CALEY SUMS AND MINKOWSKI SUMS OF 2-CONVEX-NORMAL LATTICE POLYTOPES

AKIYOSHI TSUCHIYA

ABSTRACT. In the present paper, we consider the integer decomposition property for Minkowski sums and Cayley sums. In particular, we focus on these constructions arising from 2-convex-normal lattice polytopes. Moreover, we discuss the level property of Minkowski sums and Cayley sums.

INTRODUCTION

A lattice polytope is a convex polytope all of whose vertices have integer coordinates. In the present paper, we discuss two algebraic properties of lattice polytopes, which are called the integer decomposition property and the level property. First, we begin with the definitions of these properties.

0.1. IDP polytopes and level polytopes. Let $P \subset \mathbb{R}^N$ be a lattice polytope and let $\dim(P)$ denote the dimension of $P$. We say that a lattice polytope $P$ has the integer decomposition property if for each integer $n \geq 1$,

$$nP \cap \mathbb{Z}^N = (n - 1)P \cap \mathbb{Z}^N + P \cap \mathbb{Z}^N,$$

where $nP$ is the $n$th dilated polytope of $P$, i.e., $nP = \{nx : x \in P\}$. A lattice polytope which has the integer decomposition property is called IDP. IDP polytopes turn up in many fields of mathematics such as algebraic geometry, where they correspond to projectively normal embeddings of toric varieties, and commutative algebra, where they correspond to standard graded Cohen-Macaulay domains (see [3]). Moreover, the integer decomposition property is particularly important in the theory and application of integer programming [15, §22.10].

Now, we see a connection between IDP polytopes and commutative algebras. Let $K$ be a field. Given a graded noetherian commutative ring with $A = \bigoplus_{i=0}^{\infty}A_i$ with $A_0 = K$, we say $A$ is standard graded if $A = K[A_1]$, i.e., $A$ is generated by $A_1$ as a $K$-algebra and semi-standard graded if $A$ is finitely generated as a $K[A_1]$-module. We associate a lattice polytope $P$ with a semi-standard graded $K$-algebra. Let $K[X^{\pm 1}, T] = K[X_1^{\pm 1}, \ldots, X_N^{\pm 1}, T]$ be the Laurent polynomial ring in $N + 1$ variables over $K$. We define the $K$-algebra $K[P]$ as follows:

$$K[P] = K[X^aT^n : a \in nP \cap \mathbb{Z}^N, n \in \mathbb{Z}_{\geq 0}] \subset K[X^{\pm 1}, T],$$

where for a lattice point $a = (a_1, \ldots, a_N) \in \mathbb{Z}^N$, $X^a T^n = X_1^{a_1} \cdots X_N^{a_N} T^n$ denotes a Laurent monomial in $K[X^{\pm 1}, T]$. It is known that $K[\mathcal{P}]$ is a semi-standard graded normal Cohen-Macaulay domain of dimension $\dim(\mathcal{P}) + 1$ by setting $\deg(X^a T^n) = n$. Moreover, $K[\mathcal{P}]$ is standard graded if and only if $\mathcal{P}$ is IDP. We call this graded $K$-algebra $K[\mathcal{P}]$ the Ehrhart ring of $\mathcal{P}$. Refer the reader to [3] for the detailed information about Ehrhart rings.

Next, we recall what level polytopes are. For a subset $A \subset \mathbb{R}^N$, let $\text{int}(A)$ denote the relative interior of $A$ with respect to the affine subspace of $\mathbb{R}^N$ spanned by $A$. We say that a lattice polytope $\mathcal{P}$ is level of index $r$, if $r = \min\{t \in \mathbb{Z}_{>0} : \text{int}(t \mathcal{P}) \cap \mathbb{Z}^N \neq \emptyset\}$ and for each integer $n \geq r$,

$$\text{int}(n \mathcal{P}) \cap \mathbb{Z}^N = \text{int}(r \mathcal{P}) \cap \mathbb{Z}^N + (n-r) \mathcal{P} \cap \mathbb{Z}^N.$$  

In particular, if $\mathcal{P}$ is level of index $r$ and $|\text{int}(r \mathcal{P}) \cap \mathbb{Z}^N| = 1$, then $\mathcal{P}$ is called Gorenstein of index $r$. The Gorenstein polytopes give important examples in combinatorial commutative algebra, mirror symmetry and tropical geometry (for details we refer to [1, 12]). On the other hand, the level property is a generalization of the Gorenstein property and it has only fairly recently been examined for certain classes polytopes (e.g., [9, 10, 11]).

Now, we see a connection between level polytopes and commutative algebras. Let $R$ be a Cohen-Macaulay graded ring with canonical module $\omega_R$. Then the number

$$a(R) = -\min\{i : (\omega_R)_i \neq 0\}$$

is called the $a$-invariant of $R$. We say that $R$ is level if the canonical module $\omega_R$ of $R$ is generated by elements of the same degree. The notion of level rings was introduced by Stanley [16] and it is a generalization of the Gorenstein property. By virtue of Danilov [5] and Stanley [17], we know that the Ehrhart ring $K[\mathcal{P}]$ of $\mathcal{P}$ is level of $a$-invariant $-r$ if and only if $\mathcal{P}$ is level of index $r$.

0.2. Motivations and main results. In the present paper, we discuss when a lattice polytope is IDP or level. For instance, every lattice polygon is IDP and level. One of the most famous results of this problem is the following:

**Theorem 0.1** ([4, Theorem 1.3.3]). Let $\mathcal{P} \subset \mathbb{R}^N$ be a lattice polytope. Then we obtain the following:

1. For any positive integer $n \geq \dim(\mathcal{P}) - 1$, $n \mathcal{P}$ is IDP;
2. For any positive integer $n \geq \dim(\mathcal{P}) + 1$, $n \mathcal{P}$ is level of index 1.

This theorem says that “large polytopes” are IDP and level. Furthermore, the following result also says that “large polytopes” are IDP:

**Theorem 0.2** ([7, Corollary 6]). Let $\mathcal{P} \subset \mathbb{R}^N$ be a lattice polytope of dimension $d$. If every edge of $\mathcal{P}$ has lattice length $\geq 2d(d+1)$, then $\mathcal{P}$ is IDP.

This theorem follows from the fact that 2-convex-normal lattice polytopes are IDP ([7, Corollary 5]). A lattice polytope $\mathcal{P} \subset \mathbb{R}^N$ is called 2-convex-normal if $2\mathcal{P} = \mathcal{P} \cap \mathbb{Z}^N + \mathcal{P}$. It is known that lattice polytopes of dimension $d$ each of whose edges has lattice length $\geq 2d(d+1)$ are 2-convex-normal ((6, Theorem 1.2)). Hence Theorem 0.2 follows from this fact.

Now, we recall two well-known constructions of lattice polytopes.
Definition 0.3. Let $\mathcal{P}_1, \ldots, \mathcal{P}_m \subset \mathbb{R}^N$ be lattice polytopes. The Minkowski sum $\mathcal{P}_1 + \cdots + \mathcal{P}_m$ of $\mathcal{P}_1, \ldots, \mathcal{P}_m$ is defined by

$$\mathcal{P}_1 + \cdots + \mathcal{P}_m = \{ \mathbf{a}_1 + \cdots + \mathbf{a}_m \in \mathbb{R}^N \mid \mathbf{a}_1 \in \mathcal{P}_1, \ldots, \mathbf{a}_m \in \mathcal{P}_m \} \subset \mathbb{R}^N.$$ 

The Cayley sum $\mathcal{P}_1 \ast * \cdots \ast \mathcal{P}_m$ of $\mathcal{P}_1, \ldots, \mathcal{P}_m$ is defined by

$$\mathcal{P}_1 \ast * \cdots \ast \mathcal{P}_m = \text{conv}(\{ \mathbf{e}_1 \} \times \mathcal{P}_1, \ldots, \{ \mathbf{e}_m \} \times \mathcal{P}_m) \subset \mathbb{R}^m \times \mathbb{R}^N = \mathbb{R}^{m+N},$$

where $\mathbf{e}_1, \ldots, \mathbf{e}_m$ are the canonical unit coordinate vectors of $\mathbb{R}^m$.

In the present paper, we consider the IDP and the level property of Minkowski sums and Cayley sums. First, we discuss relations between Minkowski sums and Cayley sums for the IDP and the level property. In particular, we will show the following theorem:

Theorem 0.4. Let $\mathcal{P}_1, \ldots, \mathcal{P}_m \subset \mathbb{R}^N$ be lattice polytopes. Then we obtain the following:

1. If $\mathcal{P}_1 \ast * \cdots \ast \mathcal{P}_m$ is IDP, then for any subset $\emptyset \neq I \subset [m] = \{1, \ldots, m\}$, $\sum_{i \in I} \mathcal{P}_i$ is IDP. Moreover, for any subset $\emptyset \neq I \subset [m]$, it follows that

   $$(\sum_{i \in I} \mathcal{P}_i) \cap \mathbb{Z}^N = \sum_{i \in I} (\mathcal{P}_i \cap \mathbb{Z}^N);$$

2. If $\mathcal{P}_1 \ast * \cdots \ast \mathcal{P}_m$ is level of index $m$, then $\mathcal{P}_1 + \cdots + \mathcal{P}_m$ is level of index 1.

It is known that $\mathcal{P}_1 \ast * \cdots \ast \mathcal{P}_m$ is Gorenstein of index $m$ if and only if $\mathcal{P}_1 + \cdots + \mathcal{P}_m$ is Gorenstein of index 1. However, the reverse of Theorem 0.4 (2) does not hold in general (Example 1.9).

Next, we discuss when Minkowski sums and Cayley sums are IDP or level. In [9], Higashitani considered when the Minkowski sums of dilated polytopes are IDP or level. In fact, he showed the following:

Theorem 0.5 ([9, Theorem 2.1]). Let $\mathcal{P}_1, \ldots, \mathcal{P}_m \subset \mathbb{R}^N$ be lattice polytopes. For each $i$, let $n_i$ be a positive integer. Then we obtain the following:

1. If for each $i$, $n_i \geq \dim(\mathcal{P}_i)$, then $n_1 \mathcal{P}_1 + \cdots + n_m \mathcal{P}_m$ is IDP;
2. If for each $i$, $n_i \geq \dim(\mathcal{P}_i) + 1$, then $n_1 \mathcal{P}_1 + \cdots + n_m \mathcal{P}_m$ is level of index 1.

Theorems 0.4 and 0.5 naturally lead us to consider the following question:

Question 0.6. Let $\mathcal{P}_1, \ldots, \mathcal{P}_m \subset \mathbb{R}^N$ be lattice polytopes. For each $i$, let $n_i$ be a positive integer.

1. If for each $i$, $n_i \geq \dim(\mathcal{P}_i)$, then is $n_1 \mathcal{P}_1 \ast * \cdots \ast n_m \mathcal{P}_m$ IDP?
2. If for each $i$, $n_i \geq \dim(\mathcal{P}_i) + 1$, then is $n_1 \mathcal{P}_1 \ast * \cdots \ast n_m \mathcal{P}_m$ level of index $m$?

The goal of the present paper is to give a complete answer to this question. In order to solve Question 0.6 (1), we focus on 2-convex-normal lattice polytopes. Let $\mathcal{P}_1, \ldots, \mathcal{P}_m \subset \mathbb{R}^N$ be lattice polytopes. We say that the tuple $(\mathcal{P}_1, \ldots, \mathcal{P}_m)$ is IDP if for any subset $\emptyset \neq I \subset [m]$, the condition (0.1) is satisfied. When $m = 2$, this notion is introduced and discussed in [7]. In particular, in [13], Oda asked for which lattice polytopes the pair $\mathcal{P}, \mathcal{Q} \subset \mathbb{R}^N$, $(\mathcal{P}, \mathcal{Q})$ is IDP. Now we consider when the Minkowski sums and the Cayley sums of 2-convex-normal lattice polytopes are IDP. In fact,

Theorem 0.7. Let $\mathcal{P}_1, \ldots, \mathcal{P}_m \subset \mathbb{R}^N$ be 2-convex-normal lattice polytopes. Then we obtain the following:
The Minkowski sum \( P_1 + \cdots + P_m \) is IDP;

The Cayley sum \( P_1 \star \cdots \star P_m \) is IDP if (and only if) the tuple \( (P_1, \ldots, P_m) \) is IDP.

By showing for any lattice polytope \( \mathcal{P} \) and for any positive integer \( n \geq \dim(\mathcal{P}) \), \( n\mathcal{P} \) is 2-convex-normal (Lemma 2.1), we obtain an answer to Question 0.6 (1) (Corollary 2.2 and Example 2.3).

Next, in order to solve Question 0.6 (2), we introduce a class of level polytopes. For a lattice polytope \( \mathcal{P} \subset \mathbb{R}^N \) with interior lattice points, we consider the following condition:

\[
\text{int}(2\mathcal{P}) = \text{int}(\mathcal{P}) + (\mathcal{P} \cap \mathbb{Z}^N).
\]

Then such polytopes are always level of index 1 (Proposition 3.1). Now, we consider when the Minkowski sum and the Cayley sum of lattice polytopes with interior lattice points satisfying the condition (0.2) are level. In fact,

**Theorem 0.8.** Let \( \mathcal{P}_1, \ldots, \mathcal{P}_m \subset \mathbb{R}^N \) be lattice polytopes with interior lattice points satisfying the condition (0.2). Then we obtain the following:

1. The Minkowski sum \( \mathcal{P}_1 + \cdots + \mathcal{P}_m \) is level of index 1;
2. The Cayley sum \( \mathcal{P}_1 \star \cdots \star \mathcal{P}_m \) is level of index \( m \).

By showing for any lattice polytope \( \mathcal{P} \) and for any positive integer \( n \geq \dim(\mathcal{P}) + 1 \), \( n\mathcal{P} \) has interior lattice points and satisfies the condition (0.2) (Lemma 3.2), we obtain an answer to Question 0.6 (2) (Corollary 3.3).

1. **Relations between Minkowski sums and Cayley sums**

In this section, we discuss relations between Minkowski sums and Cayley sums. In particular, we prove Theorem 0.4. First, we consider a relation between points in Minkowski sums and that in Cayley sums. For lattice polytopes \( \mathcal{P}_1, \ldots, \mathcal{P}_m \subset \mathbb{R}^N \) and a subset \( \emptyset \neq I \subset [m] \) with \( |I| = k \), set

\[
\mathcal{P}_I = \sum_{i \in I} \mathcal{P}_i \subset \mathbb{R}^N
\]

and

\[
eq I = \sum_{i \in I} e_i \in \mathbb{R}^m.
\]

**Lemma 1.1.** Let \( \mathcal{P}_1, \ldots, \mathcal{P}_m \subset \mathbb{R}^N \) be lattice polytopes. Then for any \( \emptyset \neq I \subset [m] \) with \( |I| = k \), we have

\[
k(\mathcal{P}_1 \star \cdots \star \mathcal{P}_m) \cap (\{e_I\} \times \mathbb{R}^N) = \{e_I\} \times \mathcal{P}_I.
\]

**Proof.** For each \( 1 \leq i \leq m \), let \( v_{ij}, \ldots, v_{ir_i} \) be the vertices of \( \mathcal{P}_i \), where \( r_i \) is the number of vertices of \( \mathcal{P}_i \). Fix a subset \( \emptyset \neq I \subset [m] \) with \( |I| = k \). Given a point \( \mathbf{a} \in \mathcal{P}_I \), we can write \( \mathbf{a} = \sum_{i \in I} \sum_{j=1}^{r_i} \lambda_{ij} v_{ij} \), where for any \( i \in I \) and \( 1 \leq j \leq r_i \), \( 0 \leq \lambda_{ij} \leq 1 \) and \( \sum_{j=1}^{r_i} \lambda_{ij} = 1 \). Then one has

\[
(e_I, \mathbf{a}) = \sum_{i \in I} \sum_{j=1}^{r_i} \lambda_{ij} (e_i, v_{ij}) \in \mathbb{R}^{m+N}.
\]
Since each \((e_i, v_{ij})\) is a vertex of \(\mathcal{P}_1 \cdots \mathcal{P}_m\), we obtain \((e_i, a) \in k(\mathcal{P}_1 \cdots \mathcal{P}_m) \cap \{(e_i) \times \mathbb{R}^N\}\). Hence it follows
\[
k(\mathcal{P}_1 \cdots \mathcal{P}_m) \cap \{(e_i) \times \mathbb{R}^N\} \supset \{e_i\} \times \mathcal{P}_i.
\]

Conversely, given a point \(x \in k(\mathcal{P}_1 \cdots \mathcal{P}_m)\), we can write \(x = \sum_{i=1}^m \sum_{j=1}^{r_i} \nu_{ij}(e_i, v_{ij})\), where for any \(1 \leq i \leq m\) and \(1 \leq j \leq r_i\), \(0 \leq v_{ij} \leq 1\) and \(\sum_{i=1}^m \sum_{j=1}^{r_i} \nu_{ij} = k\). Assume that \(x \in \{(e_i) \times \mathbb{R}^N\}\). Then for any \(i \notin I\) and \(1 \leq j \leq r_i\), one has \(v_{ij} = 0\) and for any \(i \in I\), one has \(\sum_{j=1}^{r_i} v_{ij} = 1\). Hence we obtain \(x \in \{e_i\} \times \mathcal{P}_i\). This implies that
\[
k(\mathcal{P}_1 \cdots \mathcal{P}_m) \cap \{(e_i) \times \mathbb{R}^N\} \subset \{e_i\} \times \mathcal{P}_i,
\]
as desired. \(\square\)

Next, we consider a relation between interior points in Minkowski sums and that in Cayley sums.

**Lemma 1.2.** Let \(\mathcal{P}_1, \ldots, \mathcal{P}_m \subset \mathbb{R}^N\) be lattice polytopes. Then we have
\[
\text{int}(m(\mathcal{P}_1 \cdots \mathcal{P}_m)) \cap (\{e_i\} \times \mathbb{R}^N) = \{e_i\} \times \text{int}(\mathcal{P}_1 + \cdots + \mathcal{P}_m).
\]

**Proof.** For each integer \(1 \leq i \leq m\), let \(v_{i_1}, \ldots, v_{i_r}\) be the vertices of \(\mathcal{P}_i\), where \(r_i\) is the number of vertices of \(\mathcal{P}_i\). We recall that the fact
\[
\text{int}(\mathcal{P}_1 + \cdots + \mathcal{P}_m) = \text{int}(\mathcal{P}_1) + \cdots + \text{int}(\mathcal{P}_m),
\]
see [14, Section 7]. Given a point \(a \in \text{int}(\mathcal{P}_1 + \cdots + \mathcal{P}_m)\), we can write \(a = \sum_{i=1}^m \sum_{j=1}^{r_i} \lambda_{ij} v_{ij}\), where for any \(1 \leq i \leq m\) and \(1 \leq j \leq r_i\), \(0 < \lambda_{ij} < 1\) and \(\sum_{j=1}^{r_i} \lambda_{ij} = 1\). Then \((e_i, a) = \sum_{i=1}^m \sum_{j=1}^{r_i} \lambda_{ij} (e_i, v_{ij})\). Since each \((e_i, v_{ij})\) is a vertex of \(\mathcal{P}_1 \cdots \mathcal{P}_m\), we have \((e_i, a) \in \text{int}(m(\mathcal{P}_1 \cdots \mathcal{P}_m)) \cap (\{e_i\} \times \mathbb{R}^N)\). Hence it follows
\[
\text{int}(m(\mathcal{P}_1 \cdots \mathcal{P}_m)) \cap (\{e_i\} \times \mathbb{R}^N) \supset \{e_i\} \times \text{int}(\mathcal{P}_1 + \cdots + \mathcal{P}_m).
\]

Conversely, given a point \(x \in \text{int}(m(\mathcal{P}_1 \cdots \mathcal{P}_m))\), we can write \(x = \sum_{i=1}^m \sum_{j=1}^{r_i} \nu_{ij} (e_i, v_{ij})\), where for any \(1 \leq i \leq m\) and \(1 \leq j \leq r_i\), \(0 < v_{ij} \leq 1\) and \(\sum_{i=1}^m \sum_{j=1}^{r_i} \nu_{ij} = m\). Assume that \(x \in (\{e_i\} \times \mathbb{R}^N)\). Then for any \(1 \leq i \leq m\), one has \(\sum_{j=1}^{r_i} v_{ij} = 1\). Hence we obtain \(x \in \{e_i\} \times \text{int}(\mathcal{P}_1 + \cdots + \mathcal{P}_m)\). This implies that
\[
\text{int}(m(\mathcal{P}_1 \cdots \mathcal{P}_m)) \cap (\{e_i\} \times \mathbb{R}^N) \subset \{e_i\} \times \text{int}(\mathcal{P}_1 + \cdots + \mathcal{P}_m),
\]
as desired. \(\square\)

Now, we prove Theorem 0.4.

**Proof of Theorem 0.4.** (1) Let \(\emptyset \neq I \subset [m]\) with \(|I| = k\) and \(a \in n \mathcal{P}_I \cap \mathbb{Z}^N\) with a positive integer \(n\). Then by Lemma 1.1, we have
\[
(ne_I, a) \in nk(\mathcal{P}_1 \cdots \mathcal{P}_m) \cap \{(ne_i) \times \mathbb{R}^N\}.
\]
Since \(\mathcal{P}_1 \cdots \mathcal{P}_m\) is IDP, we can write \((ne_I, a) = a_1 + \cdots + a_{nk}\), where \(a_i \in \mathcal{P}_1 \cdots \mathcal{P}_m \cap \mathbb{Z}^{m+\mathbb{N}}\). Then for each \(a_i\), there exists an integer \(j_i\) with \(1 \leq j_i \leq m\) and \(b_i \in \mathcal{P}_{j_i} \cap \mathbb{Z}^N\) such that \(a_i = (e_{j_i}, b_i)\). Hence one has \(\mathcal{P}_I \cap \mathbb{Z}^N = \sum_{i \in I} (\mathcal{P}_{j_i} \cap \mathbb{Z}^N)\). Moreover, we can write \((ne_I, a) = c_1 + \cdots + c_n\), where \(c_1, \ldots, c_n \in \{e_I\} \times (\mathcal{P}_I \cap \mathbb{Z}^N)\). This implies that \(\mathcal{P}_I\) is IDP.
(2) Every interior lattice point of \( m(\mathcal{P}_1 \ast \cdots \ast \mathcal{P}_m) \) belongs to \( \{e_{[m]}\} \times \mathbb{Z}^N \). Hence by Lemma 1.2, we know that \( \mathcal{P}_1 + \cdots + \mathcal{P}_m \) has interior lattice points. Let \( a \in \text{int}(n(\mathcal{P}_1 + \cdots + \mathcal{P}_m)) \cap \mathbb{Z}^N \) with a positive integer \( n \). Then by Lemma 1.2, one has

\[
(ne_{[m]}, a) \in \text{int}(nm(\mathcal{P}_1 \ast \cdots \ast \mathcal{P}_m)) \cap (\{ne_{[m]}\} \times \mathbb{R}^N).
\]

Since \( \mathcal{P}_1 \ast \cdots \ast \mathcal{P}_m \) is level of index \( m \), we can write \((ne_{[m]}, a) = b_1 + b_2\), where \( b_1 \in \text{int}(m(\mathcal{P}_1 \ast \cdots \mathcal{P}_m)) \cap \mathbb{Z}^{m+N} \) and \( b_2 \in (n-1)m(\mathcal{P}_1 \ast \cdots \mathcal{P}_m) \cap \mathbb{Z}^{m+N} \). Then by Lemmas 1.1 and 1.2, \( b_1 \in \{e_{[m]}\} \times \text{int}(\mathcal{P}_1 + \cdots + \mathcal{P}_m) \) and \( b_2 \in \{(n-1)e_{[m]}\} \times (n-1)(\mathcal{P}_1 + \cdots + \mathcal{P}_m) \). Hence \( \mathcal{P}_1 + \cdots + \mathcal{P}_m \) is level of index 1, as desired. \( \square \)

From the proof of Theorem 0.4 (1) we notice the following proposition.

**Proposition 1.3.** Let \( \mathcal{P}, \mathcal{Q} \subset \mathbb{R}^d \) be lattice polytopes. Then \( \mathcal{P} \ast \mathcal{Q} \) is IDP if and only if each of \( \mathcal{P} \) and \( \mathcal{Q} \) is IDP and for any nonnegative integers \( a \) and \( b \), \((a\mathcal{P}, b\mathcal{Q})\) is IDP.

On the other hand, the following conjecture by Oda is well-known.

**Conjecture 1.4** (Oda Conjecture). Let \( \mathcal{P}, \mathcal{Q} \subset \mathbb{R}^N \) be lattice polytopes. If \( \mathcal{P} \) is smooth and the normal fan of \( \mathcal{Q} \) coarsens that of \( \mathcal{P} \), then \((\mathcal{P}, \mathcal{Q})\) is IDP.

Hence from Proposition 1.3 this conjecture is equivalent to the following.

**Conjecture 1.5.** Let \( \mathcal{P}, \mathcal{Q} \subset \mathbb{R}^N \) be lattice polytopes. If \( \mathcal{P} \) is smooth and the normal fan of \( \mathcal{Q} \) coarsens that of \( \mathcal{P} \), then \( \mathcal{P} \ast \mathcal{Q} \) is IDP.

Conjecture 1.4 holds when \( N = 2 \). Moreover, in the case, we do not need the smoothness assumption on \( \mathcal{P} \). In fact,

**Theorem 1.6** ([8, Theorem 1.1]). Let \( \mathcal{P}, \mathcal{Q} \subset \mathbb{R}^2 \) be lattice polygons such that the normal fan of \( \mathcal{Q} \) coarsens that of \( \mathcal{P} \). Then \((\mathcal{P}, \mathcal{Q})\) is IDP.

Hence we obtain the following.

**Corollary 1.7.** Let \( \mathcal{P}, \mathcal{Q} \subset \mathbb{R}^2 \) be lattice polygons such that the normal fan of \( \mathcal{Q} \) coarsens that of \( \mathcal{P} \). Then \( \mathcal{P} \ast \mathcal{Q} \) is IDP.

Next, we recall the following result on the Gorenstein property of Minkowski sums and Cayley sums.

**Theorem 1.8** ([2, Th. 2.6]). Let \( \mathcal{P}_1, \ldots, \mathcal{P}_m \subset \mathbb{R}^N \) be lattice polytopes with \( \dim(\mathcal{P}_1 + \cdots + \mathcal{P}_m) = N \). Then \( \mathcal{P}_1 \ast \cdots \ast \mathcal{P}_m \) is Gorenstein of index \( m \) if and only if \( \mathcal{P}_1 + \cdots + \mathcal{P}_m \) is Gorenstein of index 1.

Let us note that Gorenstein polytopes are level. However, the reverse of Theorem 0.4 (2) does not hold in general.

**Example 1.9.** Let \( \mathcal{P}_1 \) be the line segment from \((1,0)\) to \((0,1)\) and \( \mathcal{P}_2 \) the line segment from \((1,1)\) to \((-h, -nh)\) with positive integers \( h \) and \( n \). Then since the dimension of \( \mathcal{P}_1 + \mathcal{P}_2 \) is 2, \( \mathcal{P}_1 + \mathcal{P}_2 \) is level of index 1. However, from [10, Theorem 4.5], we know that \( \mathcal{P}_1 \ast \mathcal{P}_2 \) is not level. Hence the reverse of Theorem 0.4 (2) does not hold in general.
2. Minkowski sums and Cayley sums of 2-convex-normal lattice polytopes

In this section, we will give an answer to Question 0.6 (1). First, we prove Theorem 0.7.

Proof of Theorem 0.7. (1) Given a lattice point \( x \in n(\mathcal{P}_1 + \cdots + \mathcal{P}_m) \) with a positive integer \( n \), there exist \( m \) points \( x_1, \ldots, x_m \) such that for each \( i \), \( x_i \in n\mathcal{P}_i \) and \( x = x_1 + \cdots + x_m \). Moreover, since each \( \mathcal{P}_i \) is 2-convex-normal, for each \( i \), we can write \( x_i = y_{i1} + \cdots + y_{in} \), where \( y_{ij} \in \mathcal{P}_i \) and for any \( 2 \leq j \leq n \), \( y_{ij} \in \mathcal{P}_i \cap \mathbb{Z}^N \). For \( 1 \leq j \leq n \), set \( z_j = y_{1j} + \cdots + y_{mj} \). Then \( z_2, \ldots, z_n \) are lattice points in \( \mathcal{P}_1 + \cdots + \mathcal{P}_m \). Moreover since \( x \) is a lattice point, \( z_1 \) must be a lattice point in \( \mathcal{P}_1 + \cdots + \mathcal{P}_m \). Hence \( \mathcal{P}_1 + \cdots + \mathcal{P}_m \) is IDP.

(2) Thanks to Theorem 0.4 (1), we should show that if \( (\mathcal{P}_1, \ldots, \mathcal{P}_m) \) is IDP, then \( \mathcal{P}_1 \ast \cdots \ast \mathcal{P}_m \) is IDP. In order to prove this, we use the induction on \( m \). When \( m = 1 \), this is clear. Assume that \( m \geq 2 \). Let \( \mathbf{a} \in n(\mathcal{P}_1 \ast \cdots \ast \mathcal{P}_m) \cap \mathbb{Z}^{m+1} \) with a positive integer \( n \). Then we can write

\[
\mathbf{a} = (t_1 \mathbf{e}_1, \mathbf{a}_1) + \cdots + (t_m \mathbf{e}_m, \mathbf{a}_m),
\]

where \( \mathbf{a}_i \in \mathcal{P}_i, t_i \in \mathbb{Z}_{\geq 0} \) and \( \sum_{i=1}^m t_i = n \).

Suppose that \( t_1 = 0 \). Then it follows that \( \mathbf{a} \in \{0\} \times (n(\mathcal{P}_2 \ast \cdots \ast \mathcal{P}_m) \cap \mathbb{Z}^{m-1+N}) \). By the inductive assumption, we can write \( \mathbf{a} = (0, \mathbf{b}_1) + \cdots + (0, \mathbf{b}_n) \), where

\[
(0, \mathbf{b}_i) \in \{0\} \times ((\mathcal{P}_2 \ast \cdots \ast \mathcal{P}_m) \cap \mathbb{Z}^{m-1+N}) \subset (\mathcal{P}_1 \ast \cdots \ast \mathcal{P}_m) \cap \mathbb{Z}^{N+m}.
\]

Hence we can assume that for \( i = 1, \ldots, m \), \( t_i \geq 1 \). Since each \( \mathcal{P}_i \) is 2-convex-normal, by using Lemma 1.1, \( \mathbf{a} \) can be written like

\[
\mathbf{a} = (\mathbf{e}_i[n], \mathbf{c}) + \mathbf{c}_1 + \cdots + \mathbf{c}_{n-m},
\]

where \( \mathbf{c} \in (\mathcal{P}_1 + \cdots + \mathcal{P}_m) \cap \mathbb{Z}^N \) and \( \mathbf{c}_i \in (\mathcal{P}_1 \ast \cdots \ast \mathcal{P}_m) \cap \mathbb{Z}^{m+N} \). Since \( (\mathcal{P}_1, \ldots, \mathcal{P}_m) \) is IDP, \( (\mathbf{e}_i[n], \mathbf{c}) \) can be decomposed into \( m \) lattice points belonging to \( \mathcal{P}_1 \ast \cdots \ast \mathcal{P}_m \). Thus, \( \mathcal{P}_1 \ast \cdots \ast \mathcal{P}_m \) is IDP, as desired. \( \square \)

Next, we see when a dilated polytope is 2-convex-normal.

Lemma 2.1. Let \( \mathcal{P} \subset \mathbb{R}^N \) be a lattice polytope. Then for any integer \( n \geq \text{dim}(\mathcal{P}) \), \( n\mathcal{P} \) is 2-convex-normal.

Proof. Set \( d = \text{dim}(\mathcal{P}) \). When \( d = 0 \), this is clear. We assume that \( d \geq 1 \). Let \( \mathbf{a} \in 2n\mathcal{P} \). By Carathéodory’s Theorem (cf. [15, Corollary 7.1j]), there exist \( d+1 \) affinely independent vertices \( \mathbf{v}_0, \ldots, \mathbf{v}_d \) of \( \mathcal{P} \) such that \( \mathbf{a} = \sum_{i=0}^d \lambda_i \mathbf{v}_i \), where \( \lambda_i \geq 0 \) and \( \sum_{i=0}^d \lambda_i = 2n \). From the fact that \( n+1 \geq d+1 \), \( \mathbf{a} \) can be written like \( \mathbf{a} = \mathbf{b} + \mathbf{v}_j + \cdots + \mathbf{v}_{j_n} \), where \( \mathbf{b} \in n\mathcal{P} \). Since \( \mathbf{v}_j + \cdots + \mathbf{v}_{j_n} \in (n\mathcal{P} \cap \mathbb{Z}^N) \), one has \( \mathbf{a} \in n\mathcal{P} + (n\mathcal{P} \cap \mathbb{Z}^N) \). Therefore, \( n\mathcal{P} \) is 2-convex-normal. \( \square \)

From Theorem 0.7 and Lemma 2.1 we obtain the following corollary:

Corollary 2.2. Let \( \mathcal{P}_1, \ldots, \mathcal{P}_m \subset \mathbb{R}^N \) be lattice polytopes. For each \( i \), let \( n_i \) be a positive integer with \( n_i \geq \text{dim}(\mathcal{P}_i) \). Then we obtain the following:

1. \( (\ref{1}) \) \( n_1\mathcal{P}_1 + \cdots + n_m\mathcal{P}_m \) is IDP;
(2) \( n_1 \mathcal{P}_1 \ast \cdots \ast n_m \mathcal{P}_m \) is IDP if (and only if) \((n_1 \mathcal{P}_1, \ldots, n_m \mathcal{P}_m)\) is IDP.

Now, we see that Question 0.6 (1) is not true in general.

**Example 2.3.** Let \( \mathcal{P}_1 \subset \mathbb{R}^2 \) be the line segment from \((0,0)\) to \((1,2)\) and \( \mathcal{P}_2 \subset \mathbb{R}^2 \) the line segment from \((0,0)\) to \((1,0)\). Then for any positive integer \( n_1, n_2 \), \((n_1 \mathcal{P}_1, n_2 \mathcal{P}_2)\) is not IDP. Indeed, one has \((1,1) \notin (n_1 \mathcal{P}_1 + n_2 \mathcal{P}_2) \cap \mathbb{Z}^2 \). On the other hand, since

\[
(n_1 \mathcal{P}_1 \cap \mathbb{Z}^2) + (n_2 \mathcal{P}_2 \cap \mathbb{Z}^2) = \{(a+b, 2a) : 0 \leq a \leq n_1, 0 \leq b \leq n_2\},
\]

we obtain \((1,1) \notin (n_1 \mathcal{P}_1 \cap \mathbb{Z}^2) + (n_2 \mathcal{P}_2 \cap \mathbb{Z}^2) \). Hence \((\mathcal{P}_1, \mathcal{P}_2)\) is not IDP. Thus, it follows from Theorem 0.1 (1) that \( n_1 \mathcal{P}_1 + n_2 \mathcal{P}_2 \) is not IDP. Therefore, Question 0.6 (1) in not true in general.

Finally, we give another corollary of Theorem 0.7.

**Corollary 2.4.** Let \( \mathcal{P}_1, \ldots, \mathcal{P}_m \subset \mathbb{R}^N \) be lattice polytopes. Suppose that for each \( i \), every edge of \( \mathcal{P}_i \) has lattice length \( \geq 2 \text{dim}(\mathcal{P}_i)(\text{dim}(\mathcal{P}_i) + 1) \). Then we obtain the following:

1. \( \mathcal{P}_1 + \cdots + \mathcal{P}_m \) is IDP;
2. \( \mathcal{P}_1 \ast \cdots \ast \mathcal{P}_m \) is IDP if (and only if) \((\mathcal{P}_1, \ldots, \mathcal{P}_m)\) is IDP.

**Proof.** This follows from Theorem 0.7 and [7, Corollary 6]. \( \square \)

3. **Minkowski sums and Cayley sums of level polytopes**

In this section, we give an answer to Question 0.6 (2). In particular, we prove Theorem 0.8. First, we show that a lattice polytope with interior lattice points satisfying the condition (0.2) is level.

**Proposition 3.1.** Let \( \mathcal{P} \subset \mathbb{R}^N \) be a lattice polytope with interior lattice points. Assume that \( \mathcal{P} \) satisfies the condition (0.2). Then \( \mathcal{P} \) is level of index 1.

**Proof.** Fix a positive integer \( n \geq 2 \) and take an interior lattice point \( x \) in \( n \mathcal{P} \). Since for lattice polytopes \( \mathcal{P}_1, \ldots, \mathcal{P}_m \subset \mathbb{R}^N \), \( \text{int}(\mathcal{P}_1 + \cdots + \mathcal{P}_m) = \text{int}(\mathcal{P}_1) + \cdots + \text{int}(\mathcal{P}_m) \), from the condition (0.2), one has

\[
\text{int}(n \mathcal{P}) = \text{int}(\mathcal{P}) + \left(\mathcal{P} \cap \mathbb{Z}^N\right) + \cdots + \left(\mathcal{P} \cap \mathbb{Z}^N\right).
\]

Hence there exist \( x_1 \in \text{int}(\mathcal{P}) \) and \( x_2, \ldots, x_n \in \mathcal{P} \cap \mathbb{Z}^N \) such that \( x = x_1 + x_2 + \cdots + x_n \). In particular, from \( x \in \mathbb{Z}^d \), one has \( x_1 \in \text{int}(\mathcal{P}) \cap \mathbb{Z}^N \). Therefore, since \( x_2 + \cdots + x_n \in (n - 1) \mathcal{P} \cap \mathbb{Z}^N \), \( \mathcal{P} \) is level of index 1. \( \square \)

Now, we prove Theorem 0.8.

**Proof of Theorem 0.8.** From Theorem 0.4 (2), we should show only the claim (2). Since each \( \mathcal{P}_i \) has interior lattice points, from Lemma 1.2, \( m(\mathcal{P}_1 \ast \cdots \ast \mathcal{P}_m) \) has interior lattice points. Let \( n \geq m + 1 \) and \( a \in \text{int}(n(\mathcal{P}_1 \ast \cdots \ast \mathcal{P}_m)) \cap \mathbb{Z}^{m+N} \), and for \( 1 \leq i \leq m, v_{i1}, \ldots, v_{ir_i} \) the vertices of \( \mathcal{P}_i \), where \( r_i \) is the number of vertices of \( \mathcal{P}_i \). Then since \( a \) is an interior lattice point in \( n(\mathcal{P}_1 \ast \cdots \ast \mathcal{P}_m) \), we can write

\[
a = \sum_{i=1}^{m} \sum_{j=1}^{r_i} \lambda_{ij}(e_i, v_{ij}),
\]

where \( \lambda_{ij} \) are coefficients.
where for any $1 \leq i \leq m$ and $1 \leq j \leq r_i$, $0 < \lambda_{ij}$, and $\sum_{i=1}^{m} \sum_{j=1}^{r_i} \lambda_{ij} = n$. For each $1 \leq i \leq m$, set $t_i = \sum_{j=1}^{r_i} \lambda_{ij} \in \mathbb{Z}_{\geq 1}$. We may assume that $t_1 \geq 2$. Then since $a' = \sum_{j=1}^{r_1} \lambda_{1j}(e_1, v_{1j}) \in \text{int}(t_1(\{e_1\} \times \mathcal{P}_1))$, and since $\mathcal{P}_1$ satisfies the condition (0.2), there exist $b_1 \in \text{int}(\{e_1\} \times \mathcal{P}_1)$ and $b_2, \ldots, b_{r_1} \in (\{e_1\} \times \mathcal{P}_1) \cap \mathbb{Z}^{m+N}$ with $a' = b_1 + b_2 + \cdots + b_{r_1}$. Hence we can assume that there exist $c, c_1, \ldots, c_m \in \mathbb{R}^{m+N}$ such that $c \in (n-m)(\mathcal{P}_1 \times \cdots \times \mathcal{P}_m) \cap \mathbb{Z}^{N+m}$ and for each $i$, $c_i \in \text{int}(\{e_1\} \times \mathcal{P}_i)$ with $a = c + c_1 + \cdots + c_m$. Since $a$ is a lattice point, $c_1 + \cdots + c_m$ must be a lattice point. Moreover, from Lemma 1.2, one has $c_1 + \cdots + c_m \in \text{int}(m(\mathcal{P}_1 \times \cdots \times \mathcal{P}_m)) \cap \mathbb{Z}^{m+N}$. Hence $\mathcal{P}_1 \times \cdots \times \mathcal{P}_m$ is level of index $m$, as desired. \hfill \Box

Next, we see when a dilated polytope satisfies the condition (0.2).

**Lemma 3.2.** Let $\mathcal{P} \subset \mathbb{R}^n$ be a lattice polytope. Then for any integer $n \geq \dim(\mathcal{P}) + 1$, $n\mathcal{P}$ satisfies the condition (0.2).

**Proof.** Set $d = \dim(\mathcal{P})$ and $a \in \text{int}(2n\mathcal{P})$. Then there exist $d' + 1$ affinely independent vertices $v_0, \ldots, v_{d'}$ of $\mathcal{P}$ such that $a = \sum_{i=0}^{d'} \lambda_i v_i$, where $d' \leq d$, for each $1 \leq i \leq d'$, $\lambda_i > 0$, and $\sum_{i=0}^{d'} \lambda_i = 2n$. Since $2n \geq d + 2 \geq d' + 2$, there exists an index $j$ such that $\lambda_j > 1$. Hence $a = (\sum_{i=0}^{d'} \lambda_i v_i - v_j) + v_j$ and $(\sum_{i=0}^{d'} \lambda_i v_i - v_j) \in \text{int}((2n-1)\mathcal{P})$. From the fact that $n + 1 \geq d + 2$, $a$ can be written like $a = a' + v_{j_1} + \cdots + v_{j_n}$, where $a' \in \text{int}(n\mathcal{P})$. Hence $a \in \text{int}(n\mathcal{P}) + (n\mathcal{P} \cap \mathbb{Z}^N)$, as desired. \hfill \Box

From Theorem 0.8 and Lemma 3.2 we obtain the following corollary.

**Corollary 3.3.** Let $\mathcal{P}_1, \ldots, \mathcal{P}_m \subset \mathbb{R}^n$ be lattice polytopes. For each $i$, let $n_i$ be a positive integer with $n_i \geq \dim(\mathcal{P}_i) + 1$. Then we obtain the following:

1. ([9]) $n_1 \mathcal{P}_1 + \cdots + n_m \mathcal{P}_m$ is level of index 1;
2. $n_1 \mathcal{P}_1 \times \cdots \times n_m \mathcal{P}_m$ is level of index $m$.

Therefore, Question 0.6 (2) is true.
