Abstract

Lambda-S is an extension to first-order lambda calculus unifying two approaches of non-cloning in quantum lambda-calculi. One is to forbid duplication of variables, while the other is to consider all lambda-terms as algebraic linear functions. The type system of Lambda-S have a constructor $S$ such that a type $A$ is considered as the base of a vector space while $S(A)$ is its span. A first semantics of this calculus have been given when first presented, with such an interpretation: superposed types are interpreted as vector spaces while non-superposed types as their basis. In this paper we give a concrete categorical semantics of Lambda-S, showing that $S$ is interpreted as the composition of two functors in an adjunction relation between the category of sets and the category of vector spaces over $\mathbb{C}$. The right adjoint is a forgetful functor $U$, which is hidden in the language, and plays a central role in the computational reasoning.

Keywords: Quantum computing, algebraic lambda-calculus, categorical semantics

1 Introduction

The non-cloning property of quantum computing has been treated in different ways in quantum programming languages. One way is to forbid duplication of variables with linear types \cite{1,12}, and hence, a program taking a quantum argument will not duplicate it (e.g. \cite{3,14,17,20,22}). Another way is to consider all lambda-terms as expressing linear functions (e.g. \cite{4-6,11}). The first approach forbids a term $\lambda x.(x \otimes x)$ (for some convenient definition of $\otimes$), while the second approach distributes $(\lambda x.(x \otimes x))(|0\rangle + |1\rangle)$ to $\lambda x.(x \otimes x)|0\rangle + \lambda x.(x \otimes x)|1\rangle$, mimicking the way that linear operations act on vectors in a vector space. However, adding a measurement operator to a calculus following the linear-algebraic approach need to also add linear types: indeed, if $\pi$ represent a measurement operator, $(\lambda x.\pi x)(|0\rangle + |1\rangle)$ should not reduce to $(\lambda x.\pi x)|0\rangle + (\lambda x.\pi x)|1\rangle$ but to $\pi(|0\rangle + |1\rangle)$. Therefore, the functions taking a superposition have to be marked in some way and ensure that they will not use their arguments more than once (i.e. ensure linearity in the linear-logic sense).

The calculus Lambda-S has been introduced in \cite{9} and slightly modified later in \cite{18}, as a first-order fragment of Lineal \cite{6}, extended with measurements. In linear logic we would write $A$ the types of terms that cannot be duplicated while $!A$ types duplicable terms. In Lambda-S instead $A$ are the types of the terms that cannot be superposed, while $S(A)$ are the terms that can be superposed, and since superposition forbids duplication, $A$ means that we can duplicate, while $S(A)$ means that we cannot duplicate. So the $S$ is not the same as the bang “!”!, but somehow the opposite. This can be explained by the fact that linear logic is focused...
on the possibility of duplication, while here we focus on the possibility of superposition, which implies the impossibility of duplication.

In [9] a first denotational semantics (in environment style) is given where the type $\mathbb{B}$ is interpreted as $\{0, 1\}$ while $S(\mathbb{B})$ is interpreted as $\text{Span}(\{0, 1\}) = \mathbb{C}^2$, and, in general, a type $A$ is interpreted as a basis while $S(A)$ is the vector space generated by such a basis. In this paper we go beyond and give a categorical interpretation of Lambda-$S$ where $S$ is a functor of an adjunction between the category $\text{Set}$ and the category $\text{Vec}$. Explicitly, when we evaluate $S$ we obtain formal finite linear combinations of elements of a set with complex numbers as coefficients and the other functor of the adjunction, $U$, allows us to forget the vectorial structure.

The main structural feature of our model is that it is expressive enough to describe the bridge between the quantum and the classical universes explicitly by controlling its interaction. This is achieved by providing a monoidal adjunction. In the literature, intuitionistic linear (as in linear-logic) models are obtained by a comonad determined by a monoidal adjunction $(S, m) \dashv (U, n)$, i.e. the bang $!$ is interpreted by the comonad $US$ (see [8]). In a different way, a crucial ingredient of our model is to consider the monad $US$ for the interpretation of $S$ determined by a similar monoidal adjunction. This implies that on the one hand we have a tight control of the Cartesian structure of the model (i.e. duplication, etc) and on the other hand the world of superpositions lives in some sense inside the classical world, i.e. determined externally by classical rules until we decide to explore it. This is given by the following composition of maps:

$$US(\mathbb{B}) \times US(\mathbb{B}) \xrightarrow{n} U(S(\mathbb{B}) \otimes S(\mathbb{B})) \xrightarrow{U(m)} US(\mathbb{B} \times \mathbb{B})$$

that allows us to operate in a monoidal structure representing the quantum world and then to return to the Cartesian product.

This is different from linear logic, where the classical world lives in some sense inside the quantum world i.e. $(!\mathbb{B}) \otimes (!!\mathbb{B})$ is a product inside a monoidal category.

Another source of inspiration for our model has been the work of Selinger [19] and Abramsky and Coecke [2] where they captured the notion of scalars and inner product in a more abstract categorical setting, i.e. a category in which there is an abstract notion of a dagger functor. It is envisaged that this approach will provide the basis for an abstract model in future work.

The paper is structured as follows. In Section 2 we recall the definition of Lambda-$S$ and give some examples, stating its main properties. Section 3 is divided in three subsections: first we define the categorical constructions needed to interpret the calculus, then we give the interpretation, and finally we prove its soundness and adequacy properties. Finally, we conclude in Section 4. We also include in this arXiv version an appendix with detailed proofs, which has been available to the reviewers during the review process at ENTCS.

2 The calculus Lambda-$S$

We give a slightly modified presentation of Lambda-$S$, based on [18]. In particular, instead of giving a probabilistic rewrite system where $t \rightarrow p_r r_k$ means that $t$ reduces with probability $p_r$ to $r_k$, we introduce the notation $t \rightarrow p_1 t_1 \cdots \rightarrow p_n t_n$, this way, the rewrite system is deterministic and the probabilistic distribution is internalized in the syntax.

The syntax of terms and types is given in Figure 1. We write $\mathbb{B}^n$ for $\mathbb{B} \times \cdots \times \mathbb{B}$ $n$-times, with the convention that $\mathbb{B}^1 = \mathbb{B}$, and may write $\parallel_{i=1}^n p_i t_i$, for $p_1 t_1 \cdots \parallel_{i=1}^n p_n t_n$ with the convention that $\parallel_1 t = t$. We use capital Latin letters ($A, B, C, \ldots$) for general types and the capital Greek letters $\Psi, \Phi, \Xi, \text{and} \ U$ for qubit types. $\mathcal{B} = \{\mathbb{B}^n \mid n \in \mathbb{N}\}$, $\mathcal{Q}$ is the set of qubit types, and $\mathcal{T}$ is the set of types ($\mathcal{B} \subseteq \mathcal{Q} \subseteq \mathcal{T}$). In the same way, $\text{Vars}$ is the set of variables, $\mathbb{B}$ is the set of basis terms, $\mathcal{V}$ the set of values, $\Lambda$ the set of terms, and $\mathcal{D}$ the set of probabilistic distributions on terms. We have $\text{Vars} \subseteq \mathbb{B} \subseteq \mathcal{V} \subseteq \Lambda \subseteq \mathcal{D}$.

The terms are considered modulo associativity and commutativity of the syntactic symbol $\parallel$. On the other hand, the symbol $\parallel$ is used to represent a real probabilistic distribution of terms, not as a syntactic symbol, and so, it is not only associative and commutative, we also have that $pt \parallel qt$ is the same as $(p + q)t$ and $pt \parallel 0t$. There is one atomic type $\mathbb{B}$, for basis qubits $\{0\}$ and $\{1\}$, and three constructors: $\times$, for pairs, $\Rightarrow$, for first-order functions, and $S(\cdot)$ for superpositions.

The syntax of terms contains:

\footnotesize

\[\text{As a remark, notice that } \parallel \text{ can be seen as the } + \text{ symbol of the algebraic lambda calculus [21], where the equality is confluent since scalars are positive, while our } + \text{ symbol coincides with the } + \text{ from Lineal [6] (see [7] for a more detailed discussion on different presentations of algebraic lambda calculi).}\]
\[
\begin{align*}
\Psi &:= \mathbb{B}^n \mid S(\Psi) \mid \Psi \times \Psi & \text{Qubit types (Q)} \\
A &:= \Psi \mid \Psi \Rightarrow A \mid S(A) & \text{Types (T)} \\
b &:= x \mid \lambda x: \Psi \cdot t \mid |0\rangle \mid |1\rangle \mid b \times b & \text{Basis terms (B)} \\
v &:= b \mid (v + v) \mid 0_{S(A)} \mid \alpha. v \mid v \times v & \text{Values (V)} \\
t &:= v \mid tt \mid (t + t) \mid \pi_j t \mid ?r\cdot t \mid \alpha.t \mid t \times t \mid \text{head } t \mid \text{tail } t \mid \uparrow_r t \mid \uparrow_\ell t & \text{Terms (A)} \\
p &:= \underline{p_1} \cdots \underline{p_n t_n} & \text{Probabilistic distribution (D)}
\end{align*}
\]

where \(\alpha \in \mathbb{C}\) and \(p_i \in [0, 1] \subseteq \mathbb{R}\).

**Fig. 1:** Syntax of types and terms of Lambda-\(S\).

- The three basic terms for first-order lambda-calculus, namely, variables, abstractions and applications.
- Two basic terms \(|0\rangle\) and \(|1\rangle\) to represent qubits, and one test \(?r\cdot s\) on them. We may write \(\ell\ell\cdot s\) for \(\ell\ell\cdot s\), see Example 2.1 for a clarification of why to choose this presentation.
- A product \(\times\) to represent associative pairs (i.e. lists), with its destructors head and tail. We may use the notation \([b_1 b_2 \ldots b_n]\) for \([b_1] \times [b_2] \times \cdots \times [b_n]\).
- Constructors to write linear combinations of terms, namely \((\text{sum})\) and \((\text{scalar multiplication})\), and its destructor \(\pi_j\) measuring the first \(j\) qubits written as linear combinations of lists of qubits, and one unit vector \(0_{S(A)}\) for each type \(S(A)\).
- Two casting functions \(\uparrow_r\) and \(\uparrow_\ell\) which allows us to consider lists of superpositions as superpositions of lists (see Example 2.2).

The rewrite system has not been given yet, however the next examples give some intuitions and clarify the \(\ell\ell\cdot s\) and the casting functions.

**Example 2.1** The term \(\ell\ell\cdot s\) is meant to test whether the condition is \(|1\rangle\) or \(|0\rangle\). However, defining it as a function, allows us to use the algebraic linearity to implement the quantum-if [3]:

\[
(\ell\ell\cdot s)(\alpha. |1\rangle + \beta. |0\rangle) = (\alpha. |1\rangle + \beta. |0\rangle)\ell\ell\cdot s \rightarrow^* \alpha. |1\rangle \ell\ell\cdot s + \beta. |0\rangle \ell\ell\cdot s \rightarrow^* \alpha. r + \beta. s
\]

**Example 2.2** The term \((\frac{1}{\sqrt{2}}(|0\rangle + |1\rangle)) \times |0\rangle\) is the encoding of the qubit \(\frac{1}{\sqrt{2}}(|0\rangle + |1\rangle) \otimes |0\rangle\). However, while the qubit \(\frac{1}{\sqrt{2}}(|0\rangle + |1\rangle) \otimes |0\rangle\) is equal to \(\frac{1}{\sqrt{2}}(|0\rangle \otimes |0\rangle + |1\rangle \otimes |0\rangle)\), the term will not rewrite to the encoding of it, unless a casting \(\uparrow_r\) is preceding the term:

\[
\uparrow_r \left(\frac{1}{\sqrt{2}}(|0\rangle + |1\rangle) \times |0\rangle\right) \rightarrow^* \frac{1}{\sqrt{2}}(|0\rangle \times |0\rangle + |1\rangle \times |0\rangle)
\]

The reason is that we want the term \((\frac{1}{\sqrt{2}}(|0\rangle + |1\rangle)) \times |0\rangle\) to have type \(S(\mathbb{B}) \times \mathbb{B}\), highlighting the fact that the second qubit is a basis qubit, i.e. duplicable, while the term \(\frac{1}{\sqrt{2}}(|0\rangle \times |0\rangle + |1\rangle \times |0\rangle)\) will have type \(S(\mathbb{B} \times \mathbb{B})\), showing that the full term is a superposition where no information can be extracted and hence, non-duplicable.

The rewrite system depends on types. Indeed, \(\lambda x:S(\Psi)\cdot t\) follows a call-by-name strategy, while \(\lambda x:\mathbb{B}\cdot t\), which can duplicate its argument, must follow a call-by-base strategy [7], that is, not only the argument must be reduced first, but also it will distribute over linear combinations. Therefore, we give first the type system and then the rewrite system.

The typing relation is given in Figure 2. Contexts, identified by the capital Greek letters \(\Gamma\), \(\Delta\), and \(\Theta\), are partial functions from \(\text{Vars}\) to \(T\). The contexts assigning only types in \(B\) are identified with the super-index \(B\), e.g. \(\Theta^B\). Whenever more than one context appear in a typing rule, their domains are considered pair-wise disjoint. Observe that all types are linear (as in linear-logic) except on basis types \(\mathbb{B}^n\), which can be weakened and contracted (expressed by the common contexts \(\Theta^B\)).

The rewrite relation is given in Figures 3 to 10.

The two beta rules (Figure 3) are applied according to the type of the argument. If the abstraction expects an argument with a superposed type, then the reduction follows a call-by-name strategy (rule \((\beta_n)\)), while if the
abstraction expects a basis type, the reduction is call-by-base (rule $(\beta_b)$): it $\beta$-reduces only when its argument is a basis term. However, typing rules also allow to type an abstraction expecting an argument with basis type, applied to a term with superposed type (cf. Example 2.3). In this case, the beta reduction cannot occur and, instead, the application must distribute using the rules from Figure 4: the linear distribution rules.

Figure 5 gives the two rules for the conditional construction. Together with the linear distribution rules (cf. Figure 4), these rules implement the quantum-if (cf. Example 2.1).

Figure 6 gives the rules for lists, (head) and (tail).

Figure 7 deals with the vector space structure implementing a directed version of the vector space axioms. The direction is chosen in order to yield a canonical form [6].

Figure 8 are the rules to implement the castings. The idea is that $\times$ does not distribute with respect to $+$, unless a casting allows such a distribution. This way, the types $\mathbb{B} \times S(\mathbb{B})$ and $S(\mathbb{B} \times \mathbb{B})$ are different. Indeed, $[0] \times ([0] + [1])$ have the first type but not the second, while $[0] \times [0] + [0] \times [1]$ have the second type but not the first. This way, the first type give us the information that the state is separable, while the second type do

\[
\sum_{i \in T_k} \left( \frac{\alpha_i}{\sqrt{\sum_{r \in T_k} |\alpha_r|^2}} \right) \prod_{h=j+1}^{m} |b_{hi}\rangle
\]

\[
p_k = \sum_{i \in T_k} \left( \frac{|\alpha_i|^2}{\sum_{r=1}^{n} |\alpha_r|^2} \right)
\]

\[T_k = \{ i \leq n \mid |b_{1i}\rangle \times \cdots \times |b_{ji}\rangle = |k\rangle \}\]

This way, \(p_k |k\rangle \times |\phi_k\rangle\) is the normalized \(k\)-th projection of the term.

Finally, Figure 9 gives the rule for the projective measurement with respect to the basis \(|0\rangle, |1\rangle\). In this rule, we use the following notations:

- \([\alpha.]t\) may be either \(t\) or \(\alpha.t\)
- \(j \leq m\)
- \(|k\rangle = |b_1\rangle \times \cdots \times |b_j\rangle\) where \(b_1 \ldots b_j\) is the binary representation of \(k\)

\[
|\phi_k\rangle = \sum_{i \in T_k} \left( \frac{\alpha_i}{\sqrt{\sum_{r \in T_k} |\alpha_r|^2}} \right) \prod_{h=j+1}^{m} |b_{hi}\rangle
\]

\[
p_k = \sum_{i \in T_k} \left( \frac{|\alpha_i|^2}{\sum_{r=1}^{n} |\alpha_r|^2} \right)
\]

\[T_k = \{ i \leq n \mid |b_{1i}\rangle \times \cdots \times |b_{ji}\rangle = |k\rangle \}\]

This way, \(p_k |k\rangle \times |\phi_k\rangle\) is the normalized \(k\)-th projection of the term.

Finally, Figure 9 gives the rule for the projective measurement with respect to the basis \(|0\rangle, |1\rangle\). In this rule, we use the following notations:

- \([\alpha.]t\) may be either \(t\) or \(\alpha.t\)
- \(j \leq m\)
- \(|k\rangle = |b_1\rangle \times \cdots \times |b_j\rangle\) where \(b_1 \ldots b_j\) is the binary representation of \(k\)

\[
|\phi_k\rangle = \sum_{i \in T_k} \left( \frac{\alpha_i}{\sqrt{\sum_{r \in T_k} |\alpha_r|^2}} \right) \prod_{h=j+1}^{m} |b_{hi}\rangle
\]

\[
p_k = \sum_{i \in T_k} \left( \frac{|\alpha_i|^2}{\sum_{r=1}^{n} |\alpha_r|^2} \right)
\]

\[T_k = \{ i \leq n \mid |b_{1i}\rangle \times \cdots \times |b_{ji}\rangle = |k\rangle \}\]

This way, \(p_k |k\rangle \times |\phi_k\rangle\) is the normalized \(k\)-th projection of the term.

Finally, Figure 9 gives the rule for the projective measurement with respect to the basis \(|0\rangle, |1\rangle\). In this rule, we use the following notations:

- \([\alpha.]t\) may be either \(t\) or \(\alpha.t\)
- \(j \leq m\)
- \(|k\rangle = |b_1\rangle \times \cdots \times |b_j\rangle\) where \(b_1 \ldots b_j\) is the binary representation of \(k\)

\[
|\phi_k\rangle = \sum_{i \in T_k} \left( \frac{\alpha_i}{\sqrt{\sum_{r \in T_k} |\alpha_r|^2}} \right) \prod_{h=j+1}^{m} |b_{hi}\rangle
\]

\[
p_k = \sum_{i \in T_k} \left( \frac{|\alpha_i|^2}{\sum_{r=1}^{n} |\alpha_r|^2} \right)
\]

\[T_k = \{ i \leq n \mid |b_{1i}\rangle \times \cdots \times |b_{ji}\rangle = |k\rangle \}\]

This way, \(p_k |k\rangle \times |\phi_k\rangle\) is the normalized \(k\)-th projection of the term.
\[
\pi_1(\prod_{i=1}^{n} [\alpha_i \parallel \prod_{b=1}^{m} | b_{hi} \rangle]) \rightarrow \prod_{k=0}^{2^l-1} p_k(|k\rangle \times |\phi_k\rangle) 
\] (proj)

Fig. 9: Rule for the projection

If \( t \rightarrow u \), then
\[
\begin{align*}
t v &\rightarrow u v \\
(\lambda x: B \times x) t &\rightarrow (\lambda x: B \times x) u \\
\alpha . t &\rightarrow \alpha . u \\
v . t &\rightarrow v . u \\
head t &\rightarrow \head u \\
tail t &\rightarrow \tail u \\
(p_1 t_1 \parallel \cdots \parallel p_n t_n) &\rightarrow (p_1 t_1 \parallel \cdots \parallel p_n t_n)
\end{align*}
\]

The term \( A \) Hadamard gate can be implemented by \( \sqrt{\pi} \):
\[
\begin{align*}
|0\rangle \rightarrow |0\rangle &\parallel |\lambda x: B \times x \rangle \times |\lambda x: B \times x \rangle\rangle \parallel |1\rangle \rightarrow |u v\rangle \\
\alpha . t &\rightarrow \alpha . u \\
v . t &\rightarrow v . u \\
head t &\rightarrow \head u \\
st &\rightarrow (p_1 t_1 \parallel \cdots \parallel p_n t_n)
\end{align*}
\]

Fig. 10: Contextual rules

qubit \(|0\rangle\). Indeed, \( (\lambda x: B \times x) \frac{1}{\sqrt{2}} (|0\rangle + |1\rangle) \) can be implemented by \( \sqrt{\pi} \):
\[
\begin{align*}
\beta_1 &\rightarrow \frac{1}{\sqrt{2}} ((|0\rangle \times |0\rangle) + (\lambda x: B \times x) |1\rangle) \\
\beta_2 &\rightarrow \frac{1}{\sqrt{2}} ((|0\rangle \times |0\rangle) + (\lambda x: B \times x) |1\rangle)
\end{align*}
\]

The type derivation is as follows:

Example 2.4 The term \( \pi_2 \) measures the first two qubits of its argument (in Example 3.7 we give a more detailed explanation of its reduction):
\[
\pi_2((001) + 2. |110\rangle + 3. |000\rangle) \overset{(proj)}{\rightarrow} \frac{10}{14} |00\rangle \times (\frac{1}{\sqrt{2}} |1\rangle + \frac{3}{\sqrt{2}} |0\rangle) \parallel \frac{1}{\sqrt{2}} |11\rangle \times (1. |0\rangle)
\]

The typing derivation is the following:

Example 2.5 A Hadamard gate can be implemented by \( H = \lambda x: B \times x ?-\rightarrow + \), where \(|+\rangle = \frac{1}{\sqrt{2}} |0\rangle + \frac{1}{\sqrt{2}} |1\rangle \) and \(|-\rangle = \frac{1}{\sqrt{2}} |0\rangle - \frac{1}{\sqrt{2}} |1\rangle \). Therefore, \( H: B \Rightarrow S(B) \) and we have \( H |0\rangle \rightarrow |+\rangle \) and \( H |1\rangle \rightarrow |+\rangle \).
Correctness has been established in previous works for slightly different versions of Lambda-$S$, except for the case of confluence, which have only been proved for Lineal. Lineal can be seen as an untyped fragment without several constructions (in particular, without $\pi_1$). The proof of confluence for Lambda-$S$ is delayed to future work, using the development of probabilistic confluence from [10]. The proof of Subject Reduction and Strong Normalization are straightforward modifications from the proofs of the different presentations of Lambda-$S$.

**Theorem 2.6 (Confluence of Lineal, [6, Thm. 7.25])** Lineal, an untyped fragment of Lambda-$S$, is confluent. \qed

**Theorem 2.7 (Subject reduction on closed terms, [9, Thm. 2])** For any closed terms $t$ and $u$ and type $A$, if $t \leadsto || t, u_i \leadsto t : A$, then $\| t, u_i : A$. \qed

**Theorem 2.8 (Strong normalization, [18, Thm. 5.16])** If $\Gamma \vdash t : A$ then $t$ is strongly normalizing. \qed

### 3 Denotational semantics

Even though the semantic of this article is about particular categories i.e. the category of sets and the category of vector spaces, from the start our approach is categorical in an abstract way. The idea is that the concrete situation exposed in this article will pave the way to a more abstract formulation, and that is why we give the constructions as abstract as general as possible. A more general treatment, using a monoidal adjunction between a Cartesian closed category and a monoidal category with some extra conditions, remains a topic for future publication.

**Definition 3.1** A concrete categorical model for Lambda-$S$ is given by the following data:

- A monoidal adjunction

\[
\begin{array}{c}
\text{(Vec, } \otimes, I) \quad \text{ where } \\
\text{Set is the category of sets with 1 as a terminal object. } \\
\text{Vec is the category of vector spaces over } \mathbb{C}, \text{ in which } I = \mathbb{C}. \\
\text{S is the functor such that for each set } A, S(A) \text{ is the vector space whose vectors are the formal finite linear combinations of the elements of } A \text{ with coefficients in } \mathbb{C}, \text{ and given a function } f : A \to B \text{ we define } S(f) : S(A) \to S(B) \text{ by evaluating } f \text{ in } A. \\
\text{U is the forgetful functor such that for each vector space } V, U(V) \text{ is the underlying set of vectors in } V \text{ and for each linear map } f, U(f) \text{ forgets of its linear property. } \\
m \text{ is a natural isomorphism defined by } m_{AB} : S(A) \otimes S(B) \to S(A \times B) \\
(\sum_{a \in A} \alpha_a a) \otimes (\sum_{b \in B} \beta_b b) \mapsto \sum_{(a,b) \in A \times B} \alpha_a \beta_b (a, b)
\end{array}
\]

- $n$ is a natural transformation defined by $n_{AB} : U(V) \times U(W) \to U(V \otimes W)$ such that $(v, w) \mapsto v \otimes w$.

- There is a subcategory of Vec such that for every morphism $f : V \to W$ one associates a morphism $f^\dagger : W \to V$, called the dagger of $f$, such that for all $f : V \to W$ and $g : W \to U$ we have $\text{Id}_V^\dagger = \text{Id}_V$ and $(g \circ f)^\dagger = f^\dagger \circ g^\dagger$.

- A Kleisli category defined with the following monad, called the distribution monad, $(D, \hat{\eta}, \hat{\mu})$:

\[
D : \text{Set} \to \text{Set} \quad D(A) = \{ \sum_{i=1}^n p_i \chi_{a_i} \mid \sum_{i=1}^n p_i = 1, a_i \in A, n \in \mathbb{N} \}
\]

where $\chi_a$ is the characteristic function of $a$, and $\hat{\eta}$ and $\hat{\mu}$ are defined as follows:

\[
\hat{\eta} : A \to D(A) \\
ad \mapsto 1 \chi_a
\]

\[
\hat{\mu} : D(D(A)) \to D(A) \\
\sum_{i=1}^n p_i \chi \left( \sum_{j=1}^{n_i} q_{ij} \chi_{a_{ij}} \right) \mapsto \sum_{i=1}^n \sum_{j=1}^{n_i} p_i q_{ij} \chi_{a_{ij}}
\]
Remark 3.2
- For dealing with the probabilistic effect of the measurement our semantics requires the notion of a distribution monad (see [13,16]). In order to give a more abstract categorical description we consider the Kleisli category given by this monad where a morphism \( f : A \rightarrow B \) in the Kleisli category is really a morphism \( f : A \rightarrow \mathbb{D}(B) \) in the category \( \text{Set} \) and corresponds to a computation of type \( B \).
- There exists an object \( \mathbb{B} \) and maps \( i_1, i_2 \) in \( \text{Set} \) such that for every \( t : 1 \rightarrow A \) and \( r : 1 \rightarrow A \), here exists a unique map \([t,r]\) such that the following diagram commutes

\[
\begin{array}{ccc}
1 & \xrightarrow{i_1} & \mathbb{B} \\
\downarrow t & \quad & \downarrow [t,r] \\
A & \xleftarrow{i_2} & 1
\end{array}
\]

This object \( \mathbb{B} \) is the Boolean set, and such a map will allow us to interpret the if construction (Definition 3.5).
- There exists a map \( + : \mathbb{US}(A) \times \mathbb{US}(A) \rightarrow \mathbb{US}(A) \) in \( \text{Set} \), given by \((a, b) \mapsto a + b\) in which we use the sum defined in \( \text{Set}(A) \).
- To have an adjunction means that each function \( g : A \rightarrow \mathbb{U}(V) \) extends to a unique linear transformation \( f : S(A) \rightarrow V \), given explicitly by \( f(\sum \alpha_i x_i) = \sum \alpha_i g(x_i) \), that is, formal linear combinations in \( S(A) \) to actual linear combinations in \( V \) (see [15] for details).
- For every \( A \in \text{Set} \), \( \text{Vec}(I, S(A)) \) is an abelian group with the sum defined point-wise.
- \( \text{Set} \) is a Cartesian closed category where \( \eta^A \) is the unit and \( \varepsilon^A \) is the counit of \( \times \) \( \dashv \) \( [-, -] \), from which we can define the currying (curry) and un-currying (uncurry) of any map.
- The adjunction in Definition 3.1 gives rise to a monad \((T, \eta, \mu)\) in the category \( \text{Set} \), where \( T = \mathbb{US} \), \( \eta : \text{Id} \rightarrow T \) is the unit of the adjunction, and using the counit \( \varepsilon \), we obtain \( \mu = \mathbb{U} \varepsilon S : TT \rightarrow T \), satisfying unity and associativity laws (see [15]).

Definition 3.3 Types are interpreted in the category \( \text{Set} \), as follows:

\[
[\mathbb{B}] = \mathbb{B} \quad [\Psi \Rightarrow A] = [\Psi] \Rightarrow [A] \quad [S(A)] = \mathbb{US}[A] \quad [\Psi \times \Phi] = [\Psi] \times [\Phi]
\]

Remark 3.4 To avoid cumbersome notation, we will use the following convention: We write directly \( \mathbb{US}(A) \) for \([S(A)] = \mathbb{US}[A]\) and \( A \) for \([A]\), when there is no ambiguity.

Before giving the interpretation of typing derivation trees in the model, we need to define certain maps which will serve to implement some of the constructions in the language.

To implement the if construction we define the following map.

Definition 3.5 Given \( t, r \in [\Gamma, A] \) there exists a map \( \mathbb{B} \xrightarrow{f_{t,r}} [\Gamma, A] \) in \( \text{Set} \) defined by \( f_{t,r} = [\tilde{t}, \tilde{r}] \) where \( \tilde{t} : 1 \rightarrow [\Gamma, A] \) and \( \tilde{r} : 1 \rightarrow [\Gamma, A] \) are given by \( \tilde{t} = \lambda x.t \) and \( \tilde{s} = \lambda x.s \). Concretely this means that \( i_1(\ast) \mapsto t \) and \( i_2(\ast) \mapsto r \).

Example 3.6 Consider \( t = i_1 \) and \( r = i_2 \), with \( t, r \in [1, \mathbb{B}] \), where \( \mathbb{B} = \{i_1(\ast), i_2(\ast)\} \). To make the example more clear, let us consider \( i_1(\ast) = |0\rangle \) and \( i_2(\ast) = |1\rangle \), hence \( \mathbb{B} = \{|0\rangle, |1\rangle\} \). The map \( \mathbb{B} \xrightarrow{f_{t,r}} [1, \mathbb{B}] \) in \( \text{Set} \) is defined by \( f_{t,r} = [\lambda x.i_1, \lambda x.i_2] \), where \( \lambda x.i_k : 1 \rightarrow [1, \mathbb{B}] \), for \( k = 1, 2 \). Therefore, we have the following commuting diagram

\[
\begin{array}{ccc}
1 & \xrightarrow{i_1} & \mathbb{B} \\
\downarrow \lambda x.i_1 & \quad & \downarrow \lambda x.i_2 \\
[1, \mathbb{B}] & \xleftarrow{f_{t,r}} & 1
\end{array}
\]

Hence, we have \( f_{t,r}|0\rangle = f_{t,r}(i_1(\ast)) = (i_2 \circ f_{t,r})\ast = (\lambda x.i_1)\ast = i_1 = t \)

\( f_{t,r}|1\rangle = f_{t,r}(i_2(\ast)) = (i_2 \circ f_{t,r})\ast = (\lambda x.i_2)\ast = i_2 = r \)

Therefore, \( f_{t,r} \) is the map \( |0\rangle \mapsto t \) and \( |1\rangle \mapsto r \).

A projection \( \pi_{jk} \) acts in the following way: first it projects the first \( j \) components of its argument, an \( n \)-dimensional vector, to the basis vector \(|k\rangle\) in the vector space of dimension \( j \), then it renormalizes it, and finally it factorizes the first \( j \) components. Then, the projection \( \pi_j \) takes the probabilistic distribution between the \( 2^j \) projectors \( \pi_{jk} \), each of these probabilities, calculates from the normalized vector to be projected.

Example 3.7 Let us analyse the Example 2.4:

\[
\pi_2(|001\rangle + 2.|110\rangle + 3.|000\rangle) \xrightarrow{\text{proj}} \frac{10}{14} |00\rangle \times (\frac{1}{\sqrt{2}} |1\rangle + \frac{3}{\sqrt{2}} |0\rangle) \parallel \frac{4}{14} |11\rangle \times (1.|0\rangle)
\]
We can divide this in four projectors (since \( j = 2 \), we have \( 2^2 \) projectors), which are taken in parallel (with the symbol \(|\rangle\rangle\)). The four projectors are: \( \pi_{2,00}, \pi_{2,01}, \pi_{2,10} \) and \( \pi_{2,11} \). In this case, the probability for the projectors \( \pi_{2,01} \) and \( \pi_{2,10} \) are 0, and hence these do not appear in the final term.

The projector \( \pi_{2,00} \) acts as described before: first it projects the first 2 components of \(|\psi\rangle\) to the basis vector \(|00\rangle\), obtaining \(|001\rangle+3.|000\rangle\). Then it renormalizes it, by dividing it by its norm, obtaining \( \frac{1}{\sqrt{10}}(|001\rangle + \frac{3}{\sqrt{10}}|000\rangle) \). Finally, it factorizes the vector, obtaining \(|00\rangle \times (\frac{1}{\sqrt{10}}|1\rangle + \frac{3}{\sqrt{10}}|0\rangle) \). Similarly, the projector \( \pi_{2,11} \) gives \(|11\rangle \times (1.|0\rangle) \).

Finally, the probabilities to assemble the final term are calculated by \( p_0 = \frac{|11|^2+|3|^2}{|11|^2+|3|^2+|00|^2} = \frac{10}{14} \) and \( p_1 = \frac{|3|^2}{|11|^2+|3|^2+|00|^2} = \frac{1}{14} \).

Categorically, we can describe the operator \( \pi_{jk} \) (Definition 3.11) by the composition of three arrows: a normalizing arrow \( \text{Norm} \) (Definition 3.8), a projector arrow to the \(|k\rangle\) basis vector, and a factorizing arrow \( \varphi_j \) (Definition 3.9). Then, the projection \( \pi_j \) (Definition 3.14) maps a vector to the probabilistic distribution between the \( 2^j \) basis vectors \(|k\rangle\), using a distribution map (Definition 3.12).

In the following definitions, if \(|\psi\rangle\) is a vector of dimension \( n \), we write \(|\psi\rangle : I \rightarrow S(\mathbb{B}^n)\) to the map \( 1 \mapsto |\psi\rangle \).

**Definition 3.8** The normalizing arrow \( \text{Norm} \) is defined as follows:

\[
\text{Norm} : US(\mathbb{B}^n) \rightarrow US(\mathbb{B}^n)
\]

\[|\psi\rangle \mapsto \begin{cases} 
\frac{|\psi\rangle}{\sqrt{\langle\psi|\psi\rangle}} & \text{if } |\psi\rangle \neq 0 \\
|0\rangle & \text{otherwise}
\end{cases}
\]

**Definition 3.9** The factorizing arrow \( \varphi_j \) is defined as any arrow making the following diagram commute:

\[
\begin{array}{ccc}
\mathbb{B}^j \times US(\mathbb{B}^{n-j}) & \xrightarrow{\eta \times \text{Id}} & US(\mathbb{B}^j) \times US(\mathbb{B}^{n-j}) \\
& \xrightarrow{n} & U(S(\mathbb{B}^j) \otimes S(\mathbb{B}^{n-j})) \\
\mathbb{B}^j \times US(\mathbb{B}^{n-j}) & \xleftarrow{\varphi_j} & US(\mathbb{B}^n) = US(\mathbb{B}^j \times \mathbb{B}^{n-j})
\end{array}
\]

**Example 3.10** For example, take \( \varphi_j \) as the following map:

\[
\varphi_j : US(\mathbb{B}^n) \rightarrow \mathbb{B}^j \times US(\mathbb{B}^{j-n})
\]

\[
a \mapsto \begin{cases} 
\prod_{h=1}^{j} |b_h\rangle \times \sum_{i=1}^{n} \alpha_i \left( \prod_{h=j+1}^{n} |b_{ih}\rangle \right) & \text{if } a = \sum_{i=1}^{n} \alpha_i \left( \prod_{h=1}^{j} |b_h\rangle \times \prod_{h=j+1}^{n} |b_{ih}\rangle \right) \\
|0\rangle^n & \text{otherwise}
\end{cases}
\]

**Definition 3.11** For each \( k = 0, \ldots, 2^j - 1 \), the projection to the \(|k\rangle\) basis vector, \( \pi_{jk} \), is defined as any arrow making the following diagram commute:

\[
\begin{array}{ccc}
US(\mathbb{B}^n) \cong U(S(\mathbb{B})^\otimes n) & \xrightarrow{U(|k\rangle \otimes |k\rangle) \otimes I} & U(S(\mathbb{B})^\otimes n) \cong US(\mathbb{B}^n) \\
\xrightarrow{\pi_{jk}} & & \xrightarrow{\text{Norm}}
\end{array}
\]

where the isomorphism \( US(\mathbb{B}^n) \cong U(S(\mathbb{B})^\otimes n) \) is obtained by composing \( n - 1 \) times the mediating arrow \( m \) and then applying the functor \( U \).

The following distribution map will allow to assemble the final distribution of projections in Definition 3.14.

**Definition 3.12** Let \( \{p_i\}_{i=1}^{n} \) be a set with \( p_i \in [0,1] \), and \( \sum_{i=1}^{n} p_i = 1 \). Then, we define \( d_{\{p_i\}} \), as the arrow \( d_{\{p_i\}} : A^n \rightarrow D(A) \) such that \( (a_1, \ldots, a_n) \mapsto \sum_{i=1}^{n} p_i a_i \).

**Example 3.13** Consider \( d_{\{\frac{1}{2}, \frac{1}{2}, \frac{1}{2}\}} : D(\mathbb{B}) \rightarrow D(\mathbb{B}) \) defined by \( d_{\{\frac{1}{2}, \frac{1}{2}, \frac{1}{2}\}} (b_1 \times b_2 \times b_3) = \frac{1}{2} \chi b_1 + \frac{1}{2} \chi b_2 + \frac{1}{2} \chi b_3 \).

Then, for example, \( d_{\{\frac{1}{2}, \frac{1}{2}, \frac{1}{2}\}} |101\rangle = \frac{1}{2} \chi |1\rangle + \frac{1}{2} \chi |0\rangle + \frac{1}{2} \chi |1\rangle \).
Definition 3.14 \( \pi_j \) is the arrow \( \pi_j : US(\mathbb{B}^n) \to D(\mathbb{B}^j \times US(\mathbb{B}^{n-j})) \) such that \( |\psi\rangle \mapsto \sum_{k=0}^{2^{j-1}} p_k \chi_{\pi_j|\psi} \), where \( p_k = \frac{\text{Norm}(|\psi\rangle)}{\sqrt{|\psi\rangle \cdot |\psi\rangle}} \circ P_k \circ \text{Norm}(|\psi\rangle) \) with \( P_k = (|k\rangle \otimes |k\rangle) \otimes \text{Id} \) and \( \pi_{jk} \) is the arrow given in Definition 3.11.

Example 3.15 Consider the set \( \mathbb{B}^2 \) and the vector space \( S(\mathbb{B}^2) \). We can describe the projection \( \pi_1 \) as the map \( \pi_1 : US(\mathbb{B}^2) \to D(\mathbb{B} \times US(\mathbb{B})) \) such that \( |\psi\rangle \mapsto p_0 \chi_{\pi_1|\psi} + p_1 \chi_{\pi_1|\psi} \), where, if \( |\psi\rangle = \alpha_1 \cdot |00\rangle + \alpha_2 \cdot |01\rangle + \alpha_3 \cdot |10\rangle + \alpha_4 \cdot |11\rangle \), then \( p_0 = \frac{|\alpha_1|^2 + |\alpha_2|^2}{\sqrt{\sum_{i=1}^{2} |\alpha_i|^2}} \) and \( p_1 = \frac{|\alpha_3|^2 + |\alpha_4|^2}{\sqrt{\sum_{i=1}^{2} |\alpha_i|^2}} \).

The Norm arrow is the arrow \( \text{Norm} : US(\mathbb{B}^2) \to US(\mathbb{B}^2) \) such that

\[
\alpha_1 \cdot |00\rangle + \alpha_2 \cdot |01\rangle + \alpha_3 \cdot |10\rangle + \alpha_4 \cdot |11\rangle \mapsto \frac{\alpha_1}{\sqrt{\sum_{i=1}^{2} |\alpha_i|^2}} \cdot |00\rangle + \frac{\alpha_2}{\sqrt{\sum_{i=1}^{2} |\alpha_i|^2}} \cdot |01\rangle + \frac{\alpha_3}{\sqrt{\sum_{i=1}^{2} |\alpha_i|^2}} \cdot |10\rangle + \frac{\alpha_4}{\sqrt{\sum_{i=1}^{2} |\alpha_i|^2}} \cdot |11\rangle
\]

The factorisation arrow is the arrow \( \varphi_1 : US(\mathbb{B}^2) \to B \times US(\mathbb{B}) \) such that

\[
\alpha_1 \cdot |00\rangle + \alpha_2 \cdot |01\rangle + \alpha_3 \cdot |10\rangle + \alpha_4 \cdot |11\rangle \mapsto \begin{cases} 
|0\rangle \times (\alpha_1 \cdot |0\rangle + \alpha_2 \cdot |1\rangle) & \text{if } \alpha_3 = \alpha_4 = 0 \\
|1\rangle \times (\alpha_3 \cdot |0\rangle + \alpha_4 \cdot |1\rangle) & \text{if } \alpha_1 = \alpha_2 = 0 \\
|00\rangle & \text{otherwise}
\end{cases}
\]

Finally, \( \pi_{10} \) and \( \pi_{11} \) are defined as \( \pi_{10} : US(\mathbb{B}^2) \to B \times US(\mathbb{B}) \) and \( \pi_{11} : US(\mathbb{B}^2) \to B \times US(\mathbb{B}) \) such that

\[
\pi_{10} = \varphi_1 \circ \text{Norm} \circ U(U(|0\rangle \otimes |0\rangle) \otimes \text{Id}) \quad \pi_{11} = \varphi_1 \circ \text{Norm} \circ U(U(|1\rangle \otimes |1\rangle) \otimes \text{Id})
\]

We write \((US)^m(A)\) for \(US(\ldots US(A))\), where \( m > 0 \) and \( A \neq US(B) \). The arrow sum on \((US)^m(A)\) will use the underlying sum in the vector space \( S(A) \). Therefore, in order to implement this sum, we need the following map.

Definition 3.16 The map \( g_k : (US)^{k+1}(A) \times (US)^{k+1}(A) \to (US)^{k}(US(A) \times US(A)) \) is defined by

\[
g_k = (US)^k U(m) \circ (US)^{k-1}(n) \circ (US)^k U(m) \circ (US)^{k-2}(n) \circ \cdots \circ U(m) \circ n
\]

Example 3.17 We can define the sum on \((US)^3(A) \times (US)^3(A)\) by using the sum on \( S(A) \) as \( g_2 \circ (US)^2(+) \), where \( g_2 = USU(m) \circ US(n) \circ U(m) \circ n \). This gives the following diagram

\[
\begin{array}{c}
\text{USUSUS}(A) \times \text{USUSUS}(A) \xrightarrow{\text{sum}} \text{USUSUS}(A) \\
\downarrow \text{USUSUS}(+) \quad \downarrow \text{USUSUS}(A) \times \text{USUS}(A) \quad \downarrow \text{USUSUS}(A) \quad \downarrow \text{USUSUS}(A)
\end{array}
\]

Using all the previous definitions, we can finally give the interpretation of a type derivation tree in our model. If \( \Gamma \vdash t : A \) with a derivation \( T \), we write it generically \( [T] \) as \( \Gamma \vdash t : A \). On the following definition, we write \( S^m(A) \) for \( S(\ldots S(A)) \), where \( m > 0 \) and \( A \neq S(B) \).

Definition 3.18 If \( T \) is a type derivation tree, we define \([T]\) inductively as follows,

\[
\begin{align*}
[\Gamma^3, x : \Psi \vdash x : \Psi] & = \Gamma^3 \times \Psi \\
[\Gamma^3 \vdash 0_{S(A)} : S(A)] & = \Gamma^3 \vdash 1 \times S(A) \\
[\Gamma^3 \vdash 0_{\mathbb{B}}] & = \Gamma^3 \vdash 1 \times \mathbb{B} \\
[\Gamma^3 \vdash 1_{\mathbb{B}}] & = \Gamma^3 \vdash 1 \times \mathbb{B} \\
[\Gamma^3 \vdash t : S^m(A)] & = \Gamma^3 \vdash (US)^{m-1} U^m(A) \\
[\Gamma^3 \vdash \alpha.t : S^m(A)] & = \Gamma^3 \vdash (US)^{m-1} U^m(A)
\end{align*}
\]
Proposition 3.19 (Independence of derivation) If \( \Gamma \vdash t : A \) can be derived with two different derivations \( T \) and \( T' \), then \([T] = [T']\).

Proof. Without taking into account rules \( \Rightarrow_E \) and \( \Rightarrow_{ES} \) and \( S_I \), the typing system is syntax directed. In the case of the application (rules \( \Rightarrow_E \) and \( \Rightarrow_{ES} \)), they can be interchanged only in few specific cases.

Hence, we give a rewrite system on trees such that each time a rule \( S_I \) can be applied before or after another rule, we chose a direction to rewrite the three to one of these forms. Similarly, we chose a direction for rules \( \Rightarrow_E \) and \( \Rightarrow_{ES} \). Then we prove that every rule preserves the semantics of the tree. This rewrite system is clearly confluent and normalizing, hence for each tree \( T \) we can take the semantics of its normal form, and so every sequent will have one way to calculate its semantics: as the semantics of the normal tree.

The full proof is given in the appendix. \(\square\)

Remark 3.20 Proposition 3.19 allows us to write the semantics of a sequent, independently of its derivation. Hence, from now on, we will use \([\Gamma \vdash t : A]\), without ambiguity.

Lemma 3.21 (Substitution) If \( \Gamma', x : \Psi, \Gamma \vdash t : A \) and \( \vdash r : \Psi \), then the following diagram commutes:
\[
\Gamma' \times \Gamma \xrightarrow{(r/x)t} A
\]

That is, \(\{\Gamma', \Gamma \vdash (r/x)t : A\} = \{\Gamma', x : \Psi, \Gamma \vdash t : A\} \circ (\{t : \Psi\} \times \text{Id})\).

**Proof.** By induction on the derivation of \(\Gamma', x : \Psi, \Gamma \vdash t : A\). The full proof is given in the appendix. \(\square\)

**Theorem 3.22 (Soundness)** If \(\vdash t : A\), and \(t \rightarrow r\), then \(\{t : A\} = \{r : A\}\).

**Proof.** By induction on the rewrite relation, using the first derivable type for each term. The full proof is given in the appendix. \(\square\)

In order to prove adequacy (Theorem 3.26), we use an adaptation to Lambda-\(\mathcal{S}\) of Tait’s proof for strong normalization.

**Definition 3.23** Let \(\mathcal{A}, \mathcal{B}\) be sets of closed terms. We define the following operators on them:

1. **Closure by antireduction:** \(\mathcal{A}^{\dagger} = \{t \mid t \rightarrow^* r\}, \text{ with } r \in \mathcal{A} \text{ and } FV(t) = \emptyset\}\).
2. **Closure by parallelism:** \(\mathcal{A}^\parallel = \{|r_i | t_i \mid t_i \in \mathcal{A} \text{ and } \sum_i p_i = 1\}\).
3. **Product:** \(\mathcal{A} \times \mathcal{B} = \{t \times u \mid t \in \mathcal{A} \text{ and } u \in \mathcal{B}\}\).
4. **Arrow:** \(\mathcal{A} \Rightarrow \mathcal{B} = \{t \mid \forall u \in \mathcal{A}, tu \in \mathcal{B}\}\).
5. **Span:** \(S\mathcal{A} = \{\sum_i \alpha_i r_i \mid r_i \in \mathcal{A}\}\) where \(\alpha r\) is a notation for \(\alpha.r\) when \(\alpha \neq 1\), or \(1.r\) or just \(r\) when \(\alpha = 1\).
6. **Error:** \(E\mathcal{A} = \mathcal{A} \cup \{\text{error}\}\), where \(\text{error}\) is any term containing a subterm \(\pi_j 0_{S(B)}\).

The set of computational closed terms of type \(A\) (denoted \(\mathcal{C}_A\)), is defined by

\[
\mathcal{E}_\Psi \Rightarrow A = E(\mathcal{E}_\Psi \Rightarrow \mathcal{C}_A) \\
\mathcal{C}_A \times \mathcal{B} = E(\mathcal{C}_A \times \mathcal{C}_B) \\
\mathcal{C}_A^{\dagger} = \mathcal{E}(\mathcal{C}_A^{\dagger}) \\
\mathcal{E}(A) = E(\mathcal{C}_A) \\
\overline{S(A)} = E(\mathcal{S}_A \cup \{0_{S(B)} \mid S(B) \leq S(A)\})
\]

Where \(\leq\) is defined as \(S(S(A)) \leq S(A)\) and \(A \leq S(A)\).

A substitution \(\sigma\) is valid with respect to a context \(\Gamma\) (notation \(\sigma \vdash \Gamma\)) if for each \(x : A \in \Gamma\), \(\sigma x \in \mathcal{C}_A\).

**Lemma 3.24** For any type \(A\), we have \(\text{error} \in \mathcal{C}_A\).

**Proof.** By induction on \(A\). The detailed proof can be found in the appendix. \(\square\)

**Lemma 3.25** If \(\vdash t : A\) and \(\sigma \vdash \Gamma\), then \(\sigma t \in \mathcal{C}_A\).

**Proof.** By induction on the derivation of \(\Gamma \vdash t : A\). The detailed proof can be found in the appendix. \(\square\)

**Theorem 3.26 (Adequacy)** If \(\{t : B\} = \{v : B\}\), where \(v \in \{|0\}, |1\}\), then either \(t \rightarrow^* v\) or \(t \rightarrow^* \text{error}\).

**Proof.** By Lemma 3.25, \(t \in \mathcal{A}^{\dagger} = \{|0\}, |1\}\), therefore, \(t \rightarrow^* \|_{i=1}^n p_i r_i\) where \(r_i \in \{|0\}, |1\}\), \(\text{error}\).

Since \(\{t : B\} = \{v : B\}\), we have that \(n = p_1 = 1\) and so \(t \rightarrow^* v\), or \(t \rightarrow^* \text{error}\). \(\square\)

## 4 Conclusion

In this paper we have given a concrete categorical semantics of Lambda-\(\mathcal{S}\) and proved that it is sound (Theorem 3.22) and adequate (Theorem 3.26). Such a semantics highlights the dynamics of the calculus: The algebraic rewriting (linear distribution, vector space axioms, and typing casts rules) emphasize the standard behaviour of vector spaces, and the natural transformation \(n\) takes these arrows from the Cartesian category \(\text{Set}\) to the tensorial category \(\text{Vec}\), where such a behaviour occur naturally, and then are taken back to the Cartesian realm with the natural transformation \(m\). This way, rules such as \((\text{lin}_r^\pi)\): \(t(u + v) \rightarrow tu + tv\), are simply considered as \(U(m) \circ n\) producing \((u + v, t) \rightarrow (u, t) + (v, t)\) in two steps: \((u + v, t) \rightarrow (u + v) \otimes t = u \otimes t + v \otimes t \rightarrow (u, t) + (v, t)\), using the fact that \((u + v) \otimes t = u \otimes t + v \otimes t\) in \(\text{Vec}\).

We have constructed a concrete mathematical semantic model of Lambda-\(\mathcal{S}\) based on a monoidal adjunction with some extra conditions. However, the construction depends crucially on inherent properties of the categories
of set and vector spaces. In a future work we will study the semantics from a more abstract point of view. Our approach will be based on recasting the concrete model at a more abstract categorical level of monoidal categories with some axiomatic properties that are now veiled in the concrete model. Some of these properties, such as to consider an abstract dagger instead of an inner product, were introduced in the concrete model from the very beginning, but others are described in Remark 3.2 and Definitions 3.5, 3.8, 3.9, 3.11, 3.12, and 3.14. Another question we hope to address in future work is the exact categorical relationship between the notion of amplitude and probability in the context of the abstract semantics. While some research has been done in this topic (see, for example, [2, 19]) it differs from our point of view in some important aspects: for example to consider a notion of abstract normalization as primitive.

A Detailed proofs

Proposition 3.19 (Independence of derivation). If $\Gamma \vdash t : A$ can be derived with two different derivations $T$ and $T'$, then $[T] = [T']$.

Proof. Without taking into account rules $\Rightarrow E$, $\Rightarrow_{SE}$ and $S_I$, the typing system is syntax directed. In the case of the application (rules $\Rightarrow E$ and $\Rightarrow_{SE}$), they can be interchanged only in few specific cases.

Hence, we give a rewrite system on trees such that each time a rule $S_I$ can be applied before or after another rule, we chose a direction to rewrite the three to one of these forms. Similarly we chose a direction for rules $\Rightarrow E$ and $\Rightarrow_{ES}$. Then we prove that every rule preserves the semantics of the tree. This rewrite system is clearly confluent and normalizing, hence for each tree $T$ we can take the semantics of its normal form, and so every sequent will have one way to calculate its semantics: as the semantics of the normal tree.

In order to define the rewrite system, we first analyze the typing rules containing only one premise, and check whether these rules allow for a previous and posterior rule $S_I$. If both are allowed, we choose a direction for the rewrite rule. Then we continue with rules with more than one premise and check under which conditions a commutation of rules is possible, choosing also a direction.

Rules with one premise:
• Rule $\alpha_I$:

\[
\frac{\Gamma \vdash t : S(A)}{\Gamma \vdash t : S(S(A))} \quad S_I \quad \frac{\Gamma \vdash \alpha.t : S(A)}{\Gamma \vdash \alpha.t : S(S(A))} \quad \alpha_I
\]

• Rules $S_E, \Rightarrow I$, $\times E_r$, $\times E_i$, $\uparrow r$, and $\uparrow l$: These rules end with a specific types not admitting two $S$ in the head position (i.e. $\mathbb{B} \Rightarrow \mathbb{B} \times \mathbb{B}^{n-1}$, $\Psi \Rightarrow A$, $\mathbb{B}$, $\mathbb{B}^{n-1}$, and $S(\Psi \times \Phi)$) hence removing an $S$ or adding an $S$ would not allow the rule to be applied, and hence, these rules followed or preceded by $S_I$ cannot commute.

Rules with more than one premise:
• Rule $+I$:

\[
\frac{\Gamma, \exists^B \vdash t : S(A) \quad \Delta, \exists^B \vdash r : S(A) \quad s_I \quad \Delta, \exists^B \vdash u : S(A) \quad s_I}{\Gamma, \Delta, \exists^B \vdash (t + u) : S(S(A))} \quad \Rightarrow E
\]

• Rules $\Rightarrow E$ and $\Rightarrow_{ES}$:

\[
\frac{\Delta, \exists^B \vdash u : \Psi \quad s_I \quad \Delta, \exists^B \vdash t : \Psi \Rightarrow A \quad s_I}{\Delta, \exists^B \vdash tu : S(S(\Psi \Rightarrow A))} \quad \Rightarrow_{ES}
\]

• Rule $\|:$

\[
\frac{\Gamma \vdash t_1 : A \quad s_I \quad \sum_i p_i = 1 \quad \| \quad p_1 t_1 \| \cdots \| p_n t_n : S(A) \quad \sum_i p_i = 1}{\Gamma \vdash p_1 t_1 \| \cdots \| p_n t_n : S(A)} \quad \Rightarrow E
\]

• Rules $If$ and $\times I$: These rules end with a specific types not admitting two $S$ in the head position (i.e. $\mathbb{B} \Rightarrow A$ and $\Psi \times \Phi$), hence removing an $S$ or adding an $S$ would not allow the rule to be applied, and hence, these rules followed or preceded by $S_I$ cannot commute.

The confluence of this rewrite system is easily inferred from the fact that there are not critical pairs. The normalization follows from the fact that the trees are finite and all the rewrite rules push the $S_I$ to the root of the trees.

It only remains to check that each rule preserves the semantics.

• Rule $A(1.1)$: The following diagram gives the semantics of both trees (we only treat, without lost of generality, the case where $A \neq S(A')$). This diagram commutes by the naturality of $\eta$. 

Lemma A.1 (Weakening) If $\Gamma \vdash t : A$, then $\Gamma, \Delta^B \vdash t : A$. Moreover, $\llbracket, \Gamma, \Delta^B \vdash t : A \rrbracket = \llbracket, \Gamma \vdash t : A \rrbracket \circ (\text{id} \times \text{!})$.

Proof. It is easy to show that a tree deriving $\Gamma \vdash t : A$ can be transformed into a tree deriving $\Gamma, \Delta^B \vdash t : A$ just by adding $\Delta^B$ to the contexts in its axioms. Moreover, since $FV(t) \cap \Delta^B = \emptyset$, we have $\llbracket, \Gamma, \Delta^B \vdash t : A \rrbracket = \llbracket, \Gamma \vdash t : A \rrbracket \circ (\text{id} \times \text{!})$. 

Lemma A.2 (Substitution). If $\Gamma' \vdash x : \Psi, \Gamma \vdash t : A$ and $\vdash r : \Psi$, then the following diagram commutes:

That is, $\llbracket, \Gamma' \times (r/x) t : A \rrbracket = \llbracket, \Gamma, x : \Psi, \Gamma' \vdash t : A \rrbracket \circ (\text{id} \times \llbracket, r : \Psi \rrbracket \times \text{id})$.

Proof. By induction on the derivation of $\Gamma'$, $x : \Psi, \Gamma \vdash t : A$. In this proof, we write $d = (\text{id} \times \sigma \times \text{id}) \circ (\text{id} \times \delta)$. Also, we take the rules $\alpha_I$ and $+_I$ with $m = 1$, the generalization is straightforward.

$\Delta^B, x : \Psi \vdash x : \Psi$ By Lemma A.1, $\llbracket, \Delta^B \vdash r : \Psi \rrbracket = \llbracket, r : \Psi \rrbracket \circ !$. Hence,
This diagram commutes by the naturality of the projection.

\[ \Gamma', x : \Psi, \Gamma \vdash t : S(A) \]
\[ \Gamma, x : \Psi, \Gamma \vdash \alpha.t : S(A) \]
\[ \Gamma' \times \Gamma \xrightarrow{(r/x)t} US(A) \xrightarrow{U(\lambda)} U(S(A) \otimes I) \xrightarrow{U(Id \otimes \alpha)} U(S(A) \otimes I) \xrightarrow{U(\lambda^{-1})} US(A) \]
\[ \Gamma' \times 1 \times \Gamma \xrightarrow{\text{Id} \times r \times \text{Id}} \Gamma' \times \Psi \times \Gamma \]

This diagram commutes by the induction hypothesis.

\[ \Gamma', x : \Psi, \Gamma, \Xi^B \vdash t + u : S(A) \]
\[ \Gamma' \times \Delta \times \Xi^B \xrightarrow{d} \Gamma' \times \Delta \times \Xi^B \times \Xi^B \xrightarrow{(r/x)t \times u} US(A) \times US(A) \xrightarrow{\text{Id}} US(A) \times US(A) \]
\[ \Gamma' \times 1 \times \Xi^B \xrightarrow{\text{Id} \times r \times \text{Id}} \Gamma' \times \Psi \times \Xi^B \]

This diagram commutes by the induction hypothesis.

If \( x \in \text{FV}(u) \) or \( x \in \text{FV}(u) \cap \text{FV}(t) \) the cases are analogous.

\[ \Gamma', x : \Psi, \Gamma \vdash t : S(B^n) \]
\[ \Gamma', x : \Psi, \Gamma \vdash \pi_j : B^j \times S(B^{n-j}) \]
\[ \Gamma' \times \Gamma \xrightarrow{(r/x)t} US(B^n) \xrightarrow{\pi_j} D(B^j \times S(B^{n-j})) \]
\[ \Gamma' \times 1 \times \Gamma \xrightarrow{\text{Id} \times r \times \text{Id}} \Gamma' \times \Psi \times \Gamma \]

This diagram commutes by the induction hypothesis.

\[ \Gamma', x : \Psi, \Gamma \vdash t : A \quad \Gamma' \times \Gamma \xrightarrow{(r/x)G} [B, A] \]
\[ \Gamma' \times 1 \times \Gamma \xrightarrow{\text{Id} \times r \times \text{Id}} \Gamma' \times \Psi \times \Gamma \]

where \( (r/x)G = \text{curry}(\text{uncurry}(f_{(r/x)t,(r/x)s}) \circ \text{swap}) \) and \( G = \text{curry}(\text{uncurry}(f_{t,s}) \circ \text{swap}) \)

By the induction hypothesis, \( (r \times \text{Id})o t = (r/x)t \) and \( (r \times \text{Id})o s = (r/x)s \), hence, \( (r \times \text{Id})o f_{t,s} = f_{(r/x)t,(r/x)s} \) and so \( (r/x)G = (r \times \text{Id}) \circ G \), which makes the diagram commute.

\[ \Gamma', x : \Psi, \Gamma \vdash \lambda y : \Phi \vdash t : A \]
\[ \Gamma', x : \Psi, \Gamma \vdash \eta^k \circ \lambda y : \Phi.t : \Phi \Rightarrow A \]
\[ \Gamma' \times \Gamma \xrightarrow{\eta^k} [\Phi, \Gamma' \times \Phi] \xrightarrow{[\text{Id}, (r/x)t]} [\Phi, A] \]
\[ \Gamma' \times 1 \times \Gamma \xrightarrow{\text{Id} \times r \times \text{Id}} \Gamma' \times \Psi \times \Gamma \]

The dotted arrow divides the diagram in two. The upper part commutes by the induction hypothesis and
the functoriality of \([\Phi, -]\), while the lower part commutes by the naturality of \(\eta^B\).

- \(\Delta, \Xi^B \vdash u : \Phi \quad \Gamma', x : \Psi, \Gamma, \Xi^B \vdash t : \Phi \Rightarrow A\)

\[
\begin{array}{c}
\Delta \times \Gamma' \times \Gamma \times \Xi^B \xrightarrow{d} \Delta \times \Xi^B \times \Gamma' \times \Gamma \times \Xi^B \xrightarrow{u \times (r/x)t} \Phi \times [\Phi, A] \xrightarrow{\varepsilon^B} A \\
\end{array}
\]

This diagram commutes by the induction hypothesis and the functoriality of the product.

- \(\Delta', x : \Psi, \Delta, \Xi^B \vdash u : \Phi \quad \Gamma, \Xi^B \vdash t : \Phi \Rightarrow A\)

Analogous to previous case.

\[
\begin{array}{c}
\Delta \times \Gamma' \times \Gamma \times \Xi^B \xrightarrow{d} \Delta \times \Xi^B \times \Gamma' \times \Gamma \times \Xi^B \xrightarrow{u \times (r/x)t} \Phi \times [\Phi, A] \xrightarrow{\varepsilon^B} A \\
\end{array}
\]

This diagram commutes by the induction hypothesis and the functoriality of the product.

- \(\Delta', x : \Psi, \Delta, \Xi^B \vdash u : \Phi \quad \Gamma, \Xi^B \vdash t : \Phi \Rightarrow A\)

Analogous to previous case.

\[
\begin{array}{c}
\Gamma' \times \Gamma \times \Delta \times \Xi^B \xrightarrow{d} \Gamma' \times \Gamma \times \Xi^B \times \Delta \times \Xi^B \xrightarrow{(r/x) t \times u} \Phi \times \Upsilon \\
\end{array}
\]

This diagram commutes by the induction hypothesis and coherence results.

- \(\Gamma, \Xi^B \vdash t : \Phi \quad \Delta', x : \Psi, \Delta, \Xi^B \vdash t \times u : \Phi \times \Upsilon\)

Analogous to previous case.

\[
\begin{array}{c}
\Gamma \times \Gamma \xrightarrow{(r/x) t \times u} \Xi \xrightarrow{\text{head}} \Xi \\
\end{array}
\]

This diagram commutes by the induction hypothesis.
This diagram commutes by the induction hypothesis.

\[
\Gamma', x : \Psi, \Gamma \vdash t : S(\Phi) \times \Upsilon
\]

\[
\Gamma' \times \Gamma \xrightarrow{(r/x)t} U(S(\Phi) \times \Upsilon) \xrightarrow{U(\text{Id} \times \text{Id})} U(S(\Phi) \times \text{Id} \times \Upsilon) \xrightarrow{U(\text{Id} \times \text{Id})} US(U(S(\Phi) \times \text{Id} \times \Upsilon)) \xrightarrow{USU(m)} USU(S(\Phi) \times \Upsilon)
\]

This diagram commutes by the induction hypothesis.

 Analogous to previous case.

\[
\Gamma', x : \Psi, \Gamma \vdash t : S(\Phi) \times \Upsilon
\]

\[
\Gamma' \times \Gamma \xrightarrow{(r/x)t} A \xrightarrow{\eta} S(A)
\]

This diagram commutes by the induction hypothesis.

\[
\Gamma', x : \Psi, \Gamma \vdash t_i : A \quad i = 1, \ldots, n \quad \sum_{i=1}^{n} p_i = 1
\]

\[
\Gamma' \times \Gamma \xrightarrow{\delta} (\Gamma' \times \Gamma)^n \xrightarrow{\prod_{i=1}^{n}(r/x)t_i} A^n \xrightarrow{d(p_i)} D(A)
\]

This diagram commutes by the induction hypothesis.

\[\Box\]

**Theorem 3.22 (Soundness).** If \( \vdash t : A \), and \( t \rightarrow r \), then \( \llbracket \vdash t : A \rrbracket = \llbracket \vdash r : A \rrbracket \).

**Proof.** By induction on the rewrite relation, using the first derivable type for each term. We take the rules \( \alpha_I \) and \( +_I \) with \( m = 1 \), the generalization is straightforward.

(comm) \((t + r) = (r + t)\). We have

\[
\vdash t : S(A) \quad \vdash r : S(A) \quad \text{and} \quad \vdash r : S(A) \quad \vdash t : S(A)
\]

Then,

\[
1 \xrightarrow{\text{comm}} 1^2 \xrightarrow{t \times t} US(A)^2 \xrightarrow{\text{Id}} US(A) \times US(A) \xrightarrow{+} US(A)
\]

This diagram commutes by the commutativity of sum in \( S(A) \) as vector space.
\[(asso) \quad ((t + r) + s) = (t + (r + s)).\] We have

\[
\begin{array}{c}
\frac{\Gamma \vdash t : S(A) \quad \Gamma \vdash r : S(A)}{\Gamma \vdash (t + r) : S(A)} \\
\frac{\Gamma \vdash s : S(A)}{\Gamma \vdash ((t + r) + s) : S(A)}
\end{array}
\quad \text{and} \quad
\begin{array}{c}
\frac{\Gamma \vdash t : S(A) \quad \Gamma \vdash r : S(A) \quad \Gamma \vdash s : S(A)}{\Gamma \vdash ((t + r) + s) : S(A)}
\end{array}
\]

Then

\[
\begin{array}{cccc}
1 & \xrightarrow{\approx} & 1^3 & \xrightarrow{t \times r \times s} US(A)^3 \\
& & \xrightarrow{\text{Id} \times g_0} & US(A)^3 \\
& & \xrightarrow{g_0 \times \text{Id}} & US(A)^3 \\
& & \xrightarrow{\alpha \times \text{Id} +} & US(A)^3 \\
& & \xrightarrow{\text{Id}} & US(A)^2 \\
& & \xrightarrow{\text{Id}} & US(A)^2
\end{array}
\]

This diagram commutes by the associativity of sum in \(S(A)\) as vector space.

\((\beta_b)\) If \(b\) has type \(\mathbb{B}^n\) and \(b \in \mathbb{B}\), then \((\lambda x : \mathbb{B}^n.t)b \rightarrow (b/x)t\). We have,

\[
\begin{array}{c}
\frac{x : \mathbb{B}^n \vdash t : A}{\vdash \lambda x : \mathbb{B}^n.t : \mathbb{B}^n \Rightarrow A} \\
\end{array}
\quad \text{and} \quad
\begin{array}{c}
\frac{\vdash \lambda x : \mathbb{B}^n.t : \mathbb{B}^n \Rightarrow A \quad \vdash b : \mathbb{B}^n}{\vdash (\lambda x : \mathbb{B}^n.t)b : A}
\end{array}
\]

Then,

\[
\begin{array}{cccc}
1 & \xrightarrow{\approx} & \mathbb{B}^n \times [\mathbb{B}^n, 1 \times \mathbb{B}^n] \approx \mathbb{B}^n \times [\mathbb{B}^n, \mathbb{B}^n] & \xrightarrow{\text{Id} \times [\text{Id}, t]} \mathbb{B}^n \times [\mathbb{B}^n, \mathbb{B}^n] \\
& & \xrightarrow{\approx} & \mathbb{B}^n \times [\mathbb{B}^n, A] \\
& & \xrightarrow{\text{Id}} & \mathbb{B}^n \times [\mathbb{B}^n, A]
\end{array}
\]

This diagram commutes because of Lemma 3.21.

\((\beta_n)\) If \(u\) has type \(S(\Psi)\), then \((\lambda x : S(\Psi).t)u \rightarrow (u/x)t\). We have,

\[
\begin{array}{c}
\frac{x : S(\Psi) \vdash t : A}{\vdash \lambda x : S(\Psi).t : S(\Psi) \Rightarrow A} \\
\frac{\vdash \lambda x : S(\Psi).t : S(\Psi) \Rightarrow A \quad \vdash u : S(\Psi)}{\vdash (\lambda x : S(\Psi).t)u : A}
\end{array}
\]

Then,

\[
\begin{array}{cccc}
1 & \xrightarrow{\approx} & US(\Psi) \times [US(\Psi), 1 \times US(\Psi)] \approx US(\Psi) \times [US(\Psi), US(\Psi)] & \xrightarrow{\text{Id} \times \text{Id}, t] US(\Psi) \times [US(\Psi), US(\Psi)] \\
& & \xrightarrow{\approx} & S(\Psi) \times [S(\Psi), A] \\
& & \xrightarrow{\text{Id}} & S(\Psi) \times [S(\Psi), A] \\
& & \xrightarrow{\approx} & A
\end{array}
\]

This diagram commutes because of Lemma 3.21.

\((\text{lf}_1)\) \quad \(\langle 1 \rangle \mapsto t : t \cdot r \rightarrow t\). We have,

\[
\begin{array}{c}
\frac{\vdash t : A \quad \vdash r : A}{\vdash t \cdot r : \mathbb{B} \Rightarrow A} \\
\frac{\vdash \langle 1 \rangle : \mathbb{B}}{\vdash \langle 1 \rangle \cdot t \cdot r : A}
\end{array}
\quad \text{and} \quad
\begin{array}{c}
\frac{\vdash \langle 1 \rangle \cdot t \cdot r : A}{\vdash t : A}
\end{array}
\]

Then,

\[
\begin{array}{c}
\frac{\lambda x \cdot \langle 1 \rangle \times \text{curry(uncurry}(f_{t,r} \circ \text{swap})) \circ \text{swap} \} \times [\mathbb{B}, A]}{1 \xrightarrow{\approx} \mathbb{B} \times [\mathbb{B}, A]}
\end{array}
\]

Notice that \(\text{curry(uncurry}(f_{t,r} \circ \text{swap}))\) transforms the arrow \(\mathbb{B} \xrightarrow{f_{t,r}} [1, A]\) (which is the arrow \(\langle 0 \rangle \mapsto r, \langle 1 \rangle \mapsto t\)) into an arrow \(1 \rightarrow [\mathbb{B}, A]\), and hence, \(\lambda x \cdot \langle 1 \rangle \times \text{curry(uncurry}(f_{t,r} \circ \text{swap})) \circ \varepsilon = t\).

\((\text{lf}_0)\) Analogous to \((\text{lf}_1)\).
(lin₁) If \( t \) has type \( \mathbb{B}^n \Rightarrow A \), then \( t(u + v) \to tu + tv \). We have,

\[
\frac{\vdash t : \mathbb{B}^n \Rightarrow A}{\vdash t : S(\mathbb{B}^n) \Rightarrow A} \quad \frac{\vdash u : S(\mathbb{B}^n)}{\vdash u + v : S(\mathbb{B}^n)} \quad \frac{\vdash t : \mathbb{B}^n \Rightarrow A}{\vdash tu : S(A)} \quad \frac{\vdash t : \mathbb{B}^n \Rightarrow A}{\vdash tv : S(A)}
\]

\[
\begin{array}{c}
US(\mathbb{B}^n) \times US([\mathbb{B}^n, A]) \\ \\
\downarrow^{	imes \text{id}} \\
US(\mathbb{B}^n)^2 \times US([\mathbb{B}^n, A]) \\
\downarrow^{g_0 \times g_0}
\end{array} \quad \begin{array}{c}
U(S(\mathbb{B}^n) \otimes S([\mathbb{B}^n, A])) \\
\downarrow^{U(m)} \\
US(A)
\end{array}
\]

The mappings are as follows:

\[
\begin{array}{c}
(*, *, *) \mapsto (u, v, t) \mapsto (u, v, t) \mapsto (u + v) \implies t = u \otimes t + v \otimes t \mapsto (u, t) + (v, t) \mapsto t(u) + t(v)
\end{array}
\]

(\text{lin}_2) If \( t \) has type \( \mathbb{B}^n \Rightarrow A \), then \( \alpha(tu) \to \alpha.(tu) \). We have,

\[
\begin{array}{c}
\vdash t : \mathbb{B}^n \Rightarrow A \\
\vdash t : S(\mathbb{B}^n) \Rightarrow A \\
\vdash \alpha.u : S(\mathbb{B}^n)
\end{array}
\]

Then,

\[
\begin{array}{c}
U(S(\mathbb{B}^n) \otimes I) \times US([\mathbb{B}^n, A]) \\
\downarrow^{U(\lambda) \times I} \\
US(\mathbb{B}^n) \times [\mathbb{B}^n, A]
\end{array} \quad \begin{array}{c}
U(S(\mathbb{B}^n) \otimes S([\mathbb{B}^n, A])) \\
\downarrow^{U(m)} \\
US(\mathbb{B}^n) \times [\mathbb{B}^n, A]
\end{array}
\]

The mappings are as follows:

\[
(*, *) \mapsto (u, t) \mapsto (u \otimes 1, t) \mapsto (u \otimes \alpha, t) \mapsto \alpha.u = \alpha.(u \otimes t) \mapsto \alpha.(u, t) \mapsto \alpha.t(u)
\]
\((*,*) \mapsto (u,t) \mapsto (u,t) \mapsto u \otimes t \mapsto (u,t) \mapsto t(u) \mapsto t(u) \otimes 1 \mapsto t(u) \otimes \alpha \mapsto \alpha.t(u)\)

\((\text{lin}_0^0)\) If \(t\) has type \(\mathbb{B}^n \Rightarrow A\), then \(\mathbf{t}_0 : \mathbb{B}^n \Rightarrow A\). We have,

\[
\begin{array}{c}
\vdash t : \mathbb{B}^n \Rightarrow A \\
\vdash t : S(\mathbb{B}^n \Rightarrow A) \\
\vdash \mathbf{t}_0 : S(\mathbb{B}^n) \\
\vdash \mathbf{t}_0 : S(\mathbb{B}^n) : S(A) \\
\end{array}
\]

and

\[
\vdash \mathbf{t}_0 : S(A) : S(A)
\]

Then,

\[
\begin{array}{c}
US(\mathbb{B}^n) \times [\mathbb{B}^n, A] \xrightarrow{\lambda x.0 \times t} US(\mathbb{B}^n) \times US([\mathbb{B}^n, A]) \\
\end{array}
\]

The mappings are as follows

\(* \mapsto (*,*) \mapsto (0,t) \mapsto (0,t) \mapsto 0 \otimes t = 0 \mapsto 0 \mapsto 0\)

\(* \mapsto 0\)

\((\text{lin}_1^0)\) \((t+u)v \mapsto (tv + uv)\). We have

\[
\begin{array}{c}
\vdash t : S(\Psi \Rightarrow A) \\
\vdash u : S(\Psi \Rightarrow A) \\
\vdash (t+u) : S(\Psi \Rightarrow A) \\
\vdash v : S(\Psi) \\
\vdash (t+u)v : S(A) \\
\end{array}
\]

and

\[
\begin{array}{c}
\vdash t : S(\Psi \Rightarrow A) \\
\vdash v : S(\Psi) \\
\vdash u : S(\Psi \Rightarrow A) \\
\vdash uv : S(A) \\
\vdash tv : S(A) \\
\vdash (tv + uv) : S(A) \\
\end{array}
\]

Then,

\[
\begin{array}{c}
US(\Psi) \times US([\Psi, A])^2 \xrightarrow{\text{Id} \times \text{Id}_0} US(\Psi) \times US([\Psi, A])^2 \\
\end{array}
\]

The mappings are as follows

\(* \mapsto (*,*,*) \mapsto (v,t,u) \mapsto (v,t,u) \mapsto (v,t+u) \mapsto v \otimes (t+u) = v \otimes t + v \otimes u \mapsto (v,t) + (v,u) \mapsto t(v) + u(v)\)

\(* \mapsto (*,*,*,*) \mapsto (v,t,v,u) \mapsto (v \otimes t, v \otimes u) \mapsto (v,t,v,u) \mapsto (t(v), u(v)) \mapsto t(v) + u(v)\)
\((\text{lin}^n)\) \((\alpha.t)u \rightarrow \alpha.(tu)\). We have
\[
\begin{align*}
\vdash t : S(\Psi \Rightarrow A) & \quad \vdash \alpha.t : S(\Psi \Rightarrow A) \quad \vdash u : S(\Psi) \\
\vdash (\alpha.t)u : S(A) & \quad \vdash tu : S(A)
\end{align*}
\] and
\[
\vdash \alpha.(tu) : S(A)
\]

Then,
\[
\begin{align*}
US(\Psi) \times U(S(\Psi, A) \otimes I) & \xrightarrow{\text{Id} \times U(\lambda^{-1})} US(\Psi) \times US(\Psi, A) \xrightarrow{n} U(\Psi) \otimes US(\Psi, A) \\
US(\Psi) \times U(S(\Psi, A) \otimes I) & \xrightarrow{\text{Id} \times U(\lambda)} US(\Psi, A) \xrightarrow{U(\lambda^{-1})} US(\Psi, A) \xrightarrow{U(m)} US(\Psi) \times [\Psi, A]
\end{align*}
\]

The mappings are as follows:
\((\ast, \ast) \mapsto (u, t) \mapsto (u, t \otimes 1) \mapsto (u, t \otimes \alpha) \mapsto (u, \alpha.t) \mapsto u \otimes (\alpha.t) = \alpha.(u \otimes t) \mapsto \alpha.(u, t) \mapsto \alpha.t(u)

\((\ast, \ast) \mapsto (u, t) \mapsto u \otimes t \mapsto (u, t) \mapsto t(u) \mapsto t(u) \otimes 1 \mapsto t(u) \otimes \alpha \mapsto \alpha.t(u)

\((\text{lin}^n)\) \(0_{S(\mathcal{B}n \Rightarrow A)} t \rightarrow 0_{S(A)}\). We have
\[
\begin{align*}
\vdash 0_{S(\mathcal{B}n \Rightarrow A)} : S(\mathcal{B}n \Rightarrow A) & \quad \vdash t : S(\mathcal{B}n) \\
\vdash 0_{S(\mathcal{B}n \Rightarrow A)} : S(A) & \quad \vdash 0_{S(A)} : S(A)
\end{align*}
\]

Then,
\[
\begin{align*}
US(\mathcal{B}n) \times US([\mathcal{B}n, A]) & \xrightarrow{n} U(\mathcal{B}n) \otimes US([\mathcal{B}n, A]) \\
t \times \lambda x.0 & \xrightarrow{U(m)} US([\mathcal{B}n, A]) \\
1 & \approx \lambda x.0 \xrightarrow{U(\varepsilon)} US(A)
\end{align*}
\]

The mappings are as follows:
\* \mapsto (\ast, \ast) \mapsto (t, 0) \mapsto t \otimes 0 = 0 \mapsto 0 \mapsto 0

\* \mapsto 0

(neutral) \((0_{S(A)} + t) \rightarrow t\). We have
\[
\begin{align*}
\vdash 0_{S(A)} : S(A) & \quad \vdash t : S(A) \\
\vdash 0_{S(A)} + t : S(A) & \quad \vdash t : S(A)
\end{align*}
\]

Then,
\[
\begin{align*}
1 & \xrightarrow{\lambda x.0 \times t} US(A) \xrightarrow{g_0} US(A)^2 \\
1 & \xrightarrow{t} US(A)
\end{align*}
\]
The mappings are as follows:

* $\mapsto$ $(*) \mapsto (0, t) \mapsto (0, t) \mapsto t$

* $\mapsto t$

(unit) $1 \cdot t \mapsto t$. We have

\[
\begin{align*}
\vdash t : S(A) \\
\vdash 1 \cdot t : S(A) \quad \text{and} \quad \vdash t : S(A)
\end{align*}
\]

Then,

\[
\begin{array}{cccc}
US(A) & \xrightarrow{U(\lambda)} & U(S(A) \otimes I) & \xrightarrow{U(\text{Id} \otimes 1)} & U(S(A) \otimes I) \\
\uparrow t & & \downarrow \uparrow U(\lambda^{-1}) & & \\
1 & \mapsto t & & \mapsto US(A)
\end{array}
\]

The mappings are as follows:

* $\mapsto t \mapsto t \otimes 1 \mapsto t \otimes 1 \mapsto 1 \cdot t = t$

* $\mapsto t$

(zero) If $t$ has type $A$, $0 \cdot t \mapsto 0_{S(A)}$. We have

\[
\begin{align*}
\vdash t : S(A) \\
\vdash 0 \cdot t : S(A) \quad \text{and} \quad \vdash 0_{S(A)} : S(A)
\end{align*}
\]

Then,

\[
\begin{array}{cccc}
US(A) & \xrightarrow{U(\lambda)} & U(S(A) \otimes I) & \xrightarrow{U(\text{Id} \otimes 0)} & U(S(A) \otimes I) \\
\uparrow t & & \downarrow \uparrow U(\lambda^{-1}) & & \\
1 & \mapsto \lambda x. 0 & & \mapsto US(A)
\end{array}
\]

The mappings are as follows:

* $\mapsto t \mapsto t \otimes 1 \mapsto t \otimes 0 = 0 \mapsto 0$

* $\mapsto 0$

(zero) $\alpha \cdot 0_{S(A)} \mapsto 0_{S(A)}$. We have

\[
\begin{align*}
\vdash 0_{S(A)} : S(A) \\
\vdash \alpha \cdot 0_{S(A)} : S(A) \quad \text{and} \quad \vdash 0_{S(A)} : S(A)
\end{align*}
\]

Then,

\[
\begin{array}{cccc}
US(A) & \xrightarrow{U(\lambda)} & U(S(A) \otimes I) & \xrightarrow{U(\text{Id} \otimes \alpha)} & U(S(S(A) \otimes I) \\
\uparrow \lambda x. 0 & & \downarrow \uparrow U(\lambda^{-1}) & & \\
1 & \mapsto \lambda x. 0 & & \mapsto US(A)
\end{array}
\]

The mappings are as follows:

* $\mapsto 0 \mapsto 0 \otimes 1 \mapsto 0 \otimes \alpha = 0 \mapsto 0$

* $\mapsto 0$

(prod) $\alpha \cdot (\beta \cdot t) \mapsto (\alpha \beta) \cdot t$. We have

\[
\begin{align*}
\vdash t : S(A) \\
\vdash \beta \cdot t : S(A) \quad \text{and} \quad \vdash t : S(A)
\end{align*}
\]

Then
The mappings are as follows:

- \( * \mapsto t \mapsto t \otimes 1 \mapsto t \otimes \beta \mapsto \beta.t \otimes 1 \mapsto \beta.t \mapsto \beta.t \otimes 1 \mapsto \beta.t \otimes \alpha \mapsto \alpha.(\beta.t) = (\alpha.\beta).t \)
- \( * \mapsto t \mapsto t \otimes 1 \mapsto t \otimes (\alpha.\beta) \mapsto (\alpha.\beta).t \)

(\text{dist}) \( \alpha.(t + u) \rightarrow \alpha.t + \alpha.u \). We have

\[
\vdash t : S(A) \quad \vdash u : S(A) \\
\vdash t + u : S(A) \quad \text{and} \quad \vdash \alpha.t : S(A) \quad \vdash \alpha.u : S(A) \\
\vdash \alpha.(t + u) : S(A)
\]

Then

\[
\begin{array}{c}
US(A)^2 \xrightarrow{+} US(A) \xrightarrow{U(\lambda)} U(S(A) \otimes I) \\
\xrightarrow{g_0} \xrightarrow{U(\lambda)^2} U(S(A) \otimes I)^2 \xrightarrow{U(\lambda^{-1})} US(A)^2
\end{array}
\]

The mappings are as follows

- \( (t, u) \mapsto (t, u) \mapsto t + u \mapsto (t + u) \otimes 1 \mapsto (t + u) \otimes \alpha \mapsto \alpha.t + \alpha.u \)
- \( (t, u) \mapsto (t \otimes 1, u \otimes 1) \mapsto (t \otimes \alpha, u \otimes \alpha) \mapsto (\alpha.t, \alpha.u) \mapsto \alpha.t + \alpha.u \)

(\text{fact}) \( \alpha.t + \beta.t \rightarrow (\alpha + \beta).t \). We have

\[
\begin{array}{c}
\vdash t : S(A) \quad \vdash t : S(A) \\
\vdash \alpha.t : S(A) \quad \vdash \beta.t : S(A) \quad \text{and} \quad \vdash t : S(A) \\
\vdash (\alpha.t + \beta.t) : S(A) \quad \vdash (\alpha + \beta).t : S(A)
\end{array}
\]

Then
The mappings are as follows

\[\star \mapsto (\star, \star) \mapsto (t, t) \mapsto (t \otimes 1, t \otimes 1) \mapsto (t \otimes \alpha, t \otimes \beta) \mapsto (\alpha.t, \beta.t) \mapsto (\alpha + \beta).t\]

\((\text{fact}^1)\) \((\alpha.t + t) \rightarrow (\alpha + 1).t\). We have

\[\vdash t : S(A) \quad \vdash t : S(A)\]
\[\vdash (t + t) : S(A)\]

Then

\[U(S(A) \otimes I) \times US(A) \xrightarrow{U(\text{Id} \otimes \alpha) \times \text{Id}} U(S(A) \otimes I) \times US(A)\]

The mappings are as follows

\[\star \mapsto (\star, \star) \mapsto (t, t) \mapsto (t \otimes 1, t \otimes 1) \mapsto (t \otimes \alpha, t \otimes \beta) \mapsto (\alpha.t, \beta.t) \mapsto (\alpha + \beta).t\]

\((\text{fact}^2)\) \((t + t) \rightarrow 2.t\). We have

\[\vdash t : S(A) \quad \vdash t : S(A)\]
\[\vdash (t + t) : S(A)\]
\[\vdash 2.t : S(A)\]

Then
The mappings are as follows
\[ * \mapsto (*,*) \mapsto (t,t) \mapsto (t,t) \mapsto 2.t \]
\[ * \mapsto t \mapsto t \otimes 1 \mapsto t \otimes 2 \mapsto 2.t \]

(\text{head}) If \( h \neq u \times v \), and \( h \in \mathbb{B} \), \( \text{head } h \times t \rightarrow h \). We have

\[
\frac{\vdash h : \mathbb{B} \quad \vdash t : \mathbb{B}^{n-1}}{\vdash h \times t : \mathbb{B}^n}
\quad \text{and} \quad
\frac{\vdash h : \mathbb{B}}{\vdash \text{head } h \times t : \mathbb{B}}
\]

Then

\[
\begin{array}{c}
1^2 \xrightarrow{h \times t} \mathbb{B}^n \\
\uparrow \quad \text{head} \\
1 \xrightarrow{h} \mathbb{B}
\end{array}
\]

This diagram commutes since \( \text{head} \) is just the projection \( \pi_{\mathbb{B}} \).

(tail) If \( h \neq u \times v \), and \( h \in \mathbb{B} \), \( \text{tail } h \times t \rightarrow t \). We have

\[
\frac{\vdash h : \mathbb{B} \quad \vdash t : \mathbb{B}^{n-1}}{\vdash h \times t : \mathbb{B}^n}
\quad \text{and} \quad
\frac{\vdash t : \mathbb{B}^{n-1}}{\vdash \text{tail } h \times t : \mathbb{B}^{n-1}}
\]

Then

\[
\begin{array}{c}
1^2 \xrightarrow{h \times t} \mathbb{B}^n \\
\uparrow \quad \text{tail} \\
1 \xrightarrow{t} \mathbb{B}^{n-1}
\end{array}
\]

This diagram commutes since \( \text{tail} \) is just the projection \( \pi_{\mathbb{B}^{n-1}} \).

(\text{dist}^+) \( \uparrow_r ((r + s) \times u) \rightarrow \uparrow_r (r \times u) + \uparrow_r (s \times u) \).

We have,

\[
\frac{\vdash r : S(\Psi) \quad \vdash s : S(\Psi)}{\vdash r + s : S(\Psi) \quad \vdash u : \Phi} \quad \text{and} \quad
\frac{\vdash r : S(\Psi) \quad \vdash u : \Phi}{\vdash r \times u : S(\Psi) \times \Phi} \quad \text{and} \quad
\frac{\vdash s : S(\Psi) \quad \vdash u : \Phi}{\vdash s \times u : S(\Psi) \times \Phi} \quad \text{and} \quad
\frac{\vdash (r + s) \times u : S(\Psi) \times \Phi}{\vdash \uparrow_r ((r + s) \times u) : S(\Psi \times \Phi)}
\]

Then

26
The mappings are as follows:

\[
\begin{align*}
* & \mapsto (\cdot, \cdot, \cdot) \mapsto (r, s, u) \mapsto (r, s, u) \mapsto (r + s, u) \mapsto (r + s, u) \\
& \mapsto (r + s) \otimes u = (r \otimes u) + (s \otimes u) \mapsto (r, u) + (s, u) \mapsto (r, u) + (s, u) \mapsto (r, u) + (s, u)
\end{align*}
\]

(\text{dist}_r^+) \vdash_r u \times (r + s) \rightarrow \vdash_r (u \times r) + \vdash_r (u \times s). \text{ Analogous to case } (\text{dist}_r^+)\
(\text{dist}_r^\alpha) \vdash_r (\alpha \cdot r) \times u \rightarrow \vdash_r \alpha, \vdash_r r \times u. \text{ We have,}

\[
\begin{array}{c}
\vdash r : S(\Psi) \\
\vdash \alpha \cdot r : S(\Psi) \quad \vdash u : \Phi \\
\vdash (\alpha \cdot r) \times u : S(\Psi) \times \Phi \\
\vdash \alpha \cdot r \times u : S(\Psi) \times \Phi \\
\vdash \vdash_r (\alpha \cdot r) \times u : S(\Psi) \times \Phi \\
\vdash \vdash_r (r \times u) : S(\Psi) \times \Phi \\
\vdash \vdash_r \alpha, \vdash_r r \times u : S(\Psi) \times \Phi
\end{array}
\]

Then
\[ US(\Psi) \times \Phi \xrightarrow{\eta} US(US(\Psi) \times \Phi) \]

\[ U(\lambda^{-1}) \times \text{id} \]

\[ U(S(\Psi) \otimes I) \times \Phi \]

\[ U(\text{id} \otimes \alpha) \times \text{id} \]

\[ U(S(\Psi) \otimes I) \times \Phi \]

\[ U(\lambda) \times \text{id} \]

\[ US(\Psi) \times \Phi \]

\[ U(S(\Psi) \otimes I) \]

\[ U(\lambda^{-1}) \]

\[ 1^2 \]

\[ US(\Psi \times \Phi) \]

\[ U(\lambda \times \text{id}) \]

\[ US(US(\Psi) \times \Phi) \]

\[ US(\Psi \times \Phi) \]

The mappings are as follows
\((*,*) \mapsto (r, u) \mapsto (r \otimes \alpha, u) \mapsto (\alpha.r, u) \mapsto (r, u) \mapsto \alpha.(r, u) \mapsto \alpha.(r, u)\)
\((*,*) \mapsto (r, u) \mapsto (r, u) \mapsto r \otimes u \mapsto (r, u) \mapsto (r, u) \otimes 1 \mapsto (r, u) \otimes \alpha \mapsto \alpha.(r, u)\)

\((\text{dist}^a)\)  \(\uparrow\ell u \times (\alpha.r) \mapsto \alpha. \uparrow\ell u \times r\). Analogous to case \((\text{dist}^a)\).

\((\text{dist}^2)\) If \(u\) has type \(\Phi\), \(\uparrow\ell \ 0_{S(\Psi)} \times u \rightarrow 0_{S(\Psi \times \Phi)}\). We have

\[
\begin{align*}
\vdash 0_{S(\Psi)} : S(\Psi) \\
\vdash u : \Phi \\
\vdash 0_{S(\Psi)} \times u : S(\Psi \times \Phi) \\
\vdash 0_{S(\Psi)} \times u : S(\Psi \times \Phi)
\end{align*}
\]

and

\[
\begin{align*}
\vdash 0_{S(\Psi \times \Phi)} : S(\Psi \times \Phi)
\end{align*}
\]

Then

\[
\begin{align*}
1 & \xrightarrow{\lambda x. 0 \times u} US(\Psi) \times \Phi \\
& \xrightarrow{\eta} US(US(\Psi) \times \Phi) \\
& \xrightarrow{US(\lambda \times \text{id})} US(US(\Psi) \times US(\Phi)) \\
& \xrightarrow{US(\lambda)} US(S(\Psi) \times S(\Phi)) \\
& \xrightarrow{USU(m)} USUS(S(\Psi) \times S(\Phi)) \\
& \xrightarrow{USU(m)} USUS(S(\Psi) \times S(\Phi)) \\
& \xrightarrow{USU(m)} USUS(S(\Psi) \times S(\Phi)) \\
& \xrightarrow{USU(m)} USUS(S(\Psi) \times S(\Phi))
\end{align*}
\]

The mappings are as follows
\(* \mapsto (*,*) \mapsto (0, u) \mapsto (0, u) \mapsto (0, u) \mapsto 0 \times u = 0 \rightarrow 0 \rightarrow 0\)
\(* \mapsto 0\)

\((\text{dist}^4)\) If \(u\) has type \(\Psi\), \(\uparrow\ell u \times 0_{S(\Phi)} \rightarrow 0_{S(\Psi \times \Phi)}\). Analogous to case \((\text{dist}^4)\).

\((\text{dist}^5)\) \(\uparrow t + u \rightarrow (\uparrow t + \uparrow u)\). We only give the details for \(\uparrow t\), the case \(\uparrow r\) is analogous.

\[
\begin{align*}
\vdash t : S(S(\Psi) \times \Phi) \\
\vdash u : S(S(\Psi) \times \Phi) \\
\vdash t + u : S(S(\Psi) \times \Phi)
\end{align*}
\]

and

\[
\begin{align*}
\vdash t : S(S(\Psi) \times \Phi) \\
\vdash u : S(S(\Psi) \times \Phi) \\
\vdash \uparrow t, t + \uparrow r u : S(\Psi \times \Phi)
\end{align*}
\]
Then

\[
\begin{array}{c}
\begin{aligned}
US(US(\Psi) \times \Phi)^2 \\ t \times n
\end{aligned}
\xrightarrow{\eta} US(US(\Psi) \times \Phi) \\
US(US(\Psi) \times \Phi)^2 \xrightarrow{\eta} US(US(\Psi) \times \Phi)
\end{array}
\]}

The mappings are as follows. For \( i = 1, \ldots, m \), let \( a_i = \sum_{k_i} \gamma_{ik_i} \cdot a_{ik_i} \), \( t = \sum_{i=1}^n \beta_i \cdot (a_i, b_i) \) and \( u = \sum_{i=n+1}^n \beta_i \cdot (a_i, b_i) \). To avoid a more cumbersome notation, we only consider the case where \( \Psi \) and \( \Phi \) do not have a \( S \) in head position, and we omit the steps not modifying the argument.

\[
(t, u) \rightarrow t + u \mapsto \sum_{i=1}^n \beta_i \cdot a_i \otimes b_i = \sum_{i=1}^n \beta_i \cdot \sum_{k_i} \gamma_{ik_i} \cdot (a_{ik_i} \otimes b_i) \mapsto \sum_{i=1}^n \beta_i \cdot \sum_{k_i} \gamma_{ik_i} \cdot (a_{ik_i} \otimes b_i)
\]

\(
(t, u) \rightarrow (\sum_{i=1}^n \beta_i \cdot a_i \otimes b_i, \sum_{i=n+1}^n \beta_i \cdot a_i \otimes b_i) \mapsto (\sum_{i=1}^n \beta_i \cdot \sum_{k_i} \gamma_{ik_i} \cdot (a_{ik_i} \otimes b_i), \sum_{i=n+1}^n \beta_i \cdot \sum_{k_i} \gamma_{ik_i} \cdot (a_{ik_i} \otimes b_i))
\)

Then

\[
\begin{array}{c}
\begin{aligned}
U(S(US(\Psi) \times \Phi) \otimes I) \\ U(\lambda -1)
\end{aligned}
\xrightarrow{\eta} US(US(\Psi) \times \Phi) \\
\end{array}
\]

The mappings are as follows. For \( i = 1, \ldots, m \), let \( a_i = \sum_{k_i} \gamma_{ik_i} \cdot a_{ik_i} \) and \( t = \sum_{i} \beta_i \cdot (a_i, b_i) \). To avoid a more cumbersome notation, we only consider the case where \( \Psi \) and \( \Phi \) do not have a \( S \) in head position, and we omit the steps not modifying the argument.

\[
t \mapsto t \otimes 1 \mapsto t \otimes \alpha = (\sum_{i} \beta_i \cdot (a_i, b_i)) \otimes \alpha = \sum_{i} \alpha \beta_i \cdot (a_i, b_i) \mapsto \sum_{i} \alpha \beta_i \cdot (a_i \otimes b_i) = \sum_{i} \alpha \beta_i \cdot \sum_{k_i} \gamma_{ik_i} \cdot (a_{ik_i} \otimes b_i)
\]
\[ \sum_i \alpha \beta_i \cdot \sum_k \gamma_{ik} \cdot (a_{ik}, b_i) \mapsto \sum_i \sum_k \alpha \beta_i \gamma_{ik} \cdot (a_{ik}, b_i) \]
\[ t \mapsto \sum_i \beta_i \cdot (a_i \otimes b_i) = \sum_i \beta_i \cdot \sum_k \gamma_{ik} \cdot (a_{ik}, b_i) \mapsto \sum_i \sum_k \beta_i \gamma_{ik} \cdot (a_{ik}, b_i) \mapsto \sum_i \sum_k \alpha \beta_i \gamma_{ik} \cdot (a_{ik}, b_i) \]

\((\sum_k \beta_i \gamma_{ik} \cdot (a_{ik}, b_i)) \otimes 1 \mapsto (\sum_k \beta_i \gamma_{ik} \cdot (a_{ik}, b_i)) \otimes \alpha = \alpha \cdot \sum_k \beta_i \gamma_{ik} \cdot (a_{ik}, b_i) \mapsto \sum_i \sum_k \alpha \beta_i \gamma_{ik} \cdot (a_{ik}, b_i) \)

\(\text{dist}^2 \) \(\uparrow_f \) \(\eta \) \(\text{O}_S(S(\Psi)) \times \Phi \) \(\rightarrow \uparrow_f \) \(\text{O}_S(S(\Psi)) \times \Phi \). We have

\[
\begin{align*}
\vdash \text{O}_S(S(\Psi)) \times \Phi : S(S(\Psi)) \times \Phi \\
\vdash \uparrow_f \text{O}_S(S(\Psi)) \times \Phi : S(S(\Psi)) \times \Phi
\end{align*}
\]

\[
\begin{align*}
\vdash \text{O}_S(S(\Psi)) : S(S(\Psi)) \times \Phi \\
\vdash \uparrow_f \text{O}_S(S(\Psi)) : S(S(\Psi)) \times \Phi
\end{align*}
\]

Then

\[
\begin{align*}
1 \xrightarrow{\lambda x.0} \text{US}(US(US(\Psi)) \times \Phi) \xrightarrow{US(Id \times \eta)} US(US(US(\Psi))) \times US(\Phi) \\
\text{US}(US(\Psi) \times \Phi) \xleftarrow{\mu} USUS(US(\Psi) \times \Phi) \xleftarrow{USU(m)} US(US(US(\Psi)) \otimes S(\Phi)) \xrightarrow{U(\Phi) \times S(\Phi)} US(US(\Psi) \times US(\Phi))
\end{align*}
\]

Both mappings start with \(\star \mapsto 0\), and then continue mapping, by linearity, to \(0\).

\(\text{dist}^2 \) \(\uparrow_f \text{O}_S(\Phi \times S(\Psi)) \xrightarrow{\rightarrow} \uparrow_f \text{O}_S(\Phi \times S(\Psi))\). Analogous to case \(\text{dist}^2 \).

\(\text{neut}^1 \) If \(u \in B\), \(\uparrow_f u \times v \mapsto u \times v\). We have

\[
\begin{align*}
\vdash u : \Psi \\
\vdash v : \Phi \\
\vdash u \times v : S(\Psi) \times \Phi \\
\vdash u \times v : S(\Psi) \times \Phi
\end{align*}
\]

Then

\[
\begin{align*}
1 \approx 1^2 \xrightarrow{u \times v} \Psi \times \Phi \xrightarrow{\eta \times \text{Id}} US(\Psi) \times \Phi \xrightarrow{\eta} US(US(\Psi) \times \Phi) \xrightarrow{USU(m)} USUS(US(\Psi) \times \Phi) \xrightarrow{USU(m)} USUS(US(\Psi) \times US(\Phi)) \xrightarrow{USU(m)} USUS(US(\Psi) \times US(\Phi))
\end{align*}
\]

Both mappings are the identity, so we do not give the mappings. Notice that even if \(v\) is a linear combination, the \(\eta\) on \(\Phi\) will freeze its linearity by considering it as a basis vector in a new vector space \(US(\Phi)\) having \(\Phi\) as base.

\(\text{neut}^1 \) If \(u \in B\), \(\uparrow_f u \times v \mapsto u \times v\). Analogous to case \(\text{neut}^1 \).

\(\text{neut}^1 \) \(\uparrow_f \text{O}_S(S(\mathbb{B}^n) \times \Phi) \mapsto \text{O}_S(S(\mathbb{B}^n) \times \Phi)\). We have

\[
\begin{align*}
\vdash \text{O}_S(S(\mathbb{B}^n) \times \Phi) : S(S(\mathbb{B}^n) \times \Phi) \\
\vdash \uparrow_f \text{O}_S(S(\mathbb{B}^n) \times \Phi) : S(S(\mathbb{B}^n) \times \Phi)
\end{align*}
\]

Then

\[
\begin{align*}
1 \xrightarrow{\lambda x.0} \text{US}(US(\mathbb{B}^n) \times \Phi) \xrightarrow{USU(m)} USUS(US(\mathbb{B}^n) \times US(\Phi)) \xrightarrow{USU(m)} USUS(US(\mathbb{B}^n) \times US(\Phi))
\end{align*}
\]
Both mappings start with \( * \mapsto 0 \), and then continue mapping, by linearity, to 0.

\[(\text{neut}_{0}^{B}) \uparrow \sigma \circ \mathbf{0}_{S(\vec{B} \times \mathbb{B}^n)} \rightarrow \mathbf{0}_{S(\vec{B} \times \mathbb{B}^n)}.\] Analogous to case \((\text{neut}_{a}^{B})\),

\[
\left(\text{proj} \right) \pi_{j} |\psi\rangle \rightarrow \prod_{k=0}^{2^{j}-1} p_{k}(|k\rangle \times |\phi_{k}\rangle)
\]

where

\[
|\psi\rangle = \sum_{i=1}^{n} [\alpha_{i}] \prod_{h=1}^{m} [b_{hi}]
\]

\[
|k\rangle = |b_{1}\rangle \times \cdots \times |b_{j}\rangle \text{ where } b_{1} \ldots b_{j} \text{ is the binary representation of } k
\]

\[
|\phi_{k}\rangle = \sum_{i \in T_{k}} \beta_{ik} \prod_{h=j+1}^{m} [b_{hi}]
\]

\[
\beta_{ik} = \left(\frac{\alpha_{i}}{\sqrt{\sum_{r \in T_{k}} |\alpha_{r}|^{2}}} \right) \quad \text{and} \quad p_{k} = \sum_{i \in T_{k}} \left(\frac{|\alpha_{i}|^{2}}{\sum_{r=1}^{m} |\alpha_{r}|^{2}} \right)
\]

with \( T_{k} = \{ i \leq n \mid |b_{1i}| \times \cdots \times |b_{ji}| = |k\rangle \} \)

We have,

\[
\vdash [b_{i1}] : \mathbb{B} \quad \ldots \quad \vdash [b_{im}] : \mathbb{B}
\]

\[
\vdash \prod_{h=1}^{m} [b_{h1}] : \mathbb{B}^{m}
\]

\[
\vdash \prod_{h=1}^{m} [b_{hn}] : \mathbb{B}^{m}
\]

\[
\vdash [\alpha_{i}] \prod_{h=1}^{m} [b_{h1}] : S(\mathbb{B}^{m}) \quad \ldots \quad \vdash [\alpha_{n}] \prod_{h=1}^{m} [b_{hn}] : S(\mathbb{B}^{m})
\]

\[
\vdash \psi : S(\mathbb{B}^{m})
\]

\[
\vdash \pi_{j} |\psi\rangle : \mathbb{B}^{j} \times S(\mathbb{B}^{m-j})
\]

and

\[
\vdash [b_{j+1,i_{1j+1}}] : \mathbb{B} \quad \ldots \quad \vdash [b_{m,i_{2j-1}m}] : \mathbb{B}
\]

\[
\vdash \prod_{h=j+1}^{m} [b_{hi_{1j+1}}] : \mathbb{B}^{m-j}
\]

\[
\vdash \prod_{h=j+1}^{m} [b_{hi_{2j-1}m}] : \mathbb{B}^{m-j}
\]

\[
\vdash \beta_{i_{1j+1}} \prod_{h=j+1}^{m} [b_{hi_{1j+1}}] : S(\mathbb{B}^{m-j}) \quad \ldots \quad \vdash \beta_{i_{2j-1}m} \prod_{h=j+1}^{m} [b_{hi_{2j-1}m}] : S(\mathbb{B}^{m-j})
\]

\[
\vdash [k] : \mathbb{B}^{j}
\]

\[
\vdash [k] \times |\phi_{k}\rangle : \mathbb{B}^{j} \times S(\mathbb{B}^{m-j})
\]

\[
\vdash \prod_{k=0}^{2^{j}-1} p_{k}([k] \times |\phi_{k}\rangle) : \mathbb{B}^{j} \times S(\mathbb{B}^{m-j})
\]

The following diagram, where

\[
\Psi = \prod_{[\psi]} : S(\mathbb{B}^{m}) \quad \text{and} \quad P_{k} = \prod_{[k] \times |\phi_{k}\rangle} : B^{j} \times S(\mathbb{B}^{m-j})
\]

commutes.
We proceed by induction on $\Gamma$. We proceed by structural induction on the derivation of $\Gamma$.

**Lemma 3.24.** For any type $A$, we have $error \in \mathcal{C}_A$.

**Proof.** We proceed by structural induction on the derivation of $\Gamma \vdash t : A$. In order to avoid cumbersome notation, we do not take the closure by parallelism into account, except when needed. The extension of this proof to such a closure is straightforward.

- **$\Gamma^S, x : \Psi \vdash x : \Psi^S$** Since $\sigma \vdash \Gamma^S, x : \Psi$, we have $\sigma x \in \Psi$.

- **$\Gamma^S \vdash 0 : S(A)^{\alpha \cdot 0}$** By definition, $0_{S(A)} \in \mathcal{C}_{S(A)}$.

- **$\Gamma^S \vdash 1 : S(A)^{\alpha \cdot 1}$** By definition, $1_{S(A)} \in \mathcal{C}_{S(A)}$.

- **$\Gamma \vdash \alpha : S(A)^{\alpha I}$** By the induction hypothesis, $\sigma t \in \mathcal{C}_{S(A)}$, hence, by definition $\sigma_1 \sigma t = \sigma_1 \sigma t \in \mathcal{C}_{S(A)}$.

- **$\Gamma, \Xi^S \vdash t : S(A)^{\alpha, \Xi^S} \vdash u : S(A)^{\alpha + t}$** By the induction hypothesis, $\sigma_1 \sigma t, \sigma_2 \sigma u \in \mathcal{C}_{S(A)}$, hence, by definition $\sigma_1 \sigma t + \sigma_2 \sigma u = \sigma_1 \sigma_2 (t + u) \in \mathcal{C}_{S(A)}$.

- **$\Gamma \vdash t : S(B^n)^{S_B}$** By the induction hypothesis, $\sigma t \in \mathcal{C}_{S(B^n)} = ES\mathcal{C}_{B^n} \cup \{0_{S(B^n)}\}$.

Cases:

* If $\sigma t \rightarrow^* error$, then $\pi_j t \rightarrow^* error \in \mathcal{C}_{B^j \times S(B^{n-j})}$.

* Otherwise, $\sigma t \in S(\{0\}, \{1\})^n$, so $\sigma t \rightarrow^* \sum_i \sum_j \alpha_i |b_{ij}| \times \cdots \times |b_{im}|$, with $b_{ij} = 0$ or $b_{ij} = 1$. Therefore, $\pi_j \sigma t \rightarrow^* \sum_i \sum_j \alpha_i |b_{ij}| \times \cdots \times |b_{im}| \rightarrow \sum_i \beta_i |b_{ij+1}| \times \cdots \times |b_{im}| \in \{0\}, \{1\}^\alpha \subseteq \mathcal{C}_{B^j \times S(B^{n-j})}$.

- **$\Gamma \vdash r : A$** By the induction hypothesis, $\sigma r \in \mathcal{C}_A$ and $\sigma r \in \mathcal{C}_A$. Hence, for any $s \in \mathcal{C}_S$, $s^2 \sigma_1 \sigma r$ reduces either to $\sigma r$, to $\sigma r$, or to a term containing $error$, hence it is in $\mathcal{C}_A$, therefore, $? \sigma_1 \sigma r \in \mathcal{C}_S \Rightarrow A$.

- **$\Gamma, x : \Psi \vdash t : A$** Let $r \in \mathcal{C}_\Psi$. Then, $\sigma(\lambda x : \Psi. t) r = (\lambda x : \Psi. \sigma t) r \rightarrow (r/x) \sigma t$. Since $(r/x) \sigma t \vdash \Gamma, x : \Psi$, we have, by the induction hypothesis, that $(r/x) \sigma t \in \mathcal{C}_A$. Therefore, $\lambda x : \Psi. t \in \mathcal{C}_\Psi \Rightarrow A$. 

32
\[
\Delta, \Xi^B \vdash u : \Psi \\
\Delta, \Xi^B \vdash t : \Psi \Rightarrow A \\
\Delta, \Gamma, \Xi^B \vdash tu : A \\
\Delta, \Gamma, \Xi^B \vdash u : S(\Psi) \\
\Delta, \Xi^B \vdash t : S(\Psi) \Rightarrow A \\
\Delta, \Gamma, \Xi^B \vdash tu : S(A)
\]

By the induction hypothesis, \(\sigma_1 \sigma u \in \mathcal{C}_\Psi\) and \(\sigma_2 t \in \mathcal{C}_{\Psi \Rightarrow A}\). Then, by definition, \(\sigma_1 \sigma_2 \sigma tr = \sigma_1 \sigma_2 (tr) \in \mathcal{C}_A\).

\[
\Delta \vdash t : A \\
\Gamma \vdash s : S(A) \\
\Gamma, \Delta, \Xi^B \vdash u : \Psi \\
\\Delta, \Xi^B \vdash t : \Psi \times \Phi \\
\Gamma \vdash t : \mathbb{B}^n_{\times E_r} \\
\Gamma \vdash \text{head } t : \mathbb{B} \\
\Gamma \vdash \text{tail } t : \mathbb{B}^{n-1}_{\times E_l} \\
\Gamma \vdash t : S(\Psi \times \Phi) \\
\Gamma \vdash \text{tail } t : S(\Psi \times \Phi)
\]

By the induction hypothesis, \(\sigma t \in \mathcal{C}_A \subseteq \mathcal{C}_A \cup \{0_{S(B)} | S(B) \leq S(A)\} \subseteq \mathcal{C}_S(A)\).

By the induction hypothesis, \(\sigma_1 \sigma t \in \mathcal{C}_\Psi\) and \(\sigma_2 \sigma u \in \mathcal{C}_\Phi\), hence, \(\sigma_1 \sigma t \times \sigma_2 \sigma u \in \sigma_1 \sigma_2 (t \times u) \in \mathcal{C}_\Psi \times \mathcal{C}_\Phi \subseteq \mathcal{C}_S(\Psi \times \Phi)\).

By the induction hypothesis, \(\sigma l \in \mathcal{E}_\Psi \cup \{0_{S(\Psi)} | S(\Psi) \leq S(\Psi)\} \subseteq \mathcal{E}_\Phi\).

By the induction hypothesis, \(\sigma l \in \mathcal{E}_\Psi \cup \{0_{S(\Psi)} | S(\Psi) \leq S(\Psi)\} \subseteq \mathcal{E}_\Phi\).

By the induction hypothesis, we have that \(\sigma t \in \mathcal{C}_{S(S(\Psi) \times \Phi)}\). Therefore, \(\sigma t \in \mathcal{E}_{S(S(\Psi) \times \Phi)} \subseteq \mathcal{C}_{S(\Psi) \times \Phi}\).
\[ \Gamma \vdash t : S(\Psi \times S(\Phi)) \quad \Gamma \vdash \uparrow t : S(\Psi \times \Phi) \]

Analogous to previous case.

\[ \Gamma \vdash t_i : A \quad \sum_i p_i = 1 \]
\[ \Gamma \vdash p_i t_1 \parallel \cdots \parallel p_n t_n : A \]

By the induction hypothesis each \( \sigma t_i \in \mathcal{C}_A \), hence, by definition \( \sigma(p_1 t_1 \parallel \cdots \parallel p_n t_n) = p_1 \sigma t_1 \parallel \cdots \parallel p_n \sigma t_n \in \mathcal{C}_A \).

\( \square \)
