Abstract

We consider the Lane-Emden conjecture which states that there is no non-trivial non-negative solution for the Lane-Emden system whenever the pair of exponents is subcritical. By Sobolev embeddings on $S^{N-1}$ and scale invariance of the solutions, we show this conjecture holds in a new region. Our methods can also be used to prove the Lane-Emden conjecture in space dimension $N \leq 4$, that is to give a different proof of the main result in [18].

Keywords: Liouville-type theorems; Lane-Emden conjecture

AMS Subject Classification (2010): 35J60, 35B33, 35B45

1 Introduction

Liouville-type results for the nonlinear equation

$$-\Delta u = u^p, \quad x \in \mathbb{R}^N$$  \hspace{1cm} (1.1)
have received considerable attention and have many applications both for elliptic and parabolic equations (see for instance [1], [5], [8], [10], [15], [20]).

Let
\[
    p_S = \begin{cases} 
        \infty, & \text{if } N = 2, \\
        (N + 2)/(N - 2), & \text{if } N \geq 3.
    \end{cases}
\]

Gidas and Spruck [10] showed that equation (1.1) had no positive classical solutions if \( 1 < p < p_S \). Later, Chen and Li [2] gave a new proof by the Kelvin transform and the method of moving planes.

The natural extension of equation (1.1) is the following Lane-Emden system
\[
\begin{aligned}
    -\Delta u &= v^p, & x &\in \mathbb{R}^N, \\
    -\Delta v &= u^q, & x &\in \mathbb{R}^N.
\end{aligned}
\] (1.2)

For given positive constants \( p \) and \( q \), we call the pair \((p,q)\) subcritical if the pair \((p,q)\) lies below the Sobolev hyperbola, i.e.
\[
p > 0, \quad q > 0 \quad \text{and} \quad \frac{1}{p+1} + \frac{1}{q+1} > 1 - \frac{2}{N}.
\] (1.3)

If \( pq \neq 1 \), we define
\[
    \alpha = \frac{2(p + 1)}{pq - 1}, \quad \beta = \frac{2(q + 1)}{pq - 1}.
\] (1.4)

Suppose that \( pq \neq 1 \) and \((u,v)\) is a solution of system (1.2). Then \((R^\alpha u(Rx), R^\beta v(Rx))\) is also a solution of system (1.2) for any \( R > 0 \). This scale invariance is very important in our proofs.

Mitidieri [13] showed that the system (1.2) had no positive radial solutions if and only if pair \((p,q)\) was subcritical, which implies the following conjecture (see [6], [7], [17]) is true for the positive radial solutions.

**Lane-Emden Conjecture.** If the pair \((p,q)\) is subcritical, then system (1.2) has no positive classical solutions.

Serrin and Zou [17] showed this conjecture held if \( pq \leq 1 \) or \( pq > 1 \) and \( \max\{\alpha,\beta\} \geq N - 2 \). Poláčik et al. [14] established a Doubling Lemma and showed that if \( pq > 1 \), then the non-existence of bounded positive classical
solutions for system (1.2) implied the non-existence of positive classical solutions, and proved this conjecture for dimension \( N = 3 \). Souplet [18] proved this conjecture for dimension \( N = 4 \).

By Sobolev embeddings on \( S^{N-1} \) and scale invariance of the solutions, we show this conjecture holds in a new region and have the following theorem.

**Theorem 1.1.** Suppose that the pair \((p, q)\) is subcritical. If \( \min\{p, q\} \leq 1 \), then system (1.2) has no positive classical solutions.

Our methods can be used to give a different proof of the following theorem which is the main result in [18].

**Theorem 1.2.** Suppose that the pair \((p, q)\) is subcritical. If \( pq \leq 1 \) or \( pq > 1 \) and \( \max\{\alpha, \beta\} > N - 3 \), then system (1.2) has no positive classical solutions.

Figure 1. The regions obtained in Theorem 1.1 and 1.2 when \( N = 8 \).

**Remark 1.3.** Suppose that \( N \geq 5 \) and \( u \) is a positive solution of the fourth order equation

\[
\Delta^2 u = u^p, \quad x \in \mathbb{R}^N
\]  

with \( 1 < p < \frac{N+4}{N-4} \). Then \(-\Delta u > 0\) (see [19]). Hence \((u, v)\) with \( v = -\Delta u \) is a positive solution of system (1.2) with \( q = 1 \). Therefore, Theorem 1.1 covers Theorem 1.4 [12] and partial results of Theorem 1.4 [19].
Let \( B_R = \{ x \in \mathbb{R}^N : |x| < R \} \), \( S_R = \{ x \in \mathbb{R}^N : |x| = R \} \) and \( S^{N-1} = S_1 \). For \( 0 \neq x \in \mathbb{R}^N \), let \( \theta = \frac{x}{|x|} \in S^{N-1} \) and \( r = |x| \). For \( k \in [1, \infty] \), \( w \in L^k(S^{N-1}) \), we set \( ||w||_k = ||w||_{L^k(S^{N-1})} \). \( C(N, p, q, \cdots) \) and \( b(N, p, q, \cdots) \) denote positive constants which are dependent on \( N, p, q, \cdots \) and independent of the solution \((u, v)\) of system (1.2).

This paper is organized as follows: in section 2, we give some preliminaries; in section 3, we prove Theorem 1.1; and in section 4, we prove Theorem 1.2.

### 2 Preliminaries

Without loss of generality, we assume that \( p \geq q > 0 \). For a continuous function \( u(x) \) in \( \mathbb{R}^N \), we write \( u = u(r, \theta) \) and define

\[
\overline{u}(r) = \frac{1}{\omega_N} \int_{S^{N-1}} u(r, \theta) d\theta,
\]

where \( \omega_N = |S^{N-1}| \) and \( d\theta \) is the surface measure on \( S^{N-1} \). On \( S^{N-1} \), we have the following Sobolev embeddings:

**Lemma 2.1.** (Sobolev embeddings on \( S^{N-1} \)). Let \( N \geq 2 \) and \( j \geq 1 \) be integers, \( k \in (1, \infty] \) and \( w = w(\theta) \in W^{j,k}(S^{N-1}) \).

1. If \( k < \frac{N-1}{j} \), then \( ||w||_\lambda \leq C(||D^j_\theta w||_k + ||w||_1) \), where \( C = C(j, k, n) > 0 \) and \( \lambda \) satisfies
   \[
   \frac{1}{k} - \frac{1}{\lambda} = \frac{j}{N-1}.
   \]

2. If \( k = \frac{N-1}{j} \), then for any \( \lambda \in [1, \infty) \), \( ||w||_\lambda \leq C(||D^j_\theta w||_k + ||w||_1) \) with \( C = C(\lambda, k, n) > 0 \).

3. If \( k > \frac{N-1}{j} \), then \( ||w||_\infty \leq C(||D^j_\theta w||_k + ||w||_1) \) with \( C = C(j, k, n) > 0 \).

For the proof of this lemma, see Lemma 2.1 [11].
Lemma 2.2. (See [4], Lemma 2.2). Let \( k \in (1, \infty) \) and \( R > 0 \). For \( u \in W^{2,k}(B_{2R}) \), we have
\[
\|D^2 u\|_{L^k(B_R)} \leq C(\|\Delta u\|_{L^k(B_{2R})} + R^{N -(N+2)} \| u \|_{L^1(B_{2R})}),
\]
where \( C = C(k, N) > 0 \).

Lemma 2.3. Suppose that \( pq > 1 \) and \((u, v)\) is a positive solution of system \((1.2)\). Then for any \( r > 0 \),
\[
\bar{u}(r) \leq Cr^{-\alpha}, \quad \bar{v}(r) \leq Cr^{-\beta}, \quad \int_{B_r} u \leq Cr^{N-\alpha} \quad \text{and} \quad \int_{B_r} v \leq Cr^{N-\beta},
\]
where \( C = C(p, q, N) > 0 \) and \( \alpha, \beta \) are defined in \((1.4)\).

This Lemma can be obtained by Proposition 2.1, Corollary 2.1 and Theorem 3.1 [4] immediately.

Lemma 2.4. Suppose that \( pq > 1 \) and \((u, v)\) is a bounded positive solution of system \((1.2)\). Then
\[
\frac{v^{p+1}}{p + 1} \leq \frac{u^{q+1}}{q + 1}, \quad \forall x \in \mathbb{R}^N.
\]

For the proof, see [4] or [18]. Chen and Li [3] proved the following result:

Lemma 2.5. Suppose that \((u, v)\) is a positive solution of system \((1.2)\). Then \((u, v)\) solves the integral system
\[
\begin{cases}
    u(x) = \frac{1}{(N-2)\omega_N} \int_{\mathbb{R}^N} \frac{v^p(y)}{|x-y|^{N-2}} dy, \quad x \in \mathbb{R}^N \\
v(x) = \frac{1}{(N-2)\omega_N} \int_{\mathbb{R}^N} \frac{u^q(y)}{|x-y|^{N-2}} dy, \quad x \in \mathbb{R}^N.
\end{cases}
\tag{2.1}
\]

In order to prove our theorems, we need the following energy type inequality.
Lemma 2.6. Suppose that \((u, v)\) is a non-negative solution of system (1.2). Then for any \(R > 0\) and \(\lambda \in \mathbb{R}\), there holds
\[
(\frac{N}{q + 1} - \frac{N - 2}{2} - \lambda) \int_{B_R} u^{q+1} + (\frac{N}{p + 1} - \frac{N - 2}{2} + \lambda) \int_{B_R} v^{p+1} \\
\leq R \int_{S_R} \left( \frac{u^{q+1}}{q + 1} + \frac{v^{p+1}}{p + 1} \right) + \lambda \int_{S_R} \left( \frac{\partial v}{\partial v} u - \frac{\partial u}{\partial v} v \right).
\]

Proof. Let \(H(x, y) = u^q(x)v^p(y)\). By Lemma 2.5, we have
\[
\begin{aligned}
u(x) &= \frac{1}{(N - 2)\omega_N} \int_{\mathbb{R}^N} \frac{v^p(y)}{|x - y|^{N-2} dy}, \quad x \in \mathbb{R}^N \\
v(x) &= \frac{1}{(N - 2)\omega_N} \int_{\mathbb{R}^N} \frac{u^q(y)}{|x - y|^{N-2} dy}, \quad x \in \mathbb{R}^N.
\end{aligned}
\]

Hence
\[
\begin{aligned}
\nabla u(x) \cdot x &= -\frac{1}{\omega_N} \int_{\mathbb{R}^N} \frac{x(x - y)|v^p(y)|}{|x - y|^{N}} dy, \\
\nabla v(x) \cdot x &= -\frac{1}{\omega_N} \int_{\mathbb{R}^N} \frac{x(x - y)|u^q(y)|}{|x - y|^{N}} dy.
\end{aligned}
\]

On one hand,
\[
\int_{B_R} u^q Du \cdot x = \int_{B_R} D\left( \frac{u^{q+1}}{q + 1} \right) \cdot x = \frac{R}{q + 1} \int_{S_R} u^{q+1} - \frac{N}{q + 1} \int_{B_R} u^{q+1}.
\]

On the other hand,
\[
\begin{aligned}
\int_{B_R} u^q Du \cdot x &= -\frac{1}{\omega_N} \int_{B_R} dx \int_{\mathbb{R}^N} \frac{x(x - y)H(x, y)}{|x - y|^{N}} dy \\
&= -2 \frac{1}{2\omega_N} \int_{B_R} dx \int_{\mathbb{R}^N} \frac{x(x - y)H(x, y)}{|x - y|^{N}} dy \\
&= -\frac{1}{2\omega_N} \int_{B_R} dx \int_{\mathbb{R}^N} \frac{x(x - y)H(x, y)}{|x - y|^{N}} dy + \frac{2 - N}{2} \int_{B_R} u^{q+1} \\
&\quad - \frac{1}{2\omega_N} \int_{B_R} dx \int_{\mathbb{R}^N} \frac{y(x - y)H(x, y)}{|x - y|^{N}} dy.
\end{aligned}
\]

Hence
\[
\begin{aligned}
\left(\frac{N}{q + 1} - \frac{N - 2}{2}\right) \int_{B_R} u^{q+1} &= \frac{R^{q+1}}{q + 1} \int_{S_R} u^{q+1} \\
+ \frac{1}{2\omega_N} \int_{B_R} dx \int_{\mathbb{R}^N} \frac{(|x|^2 - |y|^2)H(x, y)}{|x - y|^{N-2m+2}} dy.
\end{aligned}
\]
Similarly, we have
\[
\left( \frac{N}{p+1} - \frac{N-2}{2} \right) \int_{B_R} v^{p+1} = \frac{R}{p+1} \int_{S_R} v^{p+1} \\
+ \frac{1}{2\omega_N} \int_{B_R} dx \int_{\mathbb{R}^N} \frac{(|x|^2 - |y|^2)H(y,x)}{|x-y|^N} dy.
\]
Therefore, by (2.2) and (2.3), we have
\[
\left( \frac{N}{q+1} - \frac{N-2}{2} \right) \int_{B_R} u^{q+1} + \left( \frac{N}{p+1} - \frac{N-2}{2} \right) \int_{B_R} v^{p+1} \\
= \frac{R^{1+b}}{q+1} \int_{S_R} u^{q+1} + \frac{R^{1+a}}{p+1} \int_{S_R} v^{p+1} + I,
\]
where
\[
I = \frac{1}{2\omega_N} \int_{B_R} dx \int_{B_R} \frac{(|x|^2 - |y|^2)(H(x,y) + H(y,x))}{|x-y|^N} dy \leq 0.
\]
Multiplying the first equation of system (1.2) by \( v \), the second equation by \( u \) and integrating over \( B_R \), we have
\[
\begin{cases}
\int_{B_R} Du Dv - \int_{B_R} u^{q+1} = \int_{S_R} \frac{\partial u}{\partial \nu} v, \\
\int_{B_R} Du Dv - \int_{B_R} u^{q+1} = \int_{S_R} \frac{\partial v}{\partial \nu} u,
\end{cases}
\]

which implies
\[
\int_{B_R} u^{q+1} - \int_{B_R} v^{p+1} = \int_{S_R} \left( \frac{\partial u}{\partial \nu} v - \frac{\partial v}{\partial \nu} u \right).
\]

By (2.4) and (2.5), we get this lemma. \( \square \)

3 Proof of Theorem 1.1

In this section, we prove Theorem 1.1. Let \( \kappa = \frac{\alpha + \beta}{\alpha} \).

**Lemma 3.1.** Suppose that \( \gamma \in (0,1) \) and \((u,v)\) is a positive solution of system (1.2). Then there exists a positive constant \( C = C(N,p,q,\gamma) \) such that
\[
\int_{B_2} |\nabla u^\gamma|^2 \leq C.
\]
Proof. Let \( \gamma \in (0, 1) \) and \((u, v)\) be a positive solution of system (1.2). By Lemma 2.2 of [17], for any \( \varphi \in C_c^\infty(\mathbb{R}^N) \), we have

\[
\int_{\mathbb{R}^N} \varphi^2 u^{-2} |\nabla u|^2 \leq C \int_{\mathbb{R}^N} |\nabla \varphi|^2 u^{-\gamma} \tag{3.1}
\]

with \( C = C(N, \gamma) > 0 \). Let \( \eta(x) \in C_c^\infty(\mathbb{R}^N) \) be a cut-off function:

\[
\eta(x) = \begin{cases} 
1, & |x| < 2, \\
0, & |x| > 4.
\end{cases}
\]

Let \( \varphi = \eta \) in (3.1). Then by (3.1), Lemma 2.3 and Jensen’s inequality, we have

\[
\int_{B_2} |\nabla u^2|^2 \leq C \int_{2 \leq |x| \leq 4} u^\gamma \leq C \int_2^4 r^{N-1} \pi^\gamma(r) \leq C \int_2^4 r^{N-1} r^{-\alpha r} \leq C,
\]

where \( C = C(N, p, q, \gamma) > 0 \). \( \square \)

Lemma 3.2. Suppose that \( pq > 1 \) and \((u, v)\) is a bounded positive solution of system (1.2). Then

\[
\int_{B_2} |\nabla u^2|^2 \leq C \left[ \int_{B_4} u^{q+1} + 1 \right],
\]

where \( C = C(N, p, q) > 0 \).

Proof. Let \( \eta(x) \) be the cut-off function in the proof of Lemma 3.1. Multiplying the first equation of system (1.2) by \( u^{\kappa-1} \eta \) and integrating over \( \mathbb{R}^N \), we have

\[
(\kappa - 1) \int_{B_4} u^{\kappa-2} |\nabla u|^2 \eta = \int_{B_4} u^{\kappa-1} v^p \eta + \frac{1}{\kappa} \int_{B_4} u^\kappa \Delta \eta. \tag{3.2}
\]

Since \( \kappa = \frac{\alpha + \beta}{\alpha} = 1 + \frac{q+1}{p+1} \) and \( pq > 1 \), then \( \kappa < q + 1 \), and by Lemma 2.4, we have

\[
u^{\kappa-1} v^p \leq \left( \frac{q + 1}{p + 1} \right)^\frac{p}{p+1} u^{\kappa-1} \left( \frac{q+1}{p+1} \right)^\frac{p}{p+1} u^q \]

(3.3)
Hence by (3.2), (3.3) and Hölder inequality, we have

\[
\int_{B_2} |\nabla u^{\frac{\kappa}{2}}|^2 \leq \int_{B_4} |\nabla u^{\frac{\kappa}{2}}|^2 \eta \\
\leq C \int_{B_4} u^{\kappa-2} |\nabla u|^2 \eta \\
\leq C \int_{B_4} (u^{\kappa-1} v^p + u^\kappa) \\
\leq C \int_{B_4} u^{q+1} + C(\int_{B_4} u^{q+1})^\frac{\kappa}{q+1} \\
\leq C [\int_{B_4} u^{q+1} + 1],
\]

where \( C = C(N, p, q) > 0. \)

\[\]  

**Lemma 3.3.** Suppose that \( \gamma \in (0, 1) \), \( pq > 1 \) and \((u, v)\) is a bounded positive solution of system (1.2). Then there exists \( r_0 \in [1, 2] \) such that

\[
\int_{S_{r_0}} |\nabla u| \leq C, \int_{S_{r_0}} |\nabla v| \leq C, \int_{S_{r_0}} |\nabla u^{\frac{\gamma}{2}}|^2 \leq C, \int_{S_{r_0}} |\nabla u^{\frac{\gamma}{2}}|^2 \leq C[\int_{B_4} u^{q+1} + 1],
\]

and

\[
\int_{S_{r_0}} |D^2 u|^{\frac{q+1}{p}} \leq C \int_{B_2} |D^2 u|^{\frac{q+1}{p}}, \int_{S_{r_0}} |D^2 v|^{\frac{q+1}{q}} \leq C \int_{B_2} |D^2 u|^{\frac{q+1}{q}},
\]

where \( C = C(N, p, q, \gamma) > 0. \)

**Proof.** Let \( \gamma \in (0, 1) \). By Lemma 2.3, Lemma 3.1 and Lemma 3.2 and interpolation inequalities, there exists \( C_1 = C_1(N, p, q, \gamma) > 0 \) such that

\[
\int_{B_2} |\nabla u| \leq C(N)(\int_{B_4} |\Delta u| + \int_{B_4} |u|) \leq C_1, \\
\int_{B_2} |\nabla v| \leq C(N)(\int_{B_4} |\Delta v| + \int_{B_4} |v|) \leq C_1
\]

and

\[
\int_{B_2} |\nabla u^{\frac{\gamma}{2}}|^2 \leq C_1, \int_{B_2} |\nabla u^{\frac{\gamma}{2}}|^2 \leq C_1[\int_{B_4} u^{q+1} + 1].
\]
Define

\[ A = \{ r \in [1, 2] : \int_{S_r} \nabla u > 7C_1 \} , \]
\[ B = \{ r \in [1, 2] : \int_{S_r} \nabla v > 7C_1 \} , \]
\[ C = \{ r \in [1, 2] : \int_{S_r} |\nabla u^2|^2 > 7C_1 \} , \]
\[ D = \{ r \in [1, 2] : \int_{S_r} |\nabla u^2|^2 > 7C_1 [ \int_{B_4} u^{q+1} + 1 ] , \]
\[ E = \{ r \in [1, 2] : \int_{S_r} |D^2 u|^{\frac{q+1}{q}} > 7 [ \int_{B_2} |D^2 u|^{\frac{q+1}{q}} ] , \]
\[ F = \{ r \in [1, 2] : \int_{S_r} |D^2 v|^{\frac{q+1}{q}} > 7 [ \int_{B_2} |D^2 v|^{\frac{q+1}{q}} ] . \]

Then

\[ 7C_1 |A| \leq \int_A \int_{S_r} |\nabla u| \leq \int_1^2 \int_{S_r} |\nabla u| \leq \int_{B_2} |\nabla u| \leq C_1 , \]

hence

\[ |A| \leq \frac{1}{7} , \]

where \( |A| \) is the Lebesgue measure of \( A \). Similarly, we have

\[ |B| \leq \frac{1}{7} , |C| \leq \frac{1}{7} , |D| \leq \frac{1}{7} , |E| \leq \frac{1}{7} \text{ and } |F| \leq \frac{1}{7} . \]

Hence

\[ |A \cup B \cup C \cup D \cup E \cup F| \leq \frac{6}{7} \text{ and } |A^c \cap B^c \cap C^c \cap D^c \cap E^c \cap F^c| \geq \frac{1}{7} , \]

where \( G^c = [1, 2] - G \) for \( G \subseteq [1, 2] \). Let \( r_0 \in A^c \cap B^c \cap C^c \cap D^c \cap E^c \cap F^c \).

Then we obtain this lemma with \( C = 7 \max \{ C_1 , 1 \} \).

We shall fix this specific \( r_0 \) in the rest of the proof and define \( F(r) = \int_{B_r} u^{q+1} \).

**Lemma 3.4.** Suppose that \( pq > 1 \) and \((u, v)\) is a bounded positive solution of system [1,2]. Then there exists \( C = C(N, p, q) > 0 \) such that

\[ \left( \int_{S_{r_0}} |Du|^{\frac{q+1}{q}} \right)^{\frac{q}{q+1}} \leq C [ F(4)^{\frac{q}{q+1}} + 1 ] , \quad \left( \int_{S_{r_0}} |Dv|^{\frac{q+1}{q}} \right)^{\frac{q}{q+1}} \leq C [ F(4)^{\frac{q}{q+1}} + 1 ] . \]
Proof. By Lemma 2.1, Lemma 2.2, Lemma 2.3, Lemma 2.4, Lemma 3.3, Jensen’s inequality and the fact that \( r_0 \in [1, 2] \), we have

\[
\left( \int_{S_{r_0}} |Du|^{\frac{p+1}{p}} \right)^{\frac{p}{p+1}} \leq C \left( \int_{S_1} |Du(r_0, \theta)|^{\frac{p+1}{p}} \right)^{\frac{p}{p+1}} \\
\leq C \left( \int_{S_1} |D\theta u(r_0, \theta)|^{\frac{p+1}{p}} + \int_{S_{r_0}} |Du| \right) \\
\leq C \left( \int_{B_2} |D^2 u|^{\frac{p+1}{p}} + 1 \right) \\
\leq C \left( \int_{B_4} |\Delta u|^{\frac{p+1}{p}} + 1 \right) \\
\leq C \left( \int_{B_4} v^{p+1} \right)^{\frac{p}{p+1}} + 1 \\
\leq C \left( \int_{B_4} u^{q+1} \right)^{\frac{p}{p+1}} + 1 = C[F(4)^{\frac{p}{p+1}} + 1],
\]

where \( C = C(N, p, q) > 0 \). Similarly, we have

\[
\left( \int_{S_{r_0}} |Dv|^{\frac{q+1}{q}} \right)^{\frac{q}{q+1}} \leq C[F(4)^{\frac{q}{q+1}} + 1]
\]

with \( C = C(N, p, q) > 0 \). \( \square \)

Lemma 3.5. Suppose that \( q \leq 1 \), \( pq > 1 \), \((p, q)\) is subcritical and \((u, v)\) is a bounded positive solution of system (1.2). Then there exist \( C = C(N, p, q) > 0 \) and \( a = a(N, p, q) \in [0, 1) \) such that

\[
\int_{S_{r_0}} u^{q+1} \leq C[F(4)^a + 1].
\]

Proof. By Lemma 2.1, Lemma 2.3, Lemma 3.3 and and the fact that \( r_0 \in [1, 2] \), if \( N \leq 3 \), then we have

\[
\int_{S_1} u^{q+1}(r_0, \theta) d\theta \leq C \quad (3.5)
\]
and if $N \geq 4$, then we have
\[
\int_{S_1} u^{\frac{N-1}{N-3}}(r_0, \theta) d\theta \leq C,
\]
where $\gamma \in (0, 1)$ and $C = C(N, p, q, \gamma)$. Suppose that $q < \frac{2}{N-3}$. Then there exists $\gamma_0 \in (0, 1)$ such that
\[
q + 1 < \frac{\gamma_0(N-1)}{N-3}
\]
and
\[
\int_{S_{r_0}} u^{q+1} \leq 2^{N-1} \int_{S_1} u^{q+1}(r_0, \theta) \leq 2^{N-1} \left[ \int_{S_1} u^{\frac{\gamma_0(N-1)}{N-3}}(r_0, \theta) \right]^{\frac{(q+1)(N-3)}{\gamma_0(N-1)}} \leq C.
\]
(3.7)
Therefore, if $N \leq 3$ or $q < \frac{2}{N-3}$, we obtain this lemma for any $a \in [0, 1)$ according to (3.5) and (3.7). Hence in the following, we assume that $N \geq 4$ and $q \geq \frac{2}{N-3}$.

Let $\mu = \frac{N-1}{N-3} \kappa = \frac{(N-1)(\alpha + \beta)}{(N-3)\alpha}$. Since $(p, q)$ is subcritical, by direct calculations we have
\[
\alpha + \beta > N - 2, \quad \frac{\alpha + \beta + 2}{\alpha + \beta} < \frac{N-1}{N-3} \quad \text{and} \quad q + 1 < \mu.
\]
For any $\gamma \in (0, 1)$, let $t = t(\gamma)$ solve the equation
\[
\frac{1}{q + 1} = \frac{N-3}{\gamma(N-1)}(1 - t) + \frac{t}{\mu}.
\]
Then
\[
t = \frac{\frac{N-3}{\gamma(N-1)} - \frac{1}{q+1}}{\frac{N-3}{\gamma(N-1)} - \frac{1}{\mu}} \in (0, 1).
\]
By (3.6), interpolation inequalities, (1) of Lemma 2.1, Lemma 2.2, Lemma 2.3, Lemma 3.3 and the fact that $r_0 \in [1, 2]$, we have
\[
\|u(r_0)\|_{q+1} \leq \|u(r_0)\|_{\frac{1}{\gamma(N-1)}+1}^{\frac{1-t}{N-1}} \|u(r_0)\|_{\mu}^{t}
\leq C(\|D_\theta u^{\frac{\gamma_0}{2}}(r_0)\|_{2}^{\frac{1}{2}} + 1)
\leq C(\int_{S_{r_0}} |\nabla u^{\frac{\gamma_0}{2}}|^2)^{\frac{1}{2}} + 1)
\leq C[F(4)^{\frac{1}{2}} + 1].
\]
Hence by (3.8) and the fact that \( r_0 \in [1, 2] \), we have

\[
\int_{S_{r_0}} u^{q+1} \leq C \int_{S_1} u^{q+1}(r_0, \theta) \leq C[F(4)^a(\gamma) + 1],
\]

where \( C = C(N, p, q, \gamma) > 0 \) and \( a(\gamma) = \frac{(q+1)t}{2} \). Since \( q \leq 1 \) and \( t \in (0, 1) \), for any \( \gamma \in (0, 1) \), we have

\[
a(\gamma) < 1.
\]

Therefore, choose any \( \gamma_0 \in (0, 1) \) and let \( a = a(\gamma_0) \) in (3.9). Then, we obtain this lemma.

**Proof of Theorem 1.1** We only need to prove this theorem in the case of bounded solutions and \( pq > 1 \).

Suppose that \( q = \min\{p, q\} \leq 1 \), \((p, q)\) is subcritical and \((u, v)\) is a bounded positive solution of system (1.2). Then \( \max\{a, \frac{p+a}{p+1}, \frac{q+a}{q+1}\} = \frac{p+a}{p+1} \). By Lemma 2.4, Lemma 2.6, Lemma 3.4, Lemma 3.5, Hölder inequalities and the fact that \( r_0 \in [1, 2] \), there exists \( C = C(N, p, q) > 0 \) such that

\[
\int_{B_1} u^{q+1} \leq \int_{B_{r_0}} u^{q+1}
\]

\[
\leq C \int_{S_{r_0}} (u^{q+1} + |\partial v| |u| + |\partial u| |v|)
\]

\[
\leq C[F(4)^a + \|Dv\|_{L^{\frac{q+1}{q}}(S_{r_0})} \|u\|_{L^{q+1}(S_{r_0})} + \|Du\|_{L^{\frac{p+1}{p}}(S_{r_0})} \|v\|_{L^{p+1}(S_{r_0})} + 1]
\]

\[
\leq C[F(4)^{\frac{p+a}{p+1}} + 1],
\]

where \( C = C(N, p, q) > 0 \).

Replacing \((u, v)\) by \((R^\alpha u(Rx), R^\beta v(Rx))\) in the above inequalities and changing variables yield that

\[
F(R) \leq C[F(4R)^{\frac{p+a}{p+1}} R^{\frac{(1-\alpha)(N-2-\alpha-\beta)}{p+1}} + R^{N-2-\alpha-\beta}].
\]

Since \( u \) is bounded, there exist a large positive constant \( c > 0 \) and a sequence of \( \{R_i\}_{i=1}^\infty \) with \( \lim_{i \to \infty} R_i = +\infty \) such that \( F(4R_i) \leq cF(R_i) \) (see [3], [18]). Therefore,

\[
F(R_i) \leq C[c^{\frac{p+a}{p+1}} F(R_i)^{\frac{p+a}{p+1}} R_i^{\frac{(1-\alpha)(N-2-\alpha-\beta)}{p+1}} + R_i^{N-2-\alpha-\beta}].
\]
Since \((p, q)\) is subcritical and \(a \in [0, 1)\), we have \(\frac{p+q}{p+1} \in (0, 1)\), \(N - 2 - \alpha - \beta < 0\) and \(\frac{(1-a)(N-2-\alpha-\beta)}{p+1} < 0\). Therefore, \(F(R_i)\) is bounded,

\[
\int_{\mathbb{R}^N} u^{q+1} = \lim_{i \to \infty} \int_{B_{R_i}} u^{q+1} = 0,
\]

and

\[u \equiv 0, \ v \equiv 0,\]

which is a contradiction.

4 Proof of Theorem 1.2

In this section, we prove Theorem 1.2.

\textbf{Lemma 4.1.} Suppose that \(pq > 1\), \((p, q)\) is subcritical, \(\alpha = \max\{\alpha, \beta\} > N - 3\) and \((u, v)\) is a bounded positive solution of system (1.2). Then there exist \(C = C(N, p, q) > 0\) and \(b = b(N, p, q) \in [0, 1)\) such that

\[
\int_{S_{r_0}} u^{q+1} \leq C[F(4)^b + 1].
\]

\textbf{Proof.} By the proof of Lemma 3.5, we only need to consider the case of \(N \geq 4\) and \(q \geq \frac{2}{N-3}\).

Let \(l = \frac{p+1}{p}\) and \(\frac{1}{\nu} = \frac{1}{l} - \frac{2}{N-1}\). Since \((p, q)\) is subcritical, then

\[
\frac{1}{\nu} < l - \frac{2}{N} = 1 - \frac{1}{p+1} - \frac{2}{N} < \frac{1}{q+1} \quad \text{and} \quad q+1 < \nu.
\]

For any \(\gamma \in (0, 1]\), let \(s = s(\gamma) \in [0, 1)\) solve the equation

\[
\frac{1}{q+1} = \frac{N-3}{\gamma(N-1)}(1 - s) + \frac{s}{\nu}.
\]

Then

\[
s = \frac{\frac{N-3}{\gamma(N-1)} - \frac{1}{q+1}}{\frac{N-3}{\gamma(N-1)} - \frac{1}{\nu}} \quad \text{and} \quad s(1) = (p+1)(\frac{N-3}{N-1} - \frac{1}{q+1}).
\]
By (3.6), interpolation inequalities, (1) of Lemma 2.1 Lemma 2.2 Lemma 2.3 and the fact that \( r_0 \in [1, 2] \), we have

\[
\|u(r_0)\|_{q+1} \leq \|u(r_0)\|_{\frac{1-s}{N-1}}^{1-s} \|u(r_0)\|_{s}^s \\
\leq C(\|D^2u(r_0, \theta)\|_{l}^s + 1) \\
\leq C + C(\int_{S_{r_0}} |D^2u|^l)^{\frac{s}{l}} \\
\leq C + C(\int_{B_2} |D^2u|^l)^{\frac{s}{l}} \\
\leq C + C(\int_{B_4} |\Delta u|^l)^{\frac{s}{l}} \\
= C + C(\int_{B_4} v_{p+1})^{\frac{s}{l}}. 
\]

(4.1)

Since \((u, v)\) is bounded, by (4.1), Lemma 2.4 and the fact that \( r_0 \in [1, 2] \), we have

\[
\int_{S_{r_0}} u^{q+1} \leq C + C(\int_{B_4} v_{p+1})^{b(\gamma)} \leq C[(\int_{B_4} u^{q+1})^{b(\gamma)} + 1],
\]

(4.2)

where \( C = C(N, p, q, \gamma) > 0 \) and \( b(\gamma) = \frac{(q+1)s}{l} = \frac{p(q+1)s}{p+1} \in C((0, 1]) \). Then \( b(1) = \frac{N-3}{N-1}p(q+1) - p \).

Since \((p, q)\) is subcritical, by (1.4) we have \( p = \frac{\alpha+2}{\beta} \), \( q = \frac{\beta+2}{\alpha} \) and since \( p \geq q \) and \( \alpha > N - 3 \), we have

\[
b(1) - 1 = (q+1)[\frac{(N-3)(\alpha+2)}{(N-1)\beta} - \frac{\alpha}{\beta}] = \frac{2(q+1)}{(N-1)\beta}(-\alpha + N - 3) < 0.
\]

Therefore, there exists \( \gamma_1 < 1 \) such that \( a(\gamma_1) < 1 \). Let \( a = a(\gamma_1) \) in (4.2). Then, we obtain this lemma.

By Lemma 2.4 Lemma 2.6 Lemma 3.4 Lemma 4.1 and scale invariance of the solutions, we can prove Theorem 1.2. Since the proof is similar to the proof of Theorem 1.1, we omit it.
