BILINEAR FRACTIONAL INTEGRAL OPERATORS ON MORREY SPACES

QIANJUN HE  DUNYAN YAN

ABSTRACT. We prove a plethora of boundedness property of the Adams type for bilinear fractional integral operators of the form

$$B_\alpha(f, g)(x) = \int_{\mathbb{R}^n} \frac{f(x - y)g(x + y)}{|y|^{n-\alpha}} dy, \quad 0 < \alpha < n.$$ 

For $1 < t \leq s < \infty$, we prove the non-weighted case through the known Adams type result. And we show that these results of Adams type is optimal. For $0 < t < s < \infty$ and $0 < t \leq 1$, we obtain new result of a weighted theory describing Morrey boundedness of above form operators if two weights $(v, \vec{w})$ satisfy

$$[v, \vec{w}]_{t, q/a}^{r, a} = \sup_{Q, Q' \subset Q} \left( \frac{|Q|}{|Q'|} \right)^{\frac{1}{r-1}} |Q'|^{\frac{t}{r}} \left( \int_Q v^{\frac{1}{t}} \right)^{\frac{1}{t-1}} \prod_{i=1}^{2} \left( \int_{Q'} w_i^{-(q_i/a)} \right)^{\frac{1}{q_i/a}} < \infty, \quad 0 < t < s < 1$$

and

$$[v, \vec{w}]_{1, q/a}^{r, a} := \sup_{Q, Q' \subset Q} \left( \frac{|Q|}{|Q'|} \right)^{\frac{1}{r-1}} |Q'|^{\frac{t}{r}} \left( \int_Q v^{\frac{1}{t}} \right)^{\frac{1}{t-1}} \prod_{i=1}^{2} \left( \int_{Q'} w_i^{-(q_i/a)} \right)^{\frac{1}{q_i/a}} < \infty, \quad s \geq 1$$

where $\|v\|_{L^t(Q)} = \sup_{Q} v$ when $t = 1, a, r, s, t$ and $\vec{q}$ satisfy proper conditions. As some applications we formulate a bilinear version of the Olsen inequality, the Fefferman-Stein type dual inequality and the Stein-Weiss inequality on Morrey spaces for fractional integrals.

1. Introduction

In the paper, we will consider the family of bilinear fractional integral operators

$$B_\alpha(f, g)(x) := \int_{\mathbb{R}^n} \frac{f(x - y)g(x + y)}{|y|^{n-\alpha}} dy, \quad 0 < \alpha < n.$$ (1.1)

Such operators have a long history and were studied by Bak [2], Grafakos [5], Grafakos and Kalton [6], Hoang and Moen [9], Kenig and Stein [12], Kuk and Lee [14], Moen [16], among others.

For $0 < \alpha < n$, the classical fractional integral $I_\alpha$ is given by

$$I_\alpha f(x) := \int_{\mathbb{R}^n} \frac{f(y)}{|x - y|^{n-\alpha}} dy.$$ (1.2)

It is easily to know that $B_\alpha(f, g)$ and $I_\alpha f$ have following pointwise control relationship. For any pair of conjugate exponents $1/l + 1/l' = 1$, Hölder’s inequality yields

$$|B_\alpha(f, g)| \lesssim I_\alpha(|f|^l)^{1/l} I_\alpha(|g|^{l'})^{1/l'}.$$ (1.3)

In [16], Moen initially introduced the fractional integral function $M_\alpha$, given by

$$M_\alpha(f, g)(x) = \sup_{d > 0} \frac{1}{(2d)^{n-\alpha}} \int_{|y| \leq d} |f(x - y)g(x + y)| dy.$$ (1.4)
A simple computation in [4] shows that for $0 < \alpha < n$,
\[ \mathcal{M}_\alpha(f, g)(x) \leq cB_\alpha(f, g)(x). \]

We first recall some standard notation. For any measurable function $f$ the average of $f$ over a set $E$ is given by
\[ \frac{1}{|E|} \int_E f \, dx. \]

The Euclidean norm of a point $x = (x_1, \ldots, x_n) \in \mathbb{R}^n$ is given by $|x| = (x_1^2 + \cdots + x_n^2)^{1/2}$. We also use the $l^\infty$ norm $|x|_\infty = \max(|x_1|, \ldots, |x_n|)$. Note that $|x|_\infty \leq |x| \leq \sqrt{n}|x|_\infty$ for all $x \in \mathbb{R}^n$. A cube with center $x_0$ and side length $d$, denoted $Q = Q(x_0, d)$, will be all points $x \in \mathbb{R}^n$ such that $|x - x_0|_\infty \leq \frac{d}{2}$. For an arbitrary cube $Q$, $c_Q$ will be its center and $l(Q)$ its side length, that is, $Q = Q(c_Q, l(Q))$. Given $\lambda > 0$ and a cube $Q$ we let $\lambda Q = Q(c_Q, \lambda l(Q))$. The set of dyadic cubes, denoted $\mathcal{D}$, is all cubes of the form $2^k(m + [0, 1]^n)$ where $k \in \mathbb{Z}$ and $m \in \mathbb{Z}^n$. Finally for $k \in \mathbb{Z}$ we let $\mathcal{D}_k$ denote the cubes of level $2^k$, that is, $\mathcal{D}_k = \{Q \in \mathcal{D} : l(Q) = 2^k\}$.

Morrey spaces, named after Morrey, seem to describe the boundedness property of the classical fractional integral operators $I_\alpha$ more precisely than Lebesgue spaces. We first recall the definition of the Morrey (quasi-)norms $\|f\|_{\mathcal{M}_\alpha^q}$ [18]. For $0 < q \leq p < \infty$, the Morrey norm is given by
\[ \|f\|_{\mathcal{M}_\alpha^q} = \sup_{Q \in \mathcal{D}} |Q|^{1/p} \left( \frac{1}{|Q|} \int_Q |f(x)|^q \, dx \right)^{1/q}. \] (1.5)

Applying Hölder’s inequality to (1.5), we see that
\[ \|f\|_{\mathcal{M}_\alpha^p} \geq \|f\|_{\mathcal{M}_\alpha^q} \quad \text{for all } p \geq q_1 \geq q_2 > 0. \] (1.6)

This tells us that
\[ L^p = \mathcal{M}_p^p \subset \mathcal{M}_q^{p_1} \subset \mathcal{M}_q^{p_2} \quad \text{for all } p \geq q_1 \geq q_2 > 0. \] (1.7)

**Remark 1.1.** In addition, we know that $L^{p, \infty}$ is contained in $\mathcal{M}_q^p$ with $1 \leq q < p < \infty$ (see [13, Lemma 1.7]). More precisely, $\|f\|_{\mathcal{M}_q^p} \leq C\|f\|_{L^{p, \infty}}$ with $1 \leq q < p < \infty$, here and in what follows, the letter $C$ will denote a constant, not necessarily the same in different occurrences, and let $p'$ satisfy $1/p + 1/p' = 1$ with $p > 1$.

The following result is due to Adams [1] (see also Chiarenza and Frasca [3]), which turned out sharp [17].

**Proposition 1.2.** Let $0 < \alpha < n$, $1 < q \leq p < \infty$ and $1 < t \leq s < \infty$. Assume $\frac{1}{s} = \frac{1}{p} - \frac{\alpha}{n}$, $\frac{1}{t} = \frac{q}{p}$. Then there exists a constant $C > 0$ such that
\[ \|I_\alpha f\|_{\mathcal{M}_t^q} \leq C\|f\|_{\mathcal{M}_s^p} \]
holds for all measurable functions $f$.

For the case $1 < t \leq s < \infty$, we prove the following theorem under the unweighted setting.
Theorem 1.3. Suppose that the parameters \(p_1, q_1, p_2, q_2, s, t\) and \(\alpha\) satisfy
\[
1 < q_1 \leq p_1 < \infty, \quad 1 < q_2 \leq p_2 < \infty, \quad 1/q_1 + 1/q_2 < 1, \quad 1 < t \leq s < \infty, \quad 0 < \alpha < n.
\]
Assume that \(\frac{1}{s} = \frac{1}{p_1} + \frac{1}{p_2} - \frac{\alpha}{n}\) and \(\frac{1}{t} = \frac{\alpha}{q_1} + \frac{\alpha}{q_2} - \frac{s}{n}\). Then there exists a constant \(C > 0\) such that
\[
\|B_\alpha(f, g)\|_{\mathcal{M}^p_t} \leq C\|f\|_{\mathcal{M}^p_{q_1}}\|g\|_{\mathcal{M}^p_{q_2}}
\]
holds for all measurable functions \(f\) and \(g\).

Applying inequality \((1.6)\), we can say the following result as corollary of Theorem 1.3.

Theorem 1.4. Suppose that the parameters \(p_1, q_1, p_2, q_2, s, t\) and \(\alpha\) satisfy
\[
1 < q_1 \leq p_1 < \infty, \quad 1 < q_2 \leq p_2 < \infty, \quad 1/q_1 + 1/q_2 < 1, \quad 1 < t \leq s < \infty, \quad 0 < \alpha < n.
\]
Assume that \(\frac{1}{s} = \frac{1}{p_1} + \frac{1}{p_2} - \frac{\alpha}{n}\) and \(\frac{1}{t} = \frac{\alpha}{q_1} + \frac{\alpha}{q_2} - \frac{s}{n}\). Then there exists a constant \(C > 0\) such that
\[
\|B_\alpha(f, g)\|_{\mathcal{M}^p_t} \leq C\|f\|_{\mathcal{M}^p_{q_1}}\|g\|_{\mathcal{M}^p_{q_2}}
\]
holds for all measurable functions \(f\) and \(g\).

However, this is not the end of the story; we can prove even more. Here we present our full statement of the main theorem. In special case Theorem 1.3 can be extended to a large extent.

Theorem 1.5. Suppose that \(0 < \alpha < n, 1 < q_1 \leq p_1 = n/\alpha, 1 < q_2 \leq q_2n/\alpha\) and \(1/q_1 + 1/q_2 < 1\). Then there exists a constant \(C > 0\) such that
\[
\|B_\alpha(f, g)\|_{\mathcal{M}^p_{q_2}} \leq C\|f\|_{\mathcal{M}^p_{q_1}}\|g\|_{\mathcal{M}^p_{q_2}}
\]
holds for all positive measurable functions \(f\) and \(g\).

2. The proofs of Theorems 1.3 – 1.5

Proof of Theorem 1.3. We take parameters
\[
1 < u_1, v_1 < \infty, \quad 1 < u_2, v_2 < \infty, \quad 1 < l < q_1, \quad 1 < l' < q_2
\]
such that
\[
\frac{1}{u_1} = \frac{1}{p_1} - \frac{\alpha}{n}, \quad \frac{1}{u_2} = \frac{1}{p_2} - \frac{\alpha}{l' n}, \quad \frac{v_1}{u_1} = \frac{v_2}{u_2} = \frac{t}{s}.
\]
Since
\[
1 < l < q_1, \quad 1 < l' < q_2 \quad \text{and} \quad \frac{1}{q_1} + \frac{1}{q_2} < 1
\]
there exists a pair of conjugate of exponents \(1/l + 1/l' = 1\).

Notice that
\[
\frac{1}{u_1} + \frac{1}{u_2} = \frac{1}{p_1} + \frac{1}{p_2} - \frac{\alpha}{n} = \frac{1}{s}.
\]
It follows from this, \(\frac{v_1}{u_1} = \frac{v_2}{u_2} = \frac{t}{s}\) and Hölder’s inequality that
\[
\|h_1 \cdot h_2\|_{\mathcal{M}^p_t} \leq \|h_1\|_{\mathcal{M}^p_{q_1}}\|h_2\|_{\mathcal{M}^p_{q_2}}.
\]
Thus, if we insert about pointwise estimate for $B_\alpha (1.3)$, use the Adams original result of Proposition 1.2 and inequality (2.1), we have

$$\|B_\alpha (f, g)\|_{M^p_t} \leq \|I_\alpha (|f|^{l'/l})\|_{\mathcal{M}^{p_1}_{q_1}} \|I_\alpha (|g|^{l''/l'})\|_{\mathcal{M}^{p_2}_{q_2}}.$$  \hfill (2.2)

By the condition $\frac{1}{u_1} = \frac{1}{p_1} - \frac{\alpha}{n}$, we obtain

$$\frac{1}{u_1/l} = \frac{1}{p_1/l} - \frac{\alpha}{n}. \hfill (2.3)$$

Meanwhile, observing that

$$\frac{v_1/l}{u_1/l} = \frac{v_1}{u_1} = \frac{t}{s} = \frac{q_1}{p_1} = \frac{q_1/l}{p_1/l} \quad \text{and} \quad \|I_\alpha (|f|^{l'/l})\|_{\mathcal{M}^{p_1}_{q_1}} = \|I_\alpha (|f|^{l'/l})\|_{\mathcal{M}^{p_1}_{q_1}}. \hfill (2.4)$$

Therefore, by equations (2.3) and (2.4) we conclude that

$$\|I_\alpha (|f|^{l'/l})\|_{\mathcal{M}^{p_1}_{q_1}} \lesssim \|f\|_{\mathcal{M}^{p_1}_{q_1}}. \hfill (2.5)$$

Simplifying, we imply that

$$\|I_\alpha (|g|^{l''/l'})\|_{\mathcal{M}^{p_2}_{q_2}} \lesssim \|g\|_{\mathcal{M}^{p_2}_{q_2}}. \hfill (2.6)$$

Combining (2.2), (2.5) and (2.6), we get the following estimate

$$\|B_\alpha (f, g)\|_{M^p_t} \leq C \|f\|_{\mathcal{M}^{p_1}_{q_1}} \|g\|_{\mathcal{M}^{p_2}_{q_2}}.$$  \hfill (2.7)

This completes the proof of Theorem 1.3. \hfill \Box

**Proof of Theorem 1.4.** Let $s, t_1, p_1, q_1, p_1$ and $q_1$ as in Theorem 1.3, then

$$\frac{t_1}{s} = \frac{q_1}{p_1} = \frac{q_1}{p_1} \quad \text{and} \quad \frac{1}{s} = \frac{1}{p_1} + \frac{1}{p_2} - \frac{\alpha}{n}.$$

It follows that

$$\frac{1}{t_1} = \frac{p_1}{q_1} \frac{1}{s} = \frac{p_1}{q_1} \left( \frac{1}{p_1} + \frac{1}{p_2} - \frac{\alpha}{n} \right) = \frac{1}{q_1} + \frac{p_1}{q_1} \frac{1}{p_2} - \frac{p_1}{q_1} \frac{\alpha}{n} \leq \frac{1}{q_1} + \frac{1}{q_1} \frac{\alpha}{n} = \frac{1}{t},$$

that is equivalent to

$$t \leq t_1.$$

Therefore, by Theorem 1.3 and the relation (1.6) with $1 \leq t \leq t_1 < \infty$, we obtain

$$\|B_\alpha (f, g)\|_{M^p_t} \leq \|B_\alpha (f, g)\|_{M^p_{t_1}} \leq C \|f\|_{\mathcal{M}^{p_1}_{q_1}} \|g\|_{\mathcal{M}^{p_2}_{q_2}}.$$  \hfill (2.8)

This finishes the proof of Theorem 1.4. \hfill \Box

We invoke a bilinear estimate from [19].

**Proposition 2.1.** Let $0 < \alpha < n$, $1 < p \leq p_0 < \infty$, $1 < q \leq q_0 < \infty$ and $1 < r \leq r_0 < \infty$. Assume that

$$q > r, \quad \frac{1}{p_0} > \frac{\alpha}{n}, \quad \frac{1}{q_0} \leq \frac{\alpha}{n},$$

and

$$\frac{1}{r_0} = \frac{1}{p_0} + \frac{1}{q_0} - \frac{\alpha}{n}, \quad \frac{r}{r_0} = \frac{p}{p_0}.$$

Then

$$\|g \cdot I_\alpha f\|_{\mathcal{M}^{p_0}_{q_0}} \leq C \|g\|_{\mathcal{M}^{p_0}_{q_0}} \|f\|_{\mathcal{M}^{p_0}_{q_0}},$$

where the constant $C$ is independent of $f$ and $g$. 

We now prove Theorem 1.5.

**Proof of Theorem 1.5.** We first claim that we can choose parameters $1 < v \leq u < \infty$ and a pair of conjugate of exponents $l, l' > 1$ such that

$$p_1 = \frac{n}{\alpha} < \frac{\ln}{\alpha}, \quad p_2 < \frac{l'n}{\alpha}, \quad v > q_2, \quad \frac{v}{u} = \frac{q_1}{p_1}, \quad \frac{1}{u} = \frac{1}{p_1} - \frac{\alpha}{\ln} = \frac{\alpha}{l'n}. \quad (2.7)$$

This is possible by assumption. In fact, let us choose $1 < v \leq u < \infty$ and $l, l' > 1$ such that

$$\frac{v}{u} = \frac{q_1}{p_1}, \quad \frac{1}{u} = \frac{1}{p_1} - \frac{\alpha}{\ln}. \quad (2.8)$$

Then we have

$$\frac{1}{u} = \frac{1}{p_1} - \frac{\alpha}{\ln} = \frac{\alpha}{n} - \frac{\alpha}{l'n} = v = \frac{q_1}{p_1} \cdot \frac{l'n}{\alpha}. \quad (2.9)$$

Therefore, if we choose $l, l'$ satisfy

$$1 < l < q_1, \quad \max(1, \frac{q_2}{q_1}) < l' < q_2 \quad \text{and} \quad l' \rightarrow q_2,$$

Then we have

$$v > q_2, \quad p_1 < \frac{\ln}{\alpha} \quad \text{and} \quad p_2 < \frac{l'n}{\alpha}. \quad (2.10)$$

Consequently, we could justify the claim that we can choose the parameters $1 < v \leq u < \infty$ and $l, l' > 1$ so that they satisfy (2.7).

By inequality (2.2) and recur to Proposition (2.1) with

$$v > q_2, \quad p_2 < \frac{l'n}{\alpha}, \quad u = \frac{l'n}{\alpha}, \quad \frac{1}{p_2} = \frac{1}{u} + \frac{\alpha}{l'n} \quad \text{and} \quad \frac{q_2}{p_2} = \frac{q_2}{p_2},$$

we have

$$\|B_\alpha(f, g)\|_{\mathcal{M}^p_{q_2}} \leq \|I_\alpha(|f|^{l'})^{1/l} I_\alpha(|g|^{l'})^{1/l'}\|_{\mathcal{M}^p_{q_2}} = \|I_\alpha(|f|^{l'})^{1/l} : I_\alpha(|g|^{l'})^{1/l'}\|_{\mathcal{M}^p_{q_2}}. \quad (2.11)$$

Since

$$\frac{v}{l'} > q_2 > 1, \quad 1 < \frac{p_2}{l'} < \frac{n}{\alpha}, \quad \frac{u}{l'} = \frac{n}{\alpha}, \quad \frac{1}{p_2/l'} = \frac{1}{u/l'} + \frac{1}{p_2/l'} - \frac{\alpha}{n} \quad \text{and} \quad \frac{q_2/l'}{p_2/l'} = \frac{q_2/l'}{p_2/l'},$$

then we have

$$\|B_\alpha(f, g)\|_{\mathcal{M}^p_{q_2}} \leq C\|I_\alpha(|f|^{l'})^{1/l'}\|_{\mathcal{M}^p_{u/l'}} \|g\|_{\mathcal{M}^p_{q_2}} = C\|I_\alpha(|f|^{l'})^{1/l'}\|_{\mathcal{M}^p_{u/l'}} \|g\|_{\mathcal{M}^p_{q_2}}. \quad (2.12)$$

Meanwhile, notice that

$$1 < l < q_1, \quad u = p_1 l', \quad v = q_1 l', \quad \frac{v}{l} = \frac{q_1}{p_1} \quad \text{and} \quad \frac{1}{u/l} = \frac{1}{p_1/l} - \frac{\alpha}{n}. \quad (2.13)$$

Hence, by Proposition 1.2, we obtain

$$\|B_\alpha(f, g)\|_{\mathcal{M}^p_{q_2}} \leq C\|f\|_{\mathcal{M}^p_{q_1}} \|g\|_{\mathcal{M}^p_{q_2}} = C\|f\|_{\mathcal{M}^p_{q_1}} \|g\|_{\mathcal{M}^p_{q_2}}, \quad (2.14)$$

which gives us the desired result.

From Theorem 1.5 and Remark 1.1, we have the following result.

**Corollary 2.2.** Let $\alpha, p_i, q_i$ be as in Theorem 1.5 and $p_i \neq q_i$ with $i = 1, 2$. Then

$$\|B_\alpha(f, g)\|_{\mathcal{M}^p_{q_2}} \leq C\|f\|_{L^{p_1, \infty}} \|g\|_{L^{p_2, \infty}}.$$
3. Sharpness of the Results

In this section we prove that
\[ \|B_\alpha(f, g)\|_{\mathcal{M}_t^s} \leq C \|f\|_{\mathcal{M}_{q_1}^{p_1}} \|g\|_{\mathcal{M}_{q_2}^{p_2}} \]
holds only when \( \frac{t}{s} \leq \max \left( \frac{q_1}{p_1}, \frac{q_2}{p_2} \right) \).

**Theorem 3.1.** Let \( 0 < \alpha < n \), \( 0 < t \leq s < \infty \) and \( 0 < q_j \leq p_j < \infty \) for \( j = 1, 2 \). Suppose that \( 1 = \frac{1}{s} = \frac{1}{p_1} + \frac{1}{p_2} - \frac{n}{s} \) and \( \frac{t}{s} > \max \left( \frac{q_1}{p_1}, \frac{q_2}{p_2} \right) \). Then there exists no constants \( C > 0 \) such that
\[ \|B_\alpha(f, g)\|_{\mathcal{M}_t^s} \leq C \|f\|_{\mathcal{M}_{q_1}^{p_1}} \|g\|_{\mathcal{M}_{q_2}^{p_2}} < \infty. \]

**Proof.** We proof of this theorem based on following the equivalent definition of Morrey norm
\[ \|f\|_{\mathcal{M}_q^p} \approx \sup_{Q \in \mathcal{Q}} |Q|^\frac{1}{p} \left( \int_Q |f(y)|^q \, dy \right)^\frac{1}{q}, \quad (3.1) \]
where \( \mathcal{Q} \) denotes the family of all open cubes in \( \mathbb{R}^n \) with sides parallel to the coordinate axes. Without loss of generality, we may assume that
\[ 1 \geq \frac{t}{s} > \max \left( \frac{q_1}{p_1}, \frac{q_2}{p_2} \right) = \frac{q_1}{p_1} \]
and that \( q_1 < p_1 \). If \( 1 < \frac{t}{s} \), then the Morrey norm of a measurable function \( f \) is infinite unless \( f \) vanishes almost everywhere.

Fix a positive small number \( \delta \ll 1 \) and \( N = [\frac{q_1}{\delta p_1} - 1] \) be a large integer. We let the set of lattice points
\[ J := (0, 1)^n \cap \frac{1}{N} \mathbb{Z}^n. \]
For each point \( j \in J \), we place a small cube \( Q_j \) centered at \( j \) with the side length \( \delta \) and set
\[ E := \bigcup_{j \in J} Q_j. \]
Then we have
\[ |E| = N^n \delta^n \approx \delta^{\frac{nq_1}{p_1}}. \]
Set
\[ f(x) := \delta^{-\frac{n}{p_1}} \chi_{3Q_j}(x) \quad \text{and} \quad g(x) := \delta^{-\frac{n}{p_2}} \chi_{3Q_j}(x), \]
where \( 3Q_j \) denotes the triple of \( Q_j \).

Then a simple arithmetic calculation, we claim
\[ \|f\|_{\mathcal{M}_{q_1}^{p_1}} \leq C \quad \text{and} \quad \|g\|_{\mathcal{M}_{q_2}^{p_2}} \leq C. \quad (3.2) \]
In fact, we use the equivalent definition of Morrey norm (3.1). When \( l(Q) \leq 3 \delta \), we know that
\[ \|f\|_{\mathcal{M}_{q_1}^{p_1}} = \sup_{Q \in \mathcal{Q}, l(Q) \leq 3 \delta} |Q|^\frac{1}{p_1} \delta^{-\frac{n}{p_1}} \left( \int_{Q \setminus 3Q_j} dy \right)^\frac{1}{q_1} \leq \sup_{Q \in \mathcal{Q}, l(Q) \leq 3 \delta} |Q|^\frac{1}{p_1} \delta^{-\frac{n}{p_1}} \leq 3 \delta^{\frac{nq_1}{p_1}}. \]
When \( l(Q) > 3\delta \), we show that
\[
\|f\|_{\mathcal{M}_{p}^{\alpha}} = \sup_{Q \in \mathcal{Q}, l(Q) > 3\delta} \frac{|Q|^{\frac{1}{n} - \frac{1}{p} - \delta \cdot \frac{n}{p}}}{|y|^{n-\alpha}} \left( \int_{3Q} dy \right)^{\frac{1}{n}} \leq \sup_{Q \in \mathcal{Q}, l(Q) > 3\delta} 3^\frac{n}{p} \frac{|Q|^{\frac{1}{n} - \frac{1}{p} - \frac{n}{p}}}{|y|^{n-\alpha}} \leq 3^\frac{n}{p}.
\]

Similar to computing \( \|g\|_{\mathcal{M}_{q}^{\beta}} \), we obtain the claim.

Now, for \( x \in Q_j \),
\[
B_{\alpha}(f, g)(x) \approx \int_{y \in \mathbb{R}^n} \frac{f(x - y)g(x + y)}{|y|^{n-\alpha}} \, dy \geq \delta^{\alpha-n} \int_{|y| \leq \delta} f(x - y)g(x + y) \, dy = \delta^{\alpha} \delta^{-\frac{n}{n-1}} = \delta^{-\frac{n}{n-1}},
\]
where the above estimate based on facts: when \( x \in Q \) and \( |y| \leq l(Q) \), then \( (x - y, x + y) \in 3Q \times 3Q \).

This tells us that
\[
\left( \int_{(0,1)^n} B_{\alpha}(f, g)(x)^t \, dx \right) \geq \int_{E} B_{\alpha}(f, g)(x)^t \, dx \leq CN^{n-\alpha} \approx C(\delta^n)^{\frac{n}{n-1} - \frac{1}{t}}.
\]
This implies that
\[
\|B_{\alpha}(f, g)\|_{\mathcal{M}_{t}^{\alpha}} \geq \left( \int_{(0,1)^n} B_{\alpha}(f, g)(x)^t \, dx \right)^{\frac{1}{t}} \geq C \left( (\delta^n)^{\frac{n}{n-1} - \frac{1}{t}} \right)^{\frac{1}{t}}.
\]
Taking \( \delta \) small enough, we have the desired result by \( \frac{4}{t} > \frac{\alpha}{p_1} \) and (3.2).

4. The two-weight case for bilinear fractional integral operators

Our results are new and provide the first non-trivial weighted estimates for \( B_{\alpha} \) on Morrey spaces and the only known weighted estimates for \( B_{\alpha} \) on Morrey spaces \( \mathcal{M}_{t}^{\alpha} \) when \( 0 < t \leq 1 \). The estimates we obtain parallel earlier results by Iida, Sato, Sawano and Tanaka [10] for the less singular bilinear fractional integral operator
\[
I_{\alpha}(f, g)(x) = \int_{\mathbb{R}^n} \frac{f(y)g(z)}{|(x - y) + (x - z)|^{2n-\alpha}} \, dy \, dz.
\]
We first introduce two weight estimates for classical fractional integral operators on Morrey spaces, the following result is due to Iida, Sato, Sawano and Tanaka [10].

**Proposition 4.1.** Let \( v \) be a weight on \( \mathbb{R}^n \) and \( \tilde{w} = (w_1, w_2) \) be a collection of two weights on \( \mathbb{R}^n \).

Assume that
\[
0 < \alpha < 2n, \quad \tilde{q} = (q_1, q_2), \quad 1 \leq q_1, q_2 < \infty, \quad 0 < q \leq \infty, \quad 0 < t \leq s < r \leq \infty
\]
and \( 1 < a < \min(r/s, q_1, q_2) \). Here, \( q \) is given by \( 1/q = 1/q_1 + 1/q_2 \). Suppose that
\[
\frac{1}{s} = \frac{1}{p} + \frac{1}{r} - \frac{\alpha}{n}, \quad \frac{t}{s} = \frac{q}{p}, \quad 0 < t \leq 1
\]
and the weights \( v \) and \( \tilde{w} \) satisfy the following condition:
\[
[v, \tilde{w}]_{t,q/a}^{r,a} := \sup_{Q,Q' \in \mathcal{Q}} \left( \frac{|Q|}{|Q'|} \right)^{\frac{1}{q}} |Q'|^{\frac{1}{t}} \left( \int_{Q} v^t \right)^{\frac{1}{t}} \prod_{i=1}^{2} \left( \int_{Q_i} w_i^{-(q_i/a)^t} \right)^{\frac{1}{q_i/a}} < \infty. \tag{4.1}
\]
Then we have
\[
\|I_{\alpha}(f, g)v\|_{\mathcal{M}_{t}^{\alpha}} \leq C[v, \tilde{w}]_{t,q/a}^{r,a} \sup_{Q \in \mathcal{Q}} |Q|^{1/p} \left( \int_{Q} (|f|v_1)^q \right)^{1/q_1} \left( \int_{Q} (|g|v_2)^q \right)^{1/q_2}.
\]
For the case $0 < t \leq 1$, we have two weight inequalities of bilinear fractional integral operators.

**Theorem 4.2.** Let $v$ be a weight on $\mathbb{R}^n$ and $\tilde{w} = (w_1, w_2)$ be a collection of two weights on $\mathbb{R}^n$. Assume that

$$0 < \alpha < n, \ q = (q_1, q_2), \ 1 < q_1, q_2 < \infty, \ 0 < q \leq p < \infty, \ 0 < t \leq s < \infty \ \text{and} \ 0 < r \leq \infty.$$ 

Here, $q$ is given by $1/q = 1/q_1 + 1/q_2$. Suppose that

$$\frac{\alpha}{n} > \frac{1}{r}, \ \frac{1}{s} = \frac{1}{p} + \frac{1}{r} - \frac{\alpha}{n}, \ \frac{t}{s} = \frac{q}{p}, \ 0 < t \leq 1$$

and the weights $v$ and $\tilde{w}$ satisfy the following two conditions:

(i) If $0 < s < 1, \ \frac{1}{s} < r$ and $1 < a < \min(r(1-s)/s, q_1, q_2)$

$$[v, \tilde{w}]_{t, q/a}^{r, as} := \sup_{Q, Q_a \in \mathcal{Q}} \left(\frac{|Q|}{|Q_a|}\right)^{1-as} |Q|^{1/p} \left(\frac{1}{s} \sum_{i=1}^{2} \left(\int_Q v \frac{1}{v^{1-t}} \right) \prod_{i=1}^{a} \left(\int_Q w^{-\alpha/a}_i \frac{1}{\alpha/a}\right)^{1/(\alpha/a)} \right) < \infty \ (4.2)$$

(ii) If $s \geq 1$ and $1 < a < \min(q_1, q_2)$

$$[v, \tilde{w}]_{t, q/a}^{r, as} := \sup_{Q, Q_a \in \mathcal{Q}} \left(\frac{|Q|}{|Q_a|}\right)^{1-as} |Q|^{1/p} \left(\frac{1}{s} \sum_{i=1}^{2} \left(\int_Q v \frac{1}{v^{1-t}} \right) \prod_{i=1}^{a} \left(\int_Q w^{-\alpha/a}_i \frac{1}{\alpha/a}\right)^{1/(\alpha/a)} \right) < \infty, \ (4.3)$$

where $\left(\int_Q v \frac{1}{v^{1-t}} \right)^{1/p} = \|v\|_{L^\infty(Q)}$ when $t = 1$. Then we have

$$\|B_{\alpha}(f, g)v\|_{\mathcal{M}_t^r} \leq C[v, \tilde{w}]_{t, q/a}^{r, as} \sup_{Q \in \mathcal{Q}} |Q|^{1/p} \left(\frac{1}{s} \sum_{i=1}^{2} \left(\int_Q v \frac{1}{v^{1-t}} \right) \prod_{i=1}^{a} \left(\int_Q w^{-\alpha/a}_i \frac{1}{\alpha/a}\right)^{1/(\alpha/a)} \right)^{1/q_2}.$$ 

**Remark 4.3.** Inequality (4.2) holds if $v$ and $\tilde{w}$ satisfy

$$[v, \tilde{w}]_{as, q/a}^{r, as} := \sup_{Q \in \mathcal{Q}} |Q|^{1/p} \left(\frac{1}{s} \sum_{i=1}^{2} \left(\int_Q v \frac{1}{v^{1-t}} \right) \prod_{i=1}^{a} \left(\int_Q w^{-\alpha/a}_i \frac{1}{\alpha/a}\right)^{1/(\alpha/a)} \right) < \infty. \ (4.4)$$

Indeed, for any cubes $Q \subset Q'$, it immediately follows that $0 < t \leq s < 1$. Since

$$0 < t \leq s \leq 1 \Rightarrow \frac{1-s}{as} \leq \frac{1-t}{t} \Rightarrow \frac{t}{1-t} \leq \frac{as}{1-s},$$

then by using Hölder’s inequality we have

$$\left(\frac{|Q|}{|Q'|}\right)^{1-as} |Q'|^{1/p} \left(\frac{1}{s} \sum_{i=1}^{2} \left(\int_Q v \frac{1}{v^{1-t}} \right) \prod_{i=1}^{a} \left(\int_Q w^{-\alpha/a}_i \frac{1}{\alpha/a}\right)^{1/(\alpha/a)} \right) \leq \left(\frac{|Q|}{|Q'|}\right)^{1-as} |Q'|^{1/p} \left(\frac{1}{s} \sum_{i=1}^{2} \left(\int_Q v \frac{1}{v^{1-t}} \right) \prod_{i=1}^{a} \left(\int_Q w^{-\alpha/a}_i \frac{1}{\alpha/a}\right)^{1/(\alpha/a)} \right) \leq |Q'|^{1/r} \left(\frac{1}{s} \sum_{i=1}^{2} \left(\int_Q v \frac{1}{v^{1-t}} \right) \prod_{i=1}^{a} \left(\int_Q w^{-\alpha/a}_i \frac{1}{\alpha/a}\right)^{1/(\alpha/a)} \right) \leq [v, \tilde{w}]_{as, q/a}^{r, as} < \infty.$$ 

Thus, when $s = t, p = q$, Theorem 4.2 recovers the two-weight results due to Moen [16].

The following is the Olsen inequality for bilinear fractional integral operators, which can see more in the papers [7, 8, 17].
Corollary 4.4. Let $v$ be a weight on $\mathbb{R}^n$ and assume that

$$0 < \alpha < n, \quad 1 < q_1, q_2 < \infty, \quad 0 < q \leq p < \infty, \quad 0 < t \leq s < 1, \quad \frac{s}{1 - s} < r \leq \infty \quad \text{and} \quad a > 1,$$

where $q$ is given by $1/q = 1/q_1 + 1/q_2$. Suppose that

$$\frac{\alpha}{n} > \frac{1}{r}, \quad \frac{1}{s} = \frac{1}{p} + \frac{1 - \alpha}{n} \quad \text{and} \quad t = \frac{q}{p}.$$

Then we have

$$\|B_\alpha (f, g)v\|_{\mathcal{M}^r_t} \leq C\|v\|_{\mathcal{M}^r_t} \sup_{Q \in \mathcal{D}} |Q|^{1/p} \left( \frac{\int_Q |f|^q}{|Q|^{1/q}} \right)^{1/q_1} \left( \frac{\int_Q |g|^{q_2}}{|Q|^{1/q_2}} \right)^{1/q_2}.$$

Proof. This follows from Theorem 4.2 by letting $w_1 = w_2 = 1$ and noticing that, for every $Q \subset Q'$,

$$\left( \frac{|Q|}{|Q'|} \right)^{\frac{1-s}{as}} |Q'|^{\frac{1}{r}} = |Q|^{\frac{1-s}{as}} |Q'|^{\frac{1}{r} - \frac{1-s}{as}} \leq |Q|^{\frac{1}{r}}, \quad (4.5)$$

The inequality (4.5) can be deduced from the facts that $\frac{1}{r} - \frac{1-s}{as} < 0$, which follow from $\frac{s}{1-s} < r$.

The following is the Fefferman-Stein type dual inequality for bilinear fractional integral operators on Morrey spaces.

Corollary 4.5. Assume that the parameters $0 < s_i < 1$ and $\frac{\alpha}{s_i} < r \leq \infty$ with $i = 1, 2$, satisfy

$$\frac{1-s}{as} = \frac{1-s_1}{s_1} + \frac{1-s_2}{s_2} \quad \text{and} \quad \frac{1}{r} = \frac{1}{r_1} + \frac{1}{r_2}.$$

Then, for any collection of two weights $w_1$ and $w_2$, we have

$$\|B_\alpha (f, g)w_1w_2\|_{\mathcal{M}^r_t} \leq C \sup_{Q \in \mathcal{D}} |Q|^{1/p} \left( \frac{\int_Q (|f|w_1)^{q_1}}{|Q|^{1/q_1}} \right)^{1/q_1} \left( \frac{\int_Q (|g|w_2)^{q_2}}{|Q|^{1/q_2}} \right)^{1/q_2},$$

where

$$W_i(x) = \sup_{Q \in \mathcal{D}} |Q|^{1/r_i} \left( \frac{\int_Q w_i^{\frac{s_i}{1-s_i}}}{|Q|^{1/s_i}} \right)^{1-s_i/s_i} \quad \text{for} \quad i = 1, 2.$$

Proof. We need only the inequality (4.4) with $v = w_1w_2$ and $w_i = W_i$ with $i = 1, 2$. It follows from Hölder’s inequality that

$$Q^{1/r} \left( \frac{\int_Q (w_1w_2)^{\frac{as}{r-as}}}{|Q|^{1/r}} \right)^{\frac{r-as}{as}} \leq \prod_{i=1}^2 \left( \frac{\int_Q w_i^{\frac{s_i}{1-s_i}}}{|Q|^{1/s_i}} \right)^{\frac{1-s_i}{s_i}} = \prod_{i=1}^2 |Q|^{1/r_i} \left( \frac{\int_Q w_i^{\frac{s_i}{1-s_i}}}{|Q|^{1/s_i}} \right)^{1-s_i/s_i}.$$

Corollary 4.5 follows immediately from the inequality

$$W_i(x) \geq |Q|^{1/r_i} \left( \frac{\int_Q w_i^{\frac{s_i}{1-s_i}}}{|Q|^{1/s_i}} \right)^{1-s_i/s_i} \quad \text{for all} \quad x \in Q.$$

For one weight inequality we take $r = \infty$ and $v = w_1w_2$ to arrive at the following theorem.

Theorem 4.6. Let $\bar{w} = (w_1, w_2)$ be a collection of two weights on $\mathbb{R}^n$ and assume that

$$0 < \alpha < n, \quad \bar{q} = (q_1, q_2), \quad 1 < q_1, q_2 < \infty, \quad 0 < q \leq p < \infty, \quad 0 < t \leq s < \infty \quad \text{and} \quad a > 1,$$
where $q$ denotes the number determined by the Hölder relationship $1/q = 1/q_1 + 1/q_2$. Suppose that
\[
\frac{1}{s} = \frac{1}{p} - \frac{\alpha}{n}, \quad \frac{t}{s} = \frac{q}{p}, \quad 0 < t \leq 1
\]
and the weights $\vec{w}$ satisfy the following two conditions:

(i) If $0 < s < 1$,
\[
[w^s_{t,q} := \sup_{Q \subset Q'} \left( \frac{|Q|}{|Q'|} \right)^{\frac{1-s}{\alpha}} \left( \frac{\|w_1w_2\|_t}{\|w_1w_2\|_t} \right)^{\frac{1-t}{\alpha}} \prod_{i=1}^2 \left( \int_Q (w_i^{-q'_i})^{\frac{it}{n}} \right)^{\frac{1}{it}} < \infty \quad (4.6)
\]

(ii) If $s \geq 1$,
\[
[w^s_{t,q} := \sup_{Q \subset Q'} \left( \frac{|Q|}{|Q'|} \right)^{\frac{1-s}{\alpha}} \left( \frac{\|w_1w_2\|_t}{\|w_1w_2\|_t} \right)^{\frac{1-t}{\alpha}} \prod_{i=1}^2 \left( \int_Q (w_i^{-q'_i})^{\frac{it}{n}} \right)^{\frac{1}{it}} < \infty, \quad (4.7)
\]

where $\left( \int_Q (w_i^{-q'_i})^{\frac{t}{n}} \right)^{\frac{1}{it}} = \|w_1w_2\|_{L^\infty(Q)}$ when $t = 1$. Then we have
\[
\|B_{\alpha}(f,g)w_1w_2\|_{M^t_t} \leq C[w^s_{t,q} \sup_{Q \subset Q'} |Q|^{1/p} \left( \int_Q (|f|w_1)^{q_1} \right)^{1/q_1} \left( \int_Q (|g|w_2)^{q_2} \right)^{1/q_2}.
\]

Remark 4.7. In the same manner as in Remark 4.3, by using Lemma 5.6 below, the inequality (4.6) holds for $0 < s < 1$ if
\[
\sup_{Q \subset Q'} \left( \int_Q (w_i^{-q'_i})^{\frac{t}{n}} \right)^{\frac{1}{it}} \prod_{i=1}^2 \left( \int_Q (w_i^{-q'_i})^{\frac{it}{n}} \right)^{\frac{1}{it}} < \infty. \quad (4.8)
\]

Thus, when $s = t$ and $p = q$, Theorem 4.6 recovers the one-weight result due to Mone [16].

5. THE PROOFS OF THEOREMS 4.2 AND 4.6

We shall state and prove a principal lemma. Our key tool is the following bilinear maximal operator.

Definition 5.1. Let $0 < \alpha < n$ and $0 < t \leq 1$. Assume that $v$ be a weight on $\mathbb{R}^n$ and $(f, g)$ a couple of locally integrable functions on $\mathbb{R}^n$. Then define a bilinear maximal operator $\tilde{M}^t_\alpha(f, g, v)(x)$ by
\[
\tilde{M}^t_\alpha(f, g, v)(x) = \sup_{x \in Q \subset \mathcal{D}} |Q|^{\frac{t}{n}} \left( \int_Q |f(y)||g(y)||dy \right)^{\frac{1}{t}} \left( \int_Q v(y)^{\frac{t}{1-t}} dy \right)^{\frac{1}{it}},
\]

where $x \in \mathbb{R}^n$ and $\left( \int_Q v(y)^{\frac{t}{1-t}} dy \right)^{\frac{1}{it}} = \|v\|_{L^\infty(Q)}$ when $t = 1$.

The following is our principal lemma, which seems to be of interest on its own.

Lemma 5.2. Assume that $v$ be a weight on $\mathbb{R}^n$ and $(f, g)$ a couple of locally integrable functions on $\mathbb{R}^n$. For any $x \in Q_0 \subset \mathcal{D}$, set
\[
(f_0, g_0) = (f(\cdot)\chi_{Q_0}(x - \cdot), g(\cdot)\chi_{Q_0}(\cdot - x)) \quad \text{and} \quad (f_1, g_1) = (f\chi_{3Q_0}, g\chi_{3Q_0}).
\]

Then there exists a constant $C$ independent of $v, f, g, Q_0$ such that
\[
\|B_\alpha(f_0, g_0)v\|_{L^t_t(Q_0)} \leq C\|\tilde{M}^t_\alpha(f_1, g_1, v)\|_{L^t_t(Q_0)} \quad (5.1)
\]
holds for $0 < \alpha < n$ and $0 < t \leq 1$.

Since $B_\alpha$ is a positive operator, without loss of generality we may assume that $f, g$ are nonnegative. For simplicity, we will use the notation

$$m_Q(f, g) = \int_Q f(y) dy \cdot \int_Q g(y) dy.$$

We begin with an auxiliary operator that will play a key role in our analysis. For $d > 0$ define,

$$B_d(f, g)(x) = \int_{|y| \leq d} f(x - y) g(x + y) dy.$$

The operators $B_{2^k}$ are used by Kenig and Stein [12] in the analysis of $B_\alpha$. We have the following weighted estimates for $B_d$ due to [16].

**Lemma 5.3.** Assume that $v$ be a weight on $\mathbb{R}^n$ and $(f, g)$ a couple of locally integrable functions on $\mathbb{R}^n$. Let $0 < t \leq 1$ and $Q$ be a cube, then we have

$$\int_Q B_\lambda(Q)(f, g)^tv dx \leq C \left( \int_{3Q} f dx \cdot \int_{3Q} g dx \right)^t \left( \int_Q v^{1-t} dx \right)^{1-t},$$

where $\left( \int_Q v^{1-t} dx \right)^{1-t} = ||v||_{L^\infty(Q)}$ when $t = 1$.

**Proof.** By Hölder’s inequality with $1/t$ and $(1/t)' = 1/(1-t)$ we have

$$\int_Q B_\lambda(Q)(f, g)^tv dx \leq \left( \int_Q B_\lambda(Q)(f, g)(x) dx \right)^t \left( \int_Q v^{1-t} dx \right)^{1-t}$$

$$= \left( \int_Q \int_{|y| \leq l(Q)} f(x - y) g(x + y) dy dx \right)^t \left( \int_Q v^{1-t} dx \right)^{1-t}.$$

We make the change of variables $w = x + y, z = x - y$ in the first integral and notice that if $c_Q$ is the center of the cube, then $|x - c_Q| \leq \frac{l(Q)}{2}$ and $|t| \leq l(Q)$ imply that $(w, z) \in 3Q \times 3Q$. The lemma follows at once. \qed

Next we consider a discretization of the operator $B_\alpha$ into a dyadic model. Define the dyadic bilinear fractional integral by

$$B_\alpha^D(f, g)(x) = \sum_{Q \in D} \frac{|Q|^\alpha}{|Q|} B_\lambda(Q)(f, g)(x) \chi_Q(x).$$

Fix a cube $Q_0 \in D$. Let $D(Q_0)$ be the collection of all dyadic subcubes of $Q_0$, that is, all those cubes obtained by dividing $Q_0$ into $2^n$ congruent cubes of half its side-length, dividing each of those into $2^n$ congruent cubes, and so on. By convention, $Q_0$ itself belongs to $D(Q_0)$. To prove Lemma 5.2, we need the following estimate.

**Lemma 5.4.** For $x \in Q_0$,

$$cB_\alpha^{D(Q_0)}(f_0, g_0)(x) \leq B_\alpha(f_0, g_0)(x) \leq CB_\alpha^{D(Q_0)}(f_0, g_0)(x),$$

where two constants $c$ and $C$ only depending on $\alpha$ and $n$. 

Proof. We proof of (5.2) is based on [10, 16]. We first discretize the operator $B_\alpha(f_0, g_0)$. Notice that $|y| \sim |y|_\infty$ and hence

$$B_\alpha(f_0, g_0)(x) = \sum_{k \in \mathbb{Z}} \sum_{Q_0 \cap \{2^{k-1} < |y| \leq 2^k\}} \frac{f(x - y)g(x + y)}{|y|^{n-\alpha}} dy \leq 2^{n-\alpha} \sum_{k \in \mathbb{Z}} \int_{Q_0 \cap \{2^{k-1} < |y| \leq 2^k\}} \frac{f(x - y)g(x + y)}{|y|^{n-\alpha}} dy \leq C \sum_{k \in \mathbb{Z}} (2^k)^{\alpha-n} \int_{Q_0 \cap \{|y| \leq 2^k\}} \frac{f(x - y)g(x + y)}{|y|^{n-\alpha}} dy \leq C \sum_{x \in Q \in \mathcal{D}(Q_0)} \frac{|Q|^{\frac{n}{\alpha}}}{|Q|} \int_{|y| \leq l(Q)} f(x - y)g(x + y) dy.$$

On the other hand, fix $x \in Q_0$ and $\{Q_k\}_{k \in \mathbb{Z}}$ be the unique sequence of dyadic cubes with $x \in Q_k \in \mathcal{D}(Q_0)$. Then we have

$$\sum_{Q \in \mathcal{D}(Q_0)} \frac{|Q|^{\frac{n}{\alpha}}}{|Q|} B_l(Q)(f_0, g_0)(x) \chi_Q(x) = \sum_{k = -\infty}^{\log_2 l(Q_0)} \frac{|Q_k|^{\frac{n}{\alpha}}}{|Q_k|} B_{l(Q_k)}(f_0, g_0)(x) \leq c \sum_{k = -\infty}^{\log_2 l(Q_0)} \int_{2^{k-1} < |y| \leq 2^k} \frac{f(x - y)g(x + y)}{|y|^{n-\alpha}} dy + 2^{n-\alpha} \sum_{Q \in \mathcal{D}(Q_0)} \frac{|Q|^{\frac{n}{\alpha}}}{|Q|} B_l(Q)(f_0, g_0)(x) \chi_Q(x) \leq c B_{\alpha}(Q)(f_0, g_0)(x) + 2^{n-\alpha} \sum_{Q \in \mathcal{D}(Q_0)} \frac{|Q|^{\frac{n}{\alpha}}}{|Q|} B_l(Q)(f_0, g_0)(x) \chi_Q(x).$$

Since $\alpha < n$ we may rearrange the terms, then

$$c B_{\alpha}(Q)(f_0, g_0)(x) \leq B_\alpha(f_0, g_0)(x).$$

We now proceed by following [15] and observe the following. Define

$$M_3(f, g)(x) = \sup_{x \in Q \in \mathcal{D}} \int_{3Q} f dy \cdot \int_{3Q} g dy,$$

to be the maximal function with the basis of triples of dyadic cubes. Letting $a > 1$ be a fixed constant to be choose later, and for $k = 1, 2, \ldots$, we set

$$D_k = \bigcup \{Q : Q \in \mathcal{D}(Q_0), m_{3Q}(f, g) > a^k\}.$$

Considering the maximal cubes with respect to inclusion, we can write

$$D_k = \bigcup_j Q_j^k.$$
where the cubes \( \{Q_j^k\} \subset \mathcal{D}(Q_0) \) are nonoverlapping. By the maximality of \( Q_j^k \) we can see that
\[
a^k < m_{3Q_j^k}(f, g) \leq 2^n a^k. \tag{5.3}
\]

Let
\[
E_0 = Q_0 \setminus D_1 \quad \text{and} \quad E_j^k = Q_j^k \setminus D_{k+1}.
\]

We need the following properties: \( \{E_0\} \cup \{E_j^k\} \) is a disjoint family of sets which decomposes \( Q_0 \) and satisfies
\[
|Q_0| \leq 2|E_0| \quad \text{and} \quad |Q_j^k| \leq 2|E_j^k|. \tag{5.4}
\]

The inequalities (5.4) can be verified as follows:

Fixed \( E_j^k \) and by (5.3), we have that
\[
Q_j^k \cap D_{k+1} \subset \{x \in Q_j^k : M_{3Q_j^k}(f, g)(x) > a^{k+1}\}.
\]

Using the operator \( M_{3Q_j^k} \) maps \( L^1 \times L^1 \) into \( L^{1/2, \infty} \), we have
\[
|Q_j^k \cap D_{k+1}| \leq |\{x \in Q_j^k : M_{3Q_j^k}(f, g)(x) > a^{k+1}\}|
\leq \left( \frac{\|M_{3Q_j^k}\|}{a^{k+1}} \int_{3Q_j^k} f(y)dy \cdot \int_{3Q_j^k} g(y)dy \right)^{1/2}
\leq \left( \frac{\|M_{3Q_j^k}\|}{a^{k+1}} \frac{1}{|3Q_j^k|^2} \int_{3Q_j^k} f(y)dy \cdot \int_{3Q_j^k} g(y)dy \right)^{1/2} |3Q_j^k|
\leq \frac{6^n \|M_{3Q_j^k}\|^{1/2}}{a^{1/2}} |Q_j^k|,
\]

where \( \|M_{3Q_j^k}\| \) be the constant from the \( L^1 \times L^1 \rightarrow L^{1/2, \infty} \) inequality for \( M_{3Q_j^k} \) and we have used (5.3) in the last step.

Let \( a = 6^{2n} 2^2 \|M_{3Q_j^k}\| \), then we obtain
\[
|Q_j^k \cap D_{k+1}| \leq \frac{1}{2} |Q_j^k|. \tag{5.5}
\]

Similary, we see that
\[
|D_1| \leq \frac{1}{2} |Q_0|. \tag{5.6}
\]

Clearly, (5.5) and (5.6) imply (5.4).

We set
\[
\mathcal{D}_0(Q_0) = \{Q \in \mathcal{D}(Q_0) : m_{3Q}(f, g) \leq a\},
\]
\[
\mathcal{D}_j^k(Q_0) = \{Q \in \mathcal{D}(Q_0) : Q \subset Q_j^k, a^k < m_{3Q}(f, g) \leq a^{k+1}\}.
\]

Then we obtain
\[
\mathcal{D}(Q_0) = \mathcal{D}_0(Q_0) \cup \bigcup_{k,j} \mathcal{D}_j^k(Q_0). \tag{5.7}
\]
Proof of Lemma 5.2. By Lemma 5.4 it suffices to work the dyadic operator $B_{\alpha}^{\beta}(Q_0)$. Since $0 < t \leq 1$ it follows that

$$\int_{Q_0} (B_{\alpha}^{\beta}(Q_0)(f_0, g_0)v)^t \, dx \leq c \sum_{Q \in \mathcal{D}(Q_0)} \frac{|Q|^\omega}{|Q|^t} \int_{Q} B_{\iota}(Q)(f_0, g_0)^t \, v^t \, dx. \quad (5.8)$$

By Lemma 5.3 we have

$$\int_{Q_0} (B_{\alpha}^{\beta}(Q_0)(f_0, g_0)v)^t \, dx$$

$$\leq c \sum_{Q \in \mathcal{D}(Q_0)} \left( \frac{|Q|^\omega}{|Q|} \int_{3Q} f \, dx \right) \left( \int_{3Q} g \, dx \right)^t \left( \int_{Q} v^{1-t} \, dx \right)^{1-t}$$

$$= c \sum_{Q \in \mathcal{D}(Q_0)} \left( \frac{|Q|^\omega}{|Q|} \int_{3Q} f \, dx \right) \left( \int_{3Q} g \, dx \right)^t \left( \int_{Q} v^{1-t} \, dx \right)^{1-t} |Q|. \quad (5.9)$$

First, based on (5.7) we estimate

$$\sum_{Q \in \mathcal{D}^k(Q_0)} \left( \frac{|Q|^\omega}{|Q|} \int_{3Q} f \, dx \right) \left( \int_{3Q} g \, dx \right)^t \left( \int_{Q} v^{1-t} \, dx \right)^{1-t} |Q|. \quad (5.10)$$

For every $Q \in \mathcal{D}^k_j(Q_0)$, we know $Q$ contained in a unique $Q^k_j$. Then

$$(5.10) \leq a^{(k+1)t} \sum_{Q \in \mathcal{D}^k_j(Q_0)} |Q|^{\omega(t+1)} \left( \int_{Q} v^{1-t} \, dx \right)^{1-t} \leq a^{(k+1)t} \sum_{Q \subseteq Q^k_j} |Q|^{\omega(t+1)} \left( \int_{Q} v^{1-t} \, dx \right)^{1-t}. \quad (5.11)$$

We now use a packing condition to handle the terms in the innermost sum of (5.11). Fix a $Q^k_j$ and consider the sum

$$\sum_{Q \subseteq Q^k_j} |Q|^{\omega(t+1)} \left( \int_{Q} v^{1-t} \, dx \right)^{1-t}$$

$$= \sum_{i=0}^{\infty} \sum_{Q \subseteq Q^k_j \atop l(Q)=2^{-i}(Q^k_j)} |Q|^{\omega(t+1)} \left( \int_{Q} v^{1-t} \, dx \right)^{1-t}$$

$$= |Q^k_j|^{\omega(t+1)} \sum_{i=0}^{\infty} (2^{-i\alpha t} - 1) \sum_{Q \subseteq Q^k_j \atop l(Q)=2^{-i}(Q^k_j)} \left( \int_{Q} v^{1-t} \, dx \right)^{1-t}$$

$$\leq |Q^k_j|^{\omega(t+1)} \sum_{i=0}^{\infty} (2^{-i\alpha t} - 1) \left( \sum_{Q \subseteq Q^k_j \atop l(Q)=2^{-i}(Q^k_j)} \left( \int_{Q} v^{1-t} \, dx \right)^{1-t} \right)^t$$

$$= |Q^k_j|^{\omega(t+1)} \left( \int_{Q^k_j} v^{1-t} \, dx \right)^{1-t} \sum_{i=0}^{\infty} 2^{-i\alpha t} = \frac{2^{\alpha t}}{2^{\alpha t} - 1} |Q^k_j|^{\omega(t+1)} \left( \int_{Q^k_j} v^{1-t} \, dx \right)^{1-t} |Q^k_j|.$$
Using this inequality in (5.11) we have

\[
(5.10) \leq C a^{(k+1)t} |Q_j|^\frac{\alpha}{n} \left( \int_{Q_j} v^{\frac{1}{1-t}} \, dx \right)^{1-t} |Q_j^k|.
\]

From (5.3), (5.4) and (5.12), we conclude that

\[
(5.10) \leq C |Q_j|^\frac{\alpha}{n} m_{3Q_j^k}(f, g)^t \left( \int_{Q_j} v^{\frac{1}{1-t}} \, dx \right)^{1-t} |Q_j^k|
\]

\[
= C \left[ |Q_j|^\frac{\alpha}{n} m_{3Q_j^k}(f, g) \left( \int_{Q_j} v^{\frac{1}{1-t}} \, dx \right)^{\frac{1-t}{t}} \right] |E_j^k| \leq C \int_{E_j^k} \tilde{M}_0^t(f_0, g_0, v)(x)^t \, dx.
\]

Similary,

\[
\sum_{Q \in \mathcal{D}(Q_0)} \left( |Q|^{\frac{\alpha}{n}} \int_{3Q} f \, dx \cdot \int_{3Q} g \, dx \right)^t \left( \int_{Q} v^{\frac{1}{1-t}} \, dx \right)^{1-t} \leq C \int_{E_0} \tilde{M}_0^t(f_0, g_0, v)(x)^t \, dx.
\]

Summing up (5.13) and (5.14), we obtain

\[
\int_{Q_0} (B_\alpha^\mathcal{D}(Q_0)(f_0, g_0)v)^t \, dx \leq C \int_{Q_0} \tilde{M}_0^t(f_0, g_0, v)(x)^t \, dx.
\]

This is our desired inequality (5.1).

To prove Theorems 4.2 and 4.6, we also need two more lemmas.

Let \( 0 < \alpha < n \). For a vector \((f, g)\) of locally integrable functions and a vector \( \bar{r} = (r_1, r_2) \) of exponents, define a maximal operator

\[
M_{\alpha, \bar{r}}(f, g)(x) = \sup_{x \in Q \in \mathcal{D}} |Q|^{\frac{\alpha}{n}} \left( \int_{Q} |f(y)|^{r_1} \, dy \right)^{1/r_1} \left( \int_{Q} |g(y)|^{r_2} \, dy \right)^{1/r_2}.
\]

The following lemma concerns the maximal operator on Morrey spaces, which can found in the paper [10].

**Lemma 5.5.** Let \( 0 < \alpha < n \). Set \( \bar{q} = (q_1, q_2) \) and \( \bar{r} = (r_1, r_2) \). Assume in addition that \( 0 < r_i < q_i < \infty, i = 1, 2 \). If \( 0 < t \leq s < \infty \) and \( 0 < q \leq p < \infty \) satisfy

\[
\frac{1}{s} = \frac{1}{p} - \frac{\alpha}{n} \quad \text{and} \quad \frac{t}{s} = \frac{q}{p},
\]

where \( q \) is given by \( 1/q = 1/q_1 + 1/q_2 \), then

\[
\|M_{\alpha, \bar{r}}(f, g)\|_{\mathcal{M}_t^q} \leq C \sup_{Q \in \mathcal{D}} |Q|^{1/p} \left( \int_{Q} |f(y)|^{q_1} \, dy \right)^{1/q_1} \left( \int_{Q} |g(y)|^{q_2} \, dy \right)^{1/q_2}.
\]

We also need the following a Characterization of a multiple weights given by Iida [11].

**Lemma 5.6.** Let \( 1 < q_1, q_2 < \infty \) and \( \hat{t} \geq q \) with \( 1/q = 1/q_1 + 1/q_2 \). Then, for two weights \( w_1, w_2 \), the inequality

\[
\sup_{Q \in \mathcal{D}} \left( \int_{Q} (w_1 w_2)^{\hat{t}} \, dx \right)^{1/\hat{t}} \prod_{i=1}^{2} \left( \int_{Q} w_i^{-q_i} \, dx \right)^{1/q_i} < \infty
\]
holds if and only if
\[
\begin{align*}
  (w_1 w_2)^i & \in A_{1+i(2-1/q)}, \\
  a_i w_i^{-q_i} & \in A_{q_i(i+2-1/q)}, \quad i = 1, 2.
\end{align*}
\]

**Proof of Theorem 4.2.** In what follows we always assume that \( f, g \) are nonnegative and
\[
\sup_{Q \in \mathcal{Q}} |Q|^{1/p} \left( \int_Q (fw_1)^{q_1} \right)^{1/q_1} \left( \int_Q (gw_2)^{q_2} \right)^{1/q_2} = 1
\]
by normalization. To prove this theorem we have estimate, for an arbitrary cube \( Q_0 \in Q \),
\[
|Q_0|^{1/s} \left( \int_{Q_0} (B_{Q_0} f, g)_V \right)^{1/t}.
\]

Fix a cube \( Q_0 \in Q \) and recall that \( (f_0, g_0) = (f(\cdot) \chi_{Q_0}(x - \cdot), g(\cdot) \chi_{Q_0}(\cdot - x)) \). Then by a standard argument we have, for \( x \in Q_0 \),
\[
\int_{Q_0} (B_{Q_0} f, g)_V \leq \int_{Q_0} (B_0 f_0, g_0)_V + C_\infty,
\]
where
\[
C_\infty = \sum_{k=0}^{\infty} \int_{Q_0} \left( \int_{2^{k+1}l(Q_0)} \int_{2^{k+1}l(Q_0)} \frac{f(x-y)g(x+y)}{|y|^{\alpha}} \right) v^t dx.
\]

Since
\[
\int_{2^{k+1}l(Q_0)} \int_{2^{k+1}l(Q_0)} \frac{f(x-y)g(x+y)}{|y|^{\alpha}} \leq C \frac{|2^{k+1}Q_0|^{1/2}}{|2^{k+1}Q_0|^s} \int_{|y| \leq 2^{k+1}l(Q_0)} f(x-y)g(x+y) dy,
\]
Then we have
\[
C_\infty \leq C \sum_{k=0}^{\infty} \frac{|2^{k+1}Q_0|^{1/2}}{|2^{k+1}Q_0|^s} \left( \int_{2^{k+1}Q_0} f dx \cdot \int_{2^{k+1}Q_0} g dx \right)^{t} \left( \int_{Q_0} v^{1-t} dx \right)^{1-t}.
\]

First step. Keeping in mind (5.18), (5.19) and (5.20), we now estimate for \( |Q_0|^{1/s}C_\infty \) in the theorem 4.2. By (4.2), (4.3) and Hölder’s inequality we have
\[
c_0 = \sup_{Q_0 \subset Q} \left( \int_{Q_0} \left| \frac{|Q_0|^{1/\alpha}}{|Q|} \right|^n \left( \int_{Q_0} v^{1+\gamma} \right)^{\frac{1}{1+\gamma}} \int_{Q_0} w_i^{q_i} \right)^{\frac{1}{q_i}} \leq [v, \bar{w}^{r,as}_{t,q/a}]
\]
and
\[
c_* = \sup_{Q_0 \subset Q} \left( \int_{Q_0} \left| \frac{|Q_0|^{1/\alpha}}{|Q|} \right|^n \left( \int_{Q_0} v^{1+\gamma} \right)^{\frac{1}{1+\gamma}} \int_{Q_0} w_i^{q_i} \right)^{\frac{1}{q_i}} \leq [v, \bar{w}^{r,as}_{t,q/a}].
\]

From Hölder’s inequality, (5.20) and the fact that
\[
\frac{1}{s} = \frac{1}{p} + \frac{1}{r} - \frac{\alpha}{n}
\]
it follows that
\[
C_\infty \leq C \sum_{k=0}^{\infty} \left( \int_{2^{k+3}Q_0} (f w_1)^{q_1} dx \right)^{\frac{1}{q_1}} \left( \int_{2^{k+3}Q_0} (g w_2)^{q_2} dx \right)^{\frac{1}{q_2}} \left( \int_{Q_0} v^{\frac{1}{1-t}} dx \right)^{1-t} |2^{k+3}Q_0|^{\frac{\alpha t}{n}} \times \frac{|2^{k+3}Q_0|^t}{|Q_0|^t} \left( \int_{2^{k+3}Q_0} w_1^{-q_1} dx \right)^{\frac{1}{q_1}} \left( \int_{2^{k+3}Q_0} w_2^{-q_2} dx \right)^{\frac{1}{q_2}}
\]
\[
= C \sum_{k=0}^{\infty} \left( \int_{2^{k+3}Q_0} (f w_1)^{q_1} dx \right)^{\frac{1}{q_1}} \left( \int_{2^{k+3}Q_0} (g w_2)^{q_2} dx \right)^{\frac{1}{q_2}} \left( \int_{Q_0} v^{\frac{1}{1-t}} dx \right)^{1-t} |2^{k+3}Q_0|^t \times \frac{|2^{k+3}Q_0|^{t\frac{1-\frac{1}{s}}{(1-\frac{1}{s})}}}{|Q_0|^{t\frac{1-\frac{1}{s}}{(1-\frac{1}{s})}}} \left( \int_{2^{k+3}Q_0} w_1^{-q_1} dx \right)^{\frac{1}{q_1}} \left( \int_{2^{k+3}Q_0} w_2^{-q_2} dx \right)^{\frac{1}{q_2}} \left( \int_{Q_0} v^{\frac{1}{1-t}} dx \right)^{1-t}.
\]
This yields for \(0 < s < 1\)
\[
|Q_0|^t C_\infty \leq c_0 \sum_{k=0}^{\infty} \left( \frac{|Q_0|}{|2^{k+3}Q_0|} \right)^{t (1-1/a)(1/s-1)} = C c_0
\]
and for \(s \geq 1\)
\[
|Q_0|^t C_\infty \leq c_0 \sum_{k=0}^{\infty} \left( \frac{|Q_0|}{|2^{k+3}Q_0|} \right)^{(1-1/a)} = C c_0,
\]
where we have used \(1 - 1/a > 0\).

Second step. For \(0 < t \leq 1\), we shall estimate
\[
|Q_0|^{1/s} \left( \int_{Q_0} (B_\alpha(f_0, g_0) v)^t \right)^{1/t}.
\]
By (4.2) and (4.3) we have
\[
c_1 = \sup_{Q \in \mathcal{D}} |Q|^{1/r} \left( \int_{Q} v^{\frac{1}{1-t}} \right)^{\frac{1-t}{t}} \prod_{i=1}^{2} \left( \int_{Q} w_i^{-(q_i/a)'} \right)^{1/(q_i/a)'} \leq |v, w|^{r,as}_{t, \tilde{q}/a}.
\]
To apply Lemma (5.2) we now compute, for any \(Q \in \mathcal{D}\),
\[
\left( \int_{Q} |f(y)|dy \cdot \int_{Q} |g(y)|dy \right) \left( \int_{Q} v^{\frac{1}{1-t}} \right)^{\frac{1-t}{t}}
\]
\[
\leq \left( \int_{Q} (f w_1)^{q_1/a} \right)^{a/q_1} \left( \int_{Q} (g w_2)^{q_2/a} \right)^{a/q_2} \left( \int_{Q} v^{\frac{1}{1-t}} \right)^{\frac{1-t}{t}} \prod_{i=1}^{2} \left( \int_{Q} w_i^{-(q_i/a)'} \right)^{1/(q_i/a)'}
\]
\[
\leq c_1|Q|^{-1/r} \left( \int_{Q} (f w_1)^{q_1/a} \right)^{a/q_1} \left( \int_{Q} (g w_2)^{q_2/a} \right)^{a/q_2}.
\]
This implies, for \(x \in Q_0\),
\[
\tilde{M}_{\alpha}^2(f_0, g_0, v)(x) \leq c_1 M_{\alpha-n/r, \tilde{q}/a}(f, g)(x).
\]
Inequality (5.21), Lemma 5.2 and Lemma 5.5 yield
\[
|Q_0|^{1/s} \left( \int_{Q_0} (B_\alpha(f, g) v)^t \right)^{1/t} \leq C c_1 \|M_{\alpha-n/r, \tilde{q}/a}(f, g)\|_{\mathcal{M}_t^1} \leq C c_1,
\]
where we have used the assumption
\[
\frac{1}{s} = \frac{1}{p} - \frac{\alpha - n/r}{n} \quad \text{and} \quad \frac{t}{s} = \frac{q}{p}
\]
and (5.17). This completes proof of Theorem 4.2.

Proof of Theorem 4.6. Keeping in mind (5.18), (5.19) and let \( v = w_1 w_2 \), we only need estimate the following inequality

\[
\int_{Q_0} (B_\alpha(f, g)w_1 w_2)^t \leq \int_{Q_0} (B_0(f_0, g_0)w_1 w_2)^t + c_\infty, \tag{5.22}
\]

where

\[
c_\infty = \sum_{k=0}^{\infty} \int_{Q_0} \left( \int_{2^k l(Q_0) < |y| \leq 2^{k+1} l(Q_0)} \frac{f(x - y)g(x + y)}{|y|^{n-\alpha}} dy \right)^t w_1(x)^t w_2(x)^t dx.
\]

Similar to the estimate for \( C_\infty \) we have

\[
|Q_0|^{1/s} c_\infty \leq C [\vec{w}]_{t, \vec{q}}^{a_s}.
\]

Next, we will estimate, for Theorem 4.6 in the conditions (4.6) and (4.7),

\[
|Q_0|^{1/s} \left( \int_{Q_0} (B_\alpha(f_0, g_0)w_1 w_2)^t \right)^{1/t}.
\]

For \( 0 < t \leq 1 \), by assumption we have

\[
c_2 = \sup_{Q \in \mathcal{D}} \left( \int_Q (w_1 w_2)^{1-t} \right)^{1-\frac{1}{t}} \prod_{i=1}^{2} \left( \int_Q w_i^{-q_i'} \right)^{\frac{1}{q_i'}} < \infty.
\]

Then we can deduce from Lemma 5.6 and the reverse Hölder’s inequality that there a constant \( \theta \in (1, \min(q_1, q_2)) \) such that, for any cube \( Q \in \mathcal{D} \),

\[
\left( \int_Q (w_1 w_2)^{1-t} \right)^{1-t} \leq C \left( \int_Q (w_1 w_2)^{1-t} \right)^{1-t} \leq \left( \int_Q w_1^{-q_1'} \right)^{1/q_1'} \leq C \left( \int_Q w_i^{-q_i'} \right)^{1/q_i'}, \quad \text{for each } i = 1, 2. \tag{5.23}
\]

Combining (5.23) and (5.24) with the weight conditions in Theorem 4.6, we obtain

\[
[w, \vec{w}]_{t, \vec{q}/a}^{\infty, a_s, a_s} \leq [\vec{w}]_{t, \vec{q}}^{a_s} < \infty.
\]

Going through a similar argument in Theorem 4.2, we have

\[
|Q_0|^{1/s} \left( \int_{Q_0} (B_\alpha(f_0, g_0)w_1 w_2)^t \right)^{1/t} \leq C.
\]

Consequently, Theorem 4.6 is proved.
6. Examples and necessary conditions

7.1. A bilinear Stein-Weiss inequality. Given $0 < \alpha < n$ let $T_\alpha$ be define by

$$T_\alpha f(x) = I_{n-\alpha} f(x) = \int_{\mathbb{R}^n} \frac{f(y)}{|x-y|^{n-\alpha}} dy.$$ 

Stein and Weiss\cite{21} proved the following weighted inequality for $T_\alpha$:

$$
\left( \int_{\mathbb{R}^n} \left( \frac{T_\alpha f(x)}{|x|^{\beta}} \right)^t \, dx \right)^{1/t} \leq \left( \int_{\mathbb{R}^n} (f(x)|x|^{\gamma})^q \, dx \right)^{1/q},
$$

where

$$\beta < \frac{n}{t}, \quad \gamma < \frac{n}{q'},$$

$$\alpha + \beta = n + \frac{n}{t} - \frac{n}{q},$$

$$\beta + \gamma \geq 0.$$  \hspace{1cm} (6.1)

Conditions (6.1), (6.2) and (6.3) are actually sharp. Condition (6.1) ensures that $|x|^{-\beta_q}$ and $|x|^{-\gamma_p'}$ are locally integrable. Condition (6.2) follows from a scaling argument and condition (6.3) is a necessary condition for the weights to satisfy a general two weight inequality \cite{20}.

Below, we prove a bilinear Stein-Weiss inequality on Morrey spaces. For $0 < \alpha < n$ let $BT_\alpha$ be the bilinear operator defined by

$$BT_\alpha(f, g)(x) = B_{n-\alpha}(f, g)(x) = \int_{\mathbb{R}^n} \frac{f(x-y)g(x+y)}{|y|^\alpha} \, dy.$$ 

**Theorem 6.1.** Assume that $1 < q_1 \leq p_1 < \infty$, $1 < q_2 \leq p_2 < \infty$, $0 < t \leq s < 1$, $\frac{n}{n-\alpha} < r \leq \infty$ and $1 < a < \min(q_1, q_2)$. Here, $p$ and $q$ are given by

$$\frac{1}{p} = \frac{1}{p_1} + \frac{1}{p_2} \quad \text{and} \quad \frac{1}{q} = \frac{1}{q_1} + \frac{1}{q_2}.$$ 

Suppose that

$$\frac{1}{s} = \frac{1}{p} + \frac{1}{r} - \frac{n-\alpha}{n}, \quad \frac{1}{t} = \frac{1}{q} + \frac{1}{r} - \frac{n-\alpha}{n}$$

and $\alpha$, $\beta$, $\gamma_1$, $\gamma_2$ satisfy the conditions

$$\begin{cases}
\beta < n\left(\frac{1}{s} - 1\right), & \gamma_1 < \frac{n}{q_1}, & \gamma_2 < \frac{n}{q_2}, \\
\alpha + \beta + \gamma_1 + \gamma_2 = n + \frac{n}{t} - \frac{n}{q_1} - \frac{n}{q_2}, \\
\beta + \gamma_1 + \gamma_2 \geq 0.
\end{cases}$$

(6.4)

Then the following inequality holds for all $f, g \geq 0$

$$\sup_{Q \in \mathcal{D}} |Q|^{\frac{1}{t}} \left( \int_Q \left( \frac{BT_\alpha(f, g)(x)}{|x|^{\beta}} \right)^t \, dx \right)^{\frac{1}{t}} \leq C \sup_{Q \in \mathcal{D}} |Q|^{\frac{1}{p_1}} \left( \int_Q (f(x)|x|^{\gamma_1})^{q_1} \, dx \right)^{\frac{1}{q_1}} \sup_{Q \in \mathcal{D}} |Q|^{\frac{1}{p_2}} \left( \int_Q (g(x)|x|^{\gamma_2})^{q_2} \, dx \right)^{\frac{1}{q_2}}.$$
Proof. We suppose that the parameters satisfy

\[ 0 < t_0 \leq s < 1 \quad \text{and} \quad \frac{t_0}{s} = \frac{q_1}{p_1} = \frac{q_2}{p_2}. \]

Similar to the estimate for Theorem 1.4, we have

\[
\sup_{Q \in D} |Q|^{\frac{1}{\beta}} \left( \int_Q \left( \frac{BT_\alpha(f,g)(x)}{|x|^{\beta}} \right)^t \, dx \right)^{\frac{1}{t}} \leq \sup_{Q \in D} |Q|^{\frac{1}{\beta}} \left( \int_Q \left( \frac{BT_\alpha(f,g)(x)}{|x|^{\beta}} \right)^{t_0} \, dx \right)^{\frac{1}{t_0}}.
\]

By Theorem 4.2, Remark 4.3 and (6.5) we only need to prove that \( a > 1 \) and a constant \( C \) such that

\[
|Q|^{\frac{1}{\beta}} \left( \int_Q |x|^{-\frac{as\alpha}{1-\beta}} \, dx \right)^{\frac{1-s}{as}} \prod_{i=1}^2 \left( \int_Q |x|^{-\gamma_i(q_i/a)'} \, dx \right)^{\frac{1}{(q_i/a)'}} \leq C
\]

for all cubes \( Q \). From here we follow the standard estimates for power weights. Let \( a > 1 \) be such that \( a\beta < n(\frac{1}{s} - 1) \), \( \gamma_1 < \frac{n}{(q_1/a)'} \) and \( \gamma_2 < \frac{n}{(q_2/a)'} \). Given a cube \( Q \) let \( Q_0 \) be its translate to the origin, that is, \( Q_0 = Q(0,l(Q)) \). Then either \( 2Q_0 \cap Q = \emptyset \) or \( 2Q_0 \cap Q \neq \emptyset \). In the case \( 2Q_0 \cap Q = \emptyset \) we have \( |c_Q|_\infty \geq l(Q) \) and \( |x| \sim |x|_\infty \sim |c_Q|_\infty \neq 0 \) for all \( x \in Q \). Using this fact we have

\[
|Q|^{1 - \frac{a\alpha}{n} + \frac{1}{\beta}} \left( \int_Q |x|^{-\frac{as\alpha}{1-\beta}} \, dx \right)^{\frac{1-s}{as}} \prod_{i=1}^2 \left( \int_Q |x|^{-\gamma_i(q_i/a)'} \, dx \right)^{\frac{1}{(q_i/a)'}}
\]

\[
= l(Q)^{\beta + \gamma_1 + \gamma_2} \left( \int_Q |x|^{-\frac{as\alpha}{1-\beta}} \, dx \right)^{\frac{1-s}{as}} \prod_{i=1}^2 \left( \int_Q |x|^{-\gamma_i(q_i/a)'} \, dx \right)^{\frac{1}{(q_i/a)'}}
\]

\[
\leq Cl(Q)^{\beta + \gamma_1 + \gamma_2} |c_Q|_\infty^{-\gamma_1 - \gamma_2} \leq C.
\]

where in the first line we have used the second equality in (6.4) and in the last estimate we have used the third inequality in (6.4). When \( 2Q_0 \cap Q \neq \emptyset \) we have that \( Q \subseteq B = B(0,5l(Q)) \), the Euclidean ball of radius \( 5l(Q) \) about the origin. Thus,

\[
|Q|^{1 - \frac{a\alpha}{n} + \frac{1}{\beta}} \left( \int_Q |x|^{-\frac{as\alpha}{1-\beta}} \, dx \right)^{\frac{1-s}{as}} \prod_{i=1}^2 \left( \int_Q |x|^{-\gamma_i(q_i/a)'} \, dx \right)^{\frac{1}{(q_i/a)'}}
\]

\[
\leq l(Q)^{\beta + \gamma_1 + \gamma_2} \left( \int_B |x|^{-\frac{as\alpha}{1-\beta}} \, dx \right)^{\frac{1-s}{as}} \prod_{i=1}^2 \left( \int_B |x|^{-\gamma_i(q_i/a)'} \, dx \right)^{\frac{1}{(q_i/a)'}}
\]

\[
\leq C.
\]

\[ \square \]

7.2. Necessary conditions. Apparently our techniques do not address the case \( 1 < t \leq s < \infty \).

That is, other than the trivial conditions mentioned in the introduction, we do not know of sufficient conditions on weights \( (v,w_1,w_2) \) that imply

\[
\|B_\alpha (f,g)v\|_{\mathcal{M}_s^t} \leq C \sup_{Q \in D} |Q|^{1/p} \left( \int_Q (|f|v)^{q_1} \right)^{1/q_1} \left( \int_Q (|g|w_2)^{q_2} \right)^{1/q_2}
\]

when \( 1 < t \leq s < \infty \). Here we present a necessary condition for the two weight inequality for \( \mathcal{M}_\alpha \), which in turn is necessary for \( B_\alpha \) when \( 0 < \alpha < n \).
Theorem 6.2. Let $v$ be a weight on $\mathbb{R}^n$ and $\bar{w} = (w_1, w_2)$ be a collection of two weights on $\mathbb{R}^n$. Assume that

$$0 \leq \alpha < n, \quad \bar{q} = (q_1, q_2), \quad 1 < q_1, q_2 < \infty, \quad 0 < q \leq p < \infty \quad \text{and} \quad 1 \leq t \leq s < \infty.$$  

Here, $q$ is given by $1/q = 1/q_1 + 1/q_2$. Suppose that

$$\frac{\alpha}{n} \geq \frac{1}{r} \geq 0, \quad \frac{1}{s} = \frac{1}{p} + \frac{\alpha}{n} \quad \text{and} \quad \frac{s}{t} = \frac{q}{p}.$$  

Then, for every $Q \in \mathcal{D}$, the weighted inequality

$$|Q|^{1/s} \left( \int_Q (\mathcal{M}_\alpha(f, g)v)^t \right)^{1/t} \leq C \sup_{Q', Q \subset Q'} |Q'|^{1/p} \left( \int_{Q'} (|f|w_1)^{q_1} \right)^{1/q_1} \left( \int_{Q'} (|g|w_2)^{q_2} \right)^{1/q_2}. \quad (6.6)$$

Then there exists a constant $C$ such that

$$\sup_{Q \subset \mathcal{D}} |Q|^{\frac{1}{r}(\inf\limits_{Q'} v)} \left( \int_Q w_1^{-q_1'} \right)^{\frac{1}{q_1'}} \left( \int_Q w_2^{-q_2'} \right)^{\frac{1}{q_2'}} \leq C. \quad (6.7)$$

Proof. We assume to the contrary that

$$\sup_{Q \subset \mathcal{D}} |Q|^{\frac{1}{r}(\inf\limits_{Q'} v)} \left( \int_Q w_1^{-q_1'} \right)^{\frac{1}{q_1'}} \left( \int_Q w_2^{-q_2'} \right)^{\frac{1}{q_2'}} = \infty. \quad (6.8)$$

By (6.8) we can select a cube $Q$ such that for any large $M$,

$$|Q|^{\frac{1}{r}(\inf\limits_{Q'} v)} \left( \int_Q w_1^{-q_1'} \right)^{\frac{1}{q_1'}} \left( \int_Q w_2^{-q_2'} \right)^{\frac{1}{q_2'}} > M. \quad (6.9)$$

Selecting a smaller cube $Q$ in (6.9), without loss of generality we may assume that $Q$ in minimal in the sense that

$$\sup_{R \subset \mathcal{D}, Q \subset R \subset Q} \int_R w_i^{-q_i'} = \int_Q w_i^{-q_i'}, \quad \text{for } i = 1, 2. \quad (6.10)$$

Thanks to the fact that $1/p - 1/q \leq 0$, equality (6.10) yields

$$\sup_{R \subset \mathcal{D}, Q \subset R \subset Q} |R|^{1/p} \prod_{i=1}^2 \left( \int_R \chi_{Q} w_i^{-q_i'} \right)^{1/q_i} = |Q|^{1/p} \prod_{i=1}^2 \left( \int_Q w_i^{-q_i'} \right)^{1/q_i}. \quad (6.11)$$

We also need the following estimate due to [16],

$$|Q|^{\frac{1}{r}(\sup\limits_Q v)} \left( \int_Q f(y)dy \right) \left( \int_Q g(y)dy \right) \leq C \left( \int_{Q} (\mathcal{M}_\alpha(f, g)v)^{s} \right)^{\frac{1}{t}}. \quad (6.12)$$

It follows by applying (6.6), (6.11) and (6.12) with $f = \chi_{Q} w_1^{-q_1'}, \quad g = \chi_{Q} w_2^{-q_2'}$ that

$$|Q|^{\frac{1}{r}(\inf\limits_Q v)} \left( \int_Q w_1^{-q_1'} \right) \left( \int_Q w_2^{-q_2'} \right) \leq C |Q|^{-1/p} |Q|^{1/s} \left( \int_{Q} (\mathcal{M}_\alpha(\chi_{Q} w_1^{-q_1'}, \chi_{Q} w_2^{-q_2'})v)^{t} \right)^{\frac{1}{t}} \leq C |Q|^{-\frac{1}{p}} \sup_{R \subset \mathcal{D}, Q \subset R \subset Q'} |R|^{1/p} \left( \int_{R} \chi_{Q} w_1^{-q_1'} \right)^{1/q_1} \left( \int_{R} \chi_{Q} w_2^{-q_2'} \right)^{1/q_2} \leq C \left( \int_{Q} w_1^{-q_1'} \right)^{1/q_1} \left( \int_{Q} w_2^{-q_2'} \right)^{1/q_2}. \quad (6.13)$$
This yields a contradiction
\[ M < |Q|^{\frac{1}{r}} \left( \inf_{Q} v \right)^{1/q_1} \left( \frac{1}{w_2^{-q_2}} \right)^{1/q_2} \leq C. \]
This finishes the proof of Theorem 6.2. \qed
