A BIVARIATE GENERATING FUNCTION FOR ZETA VALUES
AND RELATED SUPERCONGRUENCES

ROBERTO TAURASO

Abstract. By using the Wilf-Zeilberger method, we prove a novel finite combinatorial
identity related to a bivariate generating function for \( \zeta(2 + r + 2s) \) (an extension of a
Bailey-Borwein-Bradley Apéry-like formula for even zeta values). Such identity is then
applied to show several supercongruences.

1. Introduction

The bivariate formula

\[
\sum_{k=1}^{\infty} \frac{k}{k^4 - a^2 k^2 - b^4} = \frac{1}{2} \sum_{k=1}^{\infty} \frac{(-1)^{k-1}(5k^2 - a^2)}{k(2k)} \cdot \frac{\prod_{j=1}^{k-1}(j^2 - a^2)^2 + 4b^4}{\prod_{j=1}^{k}(j^4 - a^2 j^2 - b^4)}
\]

(1)

has been first conjectured by H. Cohen and then proved independently by T. Rivoal [11,
Theorem 1.1] and D. M. Bradley [3, Theorem 1] by reducing it to the finite combinatorial
identity

\[
\sum_{k=1}^{n} \binom{2k}{k} \frac{(5k^2 - a^2) \prod_{j=1}^{k-1}((n^2 - j^2)(n^2 + j^2 - a^2))}{\prod_{j=1}^{k}(n^2 + (n - j)^2 - a^2)(n^2 + (n + j)^2 - a^2)} = \frac{2}{n^2 - a^2}
\]

(2)

and by Kh. and T. Hessami Pilehrood [6, Theorem 1] by applying the Wilf-Zeilberger
theory. Since the left-hand side of (1) can be written as the generating function of \( \zeta(3 + 2r + 4s) \),

\[
\sum_{r=0}^{\infty} \sum_{s=0}^{r} \binom{r + s}{r} \zeta(3 + 2r + 4s)a^{2r}b^{4s},
\]

it follows that, by extracting the coefficients for \((r, s) = (0, 0)\) and \((r, s) = (1, 0)\), we
obtain the Apéry-like identities

\[
\zeta(3) = \frac{5}{2} \sum_{k=1}^{\infty} \frac{(-1)^{k-1}}{k^3(2k)} \quad \text{and} \quad \zeta(5) = \frac{1}{2} \sum_{k=1}^{\infty} \frac{(-1)^{k-1}}{k^3} \left( \frac{4}{k^5} - \frac{5H_{k-1}(2)}{k^3} \right)
\]

(3)

where \( H_n(s) = \sum_{j=1}^{n} \frac{1}{j^s} \) is the harmonic sum of weight \( s \). For more details about Apéry-
like series see also [1, 4, 6, 5].

Key words and phrases. congruences, central binomial coefficients, harmonic numbers, Wilf-Zeilberger
method, zeta values, Apéry-like series.
Here we consider a similar bivariate formula
\[
\sum_{k=1}^{\infty} \frac{1}{k^2 - ak - b^2} = \sum_{k=1}^{\infty} \frac{(3k - a)}{k(2k)} \cdot \prod_{j=1}^{k-1} \frac{(j^2 - a^2 - 4b^2)}{j^2 - a_j - b^2}
\] (4)
where the left-hand side is the generating function of \(\zeta(2 + r + 2s)\),
\[
\sum_{r=0}^{\infty} \sum_{s=0}^{\infty} \binom{r+s}{r} \zeta(2 + r + 2s) a^r b^{2s}.
\]

For \(a = 0\), (4) yields a formula due to D. H. Bailey, J. M. Borwein, and D. M. Bradley,
\[
\sum_{s=0}^{\infty} \zeta(2 + 2s) b^{2s} = \sum_{k=1}^{\infty} \frac{1}{k^2 - b^2} = 3 \sum_{k=1}^{\infty} \frac{1}{k(2k)} \cdot \prod_{j=1}^{k-1} \frac{(j^2 - 4b^2)}{j^2 - b^2}
\]
which appeared in [2, Theorem 1.1]. Moreover, for \((r, s) = (1, 0)\) and \((r, s) = (0, 1)\), we
get the Apéry-like identities
\[
\zeta(3) = \sum_{k=1}^{\infty} \frac{1}{(2k)_k} \left( \frac{2}{k^3} + \frac{3H_{k-1}(1)}{k^2} \right) \quad \text{and} \quad \zeta(4) = 3 \sum_{k=1}^{\infty} \frac{1}{(2k)_k} \left( \frac{1}{k^4} - \frac{3H_{k-1}(2)}{k^2} \right). \tag{5}
\]

Replacing \(a\) by \(2a\) and then letting \(x^2 = a^2 + b^2\) in (4) we find the equivalent identity
\[
\sum_{k=1}^{\infty} \frac{1}{(k - a)^2 - x^2} = \sum_{k=1}^{\infty} \frac{(3k - 2a)}{k(2k)} \cdot \prod_{j=1}^{k-1} \frac{(j^2 - 4x^2)}{(j-a)^2 - x^2}
\]
which has been proved by Kh. and T. Hessami Pilehrood [7, (24)].

Again, in the same spirit of what has been done for (1), our proof of the identity (4) is reduced to show the following novel finite identity
\[
\sum_{k=1}^{n} \frac{(2k)}{k^2 - a^2} \cdot \prod_{j=1}^{k-1} \frac{(j - n)(j - n + a)}{j^2 - a^2} = \frac{2}{n-a}. \tag{6}
\]

In [15, Theorem 4.2] the author established that for any prime \(p > 5\),
\[
\sum_{k=1}^{p-1} \frac{1}{k} \binom{2k}{k} \equiv -\frac{8H_{p-1}(1)}{3} \pmod{p^4}, \tag{7}
\]
\[
\sum_{k=1}^{p-1} \frac{(-1)^k}{k} \binom{2k}{k} \equiv \frac{4}{5} \left( \frac{H_{p-1}(1)}{p} + 2pH_{p-1}(3) \right) \pmod{p^4}. \tag{8}
\]
Thanks to the finite identities (2) and (6), we managed to improve congruence (7) and to show several other congruences. The main results are as follows: for any prime $p > 5$,

\[
\sum_{k=1}^{p-1} \frac{1}{k^3} \binom{2k}{k} \equiv -\frac{2H_{p-1}(1)}{p^2} \pmod{p^2},
\]

(9)

\[
\sum_{k=1}^{p-1} \binom{2k}{k} \frac{H_k(2)}{k} \equiv \frac{2H_{p-1}(1)}{3p^2} \pmod{p^2}.
\]

(10)

These congruences are known modulo $p$ (see [8, Theorem 2]) and they confirm modulo $p^2$ the following conjecture by Z.-W. Sun: for each prime $p > 7$,

\[
\sum_{k=1}^{p-1} \frac{1}{k^3} \binom{2k}{k} \equiv -\frac{2H_{p-1}(1)}{p^2} - \frac{13H_{p-1}(3)}{27} \pmod{p^4},
\]

(11)

\[
\sum_{k=1}^{p-1} \binom{2k}{k} \frac{H_k(2)}{k} \equiv \frac{2H_{p-1}(1)}{3p^2} - \frac{38H_{p-1}(3)}{81} \pmod{p^3}.
\]

the first one appeared in [13, Conjecture 1.1] and the second one in [14, Conjecture 5.1].

2. Preliminaries concerning multiple harmonic sums

We define the multiple harmonic sum as

\[
H_n(s_1, \ldots, s_r) = \sum_{1 \leq k_1 < k_2 < \cdots < k_r \leq n} \frac{1}{k_1^{s_1} k_2^{s_2} \cdots k_r^{s_r}}
\]

where $n \geq r > 0$ and each $s_i$ is a positive integer. The sum $s_1 + s_2 + \cdots + s_r$ is the weight of the multiple sum. Furthermore, by \{s_1, s_2, \ldots, s_j\} with $m$ repetitions of \{s_1, s_2, \ldots, s_j\).

By [12, Theorem 5.1]), for any prime $p > s + 2$ we have

\[
H_{p-1}(s) \equiv \begin{cases} 
\frac{s(s + 1)}{2(s + 2)} p^2 B_{p-s-2} \pmod{p^3} & \text{if } s \text{ is odd,} \\
\frac{s}{s + 1} p B_{p-s-1} \pmod{p^2} & \text{if } s \text{ is even.}
\end{cases}
\]

where $B_n$ be the $n$-th Bernoulli number.

Let $p > 5$ be a prime, then by [15, Theorem 2.1],

\[
H_{p-1}(2) \equiv -\frac{2H_{p-1}(1)}{p} - \frac{pH_{p-1}(3)}{3} \pmod{p^4}.
\]

(11)

Moreover, by [8, Lemma 3],

\[
H_{p-1}(1, 2) \equiv -\frac{3H_{p-1}(1)}{p^2} - \frac{5H_{p-1}(3)}{12} \pmod{p^3}
\]

$$H_{p-1}(1, 1, 2) \equiv -\frac{11H_{p-1}(3)}{12p} \pmod{p^2}, \quad H_{p-1}(1, 1, 1, 2) \equiv -\frac{5H_{p-1}(3)}{6p^2} \pmod{p}.$$ 

Finally, by [16] Theorem 3.2,

$$H_{p-1}(2, 2) = \frac{H_{p-1}(3)}{3p}, \quad H_{p-1}(1, 3) = \frac{3H_{p-1}(3)}{4p} \pmod{p^2},$$

and by [16] Theorem 3.5,

$$H_{p-1}(2, 1, 2) \equiv 0, \quad H_{p-1}(1, 2, 2) \equiv \frac{5H_{p-1}(3)}{4p^2}, \quad H_{p-1}(1, 1, 3) \equiv -\frac{5H_{p-1}(3)}{12p^2} \pmod{p}.$$

3. Proofs of the generating function \( \text{(4)} \) and the related combinatorial identity \( \text{(3)} \)

By partial fraction decomposition with respect to \( b^2 \), we get

$$\prod_{j=1}^{k-1} \left( j^2 - a^2 - 4b^2 \right) = \sum_{n=1}^{k} C_{n,k}(a) \frac{C_{n,k}(a)}{n^2 - an - b^2}$$

where

$$C_{n,k}(a) = \frac{\prod_{j=1}^{k-1} \left( j^2 - (a-2n)^2 \right)}{\prod_{j=1, j \neq n}^{k} (j-n)(j+n-a)}.$$ 

Hence, by inverting the summations order, the identity \( \text{(4)} \) can be written as

$$\sum_{n=1}^{\infty} \frac{1}{n^2 - an - b^2} = \sum_{k=1}^{\infty} \frac{(3k-a)}{k^{(2k)}} \sum_{n=1}^{k} C_{n,k}(a) \frac{C_{n,k}(a)}{n^2 - an - b^2} = \sum_{n=1}^{\infty} \frac{1}{n^2 - an - b^2} \sum_{k=n}^{\infty} (3k-a)C_{n,k}(a) \frac{C_{n,k}(a)}{k^{(2k)}}.$$

It follows that \( \text{(4)} \) holds as soon as

$$1 = \sum_{k=n}^{\infty} \frac{(3k-a)C_{n,k}(a)}{k^{(2k)}} = \sum_{k=n}^{\infty} \frac{(3k-a)}{k^{(2k)}} \cdot \frac{\prod_{j=1}^{k-1} \left( j^2 - (a-2n)^2 \right)}{\prod_{j=1, j \neq n}^{k} (j-n)(j+n-a)}. \quad (12)$$

Taking the same approach given in [11] for the proof of \( \text{(1)} \), the above formula is equivalent to this finite combinatorial identity

$$\sum_{k=1}^{n} \frac{\left( 2k \right)}{k} \left( 3k-a \right) \frac{\prod_{j=1}^{k-1} \left( j-n \right) \left( j+n-a \right)}{\prod_{j=1}^{k} \left( j^2 - (a-2n)^2 \right)} = \frac{2}{a-n}. \quad (13)$$

Both identities \( \text{(12)} \) and \( \text{(13)} \) are consequences of the next theorem after setting \( z = 2n-a \).

**Theorem 1.** For any positive integer \( n \),

$$\sum_{k=1}^{n} \binom{2k}{k} \left( 3k-2n+z \right) \frac{\prod_{j=1}^{k-1} \left( j-n \right) \left( j-n+z \right)}{\prod_{j=1}^{k} \left( j^2 - z^2 \right)} = \frac{2}{n-z}. \quad (14)$$
and
\[\sum_{k=n}^{\infty} \frac{(3k - 2n + z)}{k(\binom{2k}{k})} \frac{\prod_{j=1}^{k-1} (j^2 - z^2)}{\prod_{j=1, j \neq n}^{k} (j - n)(j - n + z)} = 1. \tag{15}\]

**Proof.** Let
\[F(n, k) = \binom{2k}{k} (3k - 2n + z) \frac{\prod_{j=0}^{k-1} (j - n)(j - n + z)}{\prod_{j=1}^{k} (j^2 - z^2)},\]
and
\[G(n, k) = \frac{k(k^2 - z^2)F(n, k)}{(2n - 3k - z)(n + 1 - k)(n + 1 - k - z)}.\]

Then \((F, G)\) is a Wilf-Zeilberger pair, or WZ pair, which means that they satisfy the relation
\[F(n + 1, k) - F(n, k) = G(n, k + 1) - G(n, k).\]

In order to prove (14), it suffices to prove that \(S_n := \sum_{k=1}^{n} F(n, k) = 2n. \) Now \(S_1 = F(1, 1) = 2. \) Moreover,
\[S_{n+1} - S_n = \sum_{k=1}^{n+1} F(n + 1, k) - \sum_{k=1}^{n+1} F(n, k) = G(n, n + 2) - G(n, 1) = 2\]
because \(F(n, n + 1) = G(n, n + 2) = 0 \) and \(G(n, 1) = -2. \)

In a similar way, we show (15) by considering the WZ pair given by
\[F(n, k) = \frac{(3k - 2n + z)}{k(\binom{2k}{k})} \frac{\prod_{j=1}^{k-1} (j^2 - z^2)}{\prod_{j=1, j \neq n}^{k} (j - n)(j - n + z)},\]
and
\[G(n, k) = \frac{2(2k - 1)(k - n)F(n, k)}{n(2n - 3k - z)(n - z)}.\]

\[\square\]

### 4. More Binomial Identities

Here we collect a few identities, apparently new, involving the binomial coefficients \(\binom{2k}{k}\) and \(\binom{n+k}{k}\) which will play a crucial role in the next sections.
Theorem 2. For any positive integer $n$,
\[
\frac{3}{2} \sum_{k=1}^{n} \frac{1}{k} \binom{2k}{k} = \sum_{k=1}^{n} \frac{1}{k} \binom{n+k}{k} + H_n(1) \tag{16}
\]
\[
\sum_{k=1}^{n} \frac{1}{k} \binom{2k}{k} \left( \frac{3H_k(1)}{2k} - \frac{1}{k^2} \right) = \sum_{k=1}^{n} \frac{n+k}{k} \frac{H_k(1)}{k} - H_n(2) \tag{17}
\]
\[
\sum_{k=1}^{n} \frac{1}{k} \binom{2k}{k} \left( \frac{3H_k(2)}{k} - \frac{1}{2k^2} \right) = \sum_{k=1}^{n} \frac{n+k}{k} \frac{H_k(2)}{k} + \frac{H_n(2)H_n(1) - H_n(1, 2)}{2} \tag{18}
\]

Proof. Let us consider the WZ pair

\[
F(n, k) = \frac{1}{k} \binom{n+k}{k} \quad \text{and} \quad G(n, k) = \frac{k}{(n+1)^2} \binom{n+k}{k}
\]

then

\[
S_{n+1} - S_n = F(n+1, n+1) + \sum_{k=1}^{n} (G(n, k+1) - G(n, k))
\]

\[
= F(n+1, n+1) + G(n, n+1) - G(n, 1)
\]

\[
= \frac{3}{2} \left( \frac{2(n+1)}{n+1} \right) - \frac{1}{n+1}
\]

where $S_n := \sum_{k=1}^{n} F(n, k)$. Thus

\[
S_n = \frac{3}{2} \sum_{k=1}^{n} \frac{1}{k} \binom{2k}{k} - H_n(1)
\]

and we may conclude that (16) holds.

Now let $S_n^{(1)} := \sum_{k=1}^{n} F(n, k)H_k(1)$ then

\[
S_{n+1}^{(1)} - S_n^{(1)} = F(n+1, n+1)H_{n+1}(1)
\]

\[
+ \sum_{k=1}^{n} \left( G(n, k+1)H_k(1) - G(n, k) \left( H_{k-1}(1) + \frac{1}{k} \right) \right)
\]

\[
= F(n+1, n+1)H_{n+1}(1) + G(n, n+1)H_n(1) - \sum_{k=1}^{n} \frac{G(n, k)}{k}
\]

\[
= \left( \frac{2(n+1)}{n+1} \right) \left( \frac{3H_{n+1}(1)}{2(n+1)} - \frac{1}{(n+1)^2} \right) + \frac{1}{(n+1)^2}
\]

where we used $\sum_{k=1}^{n} \frac{1}{k} = \frac{1}{2} \left( \frac{2(n+1)}{n+1} \right) - 1$. Hence we find that

\[
S_n^{(1)} = \sum_{k=1}^{n} \frac{1}{k} \binom{2k}{k} \left( \frac{3H_k(1)}{2k} - \frac{1}{k^2} \right) + H_n(2)
\]
which implies (17).

Let \( S^{(2)}_n := \sum_{k=1}^n F(n, k)H_k(2) \) then

\[
S^{(2)}_{n+1} - S^{(2)}_n = F(n+1, n+1)H_{n+1}(2)
+ \sum_{k=1}^n \left( G(n, k+1)H_k(2) - G(n, k) \left( H_{k-1}(2) + \frac{1}{k^2} \right) \right)
= F(n+1, n+1)H_{n+1}(2) + G(n, n+1)H_n(2) - \sum_{k=1}^n \frac{G(n, k)}{k^2}
= \binom{2(n+1)}{n+1} \left( \frac{3H_{n+1}(2)}{2(n+1)} - \frac{1}{2(n+1)^3} \right) - \frac{S_n}{(n+1)^2}
\]

where we applied

\[
\sum_{k=1}^n \frac{G(n, k)}{k^2} = \frac{1}{(n+1)^2} \sum_{k=1}^n F(n, k) = \frac{S_n}{(n+1)^2}.
\]

Therefore

\[
S^{(2)}_n = \sum_{k=1}^n \binom{2k}{k} \left( \frac{3H_k(2)}{2k} - \frac{1}{2k^3} \right) - \sum_{k=1}^n \frac{S_{k-1}}{k^2}
= \sum_{k=1}^n \binom{2k}{k} \left( \frac{3H_k(2)}{2k} - \frac{1}{2k^3} \right) - \frac{3}{2} \sum_{k=1}^n \frac{1}{k^2} \sum_{j=1}^{k-1} \frac{1}{j} \binom{2j}{j} + H_n(1, 2)
= \sum_{k=1}^n \binom{2k}{k} \left( \frac{3H_k(2)}{2k} - \frac{1}{2k^3} \right) - \frac{3}{2} \sum_{j=1}^n \frac{1}{j} \binom{2j}{j} \left( H_n(2) - H_j(2) \right) + H_n(1, 2)
= \sum_{k=1}^n \binom{2k}{k} \left( \frac{3H_k(2)}{k} - \frac{1}{2k^3} \right) - \frac{3H_n(2)}{2} \sum_{k=1}^n \frac{1}{k} \binom{2k}{k} + H_n(1, 2)
\]

and the proof of (18) is complete. \(\Box\)

5. PROOFS OF THE MAIN SUPERCONGRUENCES

**Theorem 3.** For any prime \( p > 3 \),

\[
\sum_{k=1}^{p-1} \frac{1}{k} \binom{2k}{k} \equiv -\frac{8H_{p-1}(1)}{3} - \frac{5p^2H_{p-1}(3)}{3} \pmod{p^5}
\] (19)
Moreover, for any prime $p > 5$,

$\sum_{k=1}^{p-1} \frac{1}{k^3} \binom{2k}{k} \equiv -\frac{2H_{p-1}(1)}{p^2} \pmod{p^2}$,

$\sum_{k=1}^{p-1} \frac{2k}{k} \binom{p-1}{k} H_k(2) \equiv \frac{2H_{p-1}(1)}{3p^2} \pmod{p^2}$.

**Proof.** We first note that

$$\binom{p-1+k}{k} = \frac{p}{k} \binom{p+k-1}{k-1} = \frac{p}{k} \prod_{j=1}^{k-1} \left(1 + \frac{p}{j}\right) = \frac{1}{k} \sum_{j=0}^{k-1} p^{j+1} H_{k-1}(\{1\}^j).$$

Therefore, by (16) with $n = p - 1$ we obtain the desired congruence (19),

$$\sum_{k=1}^{p-1} \frac{1}{k} \binom{2k}{k} = \frac{2}{3} \left(H_{p-1}(1) + \sum_{j=0}^{p-2} p^{j+1} H_{p-1}(\{1\}^j, 2)\right)$$

$$\equiv \frac{2}{3} \left(H_{p-1}(1) + pH_{p-1}(2) + p^2 H_{p-1}(1, 2) + p^3 H_{p-1}(1, 1, 2) + p^4 H_{p-1}(1, 1, 1, 2)\right)$$

$$\equiv \frac{8}{3} - \frac{5p^2 H_{p-1}(3)}{3} \pmod{p^5}.$$ 

By letting $z = 2n$ in (14) we have

$$\sum_{k=1}^{n} \binom{2k}{k} \frac{k}{k^2 - 4n^2} \frac{k-1}{j^2 - 4n^2} = \frac{2}{3n}.$$

Let $n = p > 5$ be a prime and move the $p$-th term of the sum to the right-hand side,

$$\sum_{k=1}^{p-1} \frac{1}{k} \binom{2k}{k} \frac{1}{1 - 4p^2/k^2} \prod_{j=1}^{k-1} \left(1 + \frac{p^2}{j^2 - 4p^2}\right) = \frac{2}{3p} \left(\frac{1}{2} \binom{2p}{p} \prod_{j=1}^{p-1} \frac{1}{1 - 4p^2/j^2} - 1\right).$$

The left-hand side modulo $p^4$ is congruent to

$$\sum_{k=1}^{p-1} \frac{1}{k} \binom{2k}{k} \left(1 + \frac{4p^2}{k^2}\right) \prod_{j=1}^{k-1} \left(1 + \frac{3p^2}{j^2}\right) \equiv \sum_{k=1}^{p-1} \frac{1}{k} \binom{2k}{k} + p^2 \sum_{k=1}^{p-1} \binom{2k}{k} \left(1 - \frac{3H_k(2)}{k}\right).$$

On the other hand, by [15, Theorem 2.4],

$$\frac{1}{2} \binom{2p}{p} \equiv 1 + 2pH_{p-1}(1) + \frac{2p^3 H_{p-1}(3)}{3} \equiv 1 - p^2 H_{p-1}(2) - \frac{p^4 H_{p-1}(4)}{2} \pmod{p^6},$$

(21)
the right-hand side is
\[
\frac{1}{2} \left( \frac{2p}{p} \right)^{p-1} \prod_{j=1}^{p-1} \frac{1 - \frac{p^2}{j^2}}{1 - \frac{p^2}{j^2}} \equiv \frac{1}{2} \left( \frac{2p}{p} \right)^{p-1} \prod_{j=1}^{p-1} \left( 1 + \frac{3p^2}{j^2} + \frac{12p^4}{j^4} \right)
\equiv \left( 1 - p^2 H_{p-1}(2) - \frac{p^4 H_{p-1}(4)}{2} \right) \cdot \left( 1 + 3p^2 H_{p-1}(2) + 12p^4 H_{p-1}(4) + 9p^4 H_{p-1}(2, 2) \right)
\equiv 1 + 2p^2 H_{p-1}(2) + p^4 \left( \frac{17 H_{p-1}(4)}{2} + 3H_{p-1}(2, 2) \right)
\equiv 1 + 2p^2 H_{p-1}(2) \pmod{p^5}.
\]
where \(2H_{p-1}(2, 2) = (H_{p-1}(2))^2 - H_{p-1}(4) \equiv 0 \pmod{p} \). Finally, by (19),
\[
\sum_{k=1}^{p-1} \binom{2k}{k} \left( \frac{1}{k^3} + \frac{3H_k(2)}{k} \right) \equiv \frac{8H_{p-1}(1)}{3p^2} + \frac{5H_{p-1}(3)}{3} + \frac{4pH_{p-1}(2)}{3} \equiv 0 \pmod{p^2}. \tag{22}
\]
where we used (11).

By (18), with \(n = p - 1\), we have that
\[
\sum_{k=1}^{p-1} \binom{2k}{k} \left( \frac{3H_k(2)}{k} - \frac{1}{2k^3} \right) = p \sum_{k=1}^{p-1} \prod_{j=1}^{k-1} \left( 1 + \frac{p}{j} \right) \frac{H_k(2) + H_{p-1}(2)}{k^2} + H_{p-1}(2)H_{p-1}(1) - H_{p-1}(1, 2)
\equiv p \sum_{k=1}^{p-1} \frac{H_k(2)}{k^2} - H_{p-1}(1, 2)
= pH_{p-1}(2, 2) + pH_{p-1}(4) - H_{p-1}(1, 2)
\equiv -H_{p-1}(1, 2) = \frac{3H_{p-1}(1)}{p^2} \pmod{p^2}. \tag{23}
\]
The proof is complete as soon as we combine properly congruences (22) and (23). \(\square\)

6. Finale - Two Apéry-like congruences

The following congruences are related to the second series in (3) and to the first series in (5).

**Theorem 4.** For any prime \(p > 3\),
\[
\sum_{k=1}^{p-1} \binom{2k}{k} \left( \frac{2}{k^2} - \frac{3H_k(1)}{k} \right) \equiv \frac{2H_{p-1}(1)}{p} + 3pH_{p-1}(3) \pmod{p^4}, \tag{24}
\]
\[
\sum_{k=1}^{p-1} (-1)^k \binom{2k}{k} \left( \frac{4}{k^4} + \frac{5H_k(2)}{k^2} \right) \equiv -H_{p-1}(4) \pmod{p^2}. \tag{25}
\]
Proof. By (17) with \( n = p - 1 \) and by (20)

\[
\sum_{k=1}^{p-1} \binom{2k}{k} \left( \frac{3H_k(1)}{2k} - \frac{1}{k^2} \right) = \sum_{k=1}^{p-1} \frac{H_k(1)}{k^2} \sum_{j=0}^{k-1} p^{j+1}H_{k-1}(\{1\}^j) - H_{p-1}(2)
\]

\[
\equiv p \sum_{k=1}^{p-1} \frac{H_{k-1}(1)}{k^2} \left( 1 + pH_{k-1}(1) + p^2H_{k-1}(1, 1) \right) - H_{p-1}(2)
\]

\[
\equiv -H_{p-1}(2) + pH_{p-1}(1, 2) + pH_{p-1}(3) + 2p^2H_{p-1}(1, 1, 2) + p^2H_{p-1}(2, 2) + p^2H_{p-1}(1, 1, 3) + p^3H_{p-1}(1, 2, 2)
\]

\[
\equiv -\frac{H_{p-1}(1)}{p} - \frac{3pH_{p-1}(3)}{2} \pmod{p^4}
\]

where at the last step we applied the results mentioned in the preliminaries.

By comparing the coefficient of \( a^2 \) in the expansion of both sides of (2) at \( a = 0 \) we have

\[
\sum_{k=1}^{n} \binom{2k}{k} \frac{5k^2}{4n^4 + k^4} \prod_{j=1}^{k-1} \frac{n^4 - j^4}{4n^4 + j^4} \left( \frac{1}{5k^2} + \sum_{j=1}^{k-1} \frac{1}{n^2 + j^2} - 2 \sum_{j=1}^{k} \frac{2n^2 + j^2}{4n^4 + j^4} \right) = -\frac{2}{n^4}.
\]

Let \( n = p > 3 \) be a prime then move to the right-hand side the \( p \)-th term of the sum on the left. Thus, the left-hand side modulo \( p^2 \) is congruent to

\[
\sum_{k=1}^{p-1} (-1)^{k-1} \binom{2k}{k} \frac{5k^2}{4p^4 + k^2} \left( \frac{1}{5k^2} + H_{k-1}(2) - 2H_k(2) \right) = \sum_{k=1}^{p-1} (-1)^{k} \binom{2k}{k} \left( \frac{4}{k^4} + \frac{5H_k(2)}{k^2} \right).
\]

The right-hand side multiplied by \( p^4 \) is

\[
-2 - \left( \frac{2p}{p} \right) \prod_{j=1}^{p-1} \frac{p^4 - j^4}{4p^4 + j^4} \left( \frac{1}{5} + p^2 \sum_{j=1}^{p-1} \frac{1}{p^2 + j^2} - 2p^2 \sum_{j=1}^{p} \frac{2p^2 + j^2}{4p^4 + j^4} \right)
\]

(26)

and it remains to verify that it is congruent to \( -p^4H_{p-1}(4) \) modulo \( p^6 \). We note that

\[
\prod_{j=1}^{p-1} \frac{p^4 - j^4}{4p^4 + j^4} \equiv 1 - 5p^4H_{p-1}(4) \pmod{p^6},
\]

\[
p^2 \sum_{j=1}^{p-1} \frac{1}{p^2 + j^2} \equiv p^2H_{p-1}(2) - p^4H_{p-1}(4) \pmod{p^6},
\]

\[
2p^2 \sum_{j=1}^{p} \frac{2p^2 + j^2}{4p^4 + j^4} \equiv \frac{6}{5} + 2p^2H_{p-1}(2) + 4p^4H_{p-1}(4) \pmod{p^6},
\]
Hence, by (21), (26) simplifies to
\[-2 + 2 \left(1 - p^2 H_{p-1}(2) - \frac{p^4 H_{p-1}(4)}{2}\right) \left(1 + p^2 H_{p-1}(2)\right) \equiv -p^4 H_{p-1}(4) \pmod{p^6}\]
and the proof is finished. \(\square\)
