-qh) \), we have \( hq^{2i} \equiv -hq \mod n_1 \) for some integer \( i \geq 0 \). Hence, \( hq^{2i} \equiv -hq \mod n_2 \) which implies that \( \text{Cl}_{q^2,n_1n_2}(hn_2) = \text{Cl}_{q^2,n_1n_2}(-qh\text{n}_2) \) for all \( 0 \leq h < n_1 \).

**Step II:** Show that \( \text{Cl}_{q^2,n_1n_2}(an_2) \neq \text{Cl}_{q^2,n_1n_2}(bn_2) \) for all \( 0 \leq a < b < n_1 \) such that \( \text{Cl}_{q^2,n_1}(a) \neq \text{Cl}_{q^2,n_1}(b) \). Suppose that \( \text{Cl}_{q^2,n_1n_2}(an_2) = \text{Cl}_{q^2,n_1n_2}(bn_2) \) and \( \text{Cl}_{q^2,n_1}(a) \neq \text{Cl}_{q^2,n_1}(b) \) for some \( 0 \leq a < b < n_1 \). Then \( an_2^{2i} \equiv bn_2 \mod n_1n_2 \) for some integer \( i \geq 0 \). It follows that \( aq^{2i} \equiv b \mod n_1 \) which implies that \( \text{Cl}_{q^2,n_1}(a) \neq \text{Cl}_{q^2,n_1}(b) \), a contradiction. Hence, the statement is proved. 

9
Step III: Prove that $\text{Cl}_{n_1, n_2}(c) \neq \text{Cl}_{n_1, n_2}(-qc)$ for all $c \notin \{an_2 \mid 0 \leq a < n_1\}$. Let $c \notin \{an_2 \mid 0 \leq a < n_1\}$. Then $c = an_2 + b$ for some $0 \leq a < n_1$ and $0 < b < n_2$. Suppose that $\text{Cl}_{n_1, n_2}(c) = \text{Cl}_{n_1, n_2}(-qc)$. Then $q^{2i}(an_2 + b) \equiv -q(an_2 + b) \mod n_1 n_2$ for some integer $i \geq 0$. It follows that $q^{2i}(an_2 + b) \equiv -q(an_2 + b) \mod n_2$ and hence, $q^{2i}b \equiv -qb \mod n_2$. It can be deduced that $\text{Cl}_{n_1, n_2}(b) = \text{Cl}_{n_1, n_2}(-qb)$, a contradiction. Hence, $\text{Cl}_{n_1, n_2}(c) \neq \text{Cl}_{n_1, n_2}(-qc)$ for all $c \notin \{an_2 \mid 0 \leq a < n_1\}$.

Therefore, we have $|\Omega_{n_1, n_2}| = |\Omega_{n_1}|$ as desired.

In the next theorem, we consider the case where $n = n_1 n_2$ is odd and all irreducible monic factors of $x^{n_1} - 1$ and $x^{n_2} - 1$ over $\mathbb{F}_{q^2}$ are SCRIM.

**Theorem 2.20.** Let $n_1$ and $n_2$ be odd integers coprime to $q$. If all irreducible monic factors of $x^{n_1} - 1$ and $x^{n_2} - 1$ over $\mathbb{F}_{q^2}$ are SCRIM, then all irreducible monic factor of $x^{n_1 n_2} - 1$ over $\mathbb{F}_{q^2}$ are SCRIM.

**Proof.** Assume that the irreducible monic factors of $x^{n_1} - 1$ and $x^{n_2} - 1$ over $\mathbb{F}_{q^2}$ are SCRIM. From Theorem 2.13, $\text{ord}_l(q^2)$ is odd and $\text{ord}_l(q)$ is even for all prime divisors $l$ of $n_1$ and $n_2$. Hence, $\text{ord}_l(q^2)$ is odd and $\text{ord}_l(q)$ is even for all prime divisors $l$ of $n_1 n_2$. By Theorem 2.13, the irreducible monic factor of $x^{n_1 n_2} - 1$ over $\mathbb{F}_{q^2}$ are SCRIM.

Theorem 2.20 does not imply that $|\Omega_{q^2, n_1 n_2}| = |\Omega_{q^2, n_1}| |\Omega_{q^2, n_2}|$. However, it is true in some cases. It is not difficult to see that $|\Omega_{5^2, 7, 23}| = 9 \cdot 3 = |\Omega_{5^2, 7}| |\Omega_{5^2, 23}|$ and $|\Omega_{3^2, 7, 19}| = 17 \neq 3 \cdot 3 = |\Omega_{3^2, 7}| |\Omega_{3^2, 19}|$. Necessary conditions for $n_1$ and $n_2$ to have $|\Omega_{q^2, n_1 n_2}| = |\Omega_{q^2, n_1}| |\Omega_{q^2, n_2}|$ are given in the next corollary.

**Corollary 2.21.** Let $l_1$ and $l_2$ be distinct odd primes relatively prime to $q$. If all irreducible factors of $x^{l_1} - 1$ and $x^{l_2} - 1$ over $\mathbb{F}_{q^2}$ are SCRIM such that $\gcd(\text{ord}_{l_1}(q^2), \text{ord}_{l_2}(q^2)) = 1$, then the number of SCRIM factors of $x^{l_1 l_2} - 1$ over $\mathbb{F}_{q^2}$ is $|\Omega_{q^2, l_1 l_2}| = |\Omega_{q^2, n_1}| |\Omega_{q^2, n_2}|$.

**Proof.** From Theorem 2.20, all irreducible factors of $x^{l_1 l_2} - 1$ over $\mathbb{F}_{q^2}$ are SCRIM. Since $\gcd(\text{ord}_{l_1}(q^2), \text{ord}_{l_2}(q^2)) = 1$, we have $\text{ord}_{l_1 l_2}(q^2) = \text{ord}_{l_1}(q^2) \text{ord}_{l_2}(q^2)$. Hence,

$$|\Omega_{q^2, l_1 l_2}| = \sum_{d | l_1 l_2} \frac{\phi(d)}{\text{ord}_d(q^2)}$$

$$= 1 + \frac{\phi(l_1)}{\text{ord}_{l_1}(q^2)} + \frac{\phi(l_2)}{\text{ord}_{l_2}(q^2)} + \frac{\phi(l_1 l_2)}{\text{ord}_{l_1 l_2}(q^2)}$$

$$= 1 + \frac{\phi(l_1)}{\text{ord}_{l_1}(q^2)} + \frac{\phi(l_2)}{\text{ord}_{l_2}(q^2)} + \frac{\phi(l_1) \phi(l_2)}{\text{ord}_{l_1}(q^2) \text{ord}_{l_2}(q^2)}$$

$$= [1 + \frac{\phi(l_1)}{\text{ord}_{l_1}(q^2)}][1 + \frac{\phi(l_2)}{\text{ord}_{l_2}(q^2)}][1 + \frac{\phi(l_1 l_2)}{\text{ord}_{l_1 l_2}(q^2)}]$$

$$= 1 + \frac{\phi(l_1)}{\text{ord}_{l_1}(q^2)}[1 + \frac{\phi(l_2)}{\text{ord}_{l_2}(q^2)}]$$

$$= |\Omega_{q^2, l_1}| |\Omega_{q^2, l_2}|$$

as desired.
The results can be summarized in the following theorem.

**Theorem 2.22.** Let \( q \) be a prime power and let \( l_1, l_2, \ldots, l_t \) be distinct odd primes relatively prime to \( q \). For each \( 1 \leq i \leq t \), let \( r_i \) be a positive integer and let \( \text{ord}_{l_i}(q) = 2^a d_i \), where \( a_i \geq 0 \) is an integer and \( d_i \geq 1 \) is an odd integer. Then the following statements hold.

1) If there exists \( j \in \{1, 2, \ldots, t\} \) such that \( a_j = 0 \) or \( a_j \geq 2 \), then

\[
|\Omega_{q^2} \Pi_{i=1}^{t} l_i^{r_i}| = |\Omega_{q^2} \Pi_{i=1}^{t-j} l_i^{r_i} \Pi_{i=j+1}^{t} l_i^{r_i}|.
\]

2) If \( a_1 = a_2 = \cdots = a_t = 1 \), then

\[
|\Omega_{q^2} \Pi_{i=1}^{t} l_i^{r_i}| = \sum_{d \mid \Pi_{i=1}^{t} l_i^{r_i}} \frac{\phi(d)}{\text{ord}_{d}(q^2)}.
\]

3) If \( a_i \neq 1 \) for all \( i \in \{1, 2, \ldots, t\} \), then

\[
|\Omega_{q^2} \Pi_{i=1}^{t} l_i^{r_i}| = 1.
\]

*The empty product will be regarded as 1.*

**Proof.** To prove 1), assume that there exists \( j \in \{1, 2, \ldots, t\} \) such that \( a_j = 0 \) or \( a_j \geq 2 \). Then \( \text{ord}_{l_i}(q) = d_i \) is odd or \( \text{ord}_{l_i}(q^2) \) is even. Then the result can be obtained via Corollary 2.10 and Theorem 2.19.

To prove 2), assume that \( a_1 = a_2 = \cdots = a_t = 1 \). Then \( \text{ord}_{l_i}(q) = 2d_i \) and \( \text{ord}_{l_i}(q^2) = d_i \) for all \( 1 \leq i \leq t \). The result follows from Theorem 2.13 and (2.5).

To prove 3), assume that \( a_i \neq 1 \) for all \( i \in \{1, 2, \ldots, t\} \). Then for each \( i \in \{1, 2, \ldots, t\} \) we have \( \text{ord}_{l_i}(q) = d_i \) or \( \text{ord}_{l_i}(q^2) \) is even. Then the result follows from Corollary 2.10 and Theorem 2.17.

From Theorems 2.14 and 2.22 the number \( |\Omega_{q^2,n}| \) can be determined for all prime power \( q \) and all positive integers \( n \) with \( \gcd(n, q) = 1 \) using the following steps.

1. Write \( n = 2^m n' \), where \( n' \) is an odd positive integer and \( m \geq 0 \) is an integer.

2. Consider the following 2 cases.

   (a) \( n' = 1 \). Then \( |\Omega_{q^2,n}| = |\Omega_{q^2,2^m}| \) can be determined in Theorem 2.14.

   (b) \( n' \geq 3 \). Compute a prime factorization of \( n' \). Then \( n' = \prod_{i=1}^{t} l_i^{r_i} \), where \( t, r_1, r_2, \ldots, r_t \) are positive integers and \( l_1, l_2, \ldots, l_t \) are distinct primes.

      i. Compute \( \text{ord}_{l_i}(q) \).

      ii. Set \( n'' = \prod_{i=1,2;\text{ord}_{l_i}(q)} l_i^{r_i} \).

      iii. Compute \( |\Omega_{q^2,n''}| = |\Omega_{q^2,n'}| \) using Theorem 2.22.

      iv. Compute \( |\Omega_{q^2,n}| = |\Omega_{q^2,2^m}| |\Omega_{q^2,n'}| = |\Omega_{q^2,2^m}||\Omega_{q^2,n''}| \) using Theorems 2.14 and 2.22.
3 Applications

Due to their rich algebraic structures and wide applications, a family of cyclic codes has become of interest and been continuously studied. In this section, discussion on applications of SCRIM factors of \(x^n - 1\) over \(\mathbb{F}_{q^2}\) in the study of some cyclic codes will be given. In Subsection 3.1, the characterization and enumeration of Hermitian complementary dual codes of arbitrary lengths are given in terms of SCRIM factors of \(x^n - 1\) over \(\mathbb{F}_{q^2}\). Note that some results on Hermitian self-dual simple root cyclic codes over finite fields have been given in \(\text{[7]}\). The characterization and enumeration of Hermitian self-dual simple root cyclic codes over finite chain rings of prime characteristic are given based on the SCRIM factors of \(x^n - 1\) over \(\mathbb{F}_{q^2}\) in Subsection 3.2.

First, some basic concepts of cyclic codes over finite fields and over finite rings are recalled. In this paper, we focus on codes over a finite field \(\mathbb{F}_{q^2}\) and a finite chain ring \(R := \mathbb{F}_{q^2} + u\mathbb{F}_{q^2} + \cdots + u^{t-1}\mathbb{F}_{q^2}\), where \(t \geq 1\) and \(u^t = 0\). Note that \(R \cong \mathbb{F}_{q^2}\) if \(t = 1\). The ring \(R\) can be viewed as a quotient ring \(R \cong \mathbb{F}_{q^2}[z]/\langle z^t \rangle\). Note that \(R\) is local with maximal ideal \(\langle u \rangle\), nilpotency index \(t\), and order \(q^{2t}\). The residue field of \(R\) is \(\mathbb{F}_{q^2}\) and the characteristic of \(R\) equals the characteristic of \(\mathbb{F}_{q^2}\) which is prime. Let \(\varphi : R \to \mathbb{F}_{q^2} \cong R/\langle u \rangle\) be defined by \(\varphi(a) = a + \langle u \rangle\) for all \(a \in R\). Extend the map to be \(\varphi : R[x] \to \mathbb{F}_{q^2}[x]\) be defined by

\[
\sum_{i=0} a_i x^i \mapsto \sum_{i=0} \varphi(a_i)x^i.
\]

A linear code of length \(n\) over \(R\) is an \(R\)-submodule of the \(R\)-module \(R^n\). In particular, if \(t = 1\), \(R^n = \mathbb{F}_{q^2}^n\) is an \(\mathbb{F}_{q^2}\)-vector space and a linear code over \(R\) becomes a \(\mathbb{F}_{q^2}\)-subspace of \(\mathbb{F}_{q^2}^n\). A linear code \(C\) of length \(n\) over \(R\) is called a cyclic code if it is invariant under the cyclic shift. Precisely, \((c_{n-1}, c_0, \ldots, c_{n-2}) \in C\) for all \((c_0, c_1, \ldots, c_{n-1}) \in C\).

For \(u = (u_0, u_1, \ldots, u_{n-1})\) and \(v = (v_0, v_1, \ldots, v_{n-1})\) in \(R^n\), the Euclidean inner product of \(u\) and \(v\) is defined to be

\[
\langle u, v \rangle_E := \sum_{i=0}^{n-1} u_i v_i
\]

and the Hermitian inner product of \(u\) and \(v\) is defined to be

\[
\langle u, v \rangle_H := \sum_{i=0}^{n-1} u_i \overline{v_i}
\]

where \(\overline{\cdot}\) is the conjugation

\[
a = \sum_{i=0}^{n-1} u^i a_i \mapsto \sum_{i=0}^{n-1} u^i a_i^q
\]

(3.1)

for all \(a \in R\).

The Euclidean dual of a linear code \(C\) in \(R^n\) is defined to be the set

\[
C^\perp_E := \{ u \in R^n \mid \langle u, v \rangle_E = 0 \text{ for all } v \in C \}\]
and the Hermitian dual of a linear code $C$ in $R^n$ is defined to be the set

$$C^\perp_H := \{ u \in R^n \mid \langle u, v \rangle_H = 0 \text{ for all } v \in C \}.$$ 

A linear code $C$ over $R$ is said to be Euclidean self-dual (resp. Hermitian self-dual) if $C = C^{\perp_E}$ (resp. $C = C^{\perp_H}$). A linear code $C$ over $R$ is said to be Euclidean complementary dual (resp. Hermitian complementary dual) if $C \cap C^{\perp_E} = \{0\}$ (resp. $C \cap C^{\perp_H} = \{0\}$).

It is well known that the Euclidean and Hermitian dual of a cyclic code $C$ is again a cyclic code over $R$ and a cyclic code of length $n$ over $R$ can be viewed as an isomorphic ideal of the quotient ring $R[x]/(x^n - 1)$. In order to characterize the ideals in $R[x]/(x^n - 1)$, the following basic concepts can be generalized from that of polynomials over finite fields in Section 1. For a polynomial $f(x) = \sum_{i=0}^{k} f_i x^i$ of degree $k$ in $R[x]$ whose constant term $f_0$ is a unit in $R$, let $f^\ast(x)$ denote the reciprocal polynomial of $f(x)$, i.e., $f^\ast(x) = x^k f_0^{-1} f \left( \frac{1}{x} \right)$. A polynomial $f(x)$ is said to be self-reciprocal if $f(x) = f^\ast(x)$. The conjugate polynomial of $f(x)$ in $R[x]$ is defined to be $\overline{f(x)} = f_0 + f_1 x + \cdots + f_n x^n$, where $\overline{\cdot}$ is the conjugation in $R$ defined in (3.1). The conjugate-reciprocal polynomial of $f(x)$ is defined to be $f^\dagger(x) = f^\ast(\overline{x})$. A polynomial $f(x)$ is said to be self-conjugate-reciprocal if $f(x) = f^\dagger(x)$.

SCRIM factors of $x^n - 1$ over $\mathbb{F}_{q^2}$ can be applied in the study of Hermitian complementary dual cyclic codes over $\mathbb{F}_{q^2}$ and of Hermitian self-dual simple root cyclic codes over $R$ in the following subsections.

### 3.1 Hermitian Complementary Dual Cyclic Codes over Finite Fields

First, we note that the characterization and enumeration of Hermitian complementary dual cyclic codes over finite fields can be viewed as the special case of Hermitian complementary dual abelian codes in group algebras [3], where the underlying group is cyclic. Here, simpler and direct study of such complementary dual codes of arbitrary lengths using SCRIM factors of $x^n - 1$ in $\mathbb{F}_{q^2}[x]$. Some results on Hermitian self-dual simple root cyclic codes over finite fields have been discussed in [7].

Recall that a cyclic code $C$ of length $n$ over $\mathbb{F}_{q^2}$ can be viewed as an ideal in the principal ideal ring $\mathbb{F}_{q^2}[x]/(x^n - 1)$ generated by a unique monic divisor of $x^n - 1$ (see [9]). The such polynomial is called the generator polynomial for $C$. The generator polynomial of the Hermitian dual $C^{\perp_H}$ can be determined in the next proposition.

**Proposition 3.2** ([11]). Let $C$ be a cyclic code of length $n$ over $\mathbb{F}_{q^2}$ with generator polynomial $g(x)$. Then $C^{\perp_H}$ is a cyclic code of length $n$ over $\mathbb{F}_{q^2}$ with generator polynomial $h^\dagger(x)$, where $h(x) = \frac{x^n - 1}{g(x)}$.

Necessary and sufficient conditions for cyclic codes of length $n$ over $\mathbb{F}_{q^2}$ to be Hermitian complementary dual are given in the next theorem.
Theorem 3.3. Let $\mathbb{F}_{q^2}$ be a finite field and let $n$ be a positive integer. Let $C$ be a cyclic code of length $n$ over $\mathbb{F}_{q^2}$ with generator polynomial $g(x)$. Then the following statements are equivalent.

1) $C$ is Hermitian complementary dual.

2) $\gcd(g(x), h^\dagger(x)) = 1$.

3) $g(x)$ is self-conjugate-reciprocal and for each irreducible factor of $g(x)$ has the same multiplicity in $g(x)$ and in $x^n - 1$.

Proof. Note that $\langle \gcd(g(x), h^\dagger(x)) \rangle = C + C^{⊥ n}$. Then $C$ is Hermitian complementary dual if and only if $C + C^{⊥ n} = \mathbb{F}_{q^2} = \langle 1 \rangle$. Equivalently, $\gcd(g(x), h^\dagger(x)) = 1$. Therefore, 1) and 2) are equivalent.

To prove 2) $\Rightarrow$ 3), assume that $\gcd(g(x), h^\dagger(x)) = 1$. Since $h^\dagger(x)|(x^n - 1)$, we have $g(x)h^\dagger(x) = x^n - 1 = (x^n - 1)\dagger = g^\dagger(x)h^\dagger(x)$. Hence, $g(x)$ is conjugate-self-reciprocal.

Suppose that there exists a monic irreducible factor $f(x)$ of $g(x)$ such that the multiplicity in $g(x)$ is less than the multiplicity in $x^n - 1$. Since $g(x) = g^\dagger(x)$, $f(x)|g^\dagger(x)$ and $f(x)|h^\dagger(x)$. It follows that $f(x)|\gcd(g(x), h^\dagger(x))$, a contradiction. Hence, every irreducible factor of $g(x)$ has the same multiplicity in $g(x)$ and in $x^n - 1$.

To prove 3) $\Rightarrow$ 2), assume that $\gcd(g(x), h^\dagger(x)) \neq 1$. Let $f(x)$ be a monic irreducible factor of $\gcd(g(x), h^\dagger(x))$. Let $t$ be the multiplicity of $f(x)$ in $g(x)$. Then $f(x)^t|g(x)$ and $f(x)|h^\dagger(x)$. Assume further that $g(x) = g^\dagger(x)$. Then $h^\dagger(x) = h(x)$ and $f(x)|h(x)$. Hence, $f(x)^{t+1}$ is a divisor of $g(x)h(x) = x^n - 1$. Precisely, the multiplicity of $f(x)$ in $g(x)$ is less than the multiplicity of $f(x)$ in $x^n - 1$.

The next corollary follows immediately from the previous theorem.

**Corollary 3.4 (Lemma 2).** Let $\mathbb{F}_{q^2}$ be a finite field and let $n$ be a positive integer such that $\gcd(n, q) = 1$. Let $C$ be a cyclic code of length $n$ over $\mathbb{F}_{q^2}$ with generator polynomial $g(x)$. Then $C$ is Hermitian complementary dual if and only if $g(x) = g^\dagger(x)$.

**Corollary 3.5.** Let $\mathbb{F}_{q^2}$ be a finite field of characteristic $p$ and let $n = p^n \nu'$, where $\nu \geq 0$ and $p \nmid \nu'$. Then the number of Hermitian complementary dual cyclic codes of length $n$ over $\mathbb{F}_{q^2}$ is independent of $\nu$ and it is

$$2^{\left| \Omega_{q^2,n'} \right| + \left| \Lambda_{q^2,n'} \right|},$$

where $\left| \Omega_{q^2,n'} \right|$ and $\left| \Lambda_{q^2,n'} \right|$ are determined in previous section.

**Proof.** From Theorem 3.3, a cyclic code of length $n$ over $\mathbb{F}_{q^2}$ is Hermitian complementary dual if and only if $C$ has generator polynomial of the following form

$$g(x) = \prod_{i=1}^{\left| \Omega_{q^2,n'} \right|} f_i(x)^s \prod_{j=1}^{\left| \Lambda_{q^2,n'} \right|} \left( g_i(x)g_j^\dagger(x) \right)^t.$$
where $s, t \in \{0, p^r\}$ and 
\[
x^{n'} - 1 = \prod_{i=1}^{|\Omega_{q^2,n'}|} f_i(x) \prod_{j=1}^{|\Lambda_{q^2,n'}|} \left( g_i(x)g_j^2(x) \right)
\]
is the factorization in the form of (2.1). Hence, the result follows.

\[\square\]

### 3.2 Hermitian Self-Dual Cyclic Codes over Finite Chain Rings

In this subsection, we focus on Hermitian self-dual cyclic codes over a finite chain ring $R = \mathbb{F}_q + u\mathbb{F}_q + \cdots + u^{t-1}\mathbb{F}_q$. For $t = 1$, we have $R = \mathbb{F}_q$ and the study of such self-dual codes has been given in [7, Subsection III.B]. In this case, there exists a Hermitian self-dual cyclic code of length $n$ over $R$ if and only if $q$ is a 2 power and $n$ is even. The goals of this subsection are to characterize and enumerate simple root Hermitian self-dual cyclic codes of length $n$ over $R$, with $t \geq 2$.

Throughout, we assume that $\gcd(n, q) = 1$ and $t \geq 2$. The characterization of cyclic codes over $R$ determined in [1] and [4]. Here, necessary results from [1] are recalled. Let $r_0 = 1 + ua$, where $a$ is a unit in $R$. Based on the Hensel’s Lemma, there exists an index set $I \subseteq \mathbb{N}$ such that $x^n - 1 = \prod_{i \in I} h_i(x)$ is a factorization of $x^n - 1$ in to a product of distinct monic irreducible polynomials in $\mathbb{F}_q[x]$ and $x^n - r_0 = \prod_{i \in I} f_i(x)$ is a factorization of $x^n - r_0$ in to a product of pairwise coprime monic basic irreducible polynomial in $R[x]$ with $\varphi(f_i(x)) = h_i(x)$. From [1] Notation 2.4 and Theorem 2.7], every cyclic code $C$ of length $n$ over $R$ can be viewed as an ideal in $R[x]/(x^n - 1)$ generated by
\[
\prod_{i \in I} f_i^{k_i}(x),
\]
where $0 \leq k_i \leq t$. In this case, the sequence $(k_i)_{i \in I}$ is unique and $|C| = q^{\sum_{i \in I} (t-k_i \deg f_i(x))}$.

Note that for each $i \in I$, $f_i^*(x)$ and $f_i^{\dagger}(x)$ are monic basic irreducible factors of $x^n - r_0$ in $R[x]$. Then there exist permutations ` and $'$ on $I$ such that $f_i(x) = f_i^{\dagger}(x)$ and $f_i(x) = f_i^*(x)$. Consequently, $f_i(x) = f_i^{\dagger}(x) = (f_i^*(x)) = f_i^*(x)$. Moreover, $h_i(x) = h_i^{\dagger}(x)$ and $h_i(x) = h_i^*(x)$. In general, we have the following fact.

**Lemma 3.7.** Let $f(x) \in R[x]$ be a monic irreducible factor of $x^n - r_0$ such that $\varphi(f(x)) = h(x) \in \mathbb{F}_q[x]$. Then $f(x) = f_i^{\dagger}(x)$ if and only if $h(x) = h_i^{\dagger}(x)$.

**Proof.** It is not difficult to see that $h(x) = h_i^{\dagger}(x)$ if $f(x) = f_i^{\dagger}(x)$.

Conversely, assume that $h(x) = h_i^{\dagger}(x)$. Suppose $f(x) \neq f_i^{\dagger}(x) \in R[x]$. Then they are coprime in $R[x]$. Let $\rho$ be the ring homomorphism defined
\[
\rho : R[x]/\langle f(x) \rangle \rightarrow \mathbb{F}_q[x]/\langle h(x) \rangle,
\]
\[
\sum_{j=0}^{n} a_jx^j + \langle f(x) \rangle \rightarrow \sum_{j=0}^{n} \varphi(a_j)x^j + \langle h(x) \rangle.
\]
Since \( f(x) \) and \( f^\dagger(x) \) are coprime in \( R[x] \), this implies that \( f^\dagger(x) + \langle f(x) \rangle \) is a unit in \( R[x]/\langle f(x) \rangle \). Then \( \rho(f^\dagger(x) + \langle f(x) \rangle) = h^\dagger(x) + \langle h(x) \rangle = \langle h(x) \rangle \), a contradiction. Hence, \( f(x) \neq f^\dagger(x) \in R[x] \).

A relation between a cyclic code \( C \) and its Hermitian dual is given based on [1, Lemma 3.2] in the next lemma.

**Lemma 3.8.** Let \( q \) be a prime power and let \( n \) be a positive integer such that \( \gcd(n, q) = 1 \). Let \( C = \langle \prod_{i \in I} f_i^{k_i}(x) \rangle \) be a cyclic code of length \( n \) over \( R \) with \( 0 \leq k_i \leq t \) (see (3.6)). Then \( C^\perp_H = \langle \prod_{i \in I} f_i^{t-k_i}(x) \rangle \) and \( |C^\perp_H| = q^{\deg f_i(x)} \).

**Proof.** By [1, Lemma 3.2], we have

\[
C^\perp_E = \langle \prod_{i \in I} f_i^{t-k_i}(x) \rangle,
\]

and hence,

\[
C^\perp_H = C^\perp_E = \langle \prod_{i \in I} f_i^{t-k_i}(x) \rangle = \langle \prod_{i \in I} f_i^{t-k_i}(x) \rangle.
\]

From [1, Lemma 3.2], it follows that \( |C^\perp_H| = |C^\perp_E| = q^{\deg f_i(x)} \).

Necessary and sufficient conditions for a cyclic code \( C \) over \( R \) to be Hermitian self-dual are given in the next theorem.

**Theorem 3.9.** Let \( q \) be a prime power and let \( n \) be a positive integer such that \( \gcd(n, q) = 1 \). Let \( C = \langle \prod_{i \in I} f_i^{k_i}(x) \rangle \) be a cyclic code of length \( n \) over \( R \) (see (3.6)). Then \( C \) is Hermitian self-dual if and only if \( k_i + k_i = t \) for all \( i \in I \).

**Proof.** Recalled that \( \widetilde{\cdot} \) is a permutation on \( I \) such that \( \widetilde{i} = i \). From Lemma 3.8 \( C \) is Hermitian self-dual if and only if

\[
\langle \prod_{i \in I} f_i^{k_i}(x) \rangle = C = C^\perp_H = \langle \prod_{i \in I} f_i^{t-k_i}(x) \rangle = \langle \prod_{i \in I} f_i^{t-k_i}(x) \rangle = \langle \prod_{i \in I} f_i^{t-k_i}(x) \rangle.
\]

Equivalently, \( t - k_i = k_i \) which implies that \( k_i + k_i = t \) for all \( i \in I \).
Proof. Assume that $C = \langle \prod_{i \in I} f_i^{k_i}(x) \rangle$ is a Hermitian self-dual cyclic code of length $n$ over $R$. Then by Theorem 3.9 we have $\hat{k}_i + k_i = t$ for all $i \in I$. Without loss of generality, assume that $f_1(x)$ is a polynomial such that $\varphi(f_1(x)) = x - 1$. Since $x - 1$ is SCRIM, $f_1(x) = f_1(x)$ by Lemma 3.7. This implies that $2k_1 = t$. Hence, $t$ is even.

Conversely, assume that $t$ is even. Then $C = \langle \prod_{i \in I} f_i^\hat{t}(x) \rangle$ is a Hermitian self-dual cyclic code of length $n$ over $R$.

Let $I_1 = \{i \in I | i = \hat{i}\}$ and $I_2 = \{i \in I | i < \hat{i}\}$. Since $\hat{\cdot}$ is a permutation on $I$ such that $\hat{\hat{i}} = i$, the monic basic irreducible factors of $x^n - r_0$ can be rearranged of the form $x^n - r_0 = \prod_{i \in I_1} f_i(x) \prod_{i \in I_2} f_i(x)f_i(x)$. Consequently, $f_i(x) = f_i^\hat{t}(x)$ for all $i \in I_1$ and $f_i(x) \neq f_i^\hat{t}(x)$ for all $i \in I_2$. From Lemma 3.7, it follows that the number $|I_1|$ of self-conjugate-reciprocal monic basic irreducible factors of $x^n - r_0$ is equal to $|\Omega_{q^2,m'}|$, the number of SCRIM factors of $x^n - 1$ in $\mathbb{F}_q[x]$. Subsequently, $|I_2| = |\Lambda_{q^2,m'}|.$

From Theorem 3.9 and Theorem 3.10 it can be deduced that a cyclic code $C = \langle \prod_{i \in I_1} f_i^{k_i}(x) \prod_{i \in I_2} f_i^{k_i}(x) \rangle$ of length $n$ over $R$ is Hermitian self-dual if and only if $k_i = \frac{t}{2}$ for all $i \in I_1$ and $k_i + k_i = t$ for all $i \in I_2$.

The next corollary follows immediately for the above discussions.

**Corollary 3.11.** Let $t$ be an even positive integer. Then $C$ is a Hermitian self-dual cyclic code of length $n$ over $R$ if and only if $C$ can be written as a form $\langle \prod_{i \in I_1} f_i^{k_i}(x) \prod_{i \in I_2} f_i^{\hat{k}_i}(x) \prod_{i \in I_2} f_i^{t-k_i}(x) \rangle$, where $0 \leq k_j \leq t$. Then the number of Hermitian self-dual cyclic code of length $n$ over $R$ is $(t + 1)^{|I_2|} = (t + 1)^{|\Lambda_{q^2,m'}|}$.

4 Conclusion and Remarks

SCRIM factors of $x^n - 1$ over finite fields of square order have been studied. The characterization of such factors is given together the enumeration formula in recursive forms. Applications of obtained results in coding theory have been discussed. The characterization and enumeration of Hermitian complementary dual cyclic codes of arbitrary lengths have been established. The characterization and enumeration of Hermitian of Hermitian self-dual simple root cyclic codes over finite chain rings of prime characteristic have been given in terms of SCRIM factors of $x^n - 1$ over $\mathbb{F}_{q^2}$.

It would be interesting to study SCRIM and SRIM factors of $x^n - \lambda$ over a finite field and there applications in the study of some families of $\lambda$-constacyclic codes, where $\lambda$ is a unit in a finite field.
