(Dated:)
A unit-preserving and completely positive linear map, or a channel, $\Lambda: \mathcal{A} \rightarrow \mathcal{A}_{\text {in }}$ between $C^{*}$-algebras $\mathcal{A}$ and $\mathcal{A}_{\text {in }}$ is called entanglement-breaking (EB) if $\omega \circ\left(\Lambda \otimes \operatorname{id}_{\mathcal{B}}\right)$ is a separable state for any $C^{*}$-algebra $\mathcal{B}$ and any state $\omega$ on the injective $C^{*}$-tensor product $\mathcal{A}_{\text {in }} \otimes \mathcal{B}$. In this paper, we establish the equivalence of the following conditions for a channel $\Lambda$ with a quantum input space and with a general outcome $C^{*}$-algebra, generalizing known results in finite dimensions: (i) $\Lambda$ is EB; (ii) $\Lambda$ has a measurementprepare form (Holevo form); (iii) $n$ copies of $\Lambda$ are compatible for all $2 \leq n<\infty$; (iv) countably infinite copies of $\Lambda$ are compatible. By using this equivalence, we also show that the set of randomization-equivalence classes of normal EB channels with a fixed input von Neumann algebra is upper and lower Dedekind-closed, i.e. the supremum or infimum of any randomization-increasing or decreasing net of EB channels is also EB. As an example, we construct an injective normal EB channel with an arbitrary outcome operator algebra $\mathcal{M}$ acting on an infinite-dimensional separable Hilbert space by using the coherent states and the Bargmann measure.

[^0]
## I. INTRODUCTION

A quantum channel $\Lambda$ is called entanglement-breaking (EB) if $\Lambda$ tensored with the identity on any state space maps any entangled state to a separable state. In Ref. 1 some useful characterizations of finite-dimensional EB channels were established. Later EB condition is considered in the infinite-dimensional quantum systems in Refs. 26 and the operator algebraic setup in Refs. 7 9. Among them, in Ref. 2, it was shown that a channel with input and outcome separable Hilbert spaces is EB if and only if the channel has a measurementprepare form (Holevo form). Recently, another characterization of the EB condition in terms of channel compatibility was given in Ref. 10 (Proposition 12): a finite-dimensional channel is EB if and only if $n$ copies of the channel have a joint channel for all $2 \leq n<\infty$. The proof in Ref. 10 is based on an upper bound ${ }^{11}$ on the diamond norm distance that explicitly depends on the dimension of the system and is not applicable to the infinite-dimensional case.

The purpose of this paper is to generalize these characterizations of the EB condition to the case of channels with (possibly non-separable) quantum input spaces and with general outcome operator algebras. The main finding of this paper is Theorem 2, which, roughly speaking, establishes the equivalence of the following conditions for a channel $\Lambda$ with quantum input and operator algebraic outcome spaces:
(i) $\Lambda$ is EB ;
(ii) $\Lambda$ has a measurement-prepare form;
(iii) $n$-copies of $\Lambda$ are compatible for all $2 \leq n<\infty$;
(iv) countably infinite copies of $\Lambda$ are compatible.

The equivalence of the first three conditions generalizes known results in finite-dimensions,, 10 while the last infinite-self-compatibility condition is a new characterization.

This paper is organized as follows. After mathematical preliminaries in Section III, we consider in Section III general properties of separable states on injective $C^{*}$-tensor product algebras and show that any separable state is represented as a barycentric integral of product states (Corollary 2), which is a $C^{*}$-algebra version of the corresponding integral representation given in Ref. 2. In Section IV] we prove Theorem 2, the main result of this
paper. In Section (V) as an application of the characterizations given in Theorem 2, we show that the supremum or infimum of any randomization-increasing or decreasing net of normal EB channels with a fixed input von Neumann algebra is also EB (Theorem (4). In Section VI we construct a normal injective EB channel that has an arbitrary outcome von Neumann algebra acting on a separable Hilbert space. Section VII concludes the paper.

## II. PRELIMINARIES

This section introduces mathematical preliminaries needed in the main part and fixes the notation. For general references of operator algebra we refer to Refs. 12 and 13 .

## A. States and channels on operator algebras

Throughout this paper every $C^{*}$-algebra $\mathcal{A}$ is assumed to have a unit element which we write as $\mathbb{1}_{\mathcal{A}}$. For a $C^{*}$-algebra $\mathcal{A}$, a positive and normalized linear functional $\phi \in \mathcal{A}^{*}$ is called a state on $\mathcal{A}$. We denote by $\mathcal{S}(\mathcal{A})$ the set of states on $\mathcal{A}$, which is a compact convex subset of the dual space $\mathcal{A}^{*}$ in the weak-* topology $\sigma\left(\mathcal{A}^{*}, \mathcal{A}\right)$. We also denote by $\mathcal{S}_{\mathrm{p}}(\mathcal{A})$ the set of pure states on $\mathcal{A}$. Since $\mathcal{S}_{\mathrm{p}}(\mathcal{A})$ coincides with the set of extreme points of $\mathcal{S}(\mathcal{A})$, the Krein-Milman theorem implies that $\mathcal{S}(\mathcal{A})=\overline{\operatorname{co}}\left(\mathcal{S}_{\mathrm{p}}(\mathcal{A})\right)$, where $\overline{\mathrm{co}}(\cdot)$ denotes the closed convex hull in the weak-* topology. For a Hilbert space $\mathcal{H}, \mathcal{L}(\mathcal{H})$ and $\mathbb{1}_{\mathcal{H}}$ denote the algebra of bounded linear operators and the unit operator on $\mathcal{H}$, respectively. We also write the inner product of a Hilber space $\mathcal{H}$ as $\langle\xi \mid \eta\rangle(\xi, \eta \in \mathcal{H})$, which is linear and anti-linear with respect to $\eta$ and $\xi$, respectively.

A channel (in the Heisenberg picture) is a unit-preserving and completely positive (CP) map $\Lambda: \mathcal{A} \rightarrow \mathcal{B}$ between $C^{*}$-algebras $\mathcal{A}$ and $\mathcal{B}$. The algebras $\mathcal{A}$ and $\mathcal{B}$ are called the outcome and input spaces, or algebras, of $\Lambda$, respectively. In the Schrödinger picture, an input state $\phi \in \mathcal{S}(\mathcal{B})$ is mapped to the outcome state $\Lambda^{*}(\phi)=\phi \circ \Lambda \in \mathcal{S}(\mathcal{A})$. For $C^{*}$-algebras $\mathcal{A}$ and $\mathcal{B}$, the set of channels from $\mathcal{A}$ to $\mathcal{B}$ is denoted by $\operatorname{Ch}(\mathcal{A} \rightarrow \mathcal{B})$.

A channel $\Lambda \in \operatorname{Ch}(\mathcal{M} \rightarrow \mathcal{N})$ between von Neumann algebras $\mathcal{M}$ and $\mathcal{N}$ is called normal if $\Lambda$ is continuous with respect to the $\sigma$-weak topologies of $\mathcal{M}$ and $\mathcal{N}$, respectively. The set of normal channels from $\mathcal{M}$ to $\mathcal{N}$ is denoted by $\mathbf{C h}_{\sigma}(\mathcal{M} \rightarrow \mathcal{N})$. A normal channel with a commutative outcome von Neumann algebra is called a quantum-classical (QC) channel.

Let $\Lambda \in \operatorname{Ch}\left(\mathcal{A} \rightarrow \mathcal{A}_{\text {in }}\right)$ and $\Gamma \in \operatorname{Ch}\left(\mathcal{B} \rightarrow \mathcal{A}_{\text {in }}\right)$ be channels with the common input space $\mathcal{A}_{\mathrm{in}}$. We define the randomization (or coarse-graining or concatenation) relations ${ }^{10,14}$ for channels as follows:

- $\Lambda \preccurlyeq_{\mathrm{CP}} \Gamma$ ( $\Lambda$ is a randomization of $\Gamma$ ) : def. there exists a channel $\alpha \in \mathbf{C h}(\mathcal{A} \rightarrow \mathcal{B})$ such that $\Lambda=\Gamma \circ \alpha$;
- $\Lambda \sim_{\mathrm{CP}} \Gamma$ ( $\Lambda$ is randomization-equivalent to $\Gamma$ ) : $\stackrel{\text { def. }}{\Leftrightarrow} \Lambda \preccurlyeq_{\mathrm{CP}} \Gamma$ and $\Gamma \preccurlyeq_{\mathrm{CP}} \Lambda$.

The relations $\preccurlyeq_{\mathrm{CP}}$ and $\sim_{\mathrm{CP}}$ are binary preorder and equivalence relations, respectively, defined on the class of channels with a fixed input algebra. In the above definition, if $\mathcal{A}, \mathcal{B}$, and $\mathcal{A}_{\text {in }}$ are von Neumann algebras and $\Lambda$ and $\Gamma$ are normal, $\Lambda \preccurlyeq_{\mathrm{CP}} \Gamma$ if and only if there exists a normal channel $\alpha \in \mathbf{C h}_{\sigma}(\mathcal{A} \rightarrow \mathcal{B})$ such that $\Lambda=\Gamma \circ \alpha .^{\underline{14}}$

Let $\mathcal{A}$ be a $C^{*}$-algebra and let $\pi_{\mathcal{A}}: \mathcal{A} \rightarrow \mathcal{L}\left(\mathcal{H}_{\mathcal{A}}\right)$ be the universal representation of $\mathcal{A}$, which is the direct sum of the Gelfand-Naimark-Segal (GNS) representations of all the states on $\mathcal{A}$. The von Neumann algebra $\pi_{\mathcal{A}}(\mathcal{A})^{\prime \prime}$, where the prime denotes the commutant, generated by $\pi_{\mathcal{A}}(\mathcal{A})$ is called the universal enveloping von Neumann algebra of $\mathcal{A}$. The algebra $\pi_{\mathcal{A}}(\mathcal{A})^{\prime \prime}$ is isometrically isomorphic to the double dual space $\mathcal{A}^{* *}$ and we identify $\pi_{\mathcal{A}}(\mathcal{A})^{\prime \prime}$ with $\mathcal{A}^{* *}$. By identifying $\mathcal{A}$ with $\pi_{\mathcal{A}}(\mathcal{A})$, we also regard $\mathcal{A}$ as a $\sigma$-weakly dense $C^{*}$-subalgebra of $\mathcal{A}^{* *}$.

Let $\mathcal{A}$ be a $C^{*}$-algebra and let $\mathcal{M}_{\text {in }}$ be a von Neumann algebra. Then any channel $\Lambda \in \operatorname{Ch}\left(\mathcal{A} \rightarrow \mathcal{M}_{\text {in }}\right)$ uniquely extends to a normal channel $\bar{\Lambda} \in \mathbf{C h}_{\sigma}\left(\mathcal{A}^{* *} \rightarrow \mathcal{M}_{\text {in }}\right)$ which we call the normal extension of $\Lambda . \underline{14}$ The normal extension $\bar{\Lambda}$ is the least normal channel that upper bounds $\Lambda$ in the randomization order $\preccurlyeq_{\mathrm{CP}}$. Specifically, $\Lambda \preccurlyeq_{\mathrm{CP}} \bar{\Lambda}$ and for any normal channel $\Gamma \in \mathbf{C h}_{\sigma}\left(\mathcal{N} \rightarrow \mathcal{M}_{\text {in }}\right), \Lambda \preccurlyeq_{\mathrm{CP}} \Gamma$ if and only if $\bar{\Lambda} \preccurlyeq_{\mathrm{CP}} \Gamma$ (Ref. 14, Lemma 7 ). This also implies that $\Lambda \sim_{\mathrm{CP}} \bar{\Lambda}$ if $\Lambda$ is normal.

## B. Positive-operator valued measures

A positive-operator valued measure (POVM) ${ }^{\underline{15}, \underline{16} \text { on a Hilbert space } \mathcal{H} \text { is a triple }(\Omega, \Sigma, \mathrm{M}) ~(\Omega)}$ such that $(\Omega, \Sigma)$ is a measurable space, i.e. $\Sigma$ is a $\sigma$-algebra on a set $\Omega$, and $\mathrm{M}: \Sigma \rightarrow \mathcal{L}(\mathcal{H})$ is a map satisfying
(i) $\mathrm{M}(E) \geq 0(E \in \Sigma)$;
(ii) $\mathrm{M}(\Omega)=\mathbb{1}_{\mathcal{H}}$;
(iii) for any disjoint sequence $\left\{E_{n}\right\}_{n \in \mathbb{N}} \subset \Sigma, \mathrm{M}\left(\bigcup_{n \in \mathbb{N}} E_{n}\right)=\sum_{n \in \mathbb{N}} \mathrm{M}\left(E_{n}\right)$.

A POVM describes the classical outcome statistics of a general quantum measurement. For a measurable space $(\Omega, \Sigma)$, we denote by $B(\Omega, \Sigma)$ the set of bounded, complex valued, $\Sigma$ measurable functions on $\Omega$, which is a commutative $C^{*}$-algebra under the supremum norm $\|f\|:=\sup _{x \in \Omega}|f(x)|$. If $(\Omega, \Sigma, \mathrm{M})$ is a POVM on $\mathcal{H}$, for each $f \in B(\Omega, \Sigma)$ we can define the integral $\int_{\Omega} f(x) d \mathrm{M}(x) \in \mathcal{L}(\mathcal{H})$ in the weak sense.

Let $\Omega$ be a compact Hausdorff space. We denote by $C(\Omega)$ and $\mathcal{B}(\Omega)$ the commutative $C^{*}$-algebra of bounded complex-valued continuous functions on $\Omega$ and the Borel $\sigma$-algebra generated by the set of open subsets of $\Omega$, respectively. A POVM $(\Omega, \mathcal{B}(\Omega), \mathrm{M})$ on a Hilbert space $\mathcal{H}$ is called regular if

$$
\mathcal{B}(\Omega) \ni E \longmapsto\langle\xi \mid \mathrm{M}(E) \eta\rangle \in \mathbb{C}
$$

is a regular complex measure for any $\xi, \eta \in \mathcal{H}$. According to the Riesz-Markov-Kakutani representation theorem we have a one-to-one correspondence

$$
\mathcal{S}(C(\Omega)) \ni \phi \longmapsto \mu_{\phi} \in \mathbf{M}_{+, 1}(\Omega)
$$

between the state space $\mathcal{S}(C(\Omega))$ and the set $\mathrm{M}_{+, 1}(\Omega)$ of regular probability measures on $\Omega$ such that

$$
\phi(f)=\int_{\Omega} f(x) d \mu_{\phi}(x) \quad(f \in C(\Omega)) .
$$

A similar representation theorem also holds for channels as follows.

Proposition 1 (Ref. 17, Theorem 4.4). Let $\Omega$ be a compact Hausdorff space and let $\mathcal{H}$ be a Hilbert space. Then for any channel $\Gamma \in \mathbf{C h}(C(\Omega) \rightarrow \mathcal{L}(\mathcal{H}))$ there exists a unique regular $\operatorname{POVM}(\Omega, \mathcal{B}(\Omega), \mathrm{M})$ on $\mathcal{H}$ such that

$$
\Gamma(f)=\int_{\Omega} f(x) d \mathrm{M}(x) \quad(f \in C(\Omega))
$$

## C. Tensor products

Let $\mathcal{A}$ and $\mathcal{B}$ be $C^{*}$-algebras. We denote the algebraic tensor and the injective $C^{*}$-tensor products by $\mathcal{A} \otimes_{\text {alg }} \mathcal{B}$ and $\mathcal{A} \otimes \mathcal{B}$, respectively. If $\mathcal{A}$ and $\mathcal{B}$ are faithfully represented on Hilbert
spaces $\mathcal{H}$ and $\mathcal{K}$, respectively, then $\mathcal{A} \otimes \mathcal{B}$ coincides with the norm closure of $\mathcal{A} \otimes_{\text {alg }} \mathcal{B}$ on $\mathcal{L}(\mathcal{H} \otimes \mathcal{K})$ up to isomorphism. For $C^{*}$-algebras $\mathcal{A}, \mathcal{B}$, and $\mathcal{C}$, the associative law

$$
(\mathcal{A} \otimes \mathcal{B}) \otimes \mathcal{C}=\mathcal{A} \otimes(\mathcal{B} \otimes \mathcal{C})=: \mathcal{A} \otimes \mathcal{B} \otimes \mathcal{C}
$$

holds (again up to isomorphism) and the $C^{*}$-algebra $\mathcal{A} \otimes \mathcal{B} \otimes \mathcal{C}$ coincides with the norm closure of $\mathcal{A} \otimes_{\mathrm{alg}} \mathcal{B} \otimes_{\mathrm{alg}} \mathcal{C}$ on $\mathcal{L}(\mathcal{H} \otimes \mathcal{K} \otimes \mathcal{J})$ if $\mathcal{A}, \mathcal{B}$, and $\mathcal{C}$ are faithfully represented on Hilbert spaces $\mathcal{H}, \mathcal{K}$, and $\mathcal{J}$, respectively. The injective $C^{*}$-tensor product of arbitrary finite number of $C^{*}$-algebras can be defined similarly.

Let $\Lambda \in \operatorname{Ch}(\mathcal{A} \rightarrow \mathcal{B})$ and $\Gamma \in \operatorname{Ch}(\mathcal{C} \rightarrow \mathcal{D})$ be channels. Then there exists a unique CP channel $\Lambda \otimes \Gamma \in \mathbf{C h}(\mathcal{A} \otimes \mathcal{C} \rightarrow \mathcal{B} \otimes \mathcal{D})$, called the tensor product channel, such that $\Lambda \otimes \Gamma(A \otimes C)=\Lambda(A) \otimes \Gamma(C)(A \in \mathcal{A}, C \in \mathcal{C})$.

By the inductive limit procedure, we can also define the injective $C^{*}$-tensor product of infinite number of $C^{*}$-algebras. $\underline{\underline{\underline{18}}}$ In this paper we only need the countably infinite tensor product $\mathcal{A}^{\otimes \infty}$ of identical $C^{*}$-algebras, which is defined as follows. For each $C^{*}$-algebra $\mathcal{A}$ and each integer $1 \leq n<\infty$, we write

$$
\mathcal{A}^{\otimes n}:=\underbrace{\mathcal{A} \otimes \cdots \otimes \mathcal{A}}_{n \text { elements }} .
$$

For each $1 \leq m<n<\infty$, the representation $\pi_{n \leftarrow m}: \mathcal{A}^{\otimes m} \ni X \mapsto X \otimes \mathbb{1}_{\mathcal{A}^{\otimes(n-m)}} \in$ $\mathcal{A}^{\otimes n}$ is faithful and the family $\left(\pi_{n \leftarrow m}\right)_{1 \leq m<n<\infty}$ satisfies the consistency condition $\pi_{n \leftarrow k}=$ $\pi_{n \leftarrow m} \circ \pi_{m \leftarrow k}(1 \leq k<m<n<\infty)$. Then there exist a $C^{*}$-algebra $\mathcal{A}^{\otimes \infty}$ and faithful representations $\pi_{n}: \mathcal{A}^{\otimes n} \rightarrow \mathcal{A}^{\otimes \infty}(1 \leq n<\infty)$ such that $\pi_{m}=\pi_{n} \circ \pi_{n \leftarrow m}(1 \leq m<n<\infty)$ and $\bigcup_{1 \leq n<\infty} \pi_{n}\left(\mathcal{A}^{\otimes n}\right)$ is a norm dense $*$-subalgebra of $\mathcal{A}^{\otimes \infty}$. Such $\mathcal{A}^{\otimes \infty}$ and $\left(\pi_{n}\right)_{n \geq 1}$ are unique up to isomorphism. The $C^{*}$-algebra $\mathcal{A}^{\otimes \infty}$ is called the (countably) infinite injective $C^{*}$-tensor product of $\mathcal{A}$. The element $\pi_{n}(X) \in \mathcal{A}^{\otimes \infty}\left(X \in \mathcal{A}^{\otimes n}\right)$ and the $C^{*}$-subalgebra $\pi_{n}\left(\mathcal{A}^{\otimes n}\right) \subset \mathcal{A}^{\otimes \infty}$ are written as $X \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}$ and $\mathcal{A}^{\otimes n} \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}$, respectively.

Let $\mathcal{A}$ and $\mathcal{B}$ be $C^{*}$-algebras and let $2 \leq n<\infty$. A channel $\Lambda \in \operatorname{Ch}\left(\mathcal{A}^{\otimes n} \rightarrow \mathcal{B}\right)$ is called symmetric if $\Lambda=\Lambda \circ \pi_{\sigma}$ for all $\sigma \in \mathfrak{S}_{n}$, where $\mathfrak{S}_{n}$ is the symmetric group of the finite set $\{1, \ldots, n\}$ and $\pi_{\sigma}: \mathcal{A}^{\otimes n} \rightarrow \mathcal{A}^{\otimes n}\left(\sigma \in \mathfrak{S}_{n}\right)$ is a representation defined by

$$
\pi_{\sigma}\left(A_{1} \otimes \cdots \otimes A_{n}\right):=A_{\sigma(1)} \otimes \cdots \otimes A_{\sigma(n)} \quad\left(A_{1}, \ldots, A_{n} \in \mathcal{A}\right)
$$

The representation $\pi_{\sigma}\left(\sigma \in \mathfrak{S}_{n}\right)$ extends to the representation $\pi_{\sigma} \otimes \mathrm{id}_{\mathcal{A}^{\otimes \infty}}: \mathcal{A}^{\otimes \infty} \rightarrow \mathcal{A}^{\otimes \infty}$ defined by

$$
\pi_{\sigma} \otimes \operatorname{id}_{\mathcal{A}^{\otimes \infty}}\left(X \otimes Y \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}\right):=\pi_{\sigma}(X) \otimes Y \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}} \quad\left(1 \leq m<\infty, X \in \mathcal{A}^{\otimes n}, Y \in \mathcal{A}^{\otimes m}\right)
$$

A channel $\widetilde{\Lambda} \in \mathbf{C h}\left(\mathcal{A}^{\otimes \infty} \rightarrow \mathcal{B}\right)$ is called symmetric if $\widetilde{\Lambda} \circ\left(\pi_{\sigma} \otimes \operatorname{id}_{\mathcal{A}^{\otimes \infty}}\right)=\widetilde{\Lambda}$ for all $2 \leq n<\infty$ and all $\sigma \in \mathfrak{S}_{n}$. A channel $\widetilde{\Lambda} \in \mathbf{C h}\left(\mathcal{A}^{\otimes \infty} \rightarrow \mathcal{B}\right)$ is symmetric if and only if the restriction

$$
\widetilde{\Lambda}_{n}: \mathcal{A}^{\otimes n} \ni X \longmapsto \widetilde{\Lambda}\left(X \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}\right) \in \mathcal{B}
$$

is symmetric for all $2 \leq n<\infty$.

## D. Self-compatibility of channels

Let $\Lambda \in \mathbf{C h}\left(\mathcal{A} \rightarrow \mathcal{A}_{\text {in }}\right)$ be a channel. For $2 \leq n<\infty$, a channel $\Theta \in \mathbf{C h}\left(\mathcal{A}^{\otimes n} \rightarrow \mathcal{A}_{\text {in }}\right)$ is called an $n$-joint channel ${ }^{10}$ of $\Lambda$ if

$$
\Lambda(A)=\Theta\left(A \otimes \mathbb{1}_{\mathcal{A}^{\otimes(n-1)}}\right)=\cdots=\Theta\left(\mathbb{1}_{\mathcal{A}^{\otimes k}} \otimes A \otimes \mathbb{1}_{\mathcal{A}^{\otimes(n-k-1)}}\right)=\cdots=\Theta\left(\mathbb{1}_{\mathcal{A}^{\otimes(n-1)}} \otimes A\right)
$$

for all $A \in \mathcal{A}$, i.e. the $n$ marginal channels of $\Theta$ are identical to $\Lambda$. An $n$-joint channel $\Theta$ of $\Lambda$, if exists, can always be taken to be symmetric by retaking $\Theta$ as $\underline{10}$

$$
\frac{1}{n!} \sum_{\sigma \in \mathfrak{S}_{n}} \Theta \circ \pi_{\sigma}
$$

A channel $\Theta_{\infty} \in \operatorname{Ch}\left(\mathcal{A}^{\otimes \infty} \rightarrow \mathcal{A}_{\text {in }}\right)$ is called an $\omega$-joint channel of $\Lambda$ if

$$
\Lambda(A)=\Theta_{\infty}\left(A \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}\right)=\Theta_{\infty}\left(\mathbb{1}_{\mathcal{A}^{\otimes n}} \otimes A \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}\right)
$$

for all $A \in \mathcal{A}$ and all $1 \leq n<\infty$.

## E. No-broadcasting theorem

Let $\Lambda \in \operatorname{Ch}\left(\mathcal{A} \rightarrow \mathcal{A}_{\text {in }}\right)$ be a channel and let $\mathcal{A} \otimes_{x} \mathcal{A}$ be either $\mathcal{A} \otimes_{\text {alg }} \mathcal{A}$ or $\mathcal{A} \otimes \mathcal{A}$. Then a channel $\Psi \in \operatorname{Ch}\left(\mathcal{A} \otimes_{x} \mathcal{A} \rightarrow \mathcal{A}\right)$ is called a broadcasting channel of $\Lambda$ if

$$
\Lambda(A)=\Lambda \circ \Psi\left(A \otimes \mathbb{1}_{\mathcal{A}}\right)=\Lambda \circ \Psi\left(\mathbb{1}_{\mathcal{A}} \otimes A\right)
$$

for all $A \in \mathcal{A}$, where a linear map $\Phi: \mathcal{A} \otimes_{\text {alg }} \mathcal{A} \rightarrow \mathcal{B}$ for a $C^{*}$-algebra $\mathcal{B}$ is called a channel if $\Phi$ is unit-preserving and CP, i.e.

$$
\sum_{i, j=1}^{n} B_{i}^{*} \Phi\left(X_{i}^{*} X_{j}\right) B_{j} \geq 0
$$

for all $1 \leq n<\infty,\left\{B_{i}\right\}_{i=1}^{n} \subset \mathcal{B}$, and $\left\{X_{i}\right\}_{i=1}^{n} \subset \mathcal{A} \otimes_{\text {alg }} \mathcal{A}$. If $\Lambda$ has a broadcasting channel $\Psi \in \operatorname{Ch}(\mathcal{A} \otimes \mathcal{A} \rightarrow \mathcal{A})$ (respectively, $\Psi \in \operatorname{Ch}\left(\mathcal{A} \otimes_{\text {alg }} \mathcal{A} \rightarrow \mathcal{A}\right)$ ), then $\Lambda$ is called broadcastable in the sense of injective $C^{*}$-tensor product (respectively, algebraic tensor product).

The following theorem, which is immediate from Corollary 1 of Ref. 19, is an operator algebraic version of the quantum no-broadcasting theorem and will play an important role in the proof of the main result.

Theorem 1 (No-broadcasting theorem for normal channels). Let $\Lambda \in \mathbf{C h}_{\sigma}\left(\mathcal{M} \rightarrow \mathcal{M}_{\text {in }}\right)$ be a normal channel. Then the following conditions are equivalent.
(i) $\Lambda$ is broadcastable in the sense of algebraic tensor product.
(ii) $\Lambda$ is broadcastable in the sense of injective $C^{*}$-tensor product.
(iii) $\Lambda$ is randomization-equivalent to a $Q C$ channel with the input space $\mathcal{M}_{\mathrm{in}}$.

For the broadcastability for channels with outcome $C^{*}$-algebras, we have the following lemma.

Lemma 1. Let $\mathcal{A}$ be a $C^{*}$-algebra, let $\mathcal{M}_{\mathrm{in}}$ be a von Neumann algebra, and let $\Lambda \in \mathbf{C h}(\mathcal{A} \rightarrow$ $\left.\mathcal{M}_{\text {in }}\right)$ be a channel. Suppose that $\Lambda$ has a broadcasting channel $\Psi \in \operatorname{Ch}(\mathcal{A} \otimes \mathcal{A} \rightarrow \mathcal{A})$. Then the normal extension $\bar{\Lambda} \in \mathbf{C h}_{\sigma}\left(\mathcal{A}^{* *} \rightarrow \mathcal{M}_{\text {in }}\right)$ of $\Lambda$ satisfies the conditions (i)-(iii) of Theorem 1.

Proof. It is sufficient to show that $\bar{\Lambda}$ satisfies the condition (i) of Theorem 1. Let $\left(\mathcal{H}_{\mathcal{A}}, \pi_{\mathcal{A}}\right)$ be the universal representation of $\mathcal{A}$. From the complete positivity of $\Psi: \mathcal{A} \otimes \mathcal{A} \rightarrow \mathcal{A} \subset$ $\mathcal{L}\left(\mathcal{H}_{\mathcal{A}}\right)$, we can take a Stinespring representation $(\mathcal{K}, \pi, V)$ of $\Psi$, namely $\mathcal{K}$ is a Hilbert space, $\pi: \mathcal{A} \otimes \mathcal{A} \rightarrow \mathcal{L}(\mathcal{K})$ is a representation, and $V: \mathcal{H}_{\mathcal{A}} \rightarrow \mathcal{K}$ is a linear isometry such that

$$
\Psi(X)=V^{*} \pi(X) V \quad(X \in \mathcal{A} \otimes \mathcal{A})
$$

We define representations $\pi_{L}$ and $\pi_{R}$ by

$$
\pi_{L}(A):=\pi\left(A \otimes \mathbb{1}_{\mathcal{A}}\right), \quad \pi_{R}(A):=\pi\left(\mathbb{1}_{\mathcal{A}} \otimes A\right) \quad(A \in \mathcal{A})
$$

By the universality of the enveloping algebra $\mathcal{A}^{* *}$ the representations $\pi_{L}$ and $\pi_{R}$ uniquely extend to normal representations $\bar{\pi}_{L}: \mathcal{A}^{* *} \rightarrow \mathcal{L}(\mathcal{K})$ and $\bar{\pi}_{R}: \mathcal{A}^{* *} \rightarrow \mathcal{L}(\mathcal{K})$, respectively. Since $\pi_{L}(\mathcal{A})$ and $\pi_{R}(\mathcal{A})$ commute, so do the von Neumann algebras $\bar{\pi}_{L}\left(\mathcal{A}^{* *}\right)=\pi_{L}(\mathcal{A})^{\prime \prime}$ and
$\bar{\pi}_{R}\left(\mathcal{A}^{* *}\right)=\pi_{R}(\mathcal{A})^{\prime \prime}$. Thus we can define a representation $\widetilde{\pi}: \mathcal{A}^{* *} \otimes_{\text {alg }} \mathcal{A}^{* *} \rightarrow \mathcal{L}(\mathcal{K})$ and a channel $\widetilde{\Psi}: \mathcal{A}^{* *} \otimes_{\text {alg }} \mathcal{A}^{* *} \rightarrow \mathcal{A}^{* *}$ by

$$
\begin{gathered}
\widetilde{\pi}\left(\sum_{i} A_{i}^{\prime \prime} \otimes B_{i}^{\prime \prime}\right):=\sum_{i} \bar{\pi}_{L}\left(A_{i}^{\prime \prime}\right) \bar{\pi}_{R}\left(B_{i}^{\prime \prime}\right) \quad\left(A_{i}^{\prime \prime}, B_{i}^{\prime \prime} \in \mathcal{A}^{* *}\right), \\
\widetilde{\Psi}(X):=V^{*} \widetilde{\pi}(X) V \quad\left(X \in \mathcal{A}^{* *} \otimes_{\mathrm{alg}} \mathcal{A}^{* *}\right) .
\end{gathered}
$$

Then for each $A \in \mathcal{A}$,

$$
\bar{\Lambda} \circ \widetilde{\Psi}\left(A \otimes \mathbb{1}_{\mathcal{A}^{* *}}\right)=\Lambda \circ \Psi\left(A \otimes \mathbb{1}_{\mathcal{A}}\right)=\Lambda(A)=\bar{\Lambda}(A)
$$

and similarly $\bar{\Lambda} \circ \widetilde{\Psi}\left(\mathbb{1}_{\mathcal{A}^{* *}} \otimes A\right)=\bar{\Lambda}(A)$. Since the channels

$$
\begin{aligned}
& \mathcal{A}^{* *} \ni A^{\prime \prime} \longmapsto \bar{\Lambda} \circ \widetilde{\Psi}\left(A^{\prime \prime} \otimes \mathbb{1}_{\mathcal{A}^{* *}}\right) \in \mathcal{M}_{\mathrm{in}} \\
& \mathcal{A}^{* *} \ni A^{\prime \prime} \longmapsto \bar{\Lambda} \circ \widetilde{\Psi}\left(\mathbb{1}_{\mathcal{A}^{* *}} \otimes A^{\prime \prime}\right) \in \mathcal{M}_{\mathrm{in}}
\end{aligned}
$$

are normal and $\mathcal{A}$ is $\sigma$-weakly dense in $\mathcal{A}^{* *}$, this implies that $\widetilde{\Psi}$ is a broadcasting channel of $\bar{\Lambda}$.

## III. SEPARABLE STATES

For $C^{*}$-algebras $\mathcal{A}$ and $\mathcal{B}$ and for states $\phi \in \mathcal{S}(\mathcal{A})$ and $\psi \in \mathcal{S}(\mathcal{B})$, there exists a unique state $\phi \otimes \psi \in \mathcal{S}(\mathcal{A} \otimes \mathcal{B})$ such that $(\phi \otimes \psi)(A \otimes B)=\phi(A) \psi(B)(A \in \mathcal{A}, B \in \mathcal{B})$. For subsets $X \subset \mathcal{S}(\mathcal{A})$ and $Y \subset \mathcal{S}(\mathcal{B})$, we write

$$
X \otimes Y:=\{\phi \otimes \psi \in \mathcal{S}(\mathcal{A} \otimes \mathcal{B}) \mid \phi \in X, \psi \in Y\} .
$$

The states in $\mathcal{S}(\mathcal{A}) \otimes \mathcal{S}(\mathcal{B})$ are called the product states. We define

$$
\mathcal{S}_{\mathrm{sep}}(\mathcal{A} \otimes \mathcal{B}):=\overline{\mathrm{co}}(\mathcal{S}(\mathcal{A}) \otimes \mathcal{S}(\mathcal{B}))
$$

where the closed convex hull is with respect to the weak-* topology $\sigma\left((\mathcal{A} \otimes \mathcal{B})^{*}, \mathcal{A} \otimes \mathcal{B}\right)$. Each element of $\mathcal{S}_{\text {sep }}(\mathcal{A} \otimes \mathcal{B})$ is called a separable state, while each element of the complement $\mathcal{S}(\mathcal{A} \otimes \mathcal{B}) \backslash \mathcal{S}_{\text {sep }}(\mathcal{A} \otimes \mathcal{B})$ is called an entangled state.

Lemma 2. Let $\Lambda \in \operatorname{Ch}(\mathcal{A} \rightarrow \mathcal{B})$ and $\Gamma \in \operatorname{Ch}(\mathcal{C} \rightarrow \mathcal{D})$ be channels. Then $\omega \circ(\Lambda \otimes \Gamma) \in$ $\mathcal{S}_{\text {sep }}(\mathcal{A} \otimes \mathcal{C})$ for any $\omega \in \mathcal{S}_{\text {sep }}(\mathcal{B} \otimes \mathcal{D})$.

Proof. The claim immediately follows from that $\Lambda \otimes \Gamma$ maps any input product state $\phi \otimes \psi \in$ $\mathcal{S}(\mathcal{B}) \otimes \mathcal{S}(\mathcal{D})$ to the product state $(\phi \circ \Lambda) \otimes(\psi \circ \Gamma) \in \mathcal{S}(\mathcal{A}) \otimes \mathcal{S}(\mathcal{C})$.

Lemma 3. Let $\mathcal{A}$ and $\mathcal{B}$ be $C^{*}$-algebras. Suppose that $\mathcal{A}$ is commutative. Then $\mathcal{S}(\mathcal{A} \otimes \mathcal{B})=$ $\mathcal{S}_{\text {sep }}(\mathcal{A} \otimes \mathcal{B})$.

Proof. By Theorem 4.4 of Ref. 12, we have $\mathcal{S}_{\mathrm{p}}(\mathcal{A} \otimes \mathcal{B})=\mathcal{S}_{\mathrm{p}}(\mathcal{A}) \otimes \mathcal{S}_{\mathrm{p}}(\mathcal{B})$. Hence by the Krein-Milman theorem, $\mathcal{S}(\mathcal{A} \otimes \mathcal{B})=\overline{\operatorname{co}}\left(\mathcal{S}_{\mathrm{p}}(\mathcal{A}) \otimes \mathcal{S}_{\mathrm{p}}(\mathcal{B})\right) \subset \overline{\operatorname{co}}(\mathcal{S}(\mathcal{A}) \otimes \mathcal{S}(\mathcal{B}))=\mathcal{S}_{\text {sep }}(\mathcal{A} \otimes \mathcal{B}) \subset$ $\mathcal{S}(\mathcal{A} \otimes \mathcal{B})$, which proves the claim.

Lemma 4. Let $\mathcal{A}$ and $\mathcal{B}$ be $C^{*}$-algebras. Then the map

$$
f: \mathcal{S}(\mathcal{A}) \times \mathcal{S}(\mathcal{B}) \ni(\phi, \psi) \longmapsto \phi \otimes \psi \in \mathcal{S}(\mathcal{A}) \otimes \mathcal{S}(\mathcal{B})
$$

is a topological isomorphism, where the topologies of $\mathcal{S}(\mathcal{A}) \times \mathcal{S}(\mathcal{B})$ and $\mathcal{S}(\mathcal{A}) \otimes \mathcal{S}(\mathcal{B})$ are defined as the product topology of the weak-* topologies of $\mathcal{S}(\mathcal{A})$ and $\mathcal{S}(\mathcal{B})$, and the weak-* topology on $\mathcal{S}(\mathcal{A} \otimes \mathcal{B})$, respectively.

Proof. We can easily see that $f$ is bijective. Since $\mathcal{S}(\mathcal{A}) \times \mathcal{S}(\mathcal{B})$ is a compact Hausdorff space, we have only to prove the continuity of $f$. Let $\left(\phi_{i}, \psi_{i}\right)_{i \in I}$ be a net on $\mathcal{S}(\mathcal{A}) \times \mathcal{S}(\mathcal{B})$ converging to $(\phi, \psi) \in \mathcal{S}(\mathcal{A}) \times \mathcal{S}(\mathcal{B})$. Then $\left(\phi_{i} \otimes \psi_{i}\right)(X) \rightarrow(\phi \otimes \psi)(X)$ for all $X \in \mathcal{A} \otimes_{\text {alg }} \mathcal{B}$. Since the net $\left(\phi_{i} \otimes \psi_{i}\right)_{i \in I}$ is uniformly bounded and $\mathcal{A} \otimes_{\text {alg }} \mathcal{B}$ is norm dense in $\mathcal{A} \otimes \mathcal{B}$, this implies $\left(\phi_{i} \otimes \psi_{i}\right)(X) \rightarrow(\phi \otimes \psi)(X)$ for all $X \in \mathcal{A} \otimes \mathcal{B}$, which proves the continuity of $f$.

Corollary 1. For $C^{*}$-algebras $\mathcal{A}$ and $\mathcal{B}$, the $\operatorname{set} \mathcal{S}(\mathcal{A}) \otimes \mathcal{S}(\mathcal{B})$ of product states is a weakly-* compact subset of $\mathcal{S}(\mathcal{A} \otimes \mathcal{B})$.

To prove the integral representation for separable states, we need some results of barycentric integrals on compact subsets of general locally convex Hausdorff spaces. ${ }^{20}$ Let $E$ be a locally convex Hausdorff space and let $K \subset E$ be a compact subset. A regular probability measure $\mu \in \mathbf{M}_{+, 1}(K)$ is said to represent a point $\bar{x} \in E$ if

$$
f(\bar{x})=\int_{K} f(x) d \mu(x)
$$

for any continuous linear functional $f \in E^{*}$. By using the Hahn-Banach separation theorem, we can show that such a point $\bar{x}$ is, if exists, unique for given $\mu \in \mathbf{M}_{+, 1}(K)$ and called the barycenter of $\mu$. For $\mu \in \mathbf{M}_{+, 1}(K)$, we denote the barycenter of $\mu$ by

$$
\int_{K} x d \mu(x),
$$

if it exists.

Proposition 2 (Ref. 20, Proposition 1.2). Let E be a locally convex Hausdorff space and let $K \subset E$ be a compact subset. Then for a point $x \in E, x \in \overline{\operatorname{co}}(K)$ if and only if there exists a regular probability measure $\mu \in \mathbf{M}_{+, 1}(K)$ that represents $x$.

From Corollary 1 and Proposition 2 we obtain

Corollary 2. Let $\mathcal{A}$ and $\mathcal{B}$ be $C^{*}$-algebras. Then for any separable state $\omega \in \mathcal{S}_{\text {sep }}(\mathcal{A} \otimes \mathcal{B})$ there exists a regular probability measure $\nu \in \mathbf{M}_{+, 1}(\mathcal{S}(\mathcal{A}) \otimes \mathcal{S}(\mathcal{B}))$ such that

$$
\omega=\int_{\mathcal{S}(\mathcal{A}) \otimes \mathcal{S}(\mathcal{B})} \phi \otimes \psi d \nu(\phi \otimes \psi) .
$$

Corollary 2 is a $C^{*}$-algebra version of the integral representation for infinite-dimensional separable density operators obtained in Ref. 2.

In the case of state space on a $C^{*}$-algebra, the barycentric integral can be generalized to the weakly-* measurable state-valued maps as follows. Let $\mathcal{A}$ be a $C^{*}$-algebra and let $(\Omega, \Sigma, \mu)$ be a probability space. A map $\Omega \ni x \mapsto \phi_{x} \in \mathcal{S}(\mathcal{A})$ is called weakly-* measurable if $\Omega \ni x \mapsto \phi_{x}(A) \in \mathbb{C}$ is $\Sigma$-measurable for all $A \in \mathcal{A}$. For such a map $\Omega \ni x \mapsto \phi_{x} \in \mathcal{S}(\mathcal{A})$ we define the integral state $\int_{\Omega} \phi_{x} d \mu(x) \in \mathcal{S}(\mathcal{A})$ by

$$
\left(\int_{\Omega} \phi_{x} d \mu(x)\right)(A):=\int_{\Omega} \phi_{x}(A) d \mu(x) \quad(A \in \mathcal{A})
$$

## IV. CHARACTERIZATIONS OF EB CHANNELS

In this section, we give equivalent characterizations of the EB condition for a channel (Theorem (2).

Definition 1. A channel $\Lambda \in \operatorname{Ch}\left(\mathcal{A} \rightarrow \mathcal{A}_{\text {in }}\right)$ is called EB if $\omega \circ\left(\Lambda \otimes \mathrm{id}_{\mathcal{B}}\right) \in \mathcal{S}_{\text {sep }}(\mathcal{A} \otimes \mathcal{B})$ for any $C^{*}$-algebra $\mathcal{B}$ and any input state $\omega \in \mathcal{S}\left(\mathcal{A}_{\text {in }} \otimes \mathcal{B}\right)$. We denote by $\mathrm{Ch}^{\mathrm{EB}}\left(\mathcal{A} \rightarrow \mathcal{A}_{\text {in }}\right)$ the set of EB channels from $\mathcal{A}$ to $\mathcal{A}_{\text {in }}$.

In what follows in this section, we fix an input Hilbert space $\mathcal{H}_{\text {in }}$, which may be separable or non-separable, and an orthonormal basis $\left(\xi_{i}\right)_{i \in I}$ of $\mathcal{H}_{\mathrm{in}}$. We write the set of finite subsets of $I$ as $\mathbb{F}(I)$, which is directed by the set inclusion, and for each $F \in \mathbb{F}(I)$, define $P_{F}, \mathcal{H}_{F}$,
$\eta_{F} \in \mathcal{H}_{F} \otimes \mathcal{H}_{F}$, and $\omega_{F} \in \mathcal{S}\left(\mathcal{L}\left(\mathcal{H}_{\text {in }}\right) \otimes \mathcal{L}\left(\mathcal{H}_{F}\right)\right)$ by

$$
\begin{gathered}
P_{F}:=\sum_{i \in F}\left|\xi_{i}\right\rangle\left\langle\xi_{i}\right|, \\
\mathcal{H}_{F}:=P_{F} \mathcal{H}_{\mathrm{in}}, \\
\eta_{F}:=|F|^{-1 / 2} \sum_{i \in F} \xi_{i} \otimes \xi_{i}, \\
\omega_{F}(A):=\left\langle\eta_{F} \mid A \eta_{F}\right\rangle=|F|^{-1} \sum_{i, j \in F}\left\langle\xi_{i} \otimes \xi_{i} \mid A\left(\xi_{j} \otimes \xi_{j}\right)\right\rangle \quad\left(A \in \mathcal{L}\left(\mathcal{H}_{\mathrm{in}}\right) \otimes \mathcal{L}\left(\mathcal{H}_{F}\right)\right),
\end{gathered}
$$

where $|F|$ denotes the number of elements of $F$. Since $\omega_{F}\left(P_{F} \otimes P_{F}\right)=1$, we can regard $\omega_{F}$ as a state in $\mathcal{S}\left(\mathcal{L}\left(\mathcal{H}_{F}\right) \otimes \mathcal{L}\left(\mathcal{H}_{F}\right)\right)$, which we also write as $\omega_{F}$. The state $\omega_{F}$ is a maximally entangled state on $\mathcal{H}_{F} \otimes \mathcal{H}_{F}$.

Now we are in a position to prove the main result of this paper:

Theorem 2. Let $\mathcal{A}_{\text {in }}$ be a unital $C^{*}$-subalgebra of $\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)$, let $\mathcal{A}$ be a $C^{*}$-algebra, let $\Lambda \in$ $\operatorname{Ch}\left(\mathcal{A} \rightarrow \mathcal{A}_{\text {in }}\right) \subset \mathbf{C h}\left(\mathcal{A} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ be a channel, and let $\bar{\Lambda} \in \mathbf{C h}_{\sigma}\left(\mathcal{A}^{* *} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ be the normal extension of $\Lambda$. Then the following conditions are equivalent.
(i) $\Lambda \in \mathbf{C h}^{\mathrm{EB}}\left(\mathcal{A} \rightarrow \mathcal{A}_{\text {in }}\right)$.
(ii) $\Lambda \in \mathbf{C h}^{\mathrm{EB}}\left(\mathcal{A} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$.
(iii) $\bar{\Lambda} \in \mathbf{C h}^{\mathrm{EB}}\left(\mathcal{A}^{* *} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$.
(iv) $\omega_{F} \circ\left(\Lambda \otimes \operatorname{id}_{\mathcal{L}\left(\mathcal{H}_{F}\right)}\right) \in \mathcal{S}_{\text {sep }}\left(\mathcal{A} \otimes \mathcal{L}\left(\mathcal{H}_{F}\right)\right)$ for all $F \in \mathbb{F}(I)$.
(v) There exists a channel $\Gamma \in \mathbf{C h}\left(\mathcal{C} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ with a commutative outcome $C^{*}$-algebra $\mathcal{C}$ such that $\Lambda \preccurlyeq_{\mathrm{CP}} \Gamma$.
(vi) There exists a $Q C$ channel $\widetilde{\Gamma} \in \mathbf{C h}_{\sigma}\left(\mathcal{M} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ with a commutative outcome von Neumann algebra $\mathcal{M}$ such that $\Lambda \preccurlyeq_{\mathrm{CP}} \widetilde{\Gamma}$.
(vii) (Measurement-prepare form). There exists a $\operatorname{POVM}(\Omega, \Sigma, \mathrm{M})$ on $\mathcal{H}_{\text {in }}$ and a weakly-* measurable map $\Omega \ni x \mapsto \phi_{x} \in \mathcal{S}(\mathcal{A})$ such that

$$
\begin{equation*}
\Lambda(A)=\int_{\Omega} \phi_{x}(A) d \mathrm{M}(x) \quad(A \in \mathcal{A}) \tag{1}
\end{equation*}
$$

(viii) $\Lambda$ has an $n$-joint channel $\Theta_{n} \in \mathbf{C h}\left(\mathcal{A}^{\otimes n} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ for all $2 \leq n<\infty$.
(ix) $\Lambda$ has a symmetric $\omega$-joint channel $\Theta_{\infty} \in \mathbf{C h}\left(\mathcal{A}^{\otimes \infty} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$.
(x) $\Lambda$ has an $\omega$-joint channel $\Theta_{\infty}^{\prime} \in \mathbf{C h}\left(\mathcal{A}^{\otimes \infty} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$.

Proof. (ii) $\Longrightarrow$ (iii). Assume (ii) and take a $C^{*}$-algebra $\mathcal{B}$ and a state $\omega \in \mathcal{S}\left(\mathcal{L}\left(\mathcal{H}_{\text {in }}\right) \otimes \mathcal{B}\right)$. Since $\mathcal{A}_{\text {in }} \otimes \mathcal{B} \subset \mathcal{L}\left(\mathcal{H}_{\text {in }}\right) \otimes \mathcal{B}$, by the assumption we have $\omega \circ\left(\Lambda \otimes \mathrm{id}_{\mathcal{B}}\right)=\left.\omega\right|_{\mathcal{A}_{\text {in }} \otimes \mathcal{B}} \circ\left(\Lambda \otimes \operatorname{id}_{\mathcal{B}}\right) \in$ $\mathcal{S}_{\text {sep }}(\mathcal{A} \otimes \mathcal{B})$, which implies (iii).
(iii) $\Longrightarrow$ (ii). Assume (iii) and take a $C^{*}$-algebra $\mathcal{B}$ and a state $\omega \in \mathcal{S}\left(\mathcal{A}_{\text {in }} \otimes \mathcal{B}\right)$. From $\mathcal{A}_{\text {in }} \otimes \mathcal{B} \subset \mathcal{L}\left(\mathcal{H}_{\text {in }}\right) \otimes \mathcal{B}$ and the Hahn-Banach theorem, $\omega$ extends to a linear functional $\widetilde{\omega} \in\left(\mathcal{L}\left(\mathcal{H}_{\text {in }}\right) \otimes \mathcal{B}\right)^{*}$ such that $\|\widetilde{\omega}\|=\|\omega\|=1$. Since $\widetilde{\omega}\left(\mathbb{1}_{\mathcal{L}\left(\mathcal{H}_{\text {in }}\right) \otimes \mathcal{B}}\right)=\omega\left(\mathbb{1}_{\mathcal{A}_{\text {in }} \otimes \mathcal{B}}\right)=1=\|\widetilde{\omega}\|, \widetilde{\omega}$ is a state on $\mathcal{L}\left(\mathcal{H}_{\text {in }}\right) \otimes \mathcal{B}$ by Proposition 1.5.2 of Ref. 13. Thus by the assumption we have $\omega \circ\left(\Lambda \otimes \operatorname{id}_{\mathcal{B}}\right)=\widetilde{\omega} \circ\left(\Lambda \otimes \operatorname{id}_{\mathcal{B}}\right) \in \mathcal{S}_{\text {sep }}(\mathcal{A} \otimes \mathcal{B})$, which implies (ii).
(iii) $\Longrightarrow$ (iv) is obvious.
(iv) $\Longrightarrow$ (च). Assume (iv). For each $F \in \mathbb{F}(I)$, we define $\Lambda_{F} \in \operatorname{Ch}\left(\mathcal{A} \rightarrow \mathcal{L}\left(\mathcal{H}_{F}\right)\right)$ by $\Lambda_{F}(A):=P_{F} \Lambda(A) P_{F}(A \in \mathcal{A})$. By assumption we have $\omega_{F} \circ\left(\Lambda_{F} \otimes \operatorname{id}_{\mathcal{L}\left(\mathcal{H}_{F}\right)}\right)=\omega_{F} \circ(\Lambda \otimes$ $\left.\operatorname{id}_{\mathcal{L}\left(\mathcal{H}_{F}\right)}\right) \in \mathcal{S}_{\text {sep }}\left(\mathcal{A} \otimes \mathcal{L}\left(\mathcal{H}_{F}\right)\right)$. Therefore by Corollary 2 there exists a regular probability measure $\nu_{F} \in \mathbf{M}_{+, 1}\left(\mathcal{S}(\mathcal{A}) \otimes \mathcal{S}\left(\mathcal{L}\left(\mathcal{H}_{F}\right)\right)\right)$ such that

$$
\omega_{F} \circ\left(\Lambda_{F} \otimes \operatorname{id}_{\mathcal{L}\left(\mathcal{H}_{F}\right)}\right)=\int_{\mathcal{S}(\mathcal{A}) \otimes \mathcal{S}\left(\mathcal{L}\left(\mathcal{H}_{F}\right)\right)} \phi \otimes \psi d \nu_{F}(\phi \otimes \psi) .
$$

For each Borel set $E \in \mathcal{B}(\mathcal{S}(\mathcal{A}))$, we define a positive linear functional $\widetilde{\varphi}_{E} \in \mathcal{L}\left(\mathcal{H}_{F}\right)^{*}$ by

$$
\widetilde{\varphi}_{E}(B):=\int_{E \otimes \mathcal{S}\left(\mathcal{L}\left(\mathcal{H}_{F}\right)\right)} \psi(B) d \nu_{F}(\phi \otimes \psi) \quad\left(B \in \mathcal{L}\left(\mathcal{H}_{F}\right)\right)
$$

We write $\widetilde{\varphi}:=\widetilde{\varphi}_{\mathcal{S}(\mathcal{A})}$, which is a state on $\mathcal{L}\left(\mathcal{H}_{F}\right)$ given by

$$
\begin{equation*}
\widetilde{\varphi}(B)=\omega_{F} \circ\left(\Lambda_{F} \otimes \operatorname{id}_{\mathcal{L}\left(\mathcal{H}_{F}\right)}\right)\left(\mathbb{1}_{\mathcal{A}} \otimes B\right)=\left\langle\eta_{F} \mid\left(P_{F} \otimes B\right) \eta_{F}\right\rangle \quad\left(B \in \mathcal{L}\left(\mathcal{H}_{F}\right)\right) \tag{2}
\end{equation*}
$$

Then the RHS of (2) is a GNS representation of $\widetilde{\varphi}$. Furthermore, by the $\sigma$-additivity of $\nu_{F}$, the map $\mathcal{B}(\mathcal{S}(\mathcal{A})) \ni E \mapsto \widetilde{\varphi}_{E}(B) \in \mathbb{C}$ is also $\sigma$-additive for all $B \in \mathcal{L}\left(\mathcal{H}_{F}\right)$. Therefore application of the Radon-Nikodym theorem for CP maps (e.g. Theorem III. 1 of Ref. 21) to $\widetilde{\varphi} \in \operatorname{Ch}\left(\mathcal{L}\left(\mathcal{H}_{F}\right) \rightarrow \mathbb{C}\right)$ yields that there exists a unique $\operatorname{POVM}\left(\mathcal{S}(\mathcal{A}), \mathcal{B}(\mathcal{S}(\mathcal{A})), \mathrm{M}_{F}\right)$ on $\mathcal{H}_{F}$ such that

$$
\widetilde{\varphi}_{E}(B)=\left\langle\eta_{F} \mid\left(\mathrm{M}_{F}(E) \otimes B\right) \eta_{F}\right\rangle \quad\left(E \in \mathcal{B}(\mathcal{S}(\mathcal{A})), B \in \mathcal{L}\left(\mathcal{H}_{F}\right)\right)
$$

We define channels $\alpha \in \operatorname{Ch}(\mathcal{A} \rightarrow C(\mathcal{S}(\mathcal{A})))$ and $\Gamma_{F} \in \mathbf{C h}\left(C(\mathcal{S}(\mathcal{A})) \rightarrow \mathcal{L}\left(\mathcal{H}_{F}\right)\right)$ by

$$
\begin{gathered}
\alpha(A)(\phi):=\phi(A) \quad(A \in \mathcal{A}, \phi \in \mathcal{S}(\mathcal{A})), \\
\Gamma_{F}(f):=\int_{\mathcal{S}(\mathcal{A})} f(\phi) d \mathrm{M}_{F}(\phi) \quad(f \in C(\mathcal{S}(\mathcal{A}))) .
\end{gathered}
$$

Then for each $i, j \in F$ and each $E \in \mathcal{B}(\mathcal{S}(\mathcal{A}))$,

$$
\left\langle\eta_{F} \mid\left(\mathrm{M}_{F}(E) \otimes\left|\xi_{i}\right\rangle\left\langle\xi_{j}\right|\right) \eta_{F}\right\rangle=\widetilde{\varphi}_{E}\left(\left|\xi_{i}\right\rangle\left\langle\xi_{j}\right|\right)=\int_{E \otimes \mathcal{S}\left(\mathcal{L}\left(\mathcal{H}_{F}\right)\right)} \psi\left(\left|\xi_{i}\right\rangle\left\langle\xi_{j}\right|\right) d \nu_{F}(\phi \otimes \psi)
$$

Hence for each $i, j \in F$ and each $A \in \mathcal{A}$,

$$
\begin{aligned}
\left\langle\xi_{i} \mid \Gamma_{F} \circ \alpha(A) \xi_{j}\right\rangle & =\int_{\mathcal{S}(\mathcal{A})} \phi(A) d\left\langle\xi_{i} \mid \mathrm{M}_{F}(\phi) \xi_{j}\right\rangle \\
& =|F| \int_{\mathcal{S}(\mathcal{A})} \phi(A) d\left\langle\eta_{F} \mid\left(\mathrm{M}_{F}(\phi) \otimes\left|\xi_{i}\right\rangle\left\langle\xi_{j}\right|\right) \eta_{F}\right\rangle \\
& =|F| \int_{\mathcal{S}(\mathcal{A}) \otimes \mathcal{S}\left(\mathcal{L}\left(\mathcal{H}_{F}\right)\right)} \phi(A) \psi\left(\left|\xi_{i}\right\rangle\left\langle\xi_{j}\right|\right) d \nu_{F}(\phi \otimes \psi) \\
& =|F|\left(\omega_{F} \circ\left(\Lambda_{F} \otimes \operatorname{id}_{\mathcal{L}\left(\mathcal{H}_{F}\right)}\right)\right)\left(A \otimes\left|\xi_{i}\right\rangle\left\langle\xi_{j}\right|\right) \\
& =\left\langle\xi_{i} \mid \Lambda_{F}(A) \xi_{j}\right\rangle .
\end{aligned}
$$

Therefore $\Lambda_{F}=\Gamma_{F} \circ \alpha$. Since a closed ball in $\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)$ is $\sigma$-weakly compact, Tychonoff's theorem implies that there exist a subnet $\left(\Gamma_{F(j)}\right)_{j \in J}$ and a bounded linear map $\Gamma: C(\mathcal{S}(\mathcal{A})) \rightarrow$ $\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)$ such that $\Gamma_{F(j)}(f) \xrightarrow{\sigma \text {-weakly }} \Gamma(f)$ for all $f \in C(\mathcal{S}(\mathcal{A}))$. By the complete positivity of each $\Gamma_{F}, \Gamma$ is also CP. From

$$
\Gamma\left(\mathbb{1}_{C(\mathcal{S}(\mathcal{A}))}\right)=\underset{j \in J}{\sigma \mathrm{~W}-\lim } \Gamma_{F(j)}\left(\mathbb{1}_{C(\mathcal{S}(\mathcal{A}))}\right)=\sigma \underset{j \in J}{\mathrm{w}-\lim _{j}} P_{F(j)}=\mathbb{1}_{\mathcal{H}_{\mathrm{in}}},
$$

where $\sigma$ w-lim denotes the $\sigma$-weak limit, we have $\Gamma \in \mathbf{C h}\left(C(\mathcal{S}(\mathcal{A})) \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$. Moreover for each $A \in \mathcal{A}$

$$
\Gamma \circ \alpha(A)=\underset{j \in J}{\sigma \mathrm{w}-\lim } \Gamma_{F(j)} \circ \alpha(A)=\underset{j \in J}{\sigma \mathrm{w}-\lim } \Lambda_{F(j)}(A)=\Lambda(A),
$$

where we used $P_{F} B P_{F} \xrightarrow{\sigma \text {-strongly }} B\left(B \in \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ in the third equality. Therefore $\Lambda=$ $\Gamma \circ \alpha \preccurlyeq_{\mathrm{CP}} \Gamma$. Since the outcome space $C(\mathcal{S}(\mathcal{A}))$ of $\Gamma$ is commutative, this implies ( $\left.\mathbb{\nabla}\right)$.
$(\mathrm{v}) \Longrightarrow$ (vii). Let $\Gamma \in \operatorname{Ch}\left(\mathcal{C} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ be a channel such that $\mathcal{C}$ is commutative and $\Lambda \preccurlyeq_{\mathrm{CP}} \Gamma$. Then the outcome space $\mathcal{C}^{* *}$ of the normal extension $\widetilde{\Gamma} \in \mathbf{C h}_{\sigma}\left(\mathcal{C}^{* *} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ of $\Gamma$ is also commutative and hence $\widetilde{\Gamma}$ is a QC channel. Moreover we have $\Lambda \preccurlyeq_{\mathrm{CP}} \Gamma \preccurlyeq_{\mathrm{CP}} \widetilde{\Gamma}$, which implies (vil).
$(\mathrm{vi}) \Longrightarrow(\mathrm{v})$ is obvious.
( v$) \Longrightarrow$ (viil). Assume ( (V) and take channels $\Gamma \in \operatorname{Ch}\left(\mathcal{C} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ and $\beta \in \operatorname{Ch}(\mathcal{A} \rightarrow \mathcal{C})$ such that $\mathcal{C}$ is commutative and $\Lambda=\Gamma \circ \beta$. By the Gelfand representation we may assume that $\mathcal{C}=C(\Omega)$ for some compact Hausdorff space $\Omega$. Then by Proposition 1 there exists a unique regular $\operatorname{POVM}(\Omega, \mathcal{B}(\Omega), \mathrm{M})$ on $\mathcal{H}_{\text {in }}$ such that

$$
\Gamma(f)=\int_{\Omega} f(x) d \mathrm{M}(x) \quad(f \in C(\Omega))
$$

If we define $\phi_{x} \in \mathcal{S}(\mathcal{A})$ by $\phi_{x}(A):=\beta(A)(x)(A \in \mathcal{A})$ for each $x \in \Omega$, the map $\Omega \ni x \mapsto$ $\phi_{x} \in \mathcal{S}(\mathcal{A})$ is weakly-* measurable. Moreover for each $A \in \mathcal{A}$

$$
\Lambda(A)=\Gamma \circ \beta(A)=\int_{\Omega} \beta(A)(x) d \mathrm{M}(x)=\int_{\Omega} \phi_{x}(A) d \mathrm{M}(x)
$$

which implies (vii).
(vii) $\Longrightarrow(\mathbb{\nabla})$. Assume (vii) and take a $\operatorname{POVM}(\Omega, \Sigma, \mathrm{M})$ on $\mathcal{H}_{\text {in }}$ and a weakly-* measurable map $\Omega \ni x \mapsto \phi_{x} \in \mathcal{S}(\mathcal{A})$ satisfying (1). We define channels $\gamma \in \operatorname{Ch}(\mathcal{A} \rightarrow B(\Omega, \Sigma))$ and $\Gamma^{\prime} \in \mathbf{C h}\left(B(\Omega, \Sigma) \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ by

$$
\begin{gathered}
\gamma(A)(x):=\phi_{x}(A) \quad(A \in \mathcal{A}, x \in \Omega), \\
\Gamma^{\prime}(f):=\int_{\Omega} f(x) d \mathrm{M}(x) \quad(f \in B(\Omega, \Sigma)) .
\end{gathered}
$$

Then by the assumption (1) we have $\Lambda=\Gamma^{\prime} \circ \gamma \preccurlyeq_{\mathrm{CP}} \Gamma^{\prime}$. Since $B(\Omega, \Sigma)$ is commutative, this implies (v).
 such that $\mathcal{C}$ is commutative and $\Lambda=\Gamma \circ \alpha$. Then for any $C^{*}$-algebra $\mathcal{B}$ and any state $\omega \in \mathcal{S}\left(\mathcal{L}\left(\mathcal{H}_{\text {in }}\right) \otimes \mathcal{B}\right)$, Lemma 3 implies $\omega \circ\left(\Gamma \otimes \operatorname{id}_{\mathcal{B}}\right) \in \mathcal{S}_{\text {sep }}(\mathcal{C} \otimes \mathcal{B})$. Hence by Lemma 2

$$
\omega \circ\left(\Lambda \otimes \operatorname{id}_{\mathcal{B}}\right)=\omega \circ\left(\Gamma \otimes \operatorname{id}_{\mathcal{B}}\right) \circ\left(\alpha \otimes \operatorname{id}_{\mathcal{B}}\right) \in \mathcal{S}_{\mathrm{sep}}(\mathcal{A} \otimes \mathcal{B}),
$$

which proves (iii).
 such that $\mathcal{C}$ is commutative and $\Lambda=\Gamma \circ \alpha$. By the commutativity of $\mathcal{C}$, for each $2 \leq n<\infty$ there exists a channel $\alpha_{n} \in \mathbf{C h}\left(\mathcal{A}^{\otimes n} \rightarrow \mathcal{C}\right)$ such that

$$
\alpha_{n}\left(A_{1} \otimes A_{2} \otimes \cdots \otimes A_{n}\right)=\alpha\left(A_{1}\right) \alpha\left(A_{2}\right) \cdots \alpha\left(A_{n}\right) \quad\left(A_{1}, A_{2}, \ldots, A_{n} \in \mathcal{A}\right)
$$

Then $\Gamma \circ \alpha_{n} \in \operatorname{Ch}\left(\mathcal{A}^{\otimes n} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ is an $n$-joint channel of $\Lambda$.
(viii) $\Longrightarrow$ (ix). Assume (viii) and take a symmetric $n$-joint channel $\Theta_{n} \in \operatorname{Ch}\left(\mathcal{A}^{\otimes n} \rightarrow\right.$ $\left.\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ of $\Lambda$ for each $2 \leq n<\infty$. We write $\widetilde{\mathcal{A}}_{0}:=\bigcup_{n \geq 1} \mathcal{A}^{\otimes n} \otimes \mathbb{1}_{\mathcal{A}} \otimes \infty$, which is a norm dense *-subalgebra of $\mathcal{A}^{\otimes \infty}$, and for each $2 \leq n<\infty$ define a map $\Xi_{n}: \widetilde{\mathcal{A}}_{0} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)$ by

$$
\Xi_{n}(Y):= \begin{cases}\Theta_{n}(X) & \text { if } Y=X \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}} \text { and } X \in \mathcal{A}^{\otimes n} \\ 0 & \text { otherwise }\end{cases}
$$

Since $\left\|\Xi_{n}(Y)\right\| \leq\|Y\|$ for all $Y \in \widetilde{\mathcal{A}}_{0}$ and all $2 \leq n<\infty$, by Tychonoff's theorem there exists a subnet $\left(\Xi_{n(k)}\right)_{k \in K}$ such that the $\sigma$-weak limit $\Theta_{0}(Y):=\sigma \mathrm{w}$ - $\lim _{k \in K} \Xi_{n(k)}(Y)$ exists for all $Y \in \widetilde{\mathcal{A}}_{0}$. Since $\Xi_{n(k)}\left(c_{1} Y_{1}+c_{2} Y_{2}\right)=c_{1} \Xi_{n(k)}\left(Y_{1}\right)+c_{2} \Xi_{n(k)}\left(Y_{2}\right)$ eventually for each $Y_{1}, Y_{2} \in \widetilde{\mathcal{A}}_{0}$ and each $c_{1}, c_{2} \in \mathbb{C}, \Theta_{0}: \widetilde{\mathcal{A}}_{0} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)$ is a bounded linear map and hence uniquely extends to a bounded linear map $\Theta_{\infty}: \mathcal{A}^{\otimes \infty} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)$. Then, by the complete positivity of each $\Theta_{n}, \Theta_{\infty}$ is a channel in $\operatorname{Ch}\left(\mathcal{A}^{\otimes \infty} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$. By the symmetry of each $\Theta_{n}, \Theta_{\infty}$ is also symmetric. Moreover

$$
\begin{equation*}
\Theta_{\infty}\left(A \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}\right)=\underset{k \in K}{\sigma \mathrm{~W}-\lim _{K}} \Theta_{n(k)}\left(A \otimes \mathbb{1}_{\mathcal{A}^{\otimes(n(k)-1)}}\right)=\Lambda(A) \quad(A \in \mathcal{A}) \tag{3}
\end{equation*}
$$

From the symmetry of $\Theta_{\infty}$, Eq. (3) implies that $\Theta_{\infty}$ is a symmetric $\omega$-joint channel of $\Lambda$, which proves (ix).
$(\mathrm{ix}) \Longrightarrow(\mathrm{x})$ is obvious.
$(\mathrm{x}) \Longrightarrow\left(\right.$ viii) is immediate from that for an $\omega$-joint channel $\Theta_{\infty}^{\prime} \in \operatorname{Ch}\left(\mathcal{A}^{\otimes \infty} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ and each $2 \leq n<\infty$, the map

$$
\mathcal{A}^{\otimes n} \ni X \longmapsto \Theta_{\infty}^{\prime}\left(X \otimes \mathbb{1}_{\mathcal{A}}^{\otimes \infty}\right) \in \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)
$$

is an $n$-joint channel of $\Lambda$.
(ixi) $\Longrightarrow$ (vil). Let $\Theta_{\infty} \in \operatorname{Ch}\left(\mathcal{A}^{\otimes \infty} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ be a symmetric $\omega$-joint channel of $\Lambda$. If $\Theta_{\infty}$ has a broadcasting channel $\Psi_{\infty} \in \operatorname{Ch}\left(\mathcal{A}^{\otimes \infty} \otimes \mathcal{A}^{\otimes \infty} \rightarrow \mathcal{A}^{\otimes \infty}\right)$, by Lemma 1 the normal extension $\bar{\Theta}_{\infty} \in \mathbf{C h}\left(\left(\mathcal{A}^{\otimes \infty}\right)^{* *} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ of $\Theta_{\infty}$ is randomization-equivalent to a QC channel and, from $\Lambda \preccurlyeq_{\mathrm{CP}} \Theta_{\infty} \preccurlyeq_{\mathrm{CP}} \bar{\Theta}_{\infty}$, this implies (vil). Thus it suffices to construct a broadcasting channel of $\Theta_{\infty}$. For each $1 \leq n<\infty$ we define a representation

$$
\rho_{n}:\left(\mathcal{A}^{\otimes n} \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}\right) \otimes\left(\mathcal{A}^{\otimes n} \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}\right) \rightarrow \mathcal{A}^{\otimes(2 n)} \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}
$$

by

$$
\begin{aligned}
& \rho_{n}\left(\left(A_{1} \otimes A_{2} \otimes \cdots \otimes A_{n} \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}\right) \otimes\left(B_{1} \otimes B_{2} \otimes \cdots \otimes B_{n} \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}\right)\right) \\
& :=A_{1} \otimes B_{1} \otimes A_{2} \otimes B_{2} \otimes \cdots A_{n} \otimes B_{n} \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}} \\
& \left(A_{1}, \ldots, A_{n}, B_{1}, \ldots, B_{n} \in \mathcal{A}\right)
\end{aligned}
$$

Let $\mathcal{B}_{n}:=\left(\mathcal{A}^{\otimes n} \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}\right) \otimes\left(\mathcal{A}^{\otimes n} \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}\right)$ and $\mathcal{B}_{\infty}:=\bigcup_{1 \leq n<\infty} \mathcal{B}_{n}$, which are $C^{*}$ - and $*-$ subalgebras of $\mathcal{A}^{\otimes \infty} \otimes \mathcal{A}^{\otimes \infty}$, respectively. Since $\left.\rho_{n}\right|_{\mathcal{B}_{m}}=\rho_{m}$ for $1 \leq m<n<\infty$, there exists a representation $\widetilde{\rho}_{0}: \mathcal{B}_{\infty} \rightarrow \mathcal{A}^{\otimes \infty}$ such that $\left.\widetilde{\rho}_{0}\right|_{\mathcal{B}_{n}}=\rho_{n}$ for all $1 \leq n<\infty$. Now we show that $\mathcal{B}_{\infty}$ is norm dense in $\mathcal{A}^{\otimes \infty} \otimes \mathcal{A}^{\otimes \infty}$. Take an arbitrary product element $X_{1} \otimes X_{2} \in \mathcal{A}^{\otimes \infty} \otimes \mathcal{A}^{\otimes \infty}$ $\left(X_{1}, X_{2} \in \mathcal{A}^{\otimes \infty}\right)$. Then there exist sequences $\left(X_{j, m}\right)_{m \geq 1}(j=1,2)$ in $\bigcup_{n \geq 1} \mathcal{A}^{\otimes n} \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}$ such that $\left\|X_{j, m}-X_{j}\right\| \rightarrow 0$ and $\sup _{m \geq 1}\left\|X_{j, m}\right\| \leq\left\|X_{j}\right\|$. Then $\left(X_{1, m} \otimes X_{2, m}\right)_{m \geq 1}$ is a sequence in $\mathcal{B}_{\infty}$ and satisfies

$$
\begin{aligned}
\left\|X_{1, m} \otimes X_{2, m}-X_{1} \otimes X_{2}\right\| & \leq\left\|\left(X_{1, m}-X_{1}\right) \otimes X_{2, m}\right\|+\left\|X_{1} \otimes\left(X_{2, m}-X_{2}\right)\right\| \\
& \leq\left\|X_{1, m}-X_{1}\right\|\left\|X_{2}\right\|+\left\|X_{1}\right\|\left\|X_{2, m}-X_{2}\right\| \\
& \rightarrow 0
\end{aligned}
$$

Therefore $\mathcal{B}_{\infty}$ is norm dense in $\mathcal{A}^{\otimes \infty} \otimes \mathcal{A}^{\otimes \infty}$. Hence $\widetilde{\rho}_{0}$ uniquely extends to a representation $\widetilde{\rho}: \mathcal{A}^{\otimes \infty} \otimes \mathcal{A}^{\otimes \infty} \rightarrow \mathcal{A}^{\otimes \infty}$. Then by the symmetry of $\Theta_{\infty}$, for each $2 \leq n<\infty$ and each $X \in \mathcal{A}^{\otimes n}$,

$$
\Theta_{\infty}\left(X \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}\right)=\Theta_{\infty} \circ \widetilde{\rho}\left(\left(X \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}\right) \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}\right)=\Theta_{\infty} \circ \widetilde{\rho}\left(\mathbb{1}_{\mathcal{A}^{\otimes \infty}} \otimes\left(X \otimes \mathbb{1}_{\mathcal{A}^{\otimes \infty}}\right)\right) .
$$

Since $\bigcup_{n \geq 1} \mathcal{A}^{\otimes n} \otimes \mathbb{1}_{\mathcal{A}}^{\otimes \infty}$ is norm dense in $\mathcal{A}^{\otimes \infty}$, this implies that $\widetilde{\rho}$ is a broadcasting channel of $\Theta_{\infty}$, which proves (vi).
(iii) $\Longleftrightarrow$ (iii) follows from the equivalence (iii) $\Longleftrightarrow$ (vil) and from that $\Lambda \preccurlyeq_{\mathrm{CP}} \widetilde{\Gamma}$ if and only if $\bar{\Lambda} \preccurlyeq_{\mathrm{CP}} \widetilde{\Gamma}$ for any QC channel $\widetilde{\Gamma}$.

From the proof of (ix) $\Longrightarrow($ vi) in Theorem 2, we obtain
Corollary 3. Let $\mathcal{A}$ be a $C^{*}$-algebra. Then any symmetric channel $\Theta \in \operatorname{Ch}\left(\mathcal{A}^{\otimes \infty} \rightarrow \mathcal{L}\left(\mathcal{H}_{\mathrm{in}}\right)\right)$ has a broadcasting channel $\Psi \in \operatorname{Ch}\left(\mathcal{A}^{\otimes \infty} \otimes \mathcal{A}^{\otimes \infty} \rightarrow \mathcal{A}^{\otimes \infty}\right)$. Furthermore the normal extension $\bar{\Theta} \in \mathbf{C h}_{\sigma}\left(\left(\mathcal{A}^{\otimes \infty}\right)^{* *} \rightarrow \mathcal{L}\left(\mathcal{H}_{\mathrm{in}}\right)\right)$ of $\Theta$ is randomization-equivalent to a $Q C$ channel.

Remark 1. Related results to the equivalence of the EB condition and (v) of Theorem 2 were obtained in Ref. 7 (Corollary 3) and Ref. 9 (Lemma III.1).

## V. DEDEKIND-CLOSEDNESS OF EB CHANNELS

In this section we prove that the supremum or infimum of any randomization-monotone net of normal EB channels with a fixed input von Neumann algebra is also EB (Theorem (4). Before going to Theorem 4, we need to review some results from Ref. 22.

For a von Neumann algebra $\mathcal{M}_{\text {in }}$ we denote by $\mathbf{C h}_{\sigma}\left(\rightarrow \mathcal{M}_{\text {in }}\right)$ the class of normal channels with the input space $\mathcal{M}_{\text {in }}$ and with arbitrary outcome von Neumann algebras. Since the class of von Neumann algebras is a proper class, so is $\mathbf{C h}_{\sigma}\left(\rightarrow \mathcal{M}_{\text {in }}\right)$.

Proposition 3 (Ref. 22, Section 3). Let $\mathcal{M}_{\text {in }}$ be a von Neumann algebra. Then there exist a $\operatorname{set} \mathcal{C H}\left(\mathcal{M}_{\text {in }}\right)$ and a class-to-set surjection

$$
\begin{equation*}
\mathbf{C h}_{\sigma}\left(\rightarrow \mathcal{M}_{\mathrm{in}}\right) \ni \Lambda \longmapsto[\Lambda] \in \mathcal{C H}\left(\mathcal{M}_{\mathrm{in}}\right) \tag{4}
\end{equation*}
$$

such that for any $\Lambda, \Gamma \in \mathbf{C h}_{\sigma}\left(\rightarrow \mathcal{M}_{\mathrm{in}}\right), \Lambda \sim_{\mathrm{CP}} \Gamma$ if and only if $[\Lambda]=[\Gamma]$.
For each von Neumann algebra $\mathcal{M}_{\text {in }}$ we fix such a set $\mathcal{C H}\left(\mathcal{M}_{\text {in }}\right)$ and a map (4I). We call $\mathcal{C H}\left(\mathcal{M}_{\text {in }}\right)$ the set of randomization-equivalence classes of normal channels. We define a partial order $\preccurlyeq_{\mathrm{CP}}$ on $\mathcal{C H}\left(\mathcal{M}_{\text {in }}\right)$ by $[\Lambda] \preccurlyeq_{\mathrm{CP}}[\Gamma]: \stackrel{\text { def. }}{\Leftrightarrow} \Lambda \preccurlyeq_{\mathrm{CP}} \Gamma\left([\Lambda],[\Gamma] \in \mathcal{C} \mathcal{H}\left(\mathcal{M}_{\text {in }}\right)\right)$. We also define

$$
\begin{aligned}
\mathcal{C H}^{\mathrm{QC}}\left(\mathcal{M}_{\text {in }}\right):= & \left\{[\Lambda] \in \mathcal{C H}\left(\mathcal{M}_{\text {in }}\right) \mid \text { the outcome algebra of } \Lambda \text { is commutative }\right\}, \\
& \mathcal{C H}{ }^{\mathrm{EB}}\left(\mathcal{M}_{\text {in }}\right):=\left\{[\Lambda] \in \mathcal{C H}\left(\mathcal{M}_{\text {in }}\right) \mid \Lambda \text { is } \mathrm{EB}\right\},
\end{aligned}
$$

which are the sets of equivalence classes of QC and EB normal channels, respectively.
Let $(X, \leq)$ be a partially ordered set (poset). We adopt the following terminology as in Ref. 22

- A net $\left(x_{i}\right)_{i \in I}$ on $X$ is called increasing (respectively, decreasing) if for $i, j \in I, i \leq j$ implies $x_{i} \leq x_{j}$ (respectively, $x_{j} \leq x_{i}$ ).
- $X$ is called an upper (respectively, lower) directed-complete partially ordered set (dcpo) if any increasing (respectively, decreasing) net $\left(x_{i}\right)_{i \in I}$ on $X$ has a supremum $\sup _{i \in I} x_{i} \in X$ (respectively, infimum $\inf _{i \in I} x_{i} \in X$ ).
- A subset $A \subset X$ is said to be an upper (respectively, lower) Dedekind-closed subset of $X$ if whenever an increasing (respectively, decreasing) net $\left(x_{i}\right)_{i \in I}$ on $A$ has a supremum
$\sup _{i \in} x_{i} \in X$ (respectively, infimum $\inf _{i \in I} x_{i} \in X$ ), then $\sup _{i \in I} x_{i} \in A$ (respectively, $\left.\inf _{i \in I} x_{i} \in A\right)$.

The following theorem is the "channel part" of the main results of Ref. 22.

Theorem 3 (Ref. 22, Theorem 3). Let $\mathcal{M}_{\text {in }}$ be a von Neumann algebra.
(i) $\mathcal{C H}\left(\mathcal{M}_{\text {in }}\right)$ is an upper and lower dcpo.
(ii) $\mathcal{C H}{ }^{\mathrm{QC}}\left(\mathcal{M}_{\mathrm{in}}\right)$ is an upper and lower Dedekind-closed subset of $\mathcal{C H}\left(\mathcal{M}_{\mathrm{in}}\right)$.

Now we are in a position to prove the following theorem.

Theorem 4. Let $\mathcal{M}_{\text {in }}$ be a von Neumann algebra. Then $\mathcal{C H}{ }^{\mathrm{EB}}\left(\mathcal{M}_{\mathrm{in}}\right)$ is an upper and lower Dedekind-closed subset of $\mathcal{C H}\left(\mathcal{M}_{\text {in }}\right)$.

Proof. Suppose that $\mathcal{M}_{\text {in }}$ acts on a Hilbert space $\mathcal{H}_{\text {in }}$. We first show the claim when $\mathcal{M}_{\text {in }}=$ $\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)$.

By Theorem 2, we can write

$$
\mathcal{C} \mathcal{H}^{\mathrm{EB}}\left(\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)=\left\{[\Lambda] \in \mathcal{C H}\left(\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right) \mid \exists[\Gamma] \in \mathcal{C} \mathcal{H}^{\mathrm{QC}}\left(\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right) \text { s.t. }[\Lambda] \preccurlyeq \preccurlyeq_{\mathrm{CP}}[\Gamma]\right\},
$$

from which the lower Dedekind-closedness of $\mathcal{C} \mathcal{H}^{\mathrm{EB}}\left(\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ immediately follows. Now we show the upper Dedekind-closedness of $\mathcal{C} \mathcal{H}^{\mathrm{EB}}\left(\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$. According to Lemma 4 of Ref. 22, we have only to prove $\sup _{\alpha<\alpha_{0}}\left[\Lambda_{\alpha}\right] \in \mathcal{C} \mathcal{H}^{\mathrm{EB}}\left(\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ for any increasing transfinite sequence $\left(\left[\Lambda_{\alpha}\right]\right)_{\alpha<\alpha_{0}}$ in $\mathcal{C H} \mathcal{H}^{\mathrm{EB}}\left(\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ indexed by ordinals $\alpha$ smaller than $\alpha_{0}$ and greater than or equal to 0 . From the proof of Lemma 7 of Ref. 22 we can take channels $\widetilde{\Lambda}_{\alpha} \in \mathbf{C h}\left(\mathcal{A}_{\alpha} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ $\left(\alpha<\alpha_{0}\right)$ and $\Lambda \in \operatorname{Ch}\left(\mathcal{A} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ such that

- $\Lambda_{\alpha} \sim_{\mathrm{CP}} \widetilde{\Lambda}_{\alpha}\left(\alpha<\alpha_{0}\right)$;
- $\left(\mathcal{A}_{\alpha}\right)_{\alpha<\alpha_{0}}$ is an increasing transfinite sequence of unital $C^{*}$-subalgebras of $\mathcal{A}$ such that $\bigcup_{\alpha<\alpha_{0}} \mathcal{A}_{\alpha}$ is a norm dense $*$-subalgebra of $\mathcal{A} ;$
- $\widetilde{\Lambda}_{\alpha}$ is the restriction of $\Lambda$ to $\mathcal{A}_{\alpha}\left(\alpha<\alpha_{0}\right)$;
- if we denote by $\bar{\Lambda} \in \mathbf{C h}_{\sigma}\left(\mathcal{A}^{* *} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ the normal extension of $\Lambda$, we have $[\bar{\Lambda}]=$ $\sup _{\alpha<\alpha_{0}}\left[\Lambda_{\alpha}\right]$.

Therefore by the equivalence (iii) $\Longleftrightarrow$ (iiii) of Theorem 2, it suffices to show that $\Lambda$ is EB. For each $\alpha<\alpha_{0}$, since $\Lambda_{\alpha}$ is EB, so is $\widetilde{\Lambda}_{\alpha}$. Hence there exists a symmetric $n$-joint channel $\Theta_{n, \alpha} \in \mathbf{C h}\left(\mathcal{A}_{\alpha}^{\otimes n} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$ of $\widetilde{\Lambda}_{\alpha}$ for each $2 \leq n<\infty$. We define a $*$-subalgebra $\widetilde{\mathcal{A}}_{n} \subset \mathcal{A}^{\otimes n}$ and a map $\Xi_{n, \alpha}: \widetilde{\mathcal{A}}_{n} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)$ by

$$
\begin{gathered}
\widetilde{\mathcal{A}}_{n}:=\bigcup_{\alpha<\alpha_{0}} \mathcal{A}_{\alpha}^{\otimes n}, \\
\Xi_{n, \alpha}(X):= \begin{cases}\Theta_{n, \alpha}(X) & \text { if } X \in \mathcal{A}_{\alpha}^{\otimes n} \\
0 & \text { otherwise. }\end{cases}
\end{gathered}
$$

By Tychonoff's theorem, there exists a subnet $\left(\Xi_{n, \alpha(i)}\right)_{i \in I}$ such that the limit $\Theta_{n}^{\prime}(X):=$ $\sigma \mathrm{w}-\lim _{i \in I} \Xi_{n, \alpha(i)}(X)$ exists for all $X \in \widetilde{\mathcal{A}}_{n}$. Similarly as in the proofs of (viii) $\Longrightarrow$ (ix) and $(\mathrm{ix}) \Longrightarrow$ (vi) of Theorem [2, we can show that $\widetilde{\mathcal{A}}_{n}$ is norm dense in $\mathcal{A}^{\otimes n}$ and $\Theta_{n}^{\prime}$ uniquely extends to a symmetric channel $\Theta_{n} \in \mathbf{C h}\left(\mathcal{A}^{\otimes n} \rightarrow \mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$. Since

$$
\Theta_{n}\left(A \otimes \mathbb{1}_{\mathcal{A}^{\otimes(n-1)}}\right)=\underset{i \in I, \alpha(i) \geq \alpha}{\sigma \mathrm{W}-\lim _{n, \alpha(i)}}\left(A \otimes \mathbb{1}_{\mathcal{A}_{\alpha(i)}^{\otimes(n-1)}}\right)=\Lambda(A)
$$

for each $\alpha<\alpha_{0}$ and each $A \in \mathcal{A}_{\alpha}$, the norm denseness of $\bigcup_{\alpha<\alpha_{0}} \mathcal{A}_{\alpha}$ in $\mathcal{A}$ implies $\Theta_{n}(A \otimes$ $\left.\mathbb{1}_{\mathcal{A}^{\otimes(n-1)}}\right)=\Lambda(A)$ for all $A \in \mathcal{A}$. Thus by the symmetry of $\Theta_{n}, \Theta_{n}$ is an $n$-joint channel of $\Lambda$. Therefore by Theorem 2, $\Lambda$ is EB, which proves the upper Dedekind-closedness of $\mathcal{C} \mathcal{H}^{\mathrm{EB}}\left(\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$.

Finally we consider general $\mathcal{M}_{\text {in }}$. We can regard the set $\mathcal{C H}\left(\mathcal{M}_{\text {in }}\right)$ as the lower subset

$$
\left\{[\Lambda] \in \mathcal{C H}\left(\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right) \mid[\Lambda] \preccurlyeq_{\mathrm{CP}}\left[\operatorname{id}_{\mathcal{M}_{\mathrm{in}}}\right]\right\}
$$

of $\mathcal{C H}\left(\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$. Furthermore, by the equivalence (ii) $\Longleftrightarrow$ (iii) of Theorem 2, $\mathcal{C H}^{\mathrm{EB}}\left(\mathcal{M}_{\text {in }}\right)$ can be identified with the lower subset

$$
\left\{[\Lambda] \in \mathcal{C H}^{\mathrm{EB}}\left(\mathcal{L}\left(\mathcal{H}_{\mathrm{in}}\right)\right) \mid[\Lambda] \preccurlyeq_{\mathrm{CP}}\left[\operatorname{id}_{\mathcal{M}_{\text {in }}}\right]\right\}
$$

of $\mathcal{C} \mathcal{H}^{\mathrm{EB}}\left(\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right) \subset \mathcal{C H}\left(\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)\right)$. Therefore the claim for general $\mathcal{M}_{\text {in }}$ follows from that for $\mathcal{L}\left(\mathcal{H}_{\text {in }}\right)$.

## VI. EXAMPLE

In this section, we construct injective normal EB channels with arbitrary outcome von Neumann algebras on an infinite-dimensional separable Hilbert space. We first remark that
if we omit the injectivity requirement, we have a trivial example of such a channel: for each von Neumann algebra $\mathcal{M}$ acting on a Hilbert space $\mathcal{H}$ and a fixed normal state $\varphi$ on $\mathcal{M}$, the channel

$$
\mathcal{M} \ni A \mapsto \varphi(A) \mathbb{1}_{\mathcal{H}} \in \mathcal{L}(\mathcal{H})
$$

is an EB channel with the outcome algebra $\mathcal{M}$. Indeed, the above channel is trivial in the sense that it is minimal in the randomization order $\preccurlyeq_{\mathrm{CP}}$ among $\mathbf{C h}_{\sigma}(\rightarrow \mathcal{L}(\mathcal{H}))$.

In what follows in this section, we fix an infinite-dimensional separable Hilbert space $\mathcal{H}$ and an orthonormal basis $\left(x_{n}\right)_{n \in \mathbb{N}_{0}}$ of $\mathcal{H}$, where $\mathbb{N}_{0}$ is the set of natural numbers containing 0 . For each $\alpha \in \mathbb{C}$ we define the coherent state vector ${ }^{23}$ by

$$
\psi_{\alpha}:=e^{-|\alpha|^{2} / 2} \sum_{n \in \mathbb{N}_{0}} \frac{\alpha^{n}}{\sqrt{n!}} x_{n}
$$

The coherent state vectors satisfy the overcompleteness relation ${ }^{\underline{24}}$

$$
\pi^{-1} \int_{\mathbb{C}}\left|\psi_{\alpha}\right\rangle\left\langle\psi_{\alpha}\right| d^{2} \alpha=\mathbb{1}_{\mathcal{H}}
$$

where $d^{2} \alpha=d \operatorname{Re}(\alpha) d \operatorname{Im}(\alpha)$ is the 2-dimensional Lebesgue measure and the integral is in the weak sense. We denote by $L^{p}(\mathbb{C})$ the $L^{p}$ space of $\mathbb{C}$ with respect to $d^{2} \alpha$. We define normal channels $\Gamma^{\mathrm{B}} \in \mathbf{C h}_{\sigma}\left(L^{\infty}(\mathbb{C}) \rightarrow \mathcal{L}(\mathcal{H})\right), \Psi \in \mathbf{C h}_{\sigma}\left(\mathcal{L}(\mathcal{H}) \rightarrow L^{\infty}(\mathbb{C})\right)$, and $\Lambda: \mathbf{C h}_{\sigma}(\mathcal{L}(\mathcal{H}) \rightarrow$ $\mathcal{L}(\mathcal{H}))$ by

$$
\begin{gathered}
\Gamma^{\mathrm{B}}(f):=\pi^{-1} \int_{\mathbb{C}} f(\alpha)\left|\psi_{\alpha}\right\rangle\left\langle\psi_{\alpha}\right| d^{2} \alpha \quad\left(f \in L^{\infty}(\mathbb{C})\right), \\
\Psi(A)(\alpha):=\left\langle\psi_{\alpha} \mid A \psi_{\alpha}\right\rangle \quad(A \in \mathcal{L}(\mathcal{H}), \alpha \in \mathbb{C}) \\
\Lambda:=\Gamma^{\mathrm{B}} \circ \Psi .
\end{gathered}
$$

The QC channel $\Gamma^{\mathrm{B}}$ corresponds to the POVM $\pi^{-1}\left|\psi_{\alpha}\right\rangle\left\langle\psi_{\alpha}\right| d^{2} \alpha$ on $\mathbb{C}$ called the Bargmann measure. ${ }^{25}$. ${ }^{26}$ For each von Neumann algebra $\mathcal{M}$ acting on $\mathcal{H}$, we also define $\Lambda_{\mathcal{M}} \in$ $\mathrm{Ch}_{\sigma}(\mathcal{M} \rightarrow \mathcal{L}(\mathcal{H}))$ as the restriction of $\Lambda$ to $\mathcal{M}$. Then we immediately have $\Lambda_{\mathcal{M}} \preccurlyeq_{\mathrm{CP}}$ $\Lambda \preccurlyeq_{\mathrm{CP}} \Gamma^{\mathrm{B}}$ and hence $\Lambda_{\mathcal{M}}$ is EB. Now we have

Proposition 4. $\Lambda_{\mathcal{M}}$ is an injective $E B$ channel for any von Neumann algebra $\mathcal{M}$ acting on $\mathcal{H}$.

Proof. It suffices to establish the injectivity of $\Lambda$. Since the injectivity of $\Psi$ is well-known (e.g. Ref. 24), we have only to prove the injectivity of $\Gamma^{B}$. Take $f \in L^{\infty}(\mathbb{C})$ such that
$\Gamma^{\mathrm{B}}(f)=0$. Then by noting $\left|\left\langle\psi_{\alpha} \mid \psi_{\beta}\right\rangle\right|^{2}=e^{-|\beta-\alpha|^{2}}$, we have

$$
\int_{\mathbb{C}} f(\beta) e^{-|\beta-\alpha|^{2}} d^{2} \beta=\pi\left\langle\psi_{\alpha} \mid \Gamma^{\mathrm{B}}(f) \psi_{\alpha}\right\rangle=0 \quad(\forall \alpha \in \mathbb{C})
$$

and hence

$$
\begin{equation*}
\int_{\mathbb{C}} f(\beta)(h * g)(\beta) d^{2} \beta=\int_{\mathbb{C}} \int_{\mathbb{C}} f(\beta) e^{-|\beta-\alpha|^{2}} g(\alpha) d^{2} \beta d^{2} \alpha=0 \tag{5}
\end{equation*}
$$

for any $g \in L^{1}(\mathbb{C})$, where $h(\alpha):=e^{-|\alpha|^{2}}$ and

$$
F * G(\beta)=\int_{\mathbb{C}} F(\beta-\alpha) G(\alpha) d^{2} \alpha
$$

is the convolution. If we take $g(\alpha)=e^{-|\alpha|^{2}+2 i k_{1} \operatorname{Re}(\alpha)+2 i k_{2} \operatorname{Im}(\alpha)}$ for each $\left(k_{1}, k_{2}\right) \in \mathbb{R}^{2}$, then a straightforward calculation gives

$$
h * g(\beta)=\frac{\pi}{2} \exp \left[-\frac{|\beta|^{2}}{2}-\frac{1}{2}\left(k_{1}^{2}+k_{2}^{2}\right)+i k_{1} \operatorname{Re}(\beta)+i k_{2} \operatorname{Im}(\beta)\right] .
$$

Hence (5) implies

$$
\begin{equation*}
\int_{\mathbb{C}} f(\beta) e^{-\frac{|\beta|^{2}}{2}+i k_{1} \operatorname{Re}(\beta)+i k_{2} \operatorname{Im}(\beta)} d^{2} \beta=0 \tag{6}
\end{equation*}
$$

for any $\left(k_{1}, k_{2}\right) \in \mathbb{R}^{2}$. Equation (6) implies that the Fourier transform of the integrable function $f(\beta) e^{-\frac{|\beta|^{2}}{2}}$ is zero. Hence, by the injectivity of the Fourier transform, we obtain $f(\alpha)=0$ for almost all $\alpha \in \mathbb{C}$, proving the injectivity of $\Gamma^{\mathrm{B}}$.

By using the concept of the minimal sufficiency of channels,,$\frac{27}{}$ we can show that $\Lambda_{\mathcal{M}}$ is not randomization-equivalent to any QC channel if $\mathcal{M}$ is not commutative. A normal channel $\Gamma \in \mathbf{C h}_{\sigma}\left(\mathcal{N} \rightarrow \mathcal{M}_{\text {in }}\right)$ is called minimal sufficient if $\Gamma \circ \Phi=\Gamma$ implies $\Phi=\operatorname{id}_{\mathcal{N}}$ for any $\Phi \in \mathbf{C h}_{\sigma}(\mathcal{N} \rightarrow \mathcal{N})$. Any normal channel $\Gamma$ is randomization-equivalent to a minimal sufficient channel and such a minimal sufficient channels is unique up to normal isomorphism between outcome algebras. It is immediate from the definition that any injective normal channel is minimal sufficient and hence so is $\Lambda_{\mathcal{M}}$. By following the construction of the minimal sufficient channel equivalent to a given channel (Ref. 27, Theorem 1), we can also show that the minimal sufficient channel equivalent to a QC channel is also QC. Therefore $\Lambda_{\mathcal{M}}$ cannot be randomization-equivalent to a QC channel if $\mathcal{M}$ is not commutative.

Finally we remark that the injectivity of $\Lambda_{\mathcal{M}}$ still holds when $\Psi$ is generalized to $\Psi(A)(\alpha)=\left\langle\psi_{f(\alpha)} \mid A \psi_{f(\alpha)}\right\rangle$, where $f: \mathbb{C} \rightarrow \mathbb{C}$ is a non-degenerate real affine map. In specific, if $f(\alpha)=c \bar{\alpha}$ for some positive constant $c$, the EB channel $\Gamma^{\mathrm{B}} \circ \Psi$ corresponds to the conjugate channel of the ideal quantum linear amplification channel (Ref. 22, Eq. (7)).

## VII. CONCLUDING REMARK

In this paper we have investigated the EB condition of channels in the infinite-dimensional general operator algebraic framework and found equivalent characterizations in Theorem 2, generalizing known results in finite dimensions. Among the conditions, the infinite-selfcompatibility condition involves the infinite $C^{*}$-tensor product of operator algebras and is intrinsically infinite-dimensional. We have also shown the Dedekind-closedness of normal EB channels in the context of results of Ref. 22 and constructed injective normal EB channel with an arbitrary outcome von Neumann algebra.

One of the natural generalizations of the present work will be the EB condition for positive channels between general(ized) probabilistic theories (GPTs). ${ }^{28}$ In an attempt to such generalization, one new problem will be the non-uniqueness of tensor products: ${ }^{29}$ in the GPT framework, the tensor product corresponding to a composite system is not unique even in finite-dimensions, which is not the case for operator algebraic theories. This kind of problem is related to the definition of EB condition and the self-compatibility conditions (viii)-(지) in Theorem 2, while the condition (v) can be straightforwardly generalized.

## ACKNOWLEDGMENTS

This work was supported by the National Natural Science Foundation of China (Grants No. 11374375 and No. 11574405). The author would like to thank Erkka Haapasalo for helpful comments on the manuscript.
