HILBERT SERIES OF BINOMIAL EDGE IDEALS

ARVIND KUMAR AND RAJIB SARKAR

Abstract. Let $G$ be a finite simple graph on $n$ vertices and $J_G$ denote the corresponding binomial edge ideal in the polynomial ring $S = K[x_1, \ldots, x_n, y_1, \ldots, y_n]$. In this article, we compute the Hilbert series of binomial edge ideal of decomposable graphs in terms of Hilbert series of its indecomposable subgraphs. Also, we compute the Hilbert series of binomial edge ideal of join of two graphs and as a consequence we obtain the Hilbert series of complete $k$-partite graph, fan graph, multi-fan graph and wheel graph.

1. Introduction

Let $G$ be a finite simple graph on the vertex set $[n]$. Herzog et al. in [5] and Ohtani, independently in [11], introduced the notion of binomial edge ideal corresponding to a finite simple graph. Let $S = K[x_1, \ldots, x_n, y_1, \ldots, y_n]$, where $K$ is a field. The binomial edge ideal of the graph $G$ is $J_G = \langle x_i y_j - x_j y_i : \{i, j\} \in E(G), i < j \rangle$. Researchers have been trying to relate the algebraic properties of $J_G$ with the combinatorial properties of $G$, see for example [1, 4, 5, 7, 8, 9, 10]. While the Castelnuovo-Mumford regularity of binomial edge ideals of several classes of graphs are known, not much is known about other invariants such as Betti numbers, Hilbert series and multiplicity. Betti numbers and Hilbert series of the binomial edge ideals of cycles were computed by Zafar and Zahid in [13]. Mohammadi and Sharifan studied the Hilbert series of quasi cycles in [10]. In [12], Schenzel and Zafar computed dimension, depth, multiplicity and Betti numbers of complete bipartite graphs. The aim of this article is to compute the Hilbert series of binomial edge ideals of graphs in terms of the Hilbert series of certain subgraphs.

A graph $G$ is said to be decomposable if there exist induced subgraphs $G_1$ and $G_2$ such that $G = G_1 \cup G_2$, $V(G_1) \cap V(G_2) = \{v\}$ and $v$ is a free vertex of $G_1$ and $G_2$. A graph $G$ is indecomposable, if it is not decomposable. Up to permutation, $G$ has a unique decomposition into indecomposable subgraphs, i.e. there exist indecomposable subgraphs $G_1, \ldots, G_r$ of $G$ with $G = G_1 \cup \cdots \cup G_r$ such that for each $i \neq j$, either $V(G_i) \cap V(G_j) = \emptyset$ or $V(G_i) \cap V(G_j) = \{v_{i,j}\}$ and $v_{i,j}$ is a free vertex of $G_i$ and $G_j$. In Section 3, we obtain the Hilbert series and multiplicity of a decomposable graph in terms of the Hilbert series of its indecomposable subgraphs (Theorem 3.2). As consequences we obtain the Hilbert series of binomial edge ideals of graphs in terms of the Hilbert series of certain subgraphs.

A graph $G$ is said to be decomposable if there exist induced subgraphs $G_1$ and $G_2$ such that $G = G_1 \cup G_2$, $V(G_1) \cap V(G_2) = \{v\}$ and $v$ is a free vertex of $G_1$ and $G_2$. A graph $G$ is indecomposable, if it is not decomposable. Up to permutation, $G$ has a unique decomposition into indecomposable subgraphs, i.e. there exist indecomposable subgraphs $G_1, \ldots, G_r$ of $G$ with $G = G_1 \cup \cdots \cup G_r$ such that for each $i \neq j$, either $V(G_i) \cap V(G_j) = \emptyset$ or $V(G_i) \cap V(G_j) = \{v_{i,j}\}$ and $v_{i,j}$ is a free vertex of $G_i$ and $G_j$. In Section 3, we obtain the Hilbert series and multiplicity of a decomposable graph in terms of the Hilbert series of its indecomposable subgraphs (Theorem 3.2). As consequences we obtain the Hilbert series of binomial edge ideals of graphs in terms of the Hilbert series of certain subgraphs.

Let $H$ and $H'$ be two graphs with the vertex sets $[p]$ and $[q]$, respectively. The join of $H$ and $H'$, denoted by $H \ast H'$ is the graph with vertex set $[p] \sqcup [q]$ and the edge set $E(H \ast H') = E(H) \cup E(H') \cup \{\{i, j\} | i \in [p], j \in [q]\}$. Our aim is to compute the Hilbert series of $H \ast H'$ in terms of the Hilbert series of $H$ and $H'$. First, we treat the case when both the graphs are disconnected (Theorem 4.2). In order to compute the Hilbert

AMS Subject Classification (2010): 13A02, 05E40.
series of join of two arbitrary graphs, it is necessary to understand the structure of some other intermediate graphs. We define a product operation of a graph with the complete graph and study the minimal primes and Hilbert series of the resulting graph. We further compute the Hilbert series of several intermediate graphs and use those results finally to obtain:

**Theorem 4.13** Let $H$ and $H'$ be two graphs on vertex sets $[p]$ and $[q]$, respectively. Let $G = H \ast H'$ be the join of $H$ and $H'$. Let $S_H = K[x_i, y_i : i \in V(H)], S_{H'} = K[w_i, z_i : i \in V(H')]$ and $S = K[x_i, y_i, w_j, z_j : i \in V(H), j \in V(H')]$. Then

$$\text{Hilb}_{S/J_G}(t) = \text{Hilb}_{S_H/J_H(t)} + \text{Hilb}_{S_{H'}/J_{H'}(t)} + \frac{(p + q - 1)t + 1}{(1 - t)p+q+1} - \frac{(p - 1)t + 1}{(1 - t)p+1} - \frac{(q - 1)t + 1}{(1 - t)q+1}.$$

As consequences, we obtain the Hilbert series of binomial edge ideal of complete $k$-partite graph, wheel graph, fan graph and multi-fan graph.

2. Preliminaries

In this section we recall some notation and fundamental results which are used throughout this article.

Let $G$ be a finite simple graph with the vertex set $V(G)$ and edge set $E(G)$. For a subset $A \subseteq V(G)$, $G[A]$ denotes the induced subgraph of $G$ on the vertex set $A$, that is, for $i, j \in A, \{i, j\} \in E(G[A])$ if and only if $\{i, j\} \in E(G)$. A subset $U \subseteq V(G)$ is said to be a **clique** if $G[U]$ is a complete graph. A clique $U$ is said to be a maximal clique if for every $v \in V(G) \setminus U, U \cup \{v\}$ is not a clique. A vertex $v \in V(G)$ is called a **free vertex** if $v$ belongs to exactly one maximal clique. For a vertex $v, G \setminus v$ denotes the induced subgraph of $G$ on the vertex set $V(G) \setminus \{v\}$. A vertex $v \in V(G)$ is said to be a **cut vertex** if $G \setminus v$ has strictly more connected components than $G$. For a vertex $v, G_v$ denotes the graph on the vertex set $V(G)$ and edge set $E(G_v) = E(G) \cup \{\{u, w\} : u, w \in N_G(v)\}$, where for any $x \in V(G), N_G(x) = \{u \in V(G) : \{u, x\} \in E(G)\}$. Complement of $G$, denoted by $G^c$ is the graph on the vertex set $V(G)$ and the edge set $E(G^c) = \{\{i, j\} : i \neq j, \{i, j\} \notin E(G)\}$.

For a subset $T$ of $[n]$, let $\hat{T} = [n] \setminus T$ and $c_G(T)$ denote the number of connected components of $G[\hat{T}]$. Let $G_1, \cdots, G_{c_G(T)}$ be connected components of $G[\hat{T}]$. For each $i$, let $G_i$ denote the complete graph on $V(G_i)$ and $P_T(G) = (\bigcup_{i \in T}\{x_i, y_i\}, J_{G_1}, \cdots, J_{G_{c_G(T)}})$.

It was shown by Herzog et al. that $J_G = \bigcap_{T \subseteq [n]} P_T(G)$. For each $i \in T$, if $i$ is a cut vertex of the graph $G[\hat{T} \cup \{i\}]$, then we say that $T$ has the cut point property. Let $\mathcal{C}(G) = \{\phi\} \cup \{T : T \text{ has cut point property}\}$ and $\mathcal{M}(G) = \{P_T(G) : T \in \mathcal{C}(G)\}$. In [5], the authors proved that $P$ is the minimal prime associated to $J_G$ if and only if $P \in \mathcal{M}(G)$. 

Let $M = \bigoplus_{k \in \mathbb{N}} M_k$ be a graded $S$-module such that for each $k \in \mathbb{N}$, $l(M_k) < \infty$. The function $H_M : \mathbb{N} \rightarrow \mathbb{N}$ defined as $H_M(k) = l(M_k)$ is called the Hilbert function of the module $M$. The Hilbert series of $M$ is the generating function of the Hilbert function $H_M$ and is denoted by, $\text{Hilb}_M(t) = \sum_{k \in \mathbb{N}} l(M_k) t^k$. Let $M$ be a finitely generated graded $S$-module of dimension $d$. The Hilbert polynomial of $M$, denoted by $P_M(X)$ is the unique polynomial with rational coefficients such that $H_M(k) = P_M(k)$ for $k \gg 0$. It is known that one can express the polynomial $P_M(X)$ as

$$P_M(X) = \sum_{i=0}^{d-1} (-1)^{d-i} e_{d-1-i}(M) \binom{X+i}{i},$$

where $e_j(M)$’s are integers in [2 Lemma 4.1.4]. The coefficient $e(M) = e_0(M)$ is called the multiplicity of $M$.

3. Hilbert series of binomial edge ideal of decomposable graphs

In this section, we compute the Hilbert series of decomposable graphs in terms of the Hilbert series of its indecomposable components. Throughout this section, by writing $G = G_1 \cup \cdots \cup G_r$, we mean that $G_i$’s are induced subgraphs of $G$ such that $V(G_i) \cap V(G_j) = \emptyset$ or $\{v_{i,j}\}$ where $v_{i,j}$ is a free vertex in $G_i$ and $G_j$. We begin by recalling the Betti polynomial of $M$.

**Definition 3.1.** Let $M$ be a finite graded $S$-module. Then we denote by

$$B_M(s,t) = \sum_{i,j} \beta_{ij}(M)s^it^j,$$

the Betti polynomial of $M$, where $\beta_{ij}(M)$ are the graded Betti numbers of $M$.

Recently J. Herzog and G. Rinaldo [6 Proposition 3] proved that if $G = G_1 \cup G_2$, then

$$B_{S/J_G}(s,t) = B_{S/J_{G_1}}(s,t)B_{S/J_{G_2}}(s,t) = B_{S_1/J_{G_1}}(s,t)B_{S_2/J_{G_2}}(s,t),$$

where $S_i = K[x_j, y_j : j \in V(G_i)]$ for $i \in \{1, 2\}$.

By [2 Lemma 4.1.13], the Hilbert series of a graded $S$-module $S/J_G$ is

$$\text{Hilb}_{S/J_G}(t) = \frac{B_{S/J_G}(-1,t)}{(1-t)^{2n}}.$$ 

As an immediate consequence, we obtain

**Theorem 3.2.** Let $G = G_1 \cup G_2$ be a graph on the vertex set $[n]$. Then

$$\text{Hilb}_{S/J_G}(t) = (1-t)^2 \text{Hilb}_{S_1/J_{G_1}}(t) \text{Hilb}_{S_2/J_{G_2}}(t),$$

where $S_i = K[x_j, y_j : j \in V(G_i)]$, for $i = 1, 2$. In particular,

$$\dim(S/J_G) = \dim(S_1/J_{G_1}) + \dim(S_2/J_{G_2}) - 2 \text{ and } e(S/J_G) = e(S_1/J_{G_1})e(S_2/J_{G_2}).$$
Proof. For $i = 1, 2$, let $G_i$ be a graph on vertex set $[m_i]$. Note that $n = m_1 + m_2 - 1$. Now,

$$\text{Hilb}_{S/J_G}(t) = \frac{B_{S/J_G}(-1, t)}{(1 - t)^{2n}} = \frac{B_{S/J_G}(-1, t)}{(1 - t)^{2(m_1 + m_2 - 1)}} = (1 - t)^2 \text{Hilb}_{S_1/J_{G_1}}(t) \text{Hilb}_{S_2/J_{G_2}}(t).$$

Now, let $d = \dim(S/J_G)$ and $d_i = \dim(S_i/J_{G_i})$, for $i = 1, 2$. It follows from [2] Corollary 4.1.8 that $\text{Hilb}_{S/J_G}(t) = \frac{Q_{S/J_G}(t)}{(1 - t)^d}$, $\text{Hilb}_{S_1/J_{G_1}}(t) = \frac{Q_{S_1/J_{G_1}}(t)}{(1 - t)^{d_1}}$ and $\text{Hilb}_{S_2/J_{G_2}}(t) = \frac{Q_{S_2/J_{G_2}}(t)}{(1 - t)^{d_2}}$. Therefore

$$\frac{Q_{S/J_G}(t)}{(1 - t)^d} = (1 - t)^2 Q_{S_1/J_{G_1}}(t) Q_{S_2/J_{G_2}}(t).$$

Hence $d = d_1 + d_2 - 2$ and $Q_{S/J_G}(t) = Q_{S_1/J_{G_1}}(t) Q_{S_2/J_{G_2}}(t)$. Also, $e(S/J_G) = Q_{S/J_G}(1) = e(S_1/J_{G_1}) e(S_2/J_{G_2})$. \hfill \Box

The following is an immediate consequence of previous result.

**Corollary 3.3.** Let $G = G_1 \cup \cdots \cup G_r$ be a connected graph. Let $S_i = K[x_j, y_j : j \in V(G_i)]$, for each $i \in [r]$. Then

$$\text{Hilb}_{S/J_G}(t) = (1 - t)^{2r - 2} \prod_{i \in [r]} \text{Hilb}_{S_i/J_{G_i}}(t).$$

In particular, $\dim(S/J_G) = \sum_{i \in [r]} \dim(S_i/J_{G_i}) - 2r + 2$ and $e(S/J_G) = \prod_{i \in [r]} e(S_i/J_{G_i})$.

Note that if $G$ is the complete graph on $n$ vertices, then $S/J_G$ is a determinantal ring. It follows from [3] Corollary 1 that $\text{Hilb}_{S/J_G}(t) = \frac{(n-1)!+1}{(1 - t)^n}$. Hence by [2] Proposition 4.1.9, $e(S/J_G) = n$, $e_1(S/J_G) = n - 1$ and for $2 \leq i \leq n$, $e_i(S/J_G) = 0$.

**Corollary 3.4.** Let $G = P_n$ be the path graph on the vertex set $[n]$. Then

$$\text{Hilb}_{S/J_G}(t) = \frac{(1 + t)^{n-1}}{(1 - t)^{n+1}},$$

$$e_i(S/J_G) = \binom{n-1}{i-1} 2^{n-1-i} \text{ for } 0 \leq i \leq n - 1 \text{ and } e_n(S/J_G) = 0.$$  

Proof. The result follows for $n = 1, 2$. For $n \geq 3$, $G$ is a decomposable graph with $n - 1$ indecomposable subgraphs and each indecomposable subgraph of $G$ is $K_2$. Thus, by Corollary 3.3 $\text{Hilb}_{S/J_G}(t) = (1 - t)^{2n - 4} \left(\frac{1 + t}{1 - t}\right)^{n-1} = \frac{(t+1)^{n-1}}{(1 - t)^{n+1}} = \frac{Q(t)}{(1 - t)^{n+1}}$. For $0 \leq i \leq n - 1$, $Q^{(i)}(t) = i! \binom{n-1}{i} (1 + t)^{n-1-i}$, where $Q^{(i)}(t)$ denotes the $i$-th derivative of $Q(t)$ with respect to $t$. Hence it follows from [2] Proposition 4.1.9 that for $0 \leq i \leq n - 1$, $e_i(S/J_G) = \binom{n-1}{i} 2^{n-1-i}$ and $e_n(S/J_G) = 0$. \hfill \Box
Proposition 3.5. Let $\dim(e)$ and $k$ be consequences of this we obtain the Hilbert series of the binomial edge ideal of complete multigraphe. In particular, let $G$ be a Cohen-Macaulay closed graph on vertex set $[n]$. Let $L_{m,r_1,...,r_k}$ denote the graph obtained by identifying one free vertex of each path $P_{r_1},...,P_{r_k}$ with $k$ distinct vertices of $K_m$. Such a graph is called $k$-handle lollipop graph.

For an induced subgraph $H$ of $G$, set $S_H = K[x_j, y_j : j \in V(H)]$.

**Proposition 3.5.** Let $G = L_{m,r_1,...,r_k}$ be a $k$-handle lollipop graph. Then

$$\text{Hilb}_{S/J_G}(t) = \frac{((m-1)t+1)(1+t)^{r-k}}{(1-t)^{m+r-k+1}}, \text{ where } r = r_1 + \cdots + r_k.$$ 

In particular, $\dim(S/J_G) = m + r - k + 1$ and $e(S/J_G) = 2^{r-k}m$.

**Proof.** Note that $G = K_m \cup P_{r_1} \cup P_{r_2} \cup \cdots \cup P_{r_k}$. Therefore by Corollary 3.3,

$$\text{Hilb}_{S/J_G}(t) = (1-t)^{2k} \text{Hilb}_{S_{K_m}/J_{K_m}}(t) \prod_{i \in [k]} \text{Hilb}_{S_{P_{r_i}}/J_{P_{r_i}}}(t).$$

By Corollary 3.4, we have

$$\text{Hilb}_{S/J_G}(t) = (1-t)^{2k} \frac{((m-1)t+1)}{(1-t)^{m+1}} \prod_{i \in [k]} (1+t)^{r_i-1} \frac{(1+t)^{r_i+1}}{(1-t)^{m+r-k+1}}.$$

It follows from Proposition 3.5 and [2, Proposition 4.1.9] that if $G = L_{m,r_1,...,r_k}$, then for $1 \leq i \leq r-k$, $e_i(S/J_G) = (m-1)\binom{r-k}{i-1}2^{r-k-i+1} + m\binom{r-k}{i}2^{r-k-i}$, $e_{r-k+1}(S/J_G) = m - 1$ and $e_j(S/J_G) = 0$ for $j \geq r + k - 2$.

Let $G$ be a Cohen-Macaulay closed graph on vertex set $[n]$. It follows from [4, Theorem 3.1] that $G = K_{m_1} \cup \cdots \cup K_{m_r}$ for some $m_i \geq 2$. Therefore by using Corollary 3.3, we recover the result of Ene-Herzog-Hibi([4, page 66]),

$$\text{Hilb}_{S/J_G}(t) = (1-t)^{2r-2} \prod_{i \in [r]} \text{Hilb}_{S_{K_{m_i}}/J_{K_{m_i}}}(t) = \frac{\prod_{i \in [r]} ((m_i-1)t+1)}{(1-t)^{n+1}}$$

and $e(S/J_G) = \prod_{i \in [r]} m_i$.

**4. Hilbert series of binomial edge ideal of join of graphs**

In this section we compute the Hilbert series of binomial edge ideal of join of two graphs. As consequences of this we obtain the Hilbert series of the binomial edge ideal of complete $k$-partite graphs, wheel graphs, fan graphs and multi-fan graphs.
Definition 4.1. Let $H$ and $H'$ be two graphs with the vertex sets $[p]$ and $[q]$, respectively. The join of $H$ and $H'$, denoted by $H \ast H'$, is the graph with vertex set $[p] \sqcup [q]$ and the edge set $E(H \ast H') = E(H) \cup E(H') \cup \{(i, j) | i \in [p], j \in [q]\}$.

The graph $G$, given on the right, is the join of the complete graph $K_4$ and the complement graph of the complete graph $K_3$.

For rest of the section we use the following notation: Let $H$ and $H'$ be two graphs on vertex sets $[p]$ and $[q]$, respectively. Let $G = H \ast H'$ be the join of $H$ and $H'$. Set $S_H = K[x_i, y_i : i \in V(H)], S_{H'} = K[z_j, z_j' : j \in V(H')]$ and $S = K[x_i, y_i, z_j, z_j' : i \in V(H), j \in V(H')]$.

Theorem 4.2. Let $H$ and $H'$ be two disconnected graphs on vertex sets $[p]$ and $[q]$, respectively. Let $G = H \ast H'$ be the join of $H$ and $H'$. Then

$$\text{Hilb}_{S/J_G}(t) = \text{Hilb}_{S_H/J_H}(t) + \text{Hilb}_{S_{H'}/J_{H'}}(t) + \frac{(p + q - 1)t + 1}{(1 - t)^{p+q+1}} - \frac{(p - 1)t + 1}{(1 - t)^{p+1}} - \frac{(q - 1)t + 1}{(1 - t)^{q+1}}.$$ 

Proof. It follows from [9, Proposition 4.14] that

$$\mathcal{C}(G) = \{\phi\} \cup \{T \sqcup [q] : T \in \mathcal{C}(H)\} \cup \{[p] \sqcup T' : T' \in \mathcal{C}(H')\}.$$ 

Let

$$Q_1 = \bigcap_{T \in \mathcal{C}(G)} P_T(G) = (x_i, y_i : i \in [p]) + J_H'$$

and

$$Q_2 = \bigcap_{T \in \mathcal{C}(G) \setminus \{\phi\}} P_T(G) = (z_i, w_i : i \in [q]) + J_H.$$ 

Now, by [5, Corollary 3.9],

$$J_G = \bigcap_{T \in \mathcal{C}(G)} P_T(G) = P_{\phi}(G) \cap Q_1 \cap Q_2 = J_{K^{p+q}} \cap Q_1 \cap Q_2.$$ 

Set $Q_3 = J_{K^{p+q}} \cap Q_2$ and consider the short exact sequence,

$$0 \rightarrow S_{Q_3} \rightarrow S_{J_{K^{p+q}}} \oplus S_{Q_2} \rightarrow S_{J_{K^{p+q}} + Q_2} \rightarrow 0.$$ 

Note that $J_{K^{p+q}} + Q_2 = (z_i, w_i : i \in [q]) + J_K$. Therefore

$$\text{Hilb}_{S/Q_3}(t) = \text{Hilb}_{S/J_{K^{p+q}}}(t) + \text{Hilb}_{S/Q_2}(t) - \text{Hilb}_{S/J_{K^{p+q}} + Q_2}(t) = \frac{(p + q - 1)t + 1}{(1 - t)^{p+q+1}} + \text{Hilb}_{S_H/J_H}(t) - \frac{(p - 1)t + 1}{(1 - t)^{p+1}}.$$ 

Now, consider the short exact sequence

$$0 \rightarrow S_{J_G} \rightarrow S_{Q_1} \oplus S_{Q_3} \rightarrow S_{Q_1 + Q_3} \rightarrow 0.$$
Note that $Q_1 + Q_3 = (x_i, y_i : i \in [p]) + J_{K_p}$. Therefore
\[
\text{Hilb}_{S/J_G}(t) = \text{Hilb}_{S/Q_1}(t) + \text{Hilb}_{S/Q_3}(t) - \text{Hilb}_{S/Q_1 + Q_3}(t)
\]
\[
= \text{Hilb}_{S^{H'}}/J_{H'}(t) + \text{Hilb}_{S/H}(t) + \frac{(p + q - 1)t + 1}{(1 - t)^{p+q+1}} - \frac{(p - 1)t + 1}{(1 - t)^{p+1}} - \frac{(q - 1)t + 1}{(1 - t)^{q+1}}.
\]
\[
\square
\]

Now we move on to study the join of a disconnected graph with a complete graph. We first identify the subsets with cutpoint property.

**Lemma 4.3.** Let $H$ be a disconnected graph on the vertex set $[p]$. Let $G = H \ast K_q$ be the join of $H$ and $K_q$. Then
\[
\mathcal{C}(G) = \{\emptyset\} \cup \{T \cup [q] : T \in \mathcal{C}(H)\}.
\]

**Proof.** The proof is immediate from [9, Proposition 4.5].
\[
\square
\]

We now compute the Hilbert series:

**Theorem 4.4.** Let $H$ be a disconnected graph on the vertex set $[p]$. Let $G = H \ast K_q$ be the join of $H$ and the complete graph $K_q$. Then
\[
\text{Hilb}_{S/J_G}(t) = \text{Hilb}_{S^{H'}/J_{H'}}(t) + \frac{(p + q - 1)t + 1}{(1 - t)^{p+q+1}} - \frac{(p - 1)t + 1}{(1 - t)^{p+1}}.
\]

**Proof.** By [5, Corollary 3.9], $J_G = \bigcap_{T \in \mathcal{E}(G)} P_T(G)$. Let $Q = \bigcap_{T \in \mathcal{E}(G) | q \subseteq T} P_T(G) = (z_j, w_j : j \in [q]) + J_H$. Now it follows from Lemma 4.3 that $J_G = P_{\emptyset}(G) \cap Q = J_{K_{p+q}} \cap Q$. Consider the short exact sequence
\[
0 \rightarrow S_{J_G} \rightarrow S_{J_{K_{p+q}}} \oplus S_Q \rightarrow S_{J_{K_{p+q}} + Q} \rightarrow 0.
\]
Note that $J_{K_{p+q}} + Q = (z_j, w_j : j \in [q]) + J_{K_p}$. Therefore
\[
\text{Hilb}_{S/J_G}(t) = \text{Hilb}_{S/Q}(t) + \text{Hilb}_{S/J_{K_{p+q}}}(t) - \text{Hilb}_{S/(J_{K_{p+q}} + Q)}(t)
\]
\[
= \text{Hilb}_{S/H}(t) + \frac{(p + q - 1)t + 1}{(1 - t)^{p+q+1}} - \frac{(p - 1)t + 1}{(1 - t)^{p+1}}.
\]
\[
\square
\]

If $H$ is a disconnected graph, then by taking $q = 1$ in Theorem 4.4 we obtain the Hilbert series of the cone of $H$. Of particular interest is the case of multi-fan graph. Let $P_{p_1}, \ldots, P_{p_r}$ denote paths on vertices $p_1, \ldots, p_r$ respectively. The graph $\{v\} \ast (\bigcup_{i=1}^r P_{p_i})$ is called a multi-fan graph, denoted by $M_{p_1, \ldots, p_r}$. As a consequence of Theorem 4.4 we obtain the Hilbert series of binomial edge ideal of the multi-fan graphs.

**Corollary 4.5.** Let $G = M_{p_1, \ldots, p_r}$ be the multi-fan graph with $r \geq 2$. Let $p = \sum_{i \in [r]} p_i$. Then
\[
\text{Hilb}_{S/J_G}(t) = \frac{(1 + t)^{p-r}}{(1 - t)^{p+r}} + \frac{(p - 1)t^2 + 2t}{(1 - t)^{p+2}}.
\]
In particular, \( \dim(S/J_G) = p + r \) and

\[
e(S/J_G) = \begin{cases} 
2^{p-r} & \text{if } r > 2, \\
2^{p-r} + p + 1 & \text{if } r = 2.
\end{cases}
\]

Proof. Let \( H = \biguplus_{i \in [r]} P_{p_i}. \) Since \( r \geq 2, \) by Theorem 4.4 and Corollary 3.4

\[
\Hilb_{S/J_G}(t) = \Hilb_{S_{H/J_H}}(t) + \frac{(p - 1)t + 1}{(1 - t)^{p+1}} - \frac{pt + 1}{(1 - t)^{p+2}} - \frac{(p - 1)t + 1}{(1 - t)^{p+1}} - \frac{pt + 1}{(1 - t)^{p+2}}.
\]

We proceed to study the connected case now. To understand \( H \ast K_q, \) where \( H \) is a connected graph, we need more tools. We first treat the case \( q = 1. \)

**Theorem 4.6.** Let \( H \) be a connected graph on \([p]\) and \( G = H \ast \{v\}. \) Then

\[
\Hilb_{S/J_G}(t) = \Hilb_{S_{H/J_H}}(t) + \frac{(p - 1)t^2 + 2t}{(1 - t)^{p+2}}.
\]

In particular,

\[
e(S/J_G) = \begin{cases} 
e(S_{H/J_H}) & \text{if } \dim(S_{H/J_H}) \geq p + 3, \\
p + 1 + e(S_{H/J_H}) & \text{if } \dim(S_{H/J_H}) = p + 2, \\
p + 1 & \text{if } \dim(S_{H/J_H}) = p + 1.
\end{cases}
\]

Proof. If \( H = K_p, \) then the result is immediate. Assume that \( H \neq K_p, \) so that \( v \) is not a free vertex in \( G. \) By [11, Lemma 4.8], \( J_G = J_{G_v} \cap ((x_v, y_v) + J_{G \setminus v}). \) Note that \( G_v = K_{p+1} \) and \( G \setminus v = H. \) It follows from the short exact sequence

\[
0 \rightarrow S/J_G \rightarrow S/J_{K_{p+1}} \oplus S/(x_v, y_v) + J_H \rightarrow S/(x_v, y_v) + J_{K_p} \rightarrow 0
\]

that

\[
\Hilb_{S/J_G}(t) = \Hilb_{S_{H/J_H}}(t) + \frac{pt + 1}{(1 - t)^{p+2}} - \frac{(p - 1)t + 1}{(1 - t)^{p+1}}
\]

\[
= \Hilb_{S_{H/J_H}}(t) + \frac{(p - 1)t^2 + 2t}{(1 - t)^{p+2}}.
\]

The formula for the multiplicity follows directly from the Hilbert series expression. \( \square \)

As an immediate consequence, we have:
Corollary 4.7. Let $G = W_{p+1}$ be the wheel graph on $[p + 1]$ with $p \geq 3$. Then

$$\text{Hilb}_{S/J_G}(t) = \frac{(1 - t^2)(1 + t)^{p-1} + (p-1)t^p + t^{p+1}}{(1-t)^{p+1}} + \frac{(p-1)t^2 + 2t}{(1-t)^{p+2}}.$$ 

In particular, $\dim(S/J_G) = p + 2$ and $e(S/J_G) = p + 1$.

Proof. Let $H = C_p$ be the cycle graph on $[p]$. Note that $G = C_p \ast \{v\}$. Therefore by Theorem 4.6,

$$\text{Hilb}_{S/J_G}(t) = \text{Hilb}_{S_H/J_H}(t) + \frac{(p-1)t^2 + 2t}{(1-t)^{p+2}}.$$ 

Now the result follows from [13, Theorem 10]. \qed

We now define a new product which is required in the computation of the Hilbert series of join of two arbitrary graphs.

Let $H$ be a graph on $[p]$ and $H'$ be a graph on $[q]$. Let $v_1, ..., v_r$ be vertices of $H'$ with $1 \leq r \leq q$. The graph with vertex set $[p] \cup [q]$ and edge set

$$E(H) \cup \{(u, v_i) : u \in V(H), i = 1, ..., r\} \cup E(H')$$

is denoted by $H(\ast)^r H'$. Note that if $r = q$, then $H(\ast)^q H'$ is the join of $H$ and $H'$. For example, the graph $G$ given on the right side is the graph $P_3(\ast)^2 K_4$.

Our next aim is to compute the Hilbert series of $H(\ast)^r K_q$. First we identify the sets with cut point property.

Lemma 4.8. Let $H$ be a graph on $[p]$ and $G = H(\ast)^r K_q$, where $q \geq 2$ and $1 \leq r < q$. Then

$$\mathcal{C}(G) = \{\phi\} \cup \{T \cup \{v_1, ..., v_r\} : T \in \mathcal{C}(H)\}.$$

Proof. Let $T \in \mathcal{C}(G)$ and $T \neq \phi$. First note that $\{v_1, ..., v_r\} \subseteq T$. For if $v_i \notin T$ for some $i$, then $G_{\overline{T}}$ is a connected graph, which contradicts the fact that $T \in \mathcal{C}(G)$. Let $T' = T \setminus \{v_1, ..., v_r\}$. We need to show that $T' \in \mathcal{C}(H)$. If $T' = \phi$, then we are through.

Assume that $T' \neq \phi$. If $u \in T'$, then $G[T' \cup \{u\}] = H[T' \cup \{u\}] \cup K_{q-r}$. Since $u$ is a cut vertex of $G[T' \cup \{u\}]$, it is a cut vertex of $H[T' \cup \{u\}]$. Thus $T' \in \mathcal{C}(H)$.

Conversely, let $T = T' \cup \{v_1, ..., v_r\}$, where $T' \in \mathcal{C}(H)$. Note that for $i \in [r]$, $G[T \cup \{v_i\}] = H[T'](\ast)^1 K_{q-r+1}$. So $v_i$ is a cut vertex of $G[T \cup \{v_i\}]$. If $T' = \phi$, then we are done. Assume that $T' \neq \phi$ and let $u \in T'$. Since $G[T' \cup \{u\}] = H[T' \cup \{u\}] \cup K_{q-r}$, $u$ is a cut vertex of $G[T' \cup \{u\}]$ and $T \in \mathcal{C}(G)$. Hence the result follows. \qed

Theorem 4.9. Let $H$ be a graph on $[p]$ and $G = H(\ast)^r K_q$ be the graph on vertex set $[p] \cup [q]$ with $q \geq 2$ and $1 \leq r < q$. Then

$$\text{Hilb}_{S/J_G}(t) = \text{Hilb}_{S_H/J_H}(t) \frac{(q - r - 1)t + 1}{(1 - t)^{q-r+1}} + \frac{(p + q - r - 1)t + 1}{(1 - t)^{p+q-r+1}} = \frac{(p + q - r - 1)t + 1}{(1 - t)^{p+q-r+1}}.$$
Proof. By [5] Corollary 3.9, \( J_G = \bigcap_{T \in \mathcal{E}(G)} P_T(G) \). Now, by Lemma 4.8

\[
J_G = P_\phi(G) \cap \bigcap_{T \in \mathcal{E}(G), T \neq \phi} P_T(G)
\]

\[
= J_{K_{p+q}} \cap ((x_{v_1}, y_{v_1} : i \in [r]) + J_H + J_{K_{q-r}}).
\]

Let \( Q = (x_{v'}, y_{v'} : i \in [r]) + J_H + J_{K_{q-r}} \). Note that \( J_{K_{p+q}} + Q = (x_{v'}, y_{v'} : i \in [r]) + J_{K_{p+q-r}} \). Then it follows from the exact sequence below

\[
0 \to S/\mathcal{J}_G \to S/J_{K_{p+q}} \oplus S/Q \to S/J_{K_{p+q}} + Q \to 0
\]

that

\[
\text{Hilb}_{S/\mathcal{J}_G}(t) = \text{Hilb}_{S/Q}(t) + \text{Hilb}_{S/J_{K_{p+q}}}(t) - \text{Hilb}_{S/(J_{K_{p+q}} + Q)}(t)
\]

\[
= \text{Hilb}_{S/H}(t)\frac{(q - r - 1)t + 1}{(1 - t)^{q-r+1}} + \frac{(p + q - 1)t + 1}{(1 - t)^{p+q+1}} - \frac{(p + q - r - 1)t + 1}{(1 - t)^{p+q-r+1}}.
\]

Now we compute the Hilbert series of a q-cone over a connected graph \( H \), i.e., join of \( H \) and \( q \) isolated vertices. We denote the graph of \( q \) isolated vertices by \( K_q^c \).

**Theorem 4.10.** Let \( H \) be a connected graph on the vertex set \([p]\). Let \( G = H \ast K_q^c \) be the join of \( H \) and \( K_q^c \). Then

\[
\text{Hilb}_{S/\mathcal{J}_G}(t) = \text{Hilb}_{S/H}(t) + \text{Hilb}_{S/J_{K_{p+K_q^c}}}(t) - \frac{(p - 1)t + 1}{(1 - t)^{p+1}}.
\]

Proof. We proceed by induction on \( q \). For \( q = 1 \), \( G = H \ast \{v\} \) and the result follows from Theorem 4.6. Now assume that \( q > 1 \) and the result is true for \( q - 1 \). Let \( G = H \ast K_q^c \) and \( V(K_q^c) = \{v_1, v_2, \ldots, v_q\} \). Let \( Q_1 = (x_{v_q}, y_{v_q}) + J_{G \setminus v_q} \) and \( Q_2 = J_{G \setminus v_q} \). Note that \( Q_1 + Q_2 = (x_{v_q}, y_{v_q}) + J_{G \setminus v_q} \). Since \( v_q \) is not a free vertex, it follows from [4] Lemma 4.8 that \( J_G = Q_1 \cap Q_2 \). Let \( R = K[x_i, y_i : i \in V(G) \text{ and } i \neq v_q] \). Then by induction hypothesis

\[
\text{Hilb}_{S/\mathcal{J}_G}(t) = \text{Hilb}_{R/J_{G \setminus v_q}}(t) = \text{Hilb}_{S/H}(t) + \text{Hilb}_{R/J_{K_{p+K_q^c}}}(t) - \frac{(p - 1)t + 1}{(1 - t)^{p+1}}.
\]

Consider the short exact sequence

\[
0 \to S/\mathcal{J}_G \to S/Q_1 \oplus S/Q_2 \to S/Q_1 + Q_2 \to 0.
\]

Note that \( G_{v_q} = K_p \ast K_q^c, G_{v_q} \setminus v_q = K_p \ast K_{q-1}^c \) and \( G \setminus v_q = H \ast K_{q-1}^c \). Therefore, it follows from the above short exact sequence that

\[
\text{Hilb}_{S/\mathcal{J}_G}(t) = \text{Hilb}_{S/H}(t) + \text{Hilb}_{S/J_{K_{p+K_q^c}}}(t) - \frac{(p - 1)t + 1}{(1 - t)^{p+1}}.
\]
Corollary 4.11. Let $G = P_p \ast K_q^c$ be the fan graph. Then

$$\text{Hilb}_{S/J_G}(t) = \frac{(1 + t)^{p-1}}{(1 - t)^{p+1}} + \frac{1}{(1 - t)^{2q}} + \frac{(p + q - 1)t + 1}{(1 - t)^{p+q+1}} - \frac{(p - 1)t + 1}{(1 - t)^{q+1}} - \frac{(q - 1)t + 1}{(1 - t)^{q+1}}.$$ 

In particular, $\dim(S/J_G) = \max\{2q, p + q + 1\}$ and

$$e(S/J_G) = \begin{cases} 
1 & \text{if } p + 1 < q, \\
p + q + 1 & \text{if } p + 1 = q, \\
p + q & \text{if } p + 1 > q.
\end{cases}$$

Proof. By Theorem 4.10

$$\text{Hilb}_{S/J_G}(t) = \frac{(1 + t)^{p-1}}{(1 - t)^{p+1}} + \text{Hilb}_{S/J_{K_p \ast K_q^c}}(t) - \frac{(p - 1)t + 1}{(1 - t)^{p+1}}.$$ 

If $q = 1$, then the assertion follows from the Theorem 4.6 Assume that $q > 1$. Now by Theorem 4.14 the assertion follows. □

Theorem 4.12. Let $H$ be a connected graph on $[p]$ and $G = H \ast K_q$, where $q \geq 2$. Then

$$\text{Hilb}_{S/J_G}(t) = \text{Hilb}_{S/H}(t) + \frac{(p + q - 1)t + 1}{(1 - t)^{p+q+1}} - \frac{(p - 1)t + 1}{(1 - t)^{p+1}}.$$ 

Proof. Let $H' = H \cup \{w\}$, $G' = H' \ast K_q^c$, $S_{H'} = S_H[x, w]$ and $S' = S[x, y]$. By Theorem 4.2,

$$\text{Hilb}_{S'/J_{G'}}(t) = \frac{1}{(1 - t)^2} \text{Hilb}_{S/H}(t) + \frac{1}{(1 - t)^{2q}} + \frac{(p + q)t + 1}{(1 - t)^{p+q+2}} - \frac{pt + 1}{(1 - t)^{p+2}} - \frac{(q - 1)t + 1}{(1 - t)^{q+1}}.$$ 

Since $w$ is not a free vertex of $G'$, it follows from [11, Lemma 4.8] that $J_{G'} = C_{w} = H^{*} \ast K_{q+1}, G_{w} = H \ast K_{q}$ and $G_{w} \setminus w = H \ast K_{q} = G$. Consider the short exact sequence

$0 \rightarrow \frac{S'}{J_{G'}} \rightarrow \frac{S'}{Q_1} \oplus \frac{S'}{Q_2} \rightarrow \frac{S'}{Q_1 + Q_2} \rightarrow 0.$

Then by Theorem 4.9 and Theorem 4.10,

$$\text{Hilb}_{S/J_G}(t) = \text{Hilb}_{S/J_{K_q}^c}(t) + \text{Hilb}_{S'/J_{H^{*} \ast K_{q+1}}}(t) - \text{Hilb}_{S'/J_{G'}}(t)$$
$$= \text{Hilb}_{S/H}(t) + \frac{(p + q - 1)t + 1}{(1 - t)^{p+q+1}} - \frac{(p - 1)t + 1}{(1 - t)^{p+1}}.$$ 

□

Now we are ready to compute the Hilbert series of the join of two arbitrary graphs.

Theorem 4.13. Let $H$ and $H'$ be graphs on vertex sets $[p]$ and $[q]$, respectively. Let $G = H \ast H'$ be the join of $H$ and $H'$. Then

$$\text{Hilb}_{S/J_G}(t) = \text{Hilb}_{S/H}(t) + \text{Hilb}_{S'/H'}(t) + \frac{(p + q - 1)t + 1}{(1 - t)^{p+q+1}} - \frac{(p - 1)t + 1}{(1 - t)^{p+1}} - \frac{(q - 1)t + 1}{(1 - t)^{q+1}}.$$
Corollary 4.14. Let $G = K_{p_1,\ldots,p_k}$ be the complete $k$-partite graph on the vertex set 
$[n] = [p_1] \cup \cdots \cup [p_k]$ with $p_1 \geq \cdots \geq p_k$. Then

$$\text{Hilb}_{S/J_G}(t) = \sum_{i \in [k]} \frac{1}{(1-t)^{2p_i}} - \sum_{i \in [k]} \frac{(p_i - 1)t + 1}{(1-t)^{p_i+1}} + \frac{(n-1)t + 1}{(1-t)^{n+1}}.$$ 

In particular, $\dim(S/J_G) = \max\{2p_1, n + 1\}$ and

$$e(S/J_G) = \begin{cases} 
  n & \text{if } p_1 = 1 \text{ or } 2p_1 < n + 1, \\
  1 & \text{if } 2p_1 > n + 1, \\
  n + 1 & \text{if } 2p_1 = n + 1.
\end{cases}$$

Proof. Note that $G = (\cdots (K_{p_1}^c * K_{p_2}^c) * \cdots) * K_{p_k}^c$. Now the result follows by recursively applying Theorem 4.13.
