Mean asymptotics for a Poisson-Voronoi cell on a Riemannian manifold

Pierre Calka, Aurélie Chapron and Nathanaël Enriquez

November 16, 2018

Abstract

In this paper, we consider a Riemannian manifold \( M \) and the Poisson-Voronoi tessellation generated by the union of a fixed point \( x_0 \) and a Poisson point process of intensity \( \lambda \) on \( M \). We obtain asymptotic expansions up to the second order for the means of several characteristics of the Voronoi cell associated with \( x_0 \), including its volume and number of vertices. In each case, the first term of the estimate is equal to the mean characteristic in the Euclidean setting while the second term may contain a particular curvature of \( M \) at \( x_0 \): the scalar curvature in the case of the mean number of vertices, the Ricci curvature in the case of the density of vertices and the sectional curvatures in the cases of the volume and number of vertices of a section of the Voronoi cell. Several explicit formulas are also derived in the particular case of constant curvature. The key tool for proving these results is a new change of variables formula of Blaschke-Petkantschin type in the Riemannian setting. Finally, a probabilistic proof of the Gauss-Bonnet Theorem is deduced from the asymptotic estimate of the total number of vertices of the tessellation in dimension two.

1 Introduction and results

The Poisson-Voronoi tessellation is one of the most natural models of random tessellation of the Euclidean space [Møl94]. It is used in many domains such as crystallography [Mei53], telecommunications [BB01] and astrophysics [vdW94]. Available results include notably its mean characteristics [Møl89] as well as some of its distributional [BL07] and asymptotical properties [HRS04].

Let us now extend the definition of the Poisson-Voronoi tessellation to a Riemannian manifold. One of our goals is to use the mean combinatorial characteristics of this tessellation in order to estimate the local geometric characteristics of the manifold.

Let \( M \) be a complete and connected \( C^\infty \) Riemannian manifold of dimension \( n \geq 2 \) endowed with its Riemannian metric \( d^{(M)}(\cdot, \cdot) \). For \( x \in M \), let \( \langle \cdot, \cdot \rangle_x \) and \( \| \cdot \|_x \) be respectively the metric tensor and the induced norm on the tangent space of \( M \) at \( x \), denoted by \( T_xM \). We denote by \( \text{vol}^{(M)} \) the volume measure on \( M \) associated with \( d^{(M)} \). Let \( \mathcal{P}_\lambda \) be a Poisson point process on \( M \) of intensity measure \( \lambda \text{vol}^{(M)} \). The Poisson-Voronoi tessellation generated by the set of nuclei \( \mathcal{P}_\lambda \) is the collection of cells

\[
\mathcal{C}^{(M)}(x, \mathcal{P}_\lambda) = \{ y \in M, d(x, y) \leq d(x', y), \forall x' \in \mathcal{P}_\lambda \}, \quad x \in \mathcal{P}_\lambda.
\]

In order to recover the local geometry around a point \( x_0 \in M \), we add this point to the process \( \mathcal{P}_\lambda \) and we investigate the characteristics at high intensity of the Voronoi cell associated with the nucleus \( x_0 \), i.e.

\[
\mathcal{C}^{(M)}_{x_0, \lambda} := \mathcal{C}^{(M)}(x_0, \mathcal{P}_\lambda \cup \{ x_0 \}).
\]
We do so in the high intensity setting which ensures that the cell \( C_{x_0,\lambda}^{(M)} \) lies in a small neighborhood of \( x_0 \) with high probability. When \( M \) is the Euclidean space, Slivnyak’s theorem implies that this cell can be seen as a realization of the typical cell of the Poisson-Voronoi tessellation, see e.g. [Mo189]. As in the Euclidean setting, we call vertex of the cell \( C_{x_0,\lambda}^{(M)} \) any non-empty intersection of \( C_{x_0,\lambda}^{(M)} \) with \( n \) other Voronoi cells.

We are in particular interested in the mean values of two characteristics of \( C_{x_0,\lambda}^{(M)} \), namely its volume \( \text{vol}_{\lambda}^{(M)}(C_{x_0,\lambda}^{(M)}) \) and its number of vertices that we denote by \( N(C_{x_0,\lambda}^{(M)}) \). To the best of our knowledge, this has been considered up to now in the Euclidean case and for two non-Euclidean manifolds only, namely the sphere and the hyperbolic space. In both cases the constant curvature implies the invariance of the Voronoi tessellation generated by \( \mathcal{P}_\lambda \) under the action of a specific transformation group and makes it possible to define a typical cell, equal in distribution to \( C_{x_0,\lambda}^{(M)} \). For \( k > 0 \) and \( n \geq 1 \), we denote by \( S_k^n \), the \( n \)-dimensional sphere centered at the origin and of radius \( 1/k \) and by \( H_k^n \) the hyperbolic space of curvature \( -k^2 \). For sake of simplicity, the \( n \)-dimensional sphere of curvature 1 will be denoted by \( S^n \).

Besides explicit formulas in the particular case of the constant curvature, our main results include high intensity asymptotics for the mean volume and mean number of vertices of \( C_{x_0,\lambda}^{(M)} \) and its sections. Calculating these estimates requires several fundamental assumptions on the Riemannian manifold that have to be made for the whole paper. They are the following:

(A1) the sectional curvatures of \( M \) are uniformly bounded from above and from below,

(A2) \( M \) has a global injectivity radius,

(A3) the number of geodesic balls containing \((n + 1)\) fixed distinct points of \( M \) in their boundaries is uniformly bounded,

(A4) there exists \( r_{\text{max}} > 0 \) such that the number of geodesic balls of radius less than \( r_{\text{max}} \) and containing \((n + 1)\) fixed distinct points of \( M \) in their boundaries is at most 1.

The first two assumptions (A1) and (A2) are quite standard in Riemannian geometry and notably guarantee that several comparison theorems, in particular for the volume growth, can be applied. The third and fourth assumptions (A3) and (A4) are very specific to the substance of this paper and to the construction of Voronoi vertices at the intersection of \((n + 1)\) different Voronoi cells. It says that there is only a finite number of circumscribed balls of a fixed \( n \)-dimensional simplex, that this number can be bounded independently of the simplex and that it is at most 1 if the radius of the ball is small enough.

These properties might be subproducts of other more well-known results on Riemannian manifolds but to the best of our knowledge, this is not the case. Surprisingly, the question of describing the set of points which are equidistant from a finite number of fixed points is still largely open. In the rest of the paper, we will assume implicitly that the three conditions (A1), (A2), (A3) and (A4) are satisfied by \( M \). Naturally, this includes the particular cases of \( \mathbb{R}^n \), \( S^n_1 \) and \( H^n_1 \).

In \( \mathbb{R}^n \), it is well-known that the mean volume of the typical cell is equal to \( 1/\lambda \), see e.g. [Mo189] Theorem 7.2, case \( s = d \). This is due to the fact that there are, on average, \( \lambda \) cells per unit volume. Similarly, Miles obtained the mean volume of the typical cell of the Voronoi tessellation generated by a fixed number of independent points uniformly distributed in \( S^n_1 \) [Mi77b].

In Theorem 1.1, we provide a general asymptotic expansion of \( \mathbb{E}[\text{vol}_{\lambda}^{(M)}(C_{x_0,\lambda}^{(M)})] \) up to the second order at high intensity as well as explicit formulas in the particular cases of \( S^n_k \) and \( H^n_k \). Henceforth, the equality \( g(\lambda) = o(f(\lambda)) \) means that \( \lim_{\lambda \to \infty} \frac{g(\lambda)}{f(\lambda)} = 0 \).

**Theorem 1.1.** (i) When \( \lambda \to \infty \), we get

\[
\mathbb{E}[\text{vol}_{\lambda}^{(M)}(C_{x_0,\lambda}^{(M)})] = \frac{1}{\lambda} + o\left( \frac{1}{\lambda^{1 + \frac{n}{2}}} \right)
\]

(ii) For every \( n \geq 2 \), \( k > 0 \), we get when \( M = S^n_k \)

\[
\mathbb{E}[\text{vol}_{\lambda}^{(S^n_k)}(C_{x_0,\lambda}^{(S^n_k)})] = \frac{1}{\lambda} \left( 1 - e^{-2\pi_{n-1} W_{n-1}^{(k)}} \right)
\]

and when \( M = H^n_k \)

\[
\mathbb{E}[\text{vol}_{\lambda}^{(H^n_k)}(C_{x_0,\lambda}^{(H^n_k)})] = \frac{1}{\lambda}
\]
where \( \sigma_n = \text{vol}(S^n)(S^n) = \frac{2^{n+1}}{\Gamma\left(\frac{n+2}{2}\right)} \) is the volume of the unit-sphere \( S^n \) and \( W_n = \frac{\Gamma\left(\frac{n+2}{2}\right)}{2^{n+1}} \) is the \( n \)-th Wallis integral \( \int_0^{\frac{\pi}{2}} \sin^n(t)dt \).

Remarkably the estimate (1.1) shows that this mean volume does not depend, at first and second order, on the geometry of the manifold. In order to capture the effects of the local geometry of the manifold on the Voronoi cell, we now focus on the mean number of vertices of \( \mathcal{C}^{(M)}_{x_0,\lambda} \).

In \( \mathbb{R}^n \), because of the scaling invariance of the Poisson point process, the mean number of vertices of the typical cell does not depend on the intensity \( \lambda \) \cite{Mo89} Theorem 7.2, case \( s = 0 \) and is equal to

\[
E[N(\mathcal{C}^{(\mathbb{R}^n)}_{x_0,\lambda})] = 2^{n+1} n^{n-2} \left( \frac{\Gamma\left(\frac{n}{2}\right)}{\Gamma\left(\frac{n+2}{2}\right)} \right)^n \frac{\Gamma\left(\frac{n^2+1}{2}\right)}{\Gamma\left(\frac{n}{2}\right)}.
\]

In the case of the two-dimensional sphere, Miles \cite{Mi71b} obtains the mean number of vertices of the typical cell when the Voronoi tessellation is generated by a fixed number of independent points uniformly distributed in the sphere and conditional on the event that the points are not included in a half-sphere.

This result is a consequence of Euler’s formula applied to the convex hull of the random points. We can easily deduce from this work the following formula for the mean number of vertices when the Voronoi tessellation is generated by a homogeneous Poisson point process in \( S^n_k \):

\[
E[N(\mathcal{C}^{(S^n_k)}_{x_0,\lambda})] = 6 - \frac{3k^2}{\pi \lambda} + e - \frac{4k}{\pi \lambda} \left( 6 + \frac{3k^2}{\pi \lambda} \right).
\]

Three decades later, a very simple exact formula for the mean number of vertices of \( \mathcal{C}^{(M)}_{x_0,\lambda} \) when \( M = \mathcal{H}^n_k \) is derived by Isokawa \cite{Is00a}:

\[
E[N(\mathcal{C}^{(\mathcal{H}^n_k)}_{x_0,\lambda})] = 6 + \frac{3k^2}{\pi \lambda}.
\]

Simultaneously he gets an integral formula in the case of \( \mathcal{H}^n_k \) \cite{Is00a}. These results are mainly based on the existence of exact hyperbolic trigonometric formulas and can hardly be directly extended to general manifolds.

Theorem 1.2 yields a two-term asymptotic expansion of the mean number of vertices of \( \mathcal{C}^{(M)}_{x_0,\lambda} \) at high intensity.

**Theorem 1.2.** (i) When \( \lambda \to \infty \), we get

\[
E[N(\mathcal{C}^{(M)}_{x_0,\lambda})] = e_n - d_n \frac{\text{Sc}^{(M)}_{x_0}}{\lambda^\frac{2}{n}} + o \left( \frac{1}{\lambda^\frac{2}{n}} \right)
\]

where the constant \( e_n = E[N(\mathcal{C}^{(\mathbb{R}^n)}_{x_0,\lambda})] \) is given by (1.2),

\[
d_n = \frac{\pi^{\frac{n-1}{2}} n^{n-1} \Gamma(\frac{n-1}{2})}{n!2^\frac{n}{2}(n+2)} \frac{\Gamma(n+\frac{1}{2})\Gamma(n+\frac{1}{2})\Gamma(n+\frac{n+1}{2})}{\Gamma(n+\frac{1}{2})^n}.
\]

and \( \text{Sc}^{(M)}_{x_0} \) is the scalar curvature of \( M \) at \( x_0 \).

(ii) For every \( n \geq 2, k > 0 \), we get when \( M = S^n_k \)

\[
E[N(\mathcal{C}^{(S^n_n)}_{x_0,\lambda})] = \sigma_{n-1} \int_0^{\frac{\lambda^\frac{1}{2}}{k\pi}} g^{(S^n_n)}(r,u) dr
\]

and when \( M = \mathcal{H}^n_k \)

\[
E[N(\mathcal{C}^{(\mathcal{H}^n_k)}_{x_0,\lambda})] = \sigma_{n-1} \int_0^{\infty} g^{(\mathcal{H}^n_k)}(r,u) dr
\]

where \( u \) is fixed in \( S^{n-1} \) and \( g^{(S^n_n)}(r,u) \) and \( g^{(\mathcal{H}^n_k)}(r,u) \) are given by (1.7) and (1.8) respectively.
The first values of the constants $c_n$ and $d_n$ are $c_2 = 6$, $c_3 = \frac{960\pi^2}{45}$, $c_4 = \frac{1440}{9}$ and $d_2 = \frac{2}{2^2}$. $d_3 = \frac{12e^2\pi^2\Gamma\left(\frac{1}{2}\right)}{175\sqrt{2\pi}}$, $d_4 = \frac{200G}{24\pi^3\sqrt{2\pi}}$. In particular, the asymptotic expansion (1.5) shows that $\mathbb{E}[N(C_{x_0, \lambda}^{(M)})]$ converges to the constant $c_n$ which is naturally consistent with the Euclidean case (1.2). Moreover, since the scalar curvature is twice the Gaussian curvature in dimension two, it is also consistent with the exact values [153] and [143] obtained in the respective cases of the two-dimensional sphere and of the hyperbolic plane.

One of the key tools for proving (1.5) is an extension of a renowned spherical change of variables formula of Blaschke-Petkantschyn type, proved in the Euclidean space [SW08, Chapter 1] and in the case of the sphere [Mil74a]. We calculate in Theorem 1.3 an asymptotic expansion of the corresponding Jacobian in the case of a general Riemannian manifold. This result is a close companion to a previous similar formula contained in [Cha18a] though the two underlying transformations are different.

As expected, the (scalar) curvature only appears from the second term on in (1.5). This expansion will be the basis for the construction of an estimator of the scalar curvature which satisfies limit theorems, see [CCG]. Nevertheless, the asymptotic expansion of $\mathbb{E}[N(C_{x_0, \lambda}^{(M)})]$ does not capture the possible anisotropy of the metric, which implies that its mere knowledge is not enough to recover the metric for a manifold of dimension $n \geq 3$. This suggests that it will be necessary to study the set of vertices of $C_{x_0, \lambda}^{(M)}$ in a fixed direction in order to get the Ricci curvature.

Let us introduce the point process $\mathcal{Y}_{x_0, \lambda}^{(M)}$ of normalized vertices of $C_{x_0, \lambda}^{(M)}$ as follows:

$$\mathcal{Y}_{x_0, \lambda}^{(M)} = \{(r, u) \in \mathbb{R}_+ \times S^{n-1} : \exp_{x_0}(\lambda^{-\frac{1}{n}} ru)\text{ is a vertex of } C_{x_0, \lambda}^{(M)}\}$$

The renormalization factor $\lambda^{-\frac{n}{n}}$ is due to the fact that the volume of $C_{x_0, \lambda}^{(M)}$ is of order $\lambda^{-1}$ by (1.1) and that its vertices are at a distance of order $\lambda^{-\frac{1}{n}}$ from $x_0$. In Theorem 1.3 below, we provide an asymptotic expansion of the density of the intensity measure of the point process $\mathcal{Y}_{x_0, \lambda}^{(M)}$ as well as explicit formulas in the particular cases $M = S^n_k$ and $M = \mathcal{H}_k^n$.

**Theorem 1.3.**

(i) When $\lambda \to \infty$, the density denoted by $g_{\lambda}^{(M)}(r, u)$ of the intensity measure of the point process $\mathcal{Y}_{x_0, \lambda}^{(M)}$ satisfies

$$g_{\lambda}^{(M)}(r, u) = e^{-\kappa_n r^2} \left[ a_n r^{n^2 - 1} - \frac{1}{6} \left( a_n \text{Ric}_{x_0}^{(M)}(u) - n \Delta_{\text{Ric}, n}(u) \right) r^{n^2 + 1} + b_n \text{Sc}_{x_0}^{(M)}(u) r^{n^2 + n + 1} \right] \frac{1}{\lambda^{\frac{n}{n}}} + o\left(\frac{1}{\lambda^{\frac{n}{n}}}\right)$$

where $\kappa_n$ is the Euclidean volume of the $d$-dimensional unit ball, i.e., $\kappa_n = \frac{2\pi^{\frac{n}{2}}}{\Gamma\left(\frac{n}{2}\right)}$,

$$a_n = \frac{2^n\pi^{\frac{n^2 - 1}{2}} \Gamma\left(\frac{n^2 + 1}{2}\right)}{n! \Gamma\left(\frac{n + 1}{2}\right)^2 \Gamma\left(\frac{n^2}{2}\right)}, \quad b_n = \frac{2^n \Gamma\left(\frac{n^2 + 1}{2}\right)}{3n! (n + 2) \Gamma\left(\frac{n^2}{2}\right)} \frac{n^{\frac{n^2 - 1}{2}}}{\Gamma\left(\frac{n + 1}{2}\right)^2}.$$

$\text{Ric}_{x_0}^{(M)}(u)$ denotes the Ricci curvature of $M$ at $x_0$ in direction $u$ and

$\Delta_{\text{Ric}, n}(u) = \int_{u_1, \ldots, u_n \in S^{n-1}} \Delta(u, u_1, \ldots, u_n) \text{Ric}_{x_0}^{(M)}(u_1) \text{dvol}(S^{n-1})(u_1) \cdots \text{dvol}(S^{n-1})(u_n),$

with $\Delta(u, u_1, \ldots, u_n)$ as the Euclidean volume of the simplex spanned by $-u, u_1, \ldots, u_n$.

(ii) For every $n \geq 2$, $k > 0$, we get when $M = S^n_k$ and $r \leq \lambda^{\frac{k+1}{n}}$

$$g_{\lambda}^{(S^n_k)}(r, u) = a_n \left( e^{-\sigma_{n-1} \int_0^r g^{n-1}_k \frac{\lambda}{k} \frac{t}{\lambda} \text{dt}} + e^{-\sigma_{n-1} \int_r^\lambda g^{n-1}_k \frac{\lambda}{k} \frac{t}{\lambda} \text{dt}} \right) g^{n-1}_k\left(\frac{r}{\lambda}\right)$$

and when $M = \mathcal{H}_k^n$ and $r > 0$

$$g_{\lambda}^{(\mathcal{H}_k^n)}(r, u) = a_n e^{-\sigma_{n-1} \int_0^r g^{n-1}_k \frac{\lambda}{k} \frac{t}{\lambda} \text{dt}} g^{n-1}_k\left(\frac{r}{\lambda}\right),$$

(1.7)
Let us fix a value \( s \) where \( \mathcal{M}(s) \) is the Euclidean space, such a section is the intersection of the Poisson-Voronoi tessellation with a linear subspace of dimension \( s \leq n \). Note that, in general, the resulting tessellation is not a Voronoi tessellation of the linear subspace \( \mathcal{V} \). Nevertheless, it is still a stationary tessellation which makes it possible to define a typical cell of the sectional tessellation. Miles [Mil84] provides explicit formulas for the mean \( k \)-dimensional content of the \( k \)-skeleton of this typical cell for \( 0 \leq k \leq s \), see also [Mol89] Theorem 7.2. On a general Riemannian manifold \( M \), we need to define a different local notion of sectional Voronoi tessellation. Let \( V_s \) be a linear subspace of dimension \( s \) of the tangent space of \( M \) at \( x_0 \) denoted by \( T_{x_0}M \). The image of \( V_s \) by the exponential map at \( x_0 \), defined in Section 2, is a manifold of dimension \( s \), denoted by \( M_s \). We notice immediately that \( M_s \) satisfies the two assumptions (A1) and (A2). We define the sectional tessellation as the intersection of the tessellation with the manifold \( M_s \) and investigate the characteristics of the section of the cell \( C^{(M)}_{x_0,\lambda} \), i.e. the set \( C^{(M)}_{x_0,\lambda} \cap M_s \). Note that in the Euclidean case, this corresponds to the section of the typical cell which does not have the same distribution as the typical cell of the sectional tessellation. In Theorem 1.4 below, we provide an asymptotic expansion at high intensity for the mean \( s \)-content \( \text{vol}^{(M)}(C^{(M)}_{x_0,\lambda} \cap M_s) \).

**Theorem 1.4.** (i) Let us fix \( 1 \leq s \leq n \) and let \( V_s \) be a linear subspace of dimension \( s \) of \( T_{x_0}M \). When \( \lambda \to \infty \), the mean volume of the section of \( C^{(M)}_{x_0,\lambda} \) by \( V_s \) satisfies

\[
\mathbb{E}[\text{vol}^{(M_s)}(C^{(M)}_{x_0,\lambda} \cap M_s)] = v_{n,s} \frac{1}{\lambda^s} + \left( w_{n,s} \mathcal{S}_{x_0}^{(M)} - w_{n,s} \mathcal{S}_{x_0}^{(M_s)} \right) \frac{1}{\lambda^{s-1}} + o \left( \frac{1}{\lambda^{s-1}} \right)
\]

where

\[
v_{n,s} = \frac{(s+2)n^{s+2} - 2\Gamma(s+2)\Gamma(s+2)}{3\Gamma(s)(s+2)^{s+2}}, \quad w_{n,s} = \frac{n^{s+2} - 1}{3\Gamma(s)2^{s+2}}
\]

and \( \mathcal{S}_{x_0}^{(M)} \) is the scalar curvature of \( M_s \) at \( x_0 \).

(ii) For every \( n \geq 2, k > 0 \), we get when \( M = S^n_k \)

\[
\mathbb{E}[\text{vol}^{(M_s)}(C^{(S^n_k)}_{x_0,\lambda} \cap M_s)] = \sigma_{s-1} \int_0^{\pi} e^{-\lambda \sigma_{s-1}} \int_0^r g_k(t)dt \cdot g_{s-1}(r)dr.
\]

and when \( M = \mathcal{H}^n_k \)

\[
\mathbb{E}[\text{vol}^{(M_s)}(C^{(\mathcal{H}^n_k)}_{x_0,\lambda} \cap M_s)] = \sigma_{s-1} \int_0^{\pi} e^{-\lambda \sigma_{s-1}} \int_0^r g_{-k}(t)dt \cdot g_{s-1}(r)dr.
\]

The first term of the expansion, namely the term \( v_{n,s} \lambda^{-s} \), is naturally equal to \( \mathbb{E}[\text{vol}^{(C^n_R)}(C^{(S^n_R)} \cap \mathbb{R}^s)] \). To the best of our knowledge, this is the first time that such mean characteristic of the Euclidean typical Poisson-Voronoi is calculated though it is certainly very close in spirit to the calculation of the mean \( k \)-th
volume of the $k$-dimensional typical face of a stationary and isotropic Poisson hyperplane tessellation, see e.g. [SW08, Theorem 10.3.3] and [Sch09].

Moreover, Theorem 1.4 is consistent with 1.3 since $u_{n,k} = w_{n,k}$ and $v_{n,k} = 1$. Surprisingly, while the expansion up to the second term of the mean volume of $C_{x_{0}}$ provided at 1.1 is independent of the manifold $M$, a similar calculation for the section of $C_{x_{0},\lambda}$ involves both the scalar and sectional curvatures at $x_{0}$.

Theorem 1.5 contains a similar asymptotic expansion for the mean number of vertices $N(C_{x_{0},\lambda} \cap M)$ of $C_{x_{0},\lambda} \cap M$.

**Theorem 1.5.** Let us assume that $M_{s}$ satisfies the two assumptions $(A_{3})$ and $(A_{4})$.

(i) Let $1 \leq s \leq n$ and let $V_{s}$ be a linear subspace of dimension $s$ of $T_{x_{0}}M$. When $\lambda \rightarrow \infty$, the mean number of vertices of the section of $C_{x_{0},\lambda}$ by $V_{s}$ satisfies

$$
\mathbb{E}[N(C_{x_{0},\lambda} \cap M)] = e_{n,s} + \left(f_{n,s} - g_{n,s} + h_{n,s} \Delta_{\text{Ric},n,s}\right) \frac{1}{\lambda^{\frac{s}{2}}} + o\left(\frac{1}{\lambda^{\frac{s}{2}}}\right)
$$

where

$$
e_{n,s} = \frac{2\pi^{s} n^{s-1} \Gamma\left(\frac{s}{2}\right)^2 \Gamma\left(\frac{1}{2}(ns + n - s + 1)\right)}{s! \left(\frac{s}{2}\right)^{s-1} \Gamma\left(\frac{1}{2}(ns + n - s + 1)\right) \Gamma\left(\frac{n+s+\frac{s}{2}+1}{2}\right)},
$$

$$
f_{n,s} = \frac{2 - \frac{s}{2} \pi^{\frac{s}{2}} (sn + 2) \Gamma\left(s + \frac{s}{2}\right) \Gamma\left(\frac{s}{2}(ns + n - s + 1)\right)}{3 (n + 2)s! \Gamma\left(\frac{s}{2}\right) \Gamma\left(\frac{1}{2}(ns + n - s + 1)\right) \Gamma\left(\frac{n+s+\frac{s}{2}+1}{2}\right)},
$$

$$
g_{n,s} = \frac{\Gamma\left(s + \frac{s}{2}\right) n^{s} \pi^{\frac{s}{2}} \Gamma\left(\frac{s}{2}(ns + n - s + 1)\right)}{3 (n + 2) \pi^{\frac{s}{2}} \Gamma\left(\frac{s}{2}(ns + n - s + 1)\right) \Gamma\left(\frac{n+s+\frac{s}{2}+1}{2}\right)},
$$

$$
h_{n,s} = \int_{s}^{\frac{s}{2}} \int_{u_{1}, \ldots, u_{s} \in S^{n-1}} \Delta_{s}(u, u_{1}, \ldots, u_{s}) \text{Ric}(u_{1}) \text{dvol}(S^{n-1})(u_{1}) \cdots \text{dvol}(S^{n-1})(u_{s}) \text{dvol}(S^{n-1})(u)
$$

with $\Delta_{s}(u, u_{1}, \ldots, u_{s})$ being the $s$-dimensional volume of the simplex generated by $-u \in V_{s}$ and the projection of $u_{1}, \ldots, u_{s}$ onto the subspace $V_{s}$.

(ii) For every $n \geq 2$, $k > 0$, we get when $M = S^{6}_{k}$

$$
\mathbb{E}[N(C_{x_{0},\lambda} \cap M)] = \Delta_{n,s} \int_{0}^{\lambda^{\frac{s}{2}}} \left(e^{-\sigma_{n-1}} \int_{0}^{r} s^{n-1} k^{\frac{s}{2} + \frac{1}{2}} (t) dt + e^{-\sigma_{n-1}} \int_{r}^{\lambda^{\frac{s}{2}}} s^{n-1} k^{\frac{s}{2} + \frac{1}{2}} (t) dt \right) s^{n-1} k^{\frac{s}{2} + \frac{1}{2}} (r) dr
$$

and when $M = H_{k}^{n}$

$$
\mathbb{E}[N(C_{x_{0},\lambda} \cap M)] = \Delta_{n,s} \int_{0}^{\lambda^{\frac{s}{2}}} e^{-\sigma_{n-1}} \int_{0}^{r} s^{n-1} k^{\frac{s}{2} + \frac{1}{2}} (t) dt + e^{-\sigma_{n-1}} \int_{r}^{\lambda^{\frac{s}{2}}} s^{n-1} k^{\frac{s}{2} + \frac{1}{2}} (t) dt \right) s^{n-1} k^{\frac{s}{2} + \frac{1}{2}} (r) dr
$$

where

$$
\Delta_{n,s} = \frac{2^{s+1} \pi^{s+n} \Gamma\left(\frac{s}{2}(ns + n - s + 1)\right)}{s! \left(\frac{s}{2}\right)^{s-1} \Gamma\left(\frac{s}{2}(ns + n - s + 1)\right) \Gamma\left(\frac{n+s+\frac{s}{2}+1}{2}\right)}.
$$

The limit $e_{n,s}$ of $\mathbb{E}[N(C_{x_{0},\lambda} \cap M)]$ is naturally equal to $\mathbb{E}[N(C_{x_{0}}^{(n)} \cap M)]$. To the best of our knowledge, the explicit value of $e_{n,s}$ is new, as well as the formulas (1.13) and (1.14) in the particular case of constant curvature. Compared to Theorems 1.4, Theorems 1.2 and 1.3, the statements contained in Theorems 1.4 and 1.5 involve all the local characteristics of the metric around $x_{0}$. In the particular case $s = 2$, the curvature $C_{x_{0},\lambda}$ is indeed twice the sectional curvature of $M$ at $x_{0}$ with respect to the
plane $L_2$. This observation is in a way completely satisfying in regard of our initial purpose of recovering the local geometry of $M$ from the properties of the Poisson-Voronoi tessellation. Let us note, however, that their usefulness in practice is questionable since the determination of the section of the tessellation already requires the knowledge of the metric.

So far, we focused on the link between the characteristics of the Poisson-Voronoi tessellation and the local geometry around a point. Now, a natural question arises: can we get global information on the geometry of the manifold? Since the mean number of vertices of the cell associated with an extra nucleus at $x_0$ involves the scalar curvature at $x_0$, one could imagine that the mean number of vertices in the whole tessellation is connected to the integral of the curvature on the whole manifold $M$ when $M$ is a compact set. This is indeed the case, and this fact actually implies, in the case of a compact manifold of dimension 2 without boundary, a probabilistic proof of the Gauss-Bonnet theorem:

**Theorem** (Gauss-Bonnet). For a compact surface without boundary $M$,

$$
\chi(M) = \frac{1}{2\pi} \int_M K(x) \, d\operatorname{vol}(M)(x)
$$

where $\chi(M)$ denotes the Euler characteristic of $M$ and $K(x) = \frac{1}{2} \operatorname{Sc}(x)$ is the Gaussian curvature at $x \in M$.

There are naturally many classical proofs of this theorem. They are in general rather technical, i.e. they rely notably on a triangulation of the surface and a clever application of Stokes’ theorem in each triangle, see e.g. [Lee06] Chapter 9. In our opinion, the proof that we provide in this paper is to some extent shorter and more elementary though it is based on an application of Theorem 1.2 in dimension 2. To the best of our knowledge, this argument is new though Leibon used a heuristic reasoning which led him to the intuition of the existence of such probabilistic proof [Lei02].

The paper is structured as follows. In Section 2 we introduce several fundamental tools from Riemannian geometry. Section 3 is devoted to showing that we can assume without loss of generality that $M$ is a compact Riemannian manifold. The calculation of $\mathbb{E}[\operatorname{vol}(M)\operatorname{C}(x_0,\lambda)]$ and the proof of Theorem 1.1 take place in Section 4. Section 5 is devoted to the statement and proof of Theorem 5.2 which is a new integral formula of Blaschke-Petkantschin type. In Section 6 we prove Theorems 1.2 and 1.3 dealing with both the cardinality and density of the set $\mathcal{V}(M)$ of vertices of $C(x_0,\lambda)$. We concentrate on the sectional tessellation in Section 7 and prove Theorems 1.4 and 1.5 therein. Finally, we postpone to Section 8 the details for the probabilistic proof of the Gauss-Bonnet theorem which is deduced from Theorem 1.2.

This document is a comprehensive account of some of the results contained in a thesis manuscript [Cha18b]. An abridged and more to the point version is to be submitted soon for publication.

### 2 Geometric framework and preliminaries

In this section, we introduce some useful notation and we survey several fundamental definitions and results from the theory of Riemannian geometry. For more details, we refer the reader to the reference books such as [DC92], [Lee97] and [Bey03].

**Exponential map.** Let $x_0 \in M$ and $v \in T_{x_0}M$. There exists a unique geodesic $\gamma_v$ such that $\gamma_v(0) = x_0$ and $\gamma_v'(0) = v$. Since $M$ is a complete Riemannian manifold, Hopf-Rinow theorem [Ber03, Theorem 52] guarantees that this geodesic is well defined on $[0, \infty)$. The exponential map of $v$ at $x_0$, denoted by $\exp_{x_0}(v)$ is then defined by the identity

$$
\exp_{x_0}(v) = \gamma_v(1). \tag{2.1}
$$

For sake of simplicity, we omit in the notation of the exponential map the dependency on the manifold $M$ which should be implicit anyway. Intuitively, for a tangent vector $v$, we get $\exp_{x_0}(v)$ by travelling on $M$ along the geodesic starting from $x_0$ in the direction given by $v$ over a length $|v|_{x_0}$. The radius of the largest open ball on which the exponential map is a diffeomorphism is called the injectivity radius that we denote by $R_{x_0}$. The infimum of all injectivity radii over all $x_0 \in M$ is called the global injectivity radius, assumed to be positive. For sake of simplicity, we will make a slight abuse of notation by calling...
Lemma 2.1. Let \( \gamma \) be a geodesic, \( c \) a curve on \( M \) such that \( c(0) = \gamma(0) \) and \( V \) a vector field along \( c \) such that \( V(0) = \gamma'(0) \). Then the function \( f(t, s) = \exp_{c(t)}(sV(s)) \) satisfies

\[
\frac{\partial f}{\partial s}(t, 0) = J(t)
\]

where \( J \) is the unique Jacobi field along \( \gamma \) with \( J(0) = c'(0) \) and \( J'(0) = V'(0) \).
The Rauch comparison theorem yields bounds for the norm of a Jacobi field and as a consequence, we get the following expansion for any Jacobi field $J$ along $\gamma$ which satisfies $J(0) = 0$, see [DC92] Chapter 5:

$$
\|J(t)\|_{\gamma(t)} = t - \frac{K^{(M)}(J'(0), \gamma'(0))}{6} t^3 + o(t^3).
$$

Though we will not use this actual estimate in the sequel, we will prove similar expansions for scalar products involving Jacobi fields, see in particular Lemma 5.3.

**Parallel transport.** Let $V$ be a vector field along a curve $\gamma$. $V$ is called a parallel vector field if $V'(t) = 0$ for all $t$, in the sense of the covariant derivative. Now, for any $u \in T_{\gamma(0)}$, there exists a unique parallel vector field $V$ along $\gamma$ such that $V(0) = u$ which is called parallel transport of $u$ along $\gamma$. In this paper, $V(t)$ will be denoted by $P_{\gamma(0)}(\gamma(t))(u)$ and sometimes by $u(t)$ or even $u$ itself with a slight abuse of notation. Note that the parallel transport is a linear isomorphism from $T_{\gamma(0)}M$ to $T_{\gamma(t)}M$ which preserves the scalar product.

**Jacobian of the spherical change of variables.** Let us consider the following transformation into spherical coordinates:

$$
\varphi_{x_0} : \{ (0, R_{u_0}) \} \times \{ u \in T_{x_0}M : \|u\|_{x_0} = 1 \} \rightarrow \big( r, u \big) \mapsto \exp_{x_0}(ru)
$$

and let us denote by $J^{(M)}_{x_0}(r, u)$ the associated Jacobian determinant. In particular, the volume element $d\text{vol}^{(M)}(x)$ satisfies

$$
d\text{vol}^{(M)}(x) = |J^{(M)}_{x_0}(r, u)| dr \text{vol}^{(S^{n-1})}(u). \tag{2.11}
$$

The following lemma shows the asymptotic expansion of $J^{(M)}_{x_0}(r, u)$ when $r \to 0$ as well as a uniform lower bound for $r$ small enough.

**Lemma 2.2.** (i) When $r \to 0$,

$$
J^{(M)}_{x_0}(r, u) = r^{n-1} - \frac{\text{Ric}_{x_0}^{(M)}(u)}{6} r^{n+1} + o(r^{n+1}).
$$

and

$$
\sup_{u \in T_{x_0}M, \|u\|_{x_0} = 1} r^{-(n+1)} |J^{(M)}_{x_0}(r, u)| - r^{n-1} + \frac{\text{Ric}_{x_0}^{(M)}(u)}{6} r^{n+1} \to 0. \tag{2.10}
$$

(ii) In the particular case when $M$ is a compact Riemannian manifold, we get the additional result

$$
\sup_{x_0 \in M} \sup_{u \in T_{x_0}M, \|u\|_{x_0} = 1} r^{-(n+1)} |J^{(M)}_{x_0}(r, u)| - r^{n-1} + \frac{\text{Ric}_{x_0}^{(M)}(u)}{6} r^{n+1} \to 0. \tag{2.11}
$$

(iii) For any Riemannian manifold $M$, there exists $r_0 > 0$ such that for every $x_0 \in M$, $u \in T_{x_0}M$ of norm 1 and $r \in [0, r_0]$, we get

$$
\frac{1}{2} r^{n-1} \leq J^{(M)}_{x_0}(r, u) \leq \frac{3}{2} r^{n-1}.
$$

The proof of Lemma 2.2 relies on the exact calculation and Taylor expansion of each entry of the Jacobian determinant in terms of Jacobi fields. It is deferred to the Appendix.

**Uniform estimates of the volume of small balls.** We need a refinement of the Bertrand-Diquet-Puiseux estimate given at (2.5) which guarantees that the expansion is the same in a neighborhood of $x_0$ and that the remaining term $o(r^{n+2})$ is uniform with respect to the center of the ball. This is described in Lemma 2.3 below.
Lemma 2.3. (i) There exists $r_0 > 0$ such that for every $x \in B(M)(x_0, r_0)$, we get

$$\text{vol}^{(M)}(B(M)(x, r)) = \kappa_n r^n - \frac{\kappa_n \text{Sc}^{(M)}(x)}{6(n+2)} r^{n+2} + o(r^{n+2})$$

and

$$\sup_{x \in B(M)(x_0, r_0)} r^{-(n+2)} \left( \text{vol}^{(M)}(B(M)(x, r)) - \kappa_n r^n + \frac{\kappa_n \text{Sc}^{(M)}(x)}{6(n+2)} r^{n+2} \right) \to 0.$$ 

(ii) In the particular case when $M$ is a compact Riemannian manifold, we get the additional result

$$\sup_{x_0 \in M} \sup_{x \in B(M)(x_0, r_0)} r^{-(n+2)} \left( \text{vol}^{(M)}(B(M)(x, r)) - \kappa_n r^n + \frac{\kappa_n \text{Sc}^{(M)}(x)}{6(n+2)} r^{n+2} \right) \to 0.$$ 

Lemma 2.3 is essentially based on the Bishop-Gromov theorem and related comparison inequalities. The proof is postponed to the Appendix.

In the final lemma, we exhibit a general lower bound for the volume of a ball in the particular case when $M$ is not a compact set. Here and in the sequel, $c$ denotes a generic positive constant which may change from line to line.

Lemma 2.4. When $M$ is non-compact, there exists a constant $c > 0$ such that for every $x_0 \in M$ and $r > 0$,

$$\text{vol}^{(M)}(B(M)(x_0, r)) \geq c \min(r, r^n).$$

This result is in the same spirit as the classical estimate due to Calabi and Yau in the case of positive Ricci curvature, see e.g. [CK85] Section 0 and [Yau76] (iii) p. 669. Again, the proof of Lemma 2.4 can be found in the Appendix.

3 Reduction to the case when $M$ is compact

This section aims at showing that it is enough to show Theorems 1.1-1.5 in the particular case when $M$ is a compact Riemannian manifold. This is needed for the following reason: each of the considered expectations will be written as an integral of an integrand of type $e^{-\lambda \text{vol}^{(M)}(B(M)(x, r))}$ with respect to $d\text{vol}^{(M)}$ or to the product $(d\text{vol}^{(M)})^n$, see e.g. (4.1) and (6.1). In order to get the required asymptotics, we need to replace both the integrand and the Jacobian of the change of variables by precise estimates in the vicinity of the point $x_0$, see Lemma 2.3 (i), Lemma 2.2 (i) and Theorem 5.2. Being able to integrate these estimates means that they are uniform with respect to the variable(s) of integration and that the contribution of points far from $x_0$ is negligible. It turns out that it will be much more convenient to show the uniformity in the context of a compact Riemannian manifold, see Lemma 2.3 (ii), Lemma 2.2 (ii) and Proposition 3.4. Similarly, the negligibility of the contribution of points far from $x_0$ is easily proved as soon as the volume of $M$ is finite, see (4.6) and (6.6).

Let us fix $x_0 \in M$ and consider $r > 0$ small enough to be chosen later such that the closure of the geodesic ball $B(M)(x_0, r)$ is a compact neighborhood of $x_0$. We define the modification $\tilde{\text{vol}}^{(M)}(C(x_0, \lambda))$ (resp. $\text{N}(\tilde{C}(x_0, \lambda))$) of the variable $\text{vol}^{(M)}(C(x_0, \lambda))$ (resp. $\text{N}(C(x_0, \lambda))$) as the volume (resp. the number of vertices) of the Voronoi cell $\tilde{C}(x_0, \lambda)$ associated with $x_0$ when $M$ is replaced by the new manifold $B(M)(x_0, r)$, namely

$$\tilde{C}(x_0, \lambda) = C(B(M)(x_0, r))(x_0, \mathcal{P} \cap B(M)(x_0, r) \cup \{x_0\}).$$

Both variables $\text{vol}^{(M)}(\tilde{C}(x_0, \lambda))$ and $\text{vol}^{(M)}(C(x_0, \lambda))$ (resp. $\text{N}(\tilde{C}(x_0, \lambda))$ and $\text{N}(C(x_0, \lambda))$) are naturally coupled. The main result of the section is the following proposition which says that the difference in expectation between the two variables is negligible in front of $\lambda^{-1+\frac{2}{n}}$ (resp. $\lambda^{-\frac{2}{n}}$), i.e. in front of the second term of the desired two-term expansion in Theorem 1.1 (resp. Theorem 1.2).

**Proposition 3.1.** There exists $c > 0$ such that for $\lambda$ large enough, we get

$$E \left[ \text{vol}^{(M)}(C(x_0, \lambda)) - \text{vol}^{(M)}(\tilde{C}(x_0, \lambda)) 1_{\{C(x_0, \lambda) \neq \tilde{C}(x_0, \lambda)\}} \right] \leq ce^{-\lambda/c}$$

(3.1)
and
\[ E \left[ |N(\mathcal{C}_{x_0,\lambda}^{(M)}) - N(\tilde{\mathcal{C}}_{x_0,\lambda}^{(M)})| \mathbf{1}_{\{c_{x_0,\lambda},\tilde{c}_{x_0,\lambda}\neq \lambda\}} \right] \leq ce^{-\lambda/c}. \quad (3.2) \]

**Proof.** Let \( h \) be a function equal to either \( \text{vol}^{(M)}(\cdot) \) or \( N(\cdot) \). By the Cauchy-Schwarz inequality, we get
\[
E \left[ h(\mathcal{C}_{x_0,\lambda}^{(M)}) - h(\tilde{\mathcal{C}}_{x_0,\lambda}^{(M)})\mathbf{1}_{\{c_{x_0,\lambda},\tilde{c}_{x_0,\lambda}\neq \lambda\}} \right] \\
\leq \sqrt{\text{max}(E[h(\mathcal{C}_{x_0,\lambda}^{(M)})^2], E[h(\tilde{\mathcal{C}}_{x_0,\lambda}^{(M)})^2])} \sqrt{\mathbb{P}[c_{x_0,\lambda}^{(M)} \neq \tilde{c}_{x_0,\lambda}^{(M)}]}. \quad (3.3)
\]

Consequently, it is enough to show the two following facts: on one hand, \( E[h(\mathcal{C}_{x_0,\lambda}^{(M)})^2] \) and its modification \( E[h(\tilde{\mathcal{C}}_{x_0,\lambda}^{(M)})^2] \) are bounded from above by a constant not depending on \( \lambda \) and on the other hand, the probability \( \mathbb{P}[c_{x_0,\lambda}^{(M)} \neq \tilde{c}_{x_0,\lambda}^{(M)}] \) is exponentially decreasing, like \( e^{-\lambda/c} \). We do so in the next two lemmas, whose proofs are postponed to the appendix.

The next lemma provides basic estimates for the second moments of both the volume and the number of vertices of the Voronoi cell.

**Lemma 3.2.** There exists \( c > 0 \) such that for every \( \lambda > 0 \),
\[ \text{max}(E[\text{vol}^{(M)}(\mathcal{C}_{x_0,\lambda}^{(M)})^2], E[\text{vol}^{(M)}(\tilde{\mathcal{C}}_{x_0,\lambda}^{(M)})^2]) \leq \frac{c}{\lambda^d} \quad (3.4) \]
and
\[ \text{max}(E[N(c_{x_0,\lambda}^{(M)})], E[N(\tilde{c}_{x_0,\lambda}^{(M)})]) \leq c. \quad (3.5) \]

The second lemma shows the localization of the random variable \( N(\mathcal{C}_{x_0,\lambda}^{(M)}) \), namely that for \( r \) chosen to be small enough, \( c_{x_0,\lambda}^{(M)} \) and \( \tilde{c}_{x_0,\lambda}^{(M)} \) differ with a probability decreasing exponentially fast to zero when \( \lambda \to \infty \).

**Lemma 3.3.** For \( r > 0 \) small enough, there exists \( c > 0 \) such that
\[ \mathbb{P}(c_{x_0,\lambda}^{(M)} \neq \tilde{c}_{x_0,\lambda}^{(M)}) \leq ce^{-\lambda/c}. \]

Inserting the results of Lemmas 3.2 and 3.3 into (3.3), we obtain the required result (3.2). \( \square \)

Thanks to Proposition 3.1, we can henceforth assume in the rest of the paper that \( M \) is a compact Riemannian manifold and when necessary that \( M \) is equal to the closure of a geodesic ball \( B^{(M)}(x_0, r) \) for \( r \) small enough.

### 4 Mean volume of \( \mathcal{C}_{x_0,\lambda}^{(M)} \): proof of Theorem 1.1

In this section, we prove Theorem 1.1.1 which contains an asymptotic expansion of \( E(\text{vol}^{(M)}(\mathcal{C}_{x_0,\lambda}^{(M)})) \) and explicit formulas in the particular cases of \( \mathcal{S}^n_k \) and \( \mathcal{H}^n_k \).

**Proof of Theorem 1.1.1 (i).** Let us fix \( x_0 \in M \). Thanks to Fubini’s theorem and to the definition of the Poisson point process \( \mathcal{P}_\lambda \), we get
\[ E[\text{vol}^{(M)}(\mathcal{C}_{x_0,\lambda}^{(M)})] = \int_M \mathbb{P}(x \in \mathcal{C}_{x_0,\lambda}^{(M)}) \text{dvol}^{(M)}(x) = \int_M e^{-\lambda \text{vol}^{(M)}(B^{(M)}(x, d^{(M)}(x_0, x)))} \text{dvol}^{(M)}(x). \quad (4.1) \]

The computation of this integral requires to calculate the volume of \( B^{(M)}(x, d^{(M)}(x_0, x)) \) and to rewrite the volume element \( \text{dvol}^{(M)}(x) \). The key idea is to discriminate between points \( x \) close to \( x_0 \) and points \( x \) far from \( x_0 \). On the one hand, when the distance between \( x \) and \( x_0 \) tends to 0, Lemmas 2.3 and 2.4 provide asymptotics for the volume element \( \text{dvol}^{(M)}(x) \) and the volume \( \text{vol}^{(M)}(B^{(M)}(x, d^{(M)}(x_0, x))) \) respectively. On the other hand, it is expected that the contribution of points \( x \), when the distance between \( x \) and \( x_0 \) is ‘large’, is negligible since the integrand decreases exponentially fast with the distance.
We do so by choosing \( r_\lambda = \frac{\lambda}{n+2} \) so that \( r_\lambda \) is at the same time slightly larger than the diameter of \( C_{x_0,\lambda} \), which is of order \( \lambda^{-\frac{1}{n+2}} \) and small enough to guarantee that \( \lambda r^{n+2} \) is negligible when \( \lambda \to \infty \). The first requisite is natural whereas the second one will become necessary in Step 2. Using (4.1), we rewrite the expectation \( E[\text{vol}(M)(C_{x_0,\lambda})] \) as

\[
E[\text{vol}(M)(C_{x_0,\lambda})] = I_\lambda + \bar{I}_\lambda
\]

where

\[
I_\lambda = \int_{\mathcal{B}(M)(x_0,\lambda)} e^{-\lambda \text{vol}(M)(\mathcal{B}(M)(x,d(M)(x_0,x)))} \text{dvol}(M)(x)
\]

and

\[
\bar{I}_\lambda = \int_{M \setminus \mathcal{B}(M)(x_0,\lambda)} e^{-\lambda \text{vol}(M)(\mathcal{B}(M)(x,d(M)(x_0,x)))} \text{dvol}(M)(x).
\]

Step 2: \( \bar{I}_\lambda \) is negligible. Let us show that \( \bar{I}_\lambda \) given at (4.4) is negligible in front of \( \frac{1}{\lambda^{1+\frac{1}{n+2}}} \). To this end, let us observe that, since \( M \) is compact, by Lemma 2.3 (i), (ii), there exists a constant \( c \) such that for \( \lambda \) large enough and every \( x \in M \setminus \mathcal{B}(M)(x_0,\lambda^{-\frac{n+1}{n+2}}) \),

\[
\text{vol}(M)(\mathcal{B}(M)(x,d(M)(x_0,x))) \geq \text{vol}(M)(\mathcal{B}(M)(x,\lambda^{-\frac{n+1}{n+2}})) \geq c \lambda^{-\frac{n+1}{n+2}}.
\]

Inserting (4.5) into (4.4), we get

\[
\bar{I}_\lambda \leq \text{vol}(M)\text{e}^{-c \lambda^{1+\frac{1}{n+2}}}
\]

This implies that when \( \lambda \to \infty \),

\[
\bar{I}_\lambda = o\left( \frac{1}{\lambda^{1+\frac{1}{n+2}}} \right).
\]

Step 3: estimate of \( I_\lambda \). We prove now that when \( \lambda \to \infty \)

\[
I_\lambda = 1 + \frac{1}{\lambda^{1+\frac{1}{n+2}}},
\]

Applying the spherical change of variables provided by (2.11), we obtain

\[
I_\lambda = \int_0^\lambda \frac{\text{dvol}(S^{n-1})}{\text{dvol}(S^{n-1})(u)} \int e^{-\lambda \text{vol}(M)(\mathcal{B}(M)(x,r))}|J_{x_0}^{(M)}(r,u)| \text{dvol}(S^{n-1})(u).
\]

We then replace both functionals \( \text{vol}(M)(\mathcal{B}(M)(x,r)) \) and \( J_{x_0}^{(M)}(r,u) \) by suitable estimates. Let \( \varepsilon > 0 \). Thanks to Lemmas 2.2 (ii) and 2.3 (i), we get for \( \lambda \) large enough, \( 0 < r < \lambda^{-\frac{n+1}{n+2}} \) and \( u \in T_{x_0}M \) with \( ||u||_{x_0} = 1 \),

\[
r^{n-1} - \frac{\text{Ric}(M)(u)}{6} r^{n+1} - \varepsilon r^{n+1} \leq J_{x_0}^{(M)}(r,u) \leq r^{n-1} - \frac{\text{Ric}(M)(u)}{6} r^{n+1} + \varepsilon r^{n+1},
\]

and

\[
e^{-\lambda(\kappa_0 r^n - \frac{\kappa_0 S_{x_0}^{(M)}}{6(n+2)} - \varepsilon) r^{n+2}} \leq e^{-\lambda \text{vol}(M)(\mathcal{B}(M)(x,r))} \leq e^{-\lambda(\kappa_0 r^n - \frac{\kappa_0 S_{x_0}^{(M)}}{6(n+2)} + \varepsilon) r^{n+2}}
\]

which implies

\[
e^{-\lambda \kappa_0 r^n} \left[ 1 + \left( \frac{\kappa_0 S_{x_0}^{(M)}}{6(n+2)} - \varepsilon \right) \lambda r^{n+2} \right] \leq e^{-\lambda \text{vol}(M)(\mathcal{B}(M)(x,r))} \leq e^{-\lambda \kappa_0 r^n} \left( \frac{\kappa_0 S_{x_0}^{(M)}}{6(n+2)} + \varepsilon \right) \lambda r^{n+2}.
\]
We notice that the right hand side of (4.10) can be simplified. Indeed, since \( \lambda r^{n+2} \leq \lambda^{-\frac{1}{2}} \) goes to zero, we deduce from (4.10) that for \( \lambda \) large enough and \( r < \lambda^{-\frac{1}{n+1}} \),
\[
e^{-\lambda n r^n} \left[ 1 + \left( \frac{\kappa_n \text{Sc}_1^M}{6(n+2)} - \varepsilon \right) \lambda r^{n+2} \right] \leq e^{-\lambda \text{vol}^M(B^M(x,r))} \leq e^{-\lambda n r^n} \left[ 1 + \left( \frac{\kappa_n \text{Sc}_1^M}{6(n+2)} + 2\varepsilon \right) \lambda r^{n+2} \right].
\]
(4.11)

Inserting (4.9) and (4.11) into (4.3), we get
\[
I_{\lambda,-} \leq I_\lambda \leq I_{\lambda,+},
\]
(4.12)
where
\[
I_{\lambda,-} = \int_0^{\lambda^{-\frac{1}{n+1}}} \int e^{-\lambda n r^n} \left[ 1 + \left( \frac{\kappa_n \text{Sc}_1^M}{6(n+2)} - \varepsilon \right) \lambda r^{n+2} \right] d\text{vol}(S_n) r^n dr,
\]
and
\[
I_{\lambda,+} = \int_0^{\lambda^{-\frac{1}{n+1}}} \int e^{-\lambda n r^n} \left[ 1 + \left( \frac{\kappa_n \text{Sc}_1^M}{6(n+2)} + 2\varepsilon \right) \lambda r^{n+2} \right] d\text{vol}(S_n) r^n dr.
\]

Let us determine an upper bound for \( I_{\lambda,+} \). Using the change of variables \( y = \lambda n r^n \), we obtain that
\[
I_{\lambda,+} \leq \int_0^{\infty} e^{-y} \left[ 1 + \left( \frac{\kappa_n \text{Sc}_1^M}{6(n+2)} + 2\varepsilon \right) \frac{y}{\kappa_n} \right] \left( \frac{\text{Sc}_1^M(u)}{6} - \varepsilon \right) \left( \frac{y^{1+\frac{2}{n}}}{\lambda^{\frac{2}{n}}} \right) d\text{vol}(S_n) \frac{dy}{n\kappa_n \lambda}.
\]
(4.13)

Before going further, we notice that, thanks to (A1), the integration over \( y \) and \( u \) of the term
\[
e^{-y} \left( \frac{\kappa_n \text{Sc}_1^M}{6(n+2)} + 2\varepsilon \right) \left( \frac{\text{Sc}_1^M(u)}{6} - \varepsilon \right) \left( \frac{y^{1+\frac{2}{n}}}{\lambda^{\frac{2}{n}}} \right) \frac{1}{n\kappa_n \lambda}
\]
is bounded by \( \frac{1}{\lambda^{1+\frac{2}{n}}} \) up to a multiplicative constant. Consequently, an integration over \( u \in S_n \) in (4.13) combined with (2.3) provides
\[
I_{\lambda,+} \leq \int_0^{\infty} e^{-y} \left[ \frac{1}{\lambda} + \frac{1}{\kappa_n} \left( \frac{\text{Sc}_1^M}{6(n+2)} + 2\varepsilon \right) y^{1+\frac{2}{n}} - \left( \frac{\text{Sc}_1^M}{6n} - \varepsilon \right) y^\frac{2}{n} \right] \frac{1}{\lambda^{1+\frac{2}{n}}} dy + \frac{c}{\lambda^{1+\frac{2}{n}}}.
\]
(4.14)

where \( c \) is a positive constant. Integrating now over \( y \) in the right hand side of (4.14), we obtain for \( \lambda \) large enough
\[
I_{\lambda,+} \leq \frac{1}{\lambda} + \frac{\text{Sc}_1^M}{6\kappa_n} \left( \frac{\Gamma (2 + \frac{2}{n})}{n+2} - \frac{\Gamma (1 + \frac{2}{n})}{n} \right) \frac{1}{\lambda^{1+\frac{2}{n}}}
\]
\[
\leq \frac{1}{\lambda} + \frac{c \varepsilon}{\lambda^{1+\frac{2}{n}}}.
\]
(4.15)

Similarly, we can prove that
\[
I_{\lambda,-} \geq \frac{1}{\lambda} - \frac{c \varepsilon}{\lambda^{1+\frac{2}{n}}}.
\]
(4.16)

Inserting (4.15) and (4.16) into (4.12), we obtain (4.7) which, combined with (4.6) and (4.2), completes the proof of point (i) of Theorem 1.12. \( \square \)
Proof of Theorem \((\text{ii})\). Case \(M = S^n_k\). We go back to \((4.1)\) when \(M = S^n_k\) and we use the spherical change of variables \(x = \exp_{x_0}(ru)\), with \(r \in [0, \pi]\) and \(u \in S^{n-1}\). The Jacobian determinant of this change of variables satisfies
\[
dvol(S^n_k)(x) = \left(\frac{\sin(kr)}{k}\right)^{n-1} dr dvol(S^{n-1}_1)(u). \tag{4.17}
\]
The ball \(B(S^n_k)(x, d(S^n_k)(x_0, x))\) has radius \(r\) and volume
\[
\text{vol}(S^n_k)(B(S^n_k)(x, r)) = \sigma_{n-1} \int_0^r \left(\frac{\sin(kt)}{k}\right)^{n-1} dt \tag{4.18}
\]
where we recall that \(\sigma_{n-1} = \text{vol}(S^{n-1})(S^{n-1})\). Combining \((4.1)\) applied to \(M = S^n_k\), \((4.17)\) and \((4.18)\), we obtain
\[
E[\text{vol}(S^n_k)(C(S^n_k)_{x_0, \lambda})] = \int_{r=0}^{\frac{\pi}{2}} \int_{u \in S^{n-1}} e^{-\lambda \sigma_{n-1} \int_{r=0}^{\frac{\pi}{2}} \frac{\sin(kt)}{k} dt} \left(\frac{\sin(kr)}{k}\right)^{n-1} dr dvol(S^{n-1}_1)(u)
\]
\[
= \sigma_{n-1} \int_{r=0}^{\frac{\pi}{2}} e^{-\lambda \sigma_{n-1} \int_{r=0}^{\frac{\pi}{2}} \frac{\sin(kt)}{k} dt} \left(\frac{\sin(kr)}{k}\right)^{n-1} dr.
\]
Using the change of variables \(y = \sigma_{n-1} \int_{r=0}^{\frac{\pi}{2}} \frac{\sin(kt)}{k} dt\) in the integral above, we get
\[
E[\text{vol}(S^n_k)(C(S^n_k)_{x_0, \lambda})] = \frac{1}{\lambda} \int_{y=0}^{\sigma_{n-1} \frac{\pi}{2}} e^{-y} dy
\]
\[
= \frac{1}{\lambda} \left(1 - e^{-\lambda \sigma_{n-1} W_{n-1} \frac{\pi}{2}}\right)
\]
where \(W_{n-1} = \int_{t=0}^{\frac{\pi}{2}} \sin^{n-1}(t) dt\) is the \((n - 1)\)-th Wallis integral which is classically known to be equal to \(\frac{1}{2} B\left(\frac{n}{2}, \frac{1}{2}\right)\), see e.g. [Art64] Formula (5.6)].

Case \(M = H^n_k\). The identity \((2.11)\) can be rewritten as
\[
dvol(H^n_k)(x) = \left(\frac{\sinh(kr)}{k}\right)^{n-1} dr dvol(S^{n-1}_1)(u). \tag{4.19}
\]
Moreover, for any \(x \in H^n_k\) and \(r > 0\),
\[
\text{vol}(B(H^n_k)(x, r)) = \sigma_{n-1} \int_0^r \left(\frac{\sinh(kt)}{k}\right)^{n-1} dt. \tag{4.20}
\]
Combining \((4.1)\) applied to \(M = H^n_k\), \((4.19)\) and \((4.20)\), we obtain
\[
E[\text{vol}(H^n_k)(C(H^n_k)_{x_0, \lambda})] = \int_{r=0}^{\frac{\pi}{2}} \int_{u \in S^{n-1}} e^{-\lambda \sigma_{n-1} \int_{r=0}^{\frac{\pi}{2}} \frac{\sinh(kt)}{k} dt} \left(\frac{\sinh(kr)}{k}\right)^{n-1} dr dvol(S^{n-1}_1)(u)
\]
\[
= \sigma_{n-1} \int_{r=0}^{\frac{\pi}{2}} e^{-\lambda \sigma_{n-1} \int_{r=0}^{\frac{\pi}{2}} \frac{\sinh(kt)}{k} dt} \left(\frac{\sinh(kr)}{k}\right)^{n-1} dr
\]
Finally, the change of variables \(y = \lambda \sigma_{n-1} \int_{r=0}^{\frac{\pi}{2}} \frac{\sinh(kt)}{k} dt\) implies that
\[
E[\text{vol}(H^n_k)(C(H^n_k)_{x_0, \lambda})] = \frac{1}{\lambda} \int_{y=0}^{\infty} e^{-y} dy = \frac{1}{\lambda}.
\]
5 A local change of variables formula of Blaschke-Petkantschin type

The key tool for proving Theorem 1.2 is an extension of a spherical Blaschke-Petkantschin formula, known in $\mathbb{R}^n$ and in $S^n_k$, to the general setting of a Riemannian manifold.

A Blaschke-Petkantschin formula is a rewriting of the $m$-fold product of the volume measure for $m \leq (n + 1)$ which is based on a suitable geometric decomposition of a $m$-tuple of points. It provides the calculation of the Jacobian of the associated change of variables in an integral. Classically, the geometric decomposition consists in fixing the linear or affine subspace which contains all the points, integrating over all $m$-tuples in that subspace and then integrating over the Grassmannian of all subspaces, see [SW08, Chapter 7]. There exists another kind of formulas of Blaschke-Petkantschin type with a spherical decomposition: the sphere containing all the points is fixed, we integrate over the positions of the points on the sphere and then integrate over the Grassmannian of all subspaces spanned by the sphere and over the radius and center of the sphere. Such formulas have been provided by Miles in both cases of the Euclidean space $\mathbb{R}^n$ [Mil70, Formula (70)], see also [Møl94, Proposition 2.2.3], and of the sphere $S^n_k$ [Mil71a, Theorem 4].

In this paper, we concentrate on the particular case of the rewriting of the $n$-fold product of the volume measure with a slightly different spherical geometric transformation: we fix the circumscribed sphere containing both a fixed origin and the $n$ points. Let us consider the example of $\mathbb{R}^n$ first: for almost all given points $x_1, \ldots, x_n$, there exists a unique circumscribed ball associated with $0, x_1, \ldots, x_n$ that we will denote by $B(\mathbb{R}^n)(0, x_1, \ldots, x_n)$. This makes it possible to define the change of variables $(x_1, \ldots, x_n) \mapsto (r, u, u_1, \ldots, u_n)$ given by the relations

$$x_i = ru + ru_i,$$

where $(r, u) \in \mathbb{R}_+ \times S^{n-1}$ are the polar coordinates of the circumcenter of $0, x_1, \ldots, x_n$, and $u_1, \ldots, u_n \in (S^{n-1})^n$ indicate the positions of the points $x_1, \ldots, x_n$ on the boundary of $B(\mathbb{R}^n)(0, x_1, \ldots, x_n)$. Now this approach can be extended to any compact Riemannian manifold $M$. We start by fixing an origin $x_0 \in M$ and we recall that thanks to the Hopf-Rinow theorem [Ber03, Theorem 52], the compactness of $M$ guarantees that $M$ is geodesically complete, which implies that the exponential map $\exp_{x_0}$ is defined on the whole tangent space $T_{x_0}M$. Let us define the following set $\mathcal{E}_n^{(M)}$

$$\mathcal{E}_n^{(M)} = \{(r, u, u_1, \ldots, u_n) : r > 0, u \in T_{x_0}M \text{ with } \|u\|_{x_0} = 1, u_i \in T_{\exp_{x_0}(ru)}M \text{ and } \|u_i\|_{\exp_{x_0}(ru)} = 1 \forall i = 1, \ldots, n\}.$$

We then consider the following transformation $\Phi^{(M)}_{x_0}$, see Figure 1

$$\Phi^{(M)}_{x_0} : \mathcal{E}_n^{(M)} \mapsto M^n$$

$$\{(r, u, u_1, \ldots, u_n) \mapsto (x_1, \ldots, x_n)\}$$

where

$$x_i = \exp_{(\exp_{x_0}(ru))}(ru_i).$$

(5.1)
Theorem 5.2. Its two-term asymptotic expansion when

\[ r \rightarrow 0, \quad (n + 1) \text{-tuple } (u, u_1, \ldots, u_n) \text{ of unit-vectors}, \quad x_0 \text{ in either } \mathbb{R}^n \text{ or } S^n_k \text{ or } H^n_k \text{ and every } k > 0, \text{ we get} \]

\[
\tilde{\mathcal{J}}^{(R^n)}_{x_0}(r, u, u_1, \ldots, u_n) = n! \Delta(u, u_1, \ldots, u_n) r^{n^2-1}, \\
\tilde{\mathcal{J}}^{(S^n_k)}_{x_0}(r, u, u_1, \ldots, u_n) = n! \Delta(u, u_1, \ldots, u_n) \left( \frac{\sin(kr)}{k} \right)^{n^2-1}, \\
\tilde{\mathcal{J}}^{(H^n_k)}_{x_0}(r, u, u_1, \ldots, u_n) = n! \Delta(u, u_1, \ldots, u_n) \left( \frac{\sinh(kr)}{k} \right)^{n^2-1}.
\]  

(5.3) \hspace{1cm} (5.4) \hspace{1cm} (5.5)

The equalities (5.3) and (5.4) come from an almost-direct adaptation of the proofs of the classical spherical Blaschke-Petkantschin formulas due to Miles in [Mil70, Formula (70)] and [Mil71a, Theorem 4] respectively. The identity (5.5) was included in the work of Isokawa for \( n = 2 \) [Iso00b] and \( n = 3 \) [Iso00a] though it was not precisely stated. To the best of our knowledge, the formula in dimension \( n \) is new. Its proof is postponed to the end of this section.

In the general case, we are unable to derive an exact formula for \( \tilde{\mathcal{J}}^{(M)}_{x_0} \). Nevertheless, we provide in Theorem 5.2 its two-term asymptotic expansion when \( r \) tends to 0, which will be enough for our purpose in this paper.

**Theorem 5.2.** When \( r \rightarrow 0 \), we get

\[
\tilde{\mathcal{J}}^{(M)}_{x_0}(r, u, u_1, \ldots, u_n) = n! \Delta(u, u_1, \ldots, u_n) \left( r^{n^2-1} - \frac{L^{(M)}_{x_0}(u, u_1, \ldots, u_n)}{6} r^{n^2+1} + o(r^{n^2+1}) \right)
\]

(5.6)

where \( L^{(M)}_{x_0}(u, u_1, \ldots, u_n) = \sum_{i=1}^{n} \text{Ric}_{x_0}^{(M)}(u_i) + \text{Ric}_{x_0}^{(M)}(u) \), \( \text{Ric}_{x_0}^{(M)}(u) \) stands for \( \text{Ric}_{x_0}^{(M)}(P_{\exp_{x_0}(ru) \to x_0}(u_i)) \) and \( \Delta(u, u_1, \ldots, u_n) \) is the Euclidean volume of the \( n \)-dimensional simplex of \( T_{\exp_{x_0}(ru)}M \) spanned by \( P_{x_0 \to \exp_{x_0}(ru)}(-u) \) and \( u_1, \ldots, u_n \).
Note that the volume $\Delta(u, u_1, \ldots, u_n)$ does not depend on the geometry of the manifold, because the vectors involved lie in the tangent space at the circumcenter $\exp_{x_0}(ru)$, which is naturally identified with $\mathbb{R}^n$.

As expected, since the manifold can be approximated at the first order by the tangent space at $x_0$, the first term of the expansion (5.6) corresponds to the Euclidean case. Moreover, when $M$ has constant sectional curvature, the function of $r$ in (5.6) is consistent with the expansions of $\mathcal{F}_{x_0}(ru)$ and $\mathcal{F}_{x_0}'(ru)$ for small $r$.

In particular, for $r$ small enough, the Jacobian $\mathcal{F}_{x_0}(M)$ is non zero almost everywhere. Thus, the inverse function theorem implies that $\Phi_{x_0}(M)$ is a local $C^1$-diffeomorphism. This remark combined with Assumption (A4) guarantees that $\Phi_{x_0}(M)$, as an injective local $C^1$-diffeomorphism, defines a change of variables of Blaschke-Petkantschin type for small $r$.

Theorem 5.2 is a close companion to the main result from [Cha18a] which states an explicit calculation and asymptotic estimate for a change of variables in $M$ of Blaschke-Petkantschin flavor. In [Cha18a], the underlying application consists in associating to a $(n+1)$-tuple of points in $M$ its circumcenter, circumradius, and $(n+1)$ points on the circumsphere whereas in Theorem 5.2 the point $x_0$ is fixed once and for all and we associate to a $n$-tuple $(x_1, \ldots, x_n)$ the circumcenter, circumradius and $n$ points on the circumsphere of the $(n+1)$-tuple $(x_0, \ldots, x_n)$. This induces a new difficulty in the calculation of partial derivatives since the parameter $r$ appears in both the reference point and the entry of the exponential map. This will require an extra chain rule and the use of Lemma 2.1 in all its power. Moreover, another refinement here is that we require the uniformity of the expansion of the Jacobian with respect to $x_0$ and the vectors $u, u_1, \ldots, u_n$. This is done at the end of the section in Proposition 6.4.

**Proof of Theorem 5.2.** Let us fix $(r, u, u_1, \ldots, u_n)$ and let $z = \exp_{x_0}(ru)$ be the circumcenter of $x_0, \ldots, x_n$.

We endow the tangent space $T_{x_0}M$ with an orthonormal basis $V^{(0)} = \{v_1^{(0)}, \ldots, v_n^{(0)}\}$ where $v_1^{(0)} = u$. We consider in $T_{x_0}M$, the orthonormal basis $V^{(0)}(r) = \{v_1^{(0)}(r), \ldots, v_n^{(0)}(r)\}$ obtained by parallel transport of $V^{(0)}$ along $\gamma_0(t) = \exp_{x_0}(tu)$ and we write, for each $i$,

$$u_i = \sum_{j=1}^{n} u_j^i v_j^{(0)}(r).$$

Now, for each $i$, consider an orthonormal basis of $T_{x_0}M$, $V^{(i)} = \{v_1^{(i)}, \ldots, v_n^{(i)}\}$, with $v_1^{(i)} = u_i$. We endow $T_{x_0}M$, with the orthonormal basis $V^{(i)}(r) = \{v_1^{(i)}(r), \ldots, v_n^{(i)}(r)\}$ obtained by parallel transport of $V^{(i)}$ along $\gamma_i(t) = \exp_{x_0}(ru_i)$.

**Step 1: derivatives with respect to $r$.** Let us consider the vector of size $n$, $(\frac{\partial x_i}{\partial r})$ whose $l$th component is the projection onto $v_l^{(i)}(r)$ of the derivative of $x_i$ with respect to $r$. This is obtained by applying Lemma 2.1 to $\gamma = \gamma_i, c(s) = \exp_{x_0}((r+s)u)$ and $V(s) = (r+s)u_i(s)$, where $u_i(s)$ denotes the parallel transport of $u_i$ along $c$. Then,

$$\left(\frac{\partial x_i}{\partial r}\right) = J_{x}^{(i)}(1)$$

(5.7)

where $J_{x}^{(i)}$ is the unique Jacobi field along $\gamma_i(t) = \exp_x(tru_i)$, with $J_{x}^{(i)}(0) = c'(0) = u(r)$, parallel transport of $u$ along $\gamma_0$ and $J_{x}^{(i)}(0) = V'(0) = u_i$. We deduce from (5.7) and [DC92] Chapter 5, Proposition 3.6] that the first component of the vector $(\frac{\partial x_i}{\partial r})$ is

$$\left(\frac{\partial x_i}{\partial r}\right)_l = \langle v_l^{(i)}(r), J_{x}^{(i)}(1)\rangle x_i$$

$$= \langle \frac{\gamma_i(1)}{r}, J_{x}^{(i)}(1)\rangle x_i$$

$$= \langle u_i, J_{x}^{(i)}(0)\rangle x_i + \langle u_i, J_{x}^{(i)}(0)\rangle x_i$$

$$= u_i^1 + 1.$$
Consequently,
\[
\begin{pmatrix}
\frac{\partial x_i}{\partial r}
\end{pmatrix} = \begin{pmatrix}
1 + u_i^1 \\ n/a
\end{pmatrix} \tag{5.8}
\]

where ‘n/a’ only means that the vector under its first component does not need to be explicit in the rest of the proof.

**Step 2: derivatives with respect to \( u \).** Let us consider \( \left( \frac{\partial x_i}{\partial u} \right) \), whose entry \( \left( \frac{\partial x_i}{\partial u} \right)_{l,m} \) is the projection onto \( v_l^{(i)}(r) \) of the derivative of \( x_i \) with respect to \( u \) in the direction \( v_{m+1}^{(0)} \). As before, we compute these derivatives, using Lemma 2.1. To this end, let us consider \( c(s) = \exp_{x_0}(r(u + sv_{m+1}^{(0)})) \) and \( V(s) = u_i(s) \), where \( u_i(s) \) is the parallel transport of \( u_i \) along \( c \). In particular, note that \( V'(s) = 0 \). The derivative of \( c \) requires to apply again Lemma 2.1 to \( u \) first line of the proof.

Thanks to (5.10) and [DC92, Chapter 5, Proposition 3.6], we are able to compute the derivatives, using Lemma 2.1. To this end, let us consider \( c(s) = \exp_{x_0}(r(u + sv_{m+1}^{(0)})) \) and \( V(s) = u_i(s) \), where \( u_i(s) \) is the parallel transport of \( u_i \) along \( c \). In particular, note that \( V'(s) = 0 \). The derivative of \( c \) requires to apply again Lemma 2.1 to \( u \) first line of the proof.

Thus, we have
\[
\epsilon'(0) = J_{m+1}^{(i)}(r) \tag{5.9}
\]

where \( J_{m+1}^{(i)} \) is the unique Jacobi field along \( \gamma_0 \) with \( J_{m+1}^{(i)}(0) = 0 \) and \( J_{m+1}^{(i)}(0) = v_{m+1}^{(0)} \). Now, Lemma 2.1 applied to \( c \) and \( V \) given above, implies
\[
\left( \frac{\partial x_i}{\partial u} \right)_{l,m} = \langle v_l^{(i)}(r), J_{r,(m+1)}^{(i)}(r) \rangle_{x_i} \tag{5.10}
\]

where \( J_{r,(m+1)}^{(i)} \) is the unique Jacobi field along \( \gamma_i \) with \( J_{r,(m+1)}^{(i)}(0) = J_{m+1}^{(i)}(r) \), given by (5.9) and \( J_{r,(m+1)}^{(i)}(0) = 0 \). Thanks to (5.10) and [DC92] Chapter 5, Proposition 3.6, we are able to compute the first line of \( \left( \frac{\partial x_i}{\partial u} \right) \),
\[
\left( \frac{\partial x_i}{\partial u} \right)_{l,m} = \langle v_l^{(i)}(r), J_{r,(m+1)}^{(i)}(r) \rangle_{x_i}
\]

that is
\[
\left( \frac{\partial x_i}{\partial u} \right) = \begin{pmatrix}
(u_i, J_2^{(0)}(r))_z \\
\vdots \\
(u_i, J_n^{(0)}(r))_z
\end{pmatrix} \tag{5.11}
\]

\[
\left( \frac{\partial x_i}{\partial u} \right)_{l,m} = \langle v_l^{(i)}(r), J_{r,(m+1)}^{(i)}(r) \rangle_{x_i},
\]

where \( J_{m+1}^{(i)} \) is the unique Jacobi field along \( \gamma_i \) with \( J_{m+1}^{(i)}(0) = 0 \) and \( J_{m+1}^{(i)}(0) = v_{m+1}^{(i)} \). An application of [DC92] Chapter 5, Proposition 3.6 shows that \( \langle v_l^{(i)}(r), J_{m+1}^{(i)}(r) \rangle_{x_i} = 0 \) which means that \( J_{m+1}^{(i)} \) is a normal Jacobi field. This implies, with (5.12),
\[
\left( \frac{\partial x_i}{\partial u} \right)_{l,m} = \begin{pmatrix}
0_{n-1} \\
B^{(i)}
\end{pmatrix} \tag{5.13}
\]

Step 3: derivatives with respect to \( u_i \). We consider the submatrix \( \left( \frac{\partial x_i}{\partial u} \right) \) of size \( n \times (n - 1) \) whose entry \( \left( \frac{\partial x_i}{\partial u} \right)_{l,m} \) is the projection onto \( v_l^{(i)}(r) \) of the derivative of \( x_i \) with respect to \( u_i \) in the direction \( v_{m+1}^{(i)} \). We apply again Lemma 2.1 to \( \gamma_i \), \( c(s) = x_0 \) and \( V(s) = u_i + sv_{m+1}^{(i)} \), then
\[
\left( \frac{\partial x_i}{\partial u_i} \right)_{l,m} = \langle v_l^{(i)}(r), J_{m+1}^{(i)}(r) \rangle_{x_i},
\]

where \( J_{m+1}^{(i)} \) is the unique Jacobi field along \( \gamma_i \) with \( J_{m+1}^{(i)}(0) = 0 \) and \( J_{m+1}^{(i)}(0) = v_{m+1}^{(i)} \). An application of [DC92] Chapter 5, Proposition 3.6 shows that \( \langle v_L^{(i)}(r), J_{m+1}^{(i)}(r) \rangle_{x_i} = 0 \) which means that \( J_{m+1}^{(i)} \) is a normal Jacobi field. This implies, with (5.12),
\[
\left( \frac{\partial x_i}{\partial u_i} \right)_{l,m} = \begin{pmatrix}
0_{n-1} \\
B^{(i)}
\end{pmatrix} \tag{5.13}
\]
where $B^{(i)}$ denotes the $(n-1) \times (n-1)$ matrix with entries

$$B^{(i)}_{k,m} = \langle v^{(i)}_{k+1}(r), j^{(i)}_{m+1}(r) \rangle_{x_i}. \quad (5.14)$$

**Step 4: rewriting of the Jacobian determinant.** The Jacobian determinant $\tilde{J}^{(M)}_{x_0}$ can be written as

$$\tilde{J}^{(M)}_{x_0}(r, u, u_1, \ldots, u_n) = \det \begin{pmatrix}
\frac{\partial x_1}{\partial r} & \frac{\partial x_2}{\partial u} & \cdots & \frac{\partial x_n}{\partial u_1} & 0 \\
\frac{\partial x_1}{\partial u} & \frac{\partial x_2}{\partial u} & \cdots & \frac{\partial x_n}{\partial u_2} & 0 \\
\vdots & \vdots & \ddots & \vdots & \vdots \\
\frac{\partial x_1}{\partial u_n} & \frac{\partial x_2}{\partial u_n} & \cdots & \frac{\partial x_n}{\partial u_n} & \frac{\partial x_n}{\partial u_n}
\end{pmatrix}.$$

Now, thanks to (5.8), (5.11) and (5.13), we obtain

$$\tilde{J}^{(M)}_{x_0}(r, u, u_1, \ldots, u_n) = \det\begin{pmatrix}
1 + u_1 & (u_1, J^{(0)}_2(r))_z & \cdots & (u_1, J^{(0)}_n(r))_z & 0 & 0 & 0 \\
\vdots & \vdots & \ddots & \vdots & B^{(1)} & 0 & 0 \\
1 + u_n & (u_n, J^{(0)}_2(r))_z & \cdots & (u_n, J^{(0)}_n(r))_z & 0 & 0 & 0 \\
\vdots & \vdots & \ddots & \vdots & \vdots & \ddots & 0 \\
1 + u_1 & (u_1, J^{(0)}_2(r))_z & \cdots & (u_1, J^{(0)}_n(r))_z & 0 & 0 & 0 \\
\vdots & \vdots & \ddots & \vdots & B^{(n)} & 0 & 0
\end{pmatrix} \quad (5.15)$$

where for sake of simplicity, we have written $0$ for any zero matrix independently of its size. Then, we apply a permutation on lines so that the lines $(1 + u_1, (u_1, J^{(0)}_2(r))_z, \ldots, (u_1, J^{(0)}_n(r))_z)$ appear in the first $n$ lines of a new matrix which is a block lower triangular matrix and which has the same determinant as the Jacobian determinant up to a possible minus sign:

$$|\tilde{J}^{(M)}_{x_0}(r, u, u_1, \ldots, u_n)| = |\det\begin{pmatrix}
1 + u_1 & (u_1, J^{(0)}_2(r))_z & \cdots & (u_1, J^{(0)}_n(r))_z & 0 \\
\vdots & \vdots & \ddots & \vdots & B^{(1)} \\
1 + u_n & (u_n, J^{(0)}_2(r))_z & \cdots & (u_n, J^{(0)}_n(r))_z & 0 \\
\vdots & \vdots & \ddots & \vdots & \ddots \\
1 + u_1 & (u_1, J^{(0)}_2(r))_z & \cdots & (u_1, J^{(0)}_n(r))_z & 0 \\
\vdots & \vdots & \ddots & \vdots & B^{(n)}
\end{pmatrix}|. \quad (5.16)$$

Let us notice now that

$$\langle v_i, J^{(0)}_k(r) \rangle_z = \sum_{j=1}^n u_i^j (v^{(0)}_j(r), J^{(0)}_k(r))_z = \sum_{j=2}^n u_i^j (v^{(0)}_j(r), J^{(0)}_k(r))_z \quad (5.17)$$

since, from [DC92], Chapter 5, Proposition 3.6, $\langle v^{(0)}_1(r), J^{(0)}_2(r) \rangle_z = 0$. It follows that

$$\begin{pmatrix}
1 + u_1 & (u_1, J^{(0)}_2(r))_z & \cdots & (u_1, J^{(0)}_n(r))_z \\
\vdots & \vdots & \ddots & \vdots \\
1 + u_n & (u_n, J^{(0)}_2(r))_z & \cdots & (u_n, J^{(0)}_n(r))_z
\end{pmatrix} = \begin{pmatrix}
1 + u_1 & u_1^2 & \cdots & u_1^n \\
\vdots & \vdots & \ddots & \vdots \\
1 + u_n & u_n^2 & \cdots & u_n^n
\end{pmatrix} \times C \quad (5.18)$$
For let us consider the function

Proof of Lemma 5.3.

where

\[ C = \begin{pmatrix} 1 & 0 & \cdots & 0 \\ 0 & \langle v_2^0(r), J_2^0(r) \rangle_z & \cdots & \langle v_n^0(r), J_n^0(r) \rangle_z \\ \vdots & \vdots & \ddots & \vdots \\ 0 & \langle v_n^0(r), J_n^0(r) \rangle_z & \cdots & \langle v_n^0(r), J_n^0(r) \rangle_z \end{pmatrix}. \quad (5.19) \]

Inserting (5.18) into (5.16), we can write

\[ |\mathcal{J}_{x_0}^{(M)}(r, u, u_1, \ldots, u_n)| = |\det \begin{pmatrix} 1 + u_1^1 & u_1^2 & \cdots & u_1^n \\ \vdots & \vdots & \ddots & \vdots \\ 1 + u_n^1 & u_n^2 & \cdots & u_n^n \end{pmatrix} | \times | \det C | \prod_{i=1}^n | \det B^{(i)} | 
= n! \Delta(u, u_1, \ldots, u_n) | \det C | \prod_{i=1}^n | \det B^{(i)}. \quad (5.20) \]

Step 5: expansion of the Jacobian determinant. We derive from (5.20) the expansion of the Jacobian determinant \( \mathcal{J}_{x_0}^{(M)} \) for small values of \( r \). This requires to expand the determinants of \( C \) and \( B^{(i)} \). To this end, we first expand in Lemma 5.3 below, the coefficients of \( C \), given by (5.19) and \( B^{(i)} \), given by (5.13). Here and in the sequel, \( \varepsilon(s, x_0, r, u, u_1, \ldots, u_n) \) denotes a generic function that tends to 0 when \( r \) tends to 0.

Lemma 5.3. The coefficients of \( C \) satisfy for \( l, m = 2, \ldots, n \)

\[ C_{l,m} = \langle v_l^0(r), J_m^0(r) \rangle_z = r - \frac{K_{x_0}^{(M)}(u, v_m^0)}{6} r^3 + r^3 \varepsilon_{l,m}(x_0, r, u, u_1, \ldots, u_n), \quad (5.21) \]

\[ C_{l,m} = \langle v_l^0(r), J_m^0(r) \rangle_z = r^2 \varepsilon_{l,m}(x_0, r, u, u_1, \ldots, u_n), \quad l \neq m. \quad (5.22) \]

For \( 1 \leq i \leq n \), the coefficients of \( B^{(i)} \) satisfy for \( l, m = 1, \ldots, n \),

\[ B_{l,m}^{(i)} = \langle v_{l+1}^0(r), j_{m+1}^{(i)}(r) \rangle_z = r - \frac{K_{x_0}^{(M)}(u, v_{m+1}^0)}{6} r^3 + r^3 \varepsilon_{l,m}(x_0, r, u, u_1, \ldots, u_n), \quad (5.23) \]

\[ B_{l,m}^{(i)} = \langle v_{l+1}^0(r), j_{m+1}^{(i)}(r) \rangle_z = r^2 \varepsilon_{l,m}(x_0, r, u, u_1, \ldots, u_n), \quad l \neq m, \quad (5.24) \]

where \( K_{x_0}^{(M)} \) and \( K_{x_0}^{(M)} \) denotes the sectional curvatures of \( M \) at \( x_0 \) and \( z \) respectively.

Proof of Lemma 5.3. let us consider the function

\[ f_{l,m}(r, x_0, u, u_1, \ldots, u_n) = C_{l,m}^{(0)} = \langle v_l^0(r), J_m^0(r) \rangle_z. \]

In anticipation of the proof of Lemma 5.3, we make visible the dependency of the functional \( f_{l,m} \) on \( x_0 \) and \( u, u_1, \ldots, u_n \) though only the derivatives of \( f_{l,m} \) with respect to \( r \) will be used in the lines below. Indeed, we wish to apply Taylor’s theorem to the function \( r \rightarrow f_{l,m}(r, x_0, u, u_1, \ldots, u_n) \) for fixed \( x_0, u, u_1, \ldots, u_n \). We start by calculating the consecutive derivatives of \( f_{l,m} \) with respect to \( r \) at the point \( r = 0 \).

Since \( J_m^0(0) = 0 \) and \( v_l^0(r) = v_l^0 \),

\[ f_{l,m}(0, x_0, u, u_1, \ldots, u_n) = \langle v_l^0, J_m^0(0) \rangle_z = 0. \quad (5.25) \]

Let us notice that \( v_l^0(r) \) is a parallel transport thus \( v_l^0(r) \). This implies that

\[ \frac{\partial f_{l,m}}{\partial r}(0, x_0, u, u_1, \ldots, u_n) = \langle v_l^0, J_m^0(0) \rangle_{x_0} = \langle v_l^0, v_m^0 \rangle_{x_0} = \delta_{l,m}. \quad (5.26) \]

Since \( J_m^0 \) is a Jacobi field, it satisfies the Jacobi equation (2.7) and consequently,

\[ \frac{\partial^2 f_{l,m}}{\partial r^2}(0, x_0, u, u_1, \ldots, u_n) = \langle v_l^0, J_m^{0}(0) \rangle z_{x_0} = -\langle v_l^0, R_{x_0}^{(M)}(v_l^0, J_m^0(0)) \rangle z_{x_0} = 0. \quad (5.27) \]
The expansion of $C_{l,m}$, $l \neq m$, now follows from Taylor’s theorem combined with $\text{(5.25)}$-$\text{(5.27)}$. The expansion of $C_{m,m}$ requires the third derivative of $f_{m,m}$. Thanks to [DC92, p.115] and since $J_{m}^{(0)}(0) = 0$,

$$\frac{\partial^3 f_{m,m}}{\partial r^3}(0, x_0, u, u_1, \ldots, u_n) = \langle v_m^{(0)}, J_{m}^{(0)m}(0) \rangle_{x_0} = -\langle v_m^{(0)}, R_{x_0}^{(M)}(v_1^{(0)}, J_{m}^{(0)r}(0))v_1^{(0)} \rangle_{x_0}$$

$$= -\langle v_m^{(0)}, R_{x_0}^{(M)}(v_1^{(0)}, v_m^{(0)})v_1^{(0)} \rangle_{x_0} = K_{x_0}^{(M)}(u, v_m^{(0)}).$$  \hspace{1cm} (5.28)

Now, applying Taylor’s theorem at the fourth order to $f_{m,m}(\cdot, x_0, u, u_1, \ldots, u_n)$ combined with $\text{(5.25)}$-$\text{(5.27)}$, we obtain the expansion $\text{(5.21)}$. We omit the proof of $\text{(5.23)}$ and $\text{(5.24)}$ as it is very similar to the proof of $\text{(5.21)}$ and $\text{(5.22)}$.

We are now able to expand $\text{det } C$ and $\text{det } B^{(i)}$ and prove that

$$\det C = r^{n-1} - \frac{\text{Ric}_{x_0}^{(M)}(u)}{6}r^{n+1} + r^{n+1}\varepsilon_1(x_0, r, u, u_1, \ldots, u_n),$$  \hspace{1cm} (5.29)

$$\det B^{(i)} = r^{n-1} - \frac{\text{Ric}_{x_0}^{(M)}(u)}{6}r^{n+1} + r^{n+1}\varepsilon_2(x_0, r, u, u_1, \ldots, u_n),$$  \hspace{1cm} (5.30)

where $\text{Ric}_{x_0}^{(M)}$ and $\text{Ric}_{x_0}^{(M)}$ denote the Ricci curvatures at $x_0$ and $z$ respectively. To this end, let us write

$$\text{det } C = \sum_{\sigma \in \mathfrak{S}_{n-1}} \text{sgn}(\sigma) \prod_{j=2}^{n} C_{\sigma(j),j}$$

$$= \prod_{j=2}^{n} C_{j,j} + \sum_{\sigma \in \mathfrak{S}_{n-1}\backslash\{\text{Id}\}} \text{sgn}(\sigma) \prod_{j=2}^{n} C_{\sigma(j),j},$$  \hspace{1cm} (5.31)

$$\text{det } B^{(i)} = \sum_{\sigma \in \mathfrak{S}_{n-1}} \text{sgn}(\sigma) \prod_{j=2}^{n} B_{\sigma(j),j}$$

$$= \prod_{j=2}^{n} B_{j,j} + \sum_{\sigma \in \mathfrak{S}_{n-1}\backslash\{\text{Id}\}} \text{sgn}(\sigma) \prod_{j=2}^{n} B_{\sigma(j),j},$$  \hspace{1cm} (5.32)

where $\mathfrak{S}_{n-1}$ denotes the set of permutations of $\{2, \ldots, n\}$, $\text{sgn}(\sigma)$ is the signature of the permutation $\sigma$ and $\text{Id}$ is the identity of $\mathfrak{S}_{n-1}$. We expect the contribution of the first term in $\text{(5.31)}$ to be dominant in the expansion $\text{(5.29)}$. Using expansion $\text{(5.21)}$, we have

$$\prod_{j=2}^{n} C_{j,j} = \prod_{j=2}^{n}(r - \frac{K_{x_0}^{(M)}(u, v_j^{(0)})}{6}r^{3} + r^{3}\varepsilon_{j,j}(x_0, r, u, u_1, \ldots, u_n))$$

$$= r^{n-1} - \frac{r^{n+1} + \sum_{j=2}^{n} K_{x_0}^{(M)}(u, v_j^{(0)})}{6}r^{n+1}\varepsilon_{(j)}$$

$$= r^{n-1} - \frac{\text{Ric}_{x_0}^{(M)}(u)}{6}r^{n+1} + r^{n+1}\varepsilon(x_0, r, u, u_1, \ldots, u_n)$$  \hspace{1cm} (5.33)

since $V^{(0)} = \{u = v_j^{(0)}, \ldots, v_n^{(0)}\}$ is an orthonormal basis of $T_{x_0} M$. It remains to prove that the contribution of the second term in $\text{(5.31)}$ is negligible with respect to $r^{n+1}$. Let $\sigma \neq \text{Id}$. Then there are at least two indices $j$ such that $\sigma(j) \neq j$. Without loss of generality, we can assume $\sigma(2) \neq 2$ and $\sigma(3) \neq 3$. From $\text{(5.22)}$, we know that, $C_{\sigma(2),2} = r^2\varepsilon_{(2)}^{(0)}(x_0, r, u, u_1, \ldots, u_n)$ and $C_{\sigma(3),3} = r^2\varepsilon_{(3)}^{(0)}(x_0, r, u, u_1, \ldots, u_n)$. Moreover, for $j \neq 2, 3$, $C_{\sigma(j),j}$ is of order at least $r$, which means that there is a constant $c$ such that $\prod_{j=2}^{n} C_{\sigma(j),j} \leq cr^{n-3}$. Thus,

$$\lim_{r \to 0} \left| \frac{1}{r^{n+1}} \prod_{j=2}^{n} C_{\sigma(j),j} \right| = \lim_{r \to 0} \left| C_{\sigma(2),2} C_{\sigma(3),3} \prod_{j=4}^{n} C_{\sigma(j),j} \right|$$

$$\leq \lim_{r \to 0} c\varepsilon_{(2)}^{(0)}(x_0, r, u, u_1, \ldots, u_n) \varepsilon_{(3)}^{(0)}(x_0, r, u, u_1, \ldots, u_n)$$

$$= 0.$$  \hspace{1cm} (5.34)
Combining (5.33), (5.34) with (5.31), we obtain (5.29). Similarly, if we now denote by \( \mathfrak{S}_{n-1} \) the set of the permutation of \( \{1, \ldots, n-1\} \), we can write

\[
\det B^{(i)} = \frac{n-1}{\prod_{j=1}^{n-1} B_{j,j}^{(i)}} + \sum_{\sigma \in \mathfrak{S}_{n-1} \setminus \{\Id\}} \text{sgn}(\sigma) \prod_{j=1}^{n-1} B_{\sigma(j),j}^{(i)}
\]  
(5.35)

As for (5.33), the expansion (5.23) implies that

\[
\prod_{j=1}^{n-1} B_{j,j}^{(i)} = \varepsilon^{n-1} - \frac{\text{Ric}_z(M)(u_i)}{6} \varepsilon + \varepsilon^{n+1} \varepsilon(x_0, r, u, u_1, \ldots, u_n).
\]  
(5.36)

Moreover, using same arguments as for (5.34), we can prove that

\[
\lim_{r \to 0} \frac{1}{\varepsilon^{n+1}} \prod_{j=1}^{n-1} B_{\sigma(j),j}^{(i)} = 0.
\]  
(5.37)

Inserting (5.36) and (5.37) into (5.35), we get the expansion (5.30). Note that, when \( r \) tends to 0, \( z = \exp_{x_0}(ru) \) tends to \( x_0 \), thus, by continuity of the Ricci curvature,

\[
\text{Ric}_z(M)(u_i) = \text{Ric}_{x_0}(M)(u_i) + \varepsilon(x_0, r, u_i),
\]  
(5.38)

where we recall that the vector \( u_i \) on the right hand side must be understood as its parallel transport in \( T_{x_0}M \). Then, combining (5.30) with (5.38), we are able to write the following expansion of \( \det B^{(i)} \)

\[
\det B^{(i)} = \varepsilon^{n-1} - \frac{\text{Ric}_{x_0}(M)(u_i)}{6} \varepsilon + \varepsilon^{n+1} \varepsilon(x_0, r, u, u_1, \ldots, u_n)
\]  
(5.39)

The expansion of the Jacobian determinant \( \tilde{J}_{x_0}^{(M)} \) now follows from (5.20), (5.29) and (5.39).

We conclude this section by adding an additional information to the expansion of the Jacobian: the uniformity of the approximation with respect to \( x_0 \in M \) and to the vectors \( u, u_1, \ldots, u_n \). This is done in Proposition 5.4 below.

For \( x_0 \in M \), we define the function \( \varepsilon \) through the identity

\[
\tilde{J}_{x_0}^{(M)}(r, u, u_1, \ldots, u_n) = r^{n-1} - \frac{\text{Ric}_{x_0}(M)(u) + \sum_{i=1}^{n} \text{Ric}_{x_0}(M)(u_i)}{6} r^{n+1} + r^{n+1} \varepsilon(x_0, r, u, u_1, \ldots, u_n).
\]  
(5.40)

**Proposition 5.4.** There exists \( c > 0 \) such that for \( r \) small enough, every \( x_0 \in M \) and vectors \( u, u_1, \ldots, u_n \),

\[
|\varepsilon(x_0, r, u, u_1, \ldots, u_n)| \leq cr.
\]

**Proof.** We start by recalling that because of (5.20), the determinant \( \tilde{J}_{x_0}^{(M)}(r, u, u_1, \ldots, u_n) \) is a homogeneous polynomial of degree \( n^2 \) in the coefficients of the matrices \( C \) and \( B^{(i)} \), \( i = 1, \ldots, n \), and containing exclusively monomials of type \( \prod_{i=1}^{n} C_{i,\sigma(i)} \prod_{j=1}^{n} \prod_{m=1}^{n} B_{m,\sigma_1(m)}^{(i)} \cdot B_{m,\sigma_2(m)}^{(i)} \cdot \ldots \cdot B_{m,\sigma_n(m)}^{(i)} \) where \( \sigma, \sigma_1, \ldots, \sigma_n \) are permutations of \( \{1, \ldots, n\} \). This implies that the remainder \( r^{n+1} \varepsilon(x_0, r, u, u_1, \ldots, u_n) \) in (5.40) is a linear combination of products containing exclusively factors of type \( r \), \( K_{x_0}^{(M)}(\cdot, \cdot)^3 \) and at least one factor of type \( r^2 \varepsilon_{i,m}^{(i)} \). A use of (A1) and Lemma 5.5 below completes the proof of Proposition 5.4.

The next lemma shows that the functions \( \varepsilon_{i,m}^{(i)} \) appearing in the Taylor expansions of Lemma 5.3 are bounded by a linear function of \( r \).

**Lemma 5.5.** There exist positive constants \( c_{i,m}^{(k)} \), \( k = 0, \ldots, n \), \( l, m = 1, \ldots, n \) such that for every \( r \in (0, 1) \), \( x_0 \) and vectors \( u, u_1, \ldots, u_n \), \( k = 0, \ldots, n \),

\[
|\varepsilon_{i,m}^{(k)}(x_0, r, u, u_1, \ldots, u_n)| \leq c_{i,m}^{(k)} r.
\]  
(5.41)
Proof. We go back to the proof of Lemma \[\text{(5.3)}\] and, instead of using Taylor’s theorem, we wish to apply Taylor’s inequality to the function \(r \mapsto f_{l,m}(r, x_0, u, u_1, \ldots, u_n)\) for fixed \(x_0, u, u_1, \ldots, u_n\) combined with uniform upper bounds for the third (resp. fourth) derivative of \(f_{l,m}\) with respect to \(r\) when \(l \neq m\) (resp. \(l = m\)). We start by calculating the derivatives of \(f_{i,m}\) with respect to \(r\): since \(v_{i}^{(0)}(r)\) is a parallel transport, its successive derivatives are zero. Moreover, applying the Jacobi equation (2.7) to \(H\), we get

\[
\frac{\partial^2 f_{l,m}}{\partial r^2}(r, x_0, u, u_1, \ldots, u_n) = \langle v_{i}^{(0)}(r), J^{(0)}_m(r) \rangle_z = -\langle v_{i}^{(0)}(r), \frac{\partial}{\partial r} \partial_t R_z(M)(v_{0}^{(0)}(r), J^{(0)}_m(r))v_{1}^{(0)}(r) \rangle_z. \tag{5.42}
\]

It follows that the third and fourth derivatives of \(f_{l,m}\) with respect to \(r\) can be written as

\[
\frac{\partial^3 f_{l,m}}{\partial r^3}(r, x_0, u, u_1, \ldots, u_n) = -\langle v_{i}^{(0)}(r), \frac{\partial^2}{\partial r^2} \partial_t R_z(M)(v_{0}^{(0)}(r), J^{(0)}_m(r))v_{1}^{(0)}(r) \rangle_z \tag{5.43}
\]

and

\[
\frac{\partial^4 f_{l,m}}{\partial r^4}(r, x_0, u, u_1, \ldots, u_n) = -\langle v_{i}^{(0)}(r), \frac{\partial^3}{\partial r^3} \partial_t R_z(M)(v_{0}^{(0)}(r), J^{(0)}_m(r))v_{1}^{(0)}(r) \rangle_z. \tag{5.44}
\]

By the regularity of the curvature tensor, the functions \(\frac{\partial^3 f_{l,m}}{\partial r^3}\) and \(\frac{\partial^4 f_{l,m}}{\partial r^4}\) are continuous on the compact set \([0,1] \times M \times (S^{n-1})_{n+1}\) where we use with a slight abuse of notation the same notation \(S^{n-1}\) for the unit sphere of both \(T_{x_0}M\) and \(T_xM\). Consequently, there exists a positive constant \(c\) such that for every \(r \leq 1\), \(x_0 \in M\) and every \(u, u_1, \ldots, u_n\),

\[
\max \left( \frac{\partial^3 f_{l,m}}{\partial r^3}, \frac{\partial^4 f_{l,m}}{\partial r^4} \right) \left( r, x_0, u, u_1, \ldots, u_n \right) \leq c. \tag{5.45}
\]

Taylor’s inequality combined with (5.45) implies that for every \(r \leq 1\), \(x_0 \in M\) and \(u, u_1, \ldots, u_n\),

\[
\sup_{[0,1] \times M} \left| \frac{\partial^4 f_{l,m}}{\partial r^4} \right| \left( r, x_0, u, u_1, \ldots, u_n \right) \leq \frac{c}{24} r^4 \tag{5.46}
\]

and for \(l \neq m\),

\[
\sup_{[0,1] \times M} \left| \frac{\partial^4 f_{l,m}}{\partial r^4} \right| \left( r, x_0, u, u_1, \ldots, u_n \right) \leq \frac{c}{6} r^3. \tag{5.47}
\]

This proves (5.41) for \(k = 0\). For \(k = 1, \ldots, n\), (5.41) follows by the same method.

We end this section with the proof of the explicit formula of \(\tilde{J}_{x_0}^{(M)}(r, u, u_1, \ldots, u_n)\) in the case \(M = \mathcal{H}_k^n\).

**Proof of (5.3).** Let us go back to (5.20). From [DC92, p 113], we know that for \(M = \mathcal{H}_k^n\), the Jacobi fields satisfy

\[
J_j^{(0)}(r) = \frac{\sinh(kr)}{k} v_j^{(0)}(r), \tag{5.46}
\]

\[
J_j^{(i)}(r) = \frac{\sinh(kr)}{k} v_j^{(i)}(r). \tag{5.47}
\]

Hence, we can rewrite the matrices \(C\) and \(B^{(i)}\) as

\[
C = \begin{pmatrix} 1 & 0 \\ 0 & \frac{\sinh(kr)}{k} \text{Id}_{(n-1)} \end{pmatrix}, \quad B^{(i)} = \frac{\sinh(kr)}{k} \text{Id}_{(n-1)}. \tag{5.48}
\]

where \(\text{Id}_{(n-1)}\) denotes the identity matrix of size \((n-1)\). Inserting into (5.20), we obtain that

\[
\tilde{J}_{x_0}^{(\mathcal{H}_k^n)}(r, u, u_1, \ldots, u_n) = n! \Delta(u, u_1, \ldots, u_n) \left( \frac{\sinh(kr)}{k} \right)^{n-1}, \tag{5.49}
\]

which completes the proof of (5.3).
6 Mean cardinality and density of the set of vertices of $C_{x_0,\lambda}^{(M)}$: proofs of Theorem 1.2 and Theorem 1.3

In this section, we prove Theorems 1.2 and 1.3 which contain an asymptotic expansion of $\mathbb{E}[N(C_{x_0,\lambda}^{(M)})]$ and of the density of the intensity measure of the point process $Y_{x_0,\lambda}^{(M)}$ as well as explicit formulas in the particular cases of $S_k^n$ and $H_k^n$.

6.1 Proof of Theorem 1.2 (i)

Each vertex of $C_{x_0,\lambda}^{(M)}$ is a circumcenter of $x_0$ and $n$ distinct points $x_1, \ldots, x_n$ of $\mathcal{P}_\lambda$ such that the associated circumscribed ball contains no point of the point process $\mathcal{P}_\lambda$ in its interior. Thanks to Section 3 and Assumption (A4), we can assume that $M$ is included in $B^{(M)}(x_0, r_{\text{max}})$ where $r_{\text{max}}$ is given by (A4). This implies that for any $x_1, \ldots, x_n \in M$, there is at most one unique circumscribed ball $B^{(M)}(x_0, x_1, \ldots, x_n)$ with center in $B^{(M)}(x_0, r_{\text{max}})$ and radius less than $r_{\text{max}}$. Consequently, using the Mecke-Slivnyak formula, see e.g. [Møl94, Proposition 4.1.1], we get

$$\mathbb{E}[N(C_{x_0,\lambda}^{(M)})] = \mathbb{E} \left[ \sum_{\{x_1, \ldots, x_n\} \subseteq \mathcal{P}_\lambda} \mathbb{1}_{\{B^{(M)}(x_0, x_1, \ldots, x_n) \text{ exists and } B^{(M)}(x_0, x_1, \ldots, x_n) \cap \mathcal{P}_\lambda = \emptyset\}} \right],$$

$$= \frac{\lambda^n}{n!} \int_{M^n} \mathbb{P}(B^{(M)}(x_0, x_1, \ldots, x_n) \text{ exists and does not meet } \mathcal{P}_\lambda) \, d\text{vol}^{(M)}(x_1) \ldots d\text{vol}^{(M)}(x_n),$$

where

$$\hat{M}_n = \{(x_1, \ldots, x_n) \in M^n, \text{ the circumscribed ball } B^{(M)}(x_0, x_1, \ldots, x_n) \text{ exists}\}.$$ 

The integral above is of the type which is classically treated via Laplace’s method [BH86, Chap 5 and 9]. Indeed, we expect that only the small circumscribed balls which naturally correspond to points $x_1, \ldots, x_n$ in a small neighborhood of $x_0$, will contribute significantly and the rest will decay exponentially fast. The expansion of the integral requires an expansion of the volume of the ball $B^{(M)}(x_0, x_1, \ldots, x_n)$ given in Lemma 2.3 and of the volume element $d\text{vol}^{(M)}(x_1) \ldots d\text{vol}^{(M)}(x_n)$ given by (5.2) combined with Theorem 5.2.

**Step 1: decomposition of $\mathbb{E}[N(C_{x_0,\lambda}^{(M)})]$ into two integrals.** As in Section 4 let $r_\lambda = \lambda^{-\frac{n}{n+1}}$ and let $M^{(n)}_\lambda$ be the subset of $M^n$ defined by

$$M^{(n)}_\lambda = \{(x_1, \ldots, x_n) \in M^n \text{ s.t. } B^{(M)}(x_0, x_1, \ldots, x_n) \text{ exists and has radius smaller than } r_\lambda\}.$$ 

Then the integral in (6.1) can be written as

$$\mathbb{E}[N(C_{x_0,\lambda}^{(M)})] = I_\lambda + \hat{I}_\lambda,$$

where

$$I_\lambda = \frac{\lambda^n}{n!} \int_{M^{(n)}_\lambda} e^{-\lambda \text{vol}^{(M)}(B^{(M)}(x_0, x_1, \ldots, x_n))} \, d\text{vol}^{(M)}(x_1) \ldots d\text{vol}^{(M)}(x_n)$$

and

$$\hat{I}_\lambda = \frac{\lambda^n}{n!} \int_{\hat{M}_n \setminus M^{(n)}_\lambda} e^{-\lambda \text{vol}^{(M)}(B^{(M)}(x_0, x_1, \ldots, x_n))} \, d\text{vol}^{(M)}(x_1) \ldots d\text{vol}^{(M)}(x_n).$$

**Step 2: $\hat{I}_\lambda$ is negligible.** We show that $\hat{I}_\lambda$ given by (6.3) is negligible in front of $\lambda^{-\frac{n}{n+1}}$. By definition of the set $M^{(n)}_\lambda$, for every $(x_1, \ldots, x_n) \in \hat{M}_n \setminus M^{(n)}_\lambda$, the circumscribed ball $B^{(M)}(x_0, x_1, \ldots, x_n)$ has a radius
Let $I_\lambda (M) \geq c\lambda^{-\frac{n+1}{3}}$. Then, since $M$ is compact, Lemma 2.3 (ii) implies that there exists a positive constant $c$ such that for $\lambda$ large enough and for every $(x_1, \ldots, x_n) \in M^n \setminus M_\lambda^n$,

$$\text{vol}(M)(B(M)(x_0, \ldots, x_n)) \geq c\lambda^{-\frac{n+1}{3}}.$$  

(6.5)

Inserting (6.5) into (6.4), we obtain that

$$\hat{I}_\lambda \leq \text{vol}(M)\lambda^{n+1}e^{-c\lambda^{-\frac{n+1}{3}}},$$

which implies

$$\hat{I}_\lambda = o\left(\frac{1}{\lambda^\frac{n}{2}}\right).$$  

(6.6)

**Step 3: estimate of $I_\lambda$.** Let us now prove that when $\lambda \to \infty$,

$$I_\lambda = \epsilon_n - \frac{d_n \text{Sc}(M)}{\lambda^{\frac{n}{2}}} + o\left(\frac{1}{\lambda^\frac{n}{2}}\right),$$

(6.7)

where the constants $\epsilon_n$ and $d_n$ are given in Theorem 1.2 (i). To this end, we apply the change of variables $\Phi_{x_0}^{(M)}$ given by (5.1). We can do so because $\Phi_{x_0}^{(M)}$ is a global diffeomorphism as an injective function with non-vanishing Jacobian determinant. We get

$$I_\lambda = \lambda^{n+1} \int_0^{\lambda^{n+1}} \int e^{-\lambda \text{vol}(M)(B(M)(\exp_{x_0}(ru), r))} |\tilde{J}_\phi^{(M)}(r, u, u_1, u_2, \ldots, u_n)| \text{dvol}(S^{n-1})(u_1) \ldots \text{dvol}(S^{n-1})(u_n) dr.$$  

(6.8)

The estimation of $I_\lambda$ relies on the expansion of both $\text{vol}(M)(B(M)(\exp_{x_0}(ru), r))$ and $\tilde{J}_\phi^{(M)}(r, u, u_1, u_2, \ldots, u_n)$. Let $\epsilon > 0$. Theorem 5.2 implies that for $\lambda$ large enough, $0 < r < \lambda^{-\frac{n+1}{2}}$, $u \in T_{x_0}M$, $\|u\|_{x_0} = 1$ and $u_i \in T_{\exp_{x_0}(ru)}M$ with $\|u_i\|_{\exp_{x_0}(ru)} = 1$, $i = 1, \ldots, n$,

$$\left|\tilde{J}_\phi^{(M)}(r, u, u_1, u_2, \ldots, u_n)\right| \leq \epsilon r^{n+1}.$$  

(6.9)

Inserting (6.9) and (4.11) into (6.8) we obtain

$$I_{\lambda, -} \leq I_\lambda \leq I_{\lambda, +}$$

(6.10)

where

$$I_{\lambda, \pm} = \int_0^{\lambda^{n+1}} \int \varphi_{\lambda, \pm}(r, u, u_1, u_2, \ldots, u_n) \text{dvol}(S^{n-1})(u) \text{dvol}(S^{n-1})(u_1) \ldots \text{dvol}(S^{n-1})(u_n) r^n \text{d}r,$$  

(6.11)

and the functions $\varphi_{\lambda, +}$ and $\varphi_{\lambda, -}$ are defined by the equalities

$$\varphi_{\lambda, -}(r, u, u_1, u_2, \ldots, u_n) = e^{-\lambda \epsilon_n r^n} \left[ r^{n+1} + \left( \frac{\kappa_n \text{Sc}(M)}{6(n+2)} - \epsilon \right) r^{n+2} - \left( \frac{L_{x_0}^{(M)}(u, u_1, u_2, \ldots, u_n)}{6} + \epsilon \right) r^{n+3} \right] \Delta(u, u_1, \ldots, u_n)$$

and

$$\varphi_{\lambda, +}(r, u, u_1, u_2, \ldots, u_n) = e^{-\lambda \epsilon_n r^n} \left[ r^{n+1} + \left( \frac{\kappa_n \text{Sc}(M)}{6(n+2)} + 2\epsilon \right) r^{n+2} - \left( \frac{L_{x_0}^{(M)}(u, u_1, u_2, \ldots, u_n)}{6} - \epsilon \right) r^{n+3} \right] \Delta(u, u_1, \ldots, u_n).$$

In order to derive an upper bound for $I_{\lambda, +}$, we proceed in the exact same way as in the proof of Theorem 1.2 (i), Step 3, i.e.

25
- we start by applying the change of variables \( y = \lambda \kappa_n r_n \), taking \( y \) from 0 to \( \infty \),

- we use Assumption (A_1) to show that the integral of the last term of \( \varphi_{\lambda,+} \) is bounded by \( \lambda^{-\frac{d}{2}} \) up to a multiplicative constant,

- we calculate the integral of the remaining terms over \( u, u_1, \ldots, u_n \) first and then over \( y \).

We do not add details for the first two points since they come from a straightforward adaptation of Step 3 from the proof of Theorem 1.1 (i). The calculation of the integral over \( u, u_1, \ldots, u_n \) goes along the following lines. We start by recalling the formula below, see [Mil71a, Theorem 2]:

\[
\int_{u,u_1,\ldots,u_n} \Delta(u, u_1, \ldots, u_n) \, d\text{vol}^{(S^{n-1})}(u) \, d\text{vol}^{(S^{n-1})}(u_1) \ldots d\text{vol}^{(S^{n-1})}(u_n) = \frac{2^{n+1} \Gamma\left(\frac{n^2+1}{2}\right) \pi^{\frac{n^2+n-1}{2}}}{n! \Gamma\left(\frac{n^2}{2}\right) \Gamma\left(\frac{n^2+1}{2}\right)}.
\]

Denoting by \( k_n \) the constant above and using Fubini’s theorem combined with (2.6), we obtain in particular

\[
\int_{u,u_1,\ldots,u_n} \Delta(u, u_1, \ldots, u_n) \, \text{Ric}^{(M)}_{\xi_0}(u) \, d\text{vol}^{(S^{n-1})}(u) \, d\text{vol}^{(S^{n-1})}(u_1) \ldots d\text{vol}^{(S^{n-1})}(u_n)
\]

\[
= \int_{u} \text{Ric}^{(M)}_{\xi_0}(u) \int_{u_1,\ldots,u_n} \Delta(u, u_1, \ldots, u_n) \, d\text{vol}^{(S^{n-1})}(u_1) \ldots d\text{vol}^{(S^{n-1})}(u_n) \, d\text{vol}^{(S^{n-1})}(u)
\]

\[
= \int \text{Ric}^{(M)}_{\xi_0}(u) \frac{k_n \text{Sc}^{(M)}_{\xi_0}}{n} \, d\text{vol}^{(S^{n-1})}(u)
\]

\[
= \frac{k_n \text{Sc}^{(M)}_{\xi_0}}{n}.
\]

Consequently, we get

\[
\int_{u,u_1,\ldots,u_n} \Delta(u_0, u_1, \ldots, u_n) L^{(M)}_{\xi_0}(u, u_1, \ldots, u_n) \, d\text{vol}^{(S^{n-1})}(u) \, d\text{vol}^{(S^{n-1})}(u_1) \ldots d\text{vol}^{(S^{n-1})}(u_n)
\]

\[
= \sum_{i=0}^{n} \int_{u_1,\ldots,u_n} \Delta(u_0, u_1, \ldots, u_n) \, \text{Ric}^{(M)}_{\xi_0}(u_i) \, d\text{vol}^{(S^{n-1})}(u_0) \, d\text{vol}^{(S^{n-1})}(u_1) \ldots d\text{vol}^{(S^{n-1})}(u_n)
\]

\[
= \frac{k_n (n+1) \text{Sc}^{(M)}_{\xi_0}}{n}.
\]

The integration of \( \varphi_{\lambda,+} \) over \( u, u_1, \ldots, u_n \) then leads us to

\[
I_{\lambda,+} \leq k_n \int_{0}^{\infty} e^{-y} \left[ \left( \frac{y}{\lambda \kappa_n} \right)^{n-1} + \frac{\kappa_n \text{Sc}^{(M)}_{\xi_0}}{6(n+2)} + 2 \varepsilon \left( \frac{y}{\lambda \kappa_n} \right)^{n+\frac{d}{2}} \frac{1}{\lambda^{\frac{d}{2}}} \right] \frac{du}{\kappa_n} \frac{1}{\lambda^{\frac{d}{2}}}.
\]

Finally, integrating over \( y \) in (6.12), for \( \lambda \) large enough, we obtain

\[
I_{\lambda,+} \leq e_n \frac{\text{Sc}^{(M)}_{\xi_0}}{\lambda^{\frac{d}{2}}} d_n + \frac{\varepsilon}{\lambda^{\frac{d}{2}}}.
\]

where \( e_n \) and \( d_n \) are given by (1.2) and (1.6) respectively. The lower bound \( I_{\lambda,-} \) can be handled in the same way, so that

\[
I_{\lambda,-} \geq e_n \frac{\text{Sc}^{(M)}_{\xi_0}}{\lambda^{\frac{d}{2}}} d_n - \frac{\varepsilon}{\lambda^{\frac{d}{2}}}.
\]

Using (6.10), (6.13) and (6.14), we get (6.7) which, combined with (6.6), concludes the proof of Theorem 1.2 (i).
6.2 Proof of Theorem 1.3 (i)

Let \( h \) be a measurable, bounded and non-negative test function on \( \mathbb{R}^+ \times S^{n-1} \). We aim at finding a function \( g^{(M)}_\lambda \) which satisfies

\[
E \left( \sum_{(r,u) \in V^{(M)}_{x_0,\lambda}} h(r,u) \right) = \int h(r,u) g^{(M)}_\lambda(r,u) \, dr \, d\nu(S^{n-1})(u).
\]

To do so, we use again the fact that each vertex of \( C^{(M)}_{x_0,\lambda} \) is the center of a ball which is circumscribed to \( x_0 \) and to \( n \) distinct points \( x_1,\ldots,x_n \) of \( \mathcal{P}_\lambda \). For any \( x_1,\ldots,x_n \), let us define \( R := R(x_0,\ldots,x_n) > 0 \) and \( U := U(x_0,\ldots,x_n) \in S^{n-1} \) such that \( \exp_{x_0}(\lambda^{-1} R(x_0,\ldots,x_n) U(x_0,\ldots,x_n)) \) is the associated circumscribed center when it exists. Using the Mecke-Slivnyak formula, we get

\[
E \left( \sum_{(r,u) \in V^{(M)}_{x_0,\lambda}} h(r,u) \right) = \frac{\lambda^n}{n!} \int h(R,U) \mathbb{1}_{\{B^{(M)}(x_0,x_1,\ldots,x_n) \text{ exists and } B^{(M)}(x_0,x_1,\ldots,x_n) \cap \mathcal{P}_\lambda = \emptyset\}} \, dr \, d\nu(M)(x_1) \ldots d\nu(M)(x_n).
\]

We then follow line by line each step of the proof of Theorem 1.2 (i). For sake of brevity, we skip the details and only sketch the strategy, i.e.

- we decompose the integral above and isolate the contribution of \( (x_1,\ldots,x_n) \in M^{(n)}_\lambda \),
- we show that the remainder is negligible,
- we apply the change of variables provided by (5.1) in the integral over \( M^{(n)}_\lambda \), use the approximation of the Jacobian and of the volume of a ball given in Theorem 5.2 and Lemma 2.3 respectively,
- we finally integrate over \( u_1,\ldots,u_n \) and the result follows.

6.3 Proofs of Theorem 1.2 and Theorem 1.3 (ii)

Let us derive the expectation of both the number of vertices of \( C^{(M)}_{x_0,\lambda} \) and the density of the intensity measure of the point process \( V^{(M)}_{x_0,\lambda} \) in the particular cases \( M = S^n_k \) and \( M = H^n_0 \). These both rely on the fact that the Jacobian determinant of the change of variables given by (5.1) and the volume of a geodesic ball have an explicit expression. Since Theorem 1.2 (ii) is immediately obtained by integrating the densities of Theorem 1.3 (ii), we only prove the latter.

**Case** \( M = S^n_k \). For any \((n+1)-\text{tuple}, x_0,\ldots,x_n \) of \( S^n_k \), there are exactly two circumscribed balls with antipodal centers: the smallest one with a radius \( r < \frac{1}{n} \), denoted by \( B^{(S^n_k)}_1(y_0,\ldots,y_n) \) and the largest one, denoted by \( B^{(S^n_k)}_2(y_0,\ldots,y_n) \), with radius \( \frac{2n}{1-n} r \). In particular, \( B^{(S^n_k)}_2(y_0,\ldots,y_n) = S^{n-1}_k \setminus B^{(S^n_k)}_1(y_0,\ldots,y_n) \). Then applying the Mecke-Slivnyak formula, we obtain

\[
E \left( \sum_{(r,u) \in V^{(S^n_k)}_{x_0,\lambda}} h(r,u) \right) = \frac{\lambda^n}{n!} \int_{x_1,\ldots,x_n \in S^n_k} h(R,U) \left( e^{-\lambda \nu(S^n_k)(B^{(S^n_k)}_1(x_0,\ldots,x_n))} + e^{-\lambda \nu(S^n_k)(B^{(S^n_k)}_2(x_0,\ldots,x_n))} \right) \, dr \, d\nu(S^n_k)(x_1) \ldots d\nu(S^n_k)(x_n).
\]
where $R = R(x_1, \ldots, x_n)$ and $U = U(x_1, \ldots, x_n)$ are the functionals introduced in the previous section. In (6.15), we proceed with the following change of variables:

$$x_i = \exp_{\exp_{x_0}(\lambda^{-\frac{1}{k}}ru_i)}(\lambda^{-\frac{1}{k}}ru_i).$$

(6.16)

From Proposition 5.1 the Jacobian determinant of this change of variables in $\mathbb{S}_k^n$ is

$$n! \Delta(u, u_1, \ldots, u_n) \lambda^{-\frac{n}{k}} \left( \frac{\sin(k\lambda^{-\frac{1}{k}})}{k} \right)^{n^2 - 1}.$$  

(6.17)

Now, in these new coordinates,

$$\text{vol}^{(\mathbb{S}_k^n)}(B_1^{(\mathbb{S}_k^n)}(x_0, \ldots, x_n)) = \sigma_{n-1} \int_0^r \left( \frac{\sin(k\lambda^{-\frac{1}{k}}t)}{k} \right)^{n-1} dt = \sigma_{n-1} \int_0^r \left( \frac{\sin(k\lambda^{-\frac{1}{k}}t)}{k} \right)^{n-1} \lambda^\frac{n}{k} dt.$$  

(6.18)

and similarly,

$$\text{vol}^{(\mathbb{S}_k^n)}(B_2^{(\mathbb{S}_k^n)}(x_0, \ldots, x_n)) = \sigma_{n-1} \int_r^\infty \left( \frac{\sin(k\lambda^{-\frac{1}{k}}t)}{k} \right)^{n-1} \lambda^\frac{n}{k} dt.$$  

(6.19)

Inserting (6.17), (6.18) and (6.19) into (6.15), we obtain

$${\mathbb{E}} \left( \sum_{(r,u) \in V_{x_0, \lambda}^{(\mathbb{S}_k^n)}} h(r, u) \right) = \lambda^n \int_{r=0}^{\lambda^\frac{1}{k}} \int_{u, u_1, \ldots, u_n \in \mathbb{S}^{n-1}} h(R, U) \left( e^{-\lambda \sigma_{n-1} \int_0^r \left( \frac{\sin(k\lambda^{-\frac{1}{k}}t)}{k} \right)^{n-1} \lambda^\frac{n}{k} dt} + e^{-\lambda \sigma_{n-1} \int_r^\infty \left( \frac{\sin(k\lambda^{-\frac{1}{k}}t)}{k} \right)^{n-1} \lambda^\frac{n}{k} dt} \right) \times \Delta(u, u_1, \ldots, u_n) \lambda^{-\frac{n}{k}} \left( \frac{\sin(k\lambda^{-\frac{1}{k}})}{k} \right)^{n^2 - 1} dr \text{vol}^{(\mathbb{S}^{n-1})}(u) \text{vol}^{(\mathbb{S}^{n-1})}(u_1) \ldots \text{vol}^{(\mathbb{S}^{n-1})}(u_n) = k_n(k^{-\frac{1}{k}})^{\lambda^\frac{1}{k}} \int_{r=0}^{\lambda^\frac{1}{k}} \int_{u \in \mathbb{S}^{n-1}} h(R, U) \left( e^{-(k\lambda^{-\frac{1}{k}})^{1-n} \sigma_{n-1} \int_0^r \sin(k\lambda^{-\frac{1}{k}}t) dt} + e^{-(k\lambda^{-\frac{1}{k}})^{1-n} \sigma_{n-1} \int_r^\infty \sin(k\lambda^{-\frac{1}{k}} t) dt} \right) \times \sin(k\lambda^{-\frac{1}{k}}) dr \text{vol}^{(\mathbb{S}^{n-1})}(u)$$

where $k_n$ is the same constant as in the case $\mathbb{R}^n$.

It follows, since $h$ is a test function, that the intensity measure has the density

$$g^{(\mathbb{S}_k^n)}(r, u, x) = a_n \left( e^{-(k\lambda^{-\frac{1}{k}})^{1-n} \sigma_{n-1} \int_0^r \sin(k\lambda^{-\frac{1}{k}}t) dt} + e^{-(k\lambda^{-\frac{1}{k}})^{1-n} \sigma_{n-1} \int_r^\infty \sin(k\lambda^{-\frac{1}{k}} t) dt} \right) g^{(\mathbb{S}_k^n)}(r)$$

(6.20)

where $a_n$ is given in Theorem 3.3 and $a_n(t) = \frac{\sin(at)}{\sqrt{a}}$.$^n$

**Case $M = \mathcal{H}_k^n$.** We proceed in the exact same way, save for the notable difference that the circumscribed ball is unique. We deduce that

$$\mathbb{E} \left( \sum_{(r,u) \in V_{x_0, \lambda}^{(\mathcal{H}_k^n)}} h(r, u) \right) = \lambda^n \int_{x_1, \ldots, x_n \in \mathcal{H}_k^n} h(R, U) e^{-\lambda \text{vol}^{(\mathcal{H}_k^n)}(B_1^{(\mathcal{H}_k^n)}(x_0, \ldots, x_n))} \text{vol}^{(\mathcal{H}_k^n)}(x_1) \ldots \text{vol}^{(\mathcal{H}_k^n)}(x_n).$$  

(6.21)
where $R = R(x_1, \ldots, x_n)$ and $U = U(x_1, \ldots, x_n)$ are the functionals introduced in the previous section. From Proposition 5.1, the Jacobian determinant of the change of variables given by (6.10) is

$$
\tilde{J}_{x_0, \lambda}^{(H_\mu)}(r, u, u_1, \ldots, u_n) = n! \Delta(u, u_1, \ldots, u_n) \lambda^{-\frac{1}{2}} \left( \frac{\sinh(k\lambda^{-\frac{1}{2}}r)}{k} \right)^{n^2-1}.
$$

(6.22)

Now, in this new coordinates,

$$
\text{vol}^{(H_\mu)}(B(H_\mu)(x_0, \ldots, x_n)) = \sigma_{n-1} \int_0^{\lambda^{-\frac{1}{2}}r} \left( \frac{\sinh(kt)}{k} \right)^{n-1} \, dt
$$

$$
= \sigma_{n-1} \int_0^r \left( \frac{\sinh(k\lambda^{-\frac{1}{2}}t)}{k} \right)^{n-1} \lambda^{\frac{n}{2}} \, dt.
$$

(6.23)

Inserting (6.22) and (6.23) into (6.21), we obtain that the intensity measure has the density

$$
g_\lambda^{(H_\mu)}(r, u) = a_n e^{-\frac{\sigma_{n-1}}{\lambda}} \int_0^r g_{n-1} \left( \frac{\sinh(s)}{\sinh(\lambda^{\frac{1}{2}}s)} \right) \sigma_{n-1} \left( \frac{\sinh(k\lambda^{-\frac{1}{2}}s)}{k} \right)^{n-1} \sigma_{n-1} \left( \frac{\sinh(k\lambda^{\frac{1}{2}}s)}{k} \right)^{n-1} (r).
$$

(6.24)

where $g_\alpha(t) = \frac{\sin((\alpha-\lambda)t)}{\alpha}$.

7 Sectional Voronoi tessellation: proof of Theorems 1.4 and 1.5

In this section, we prove Theorems 1.4 and 1.5 which contain asymptotic expansions of both the volume and the number of vertices of a cell from a section of the original Voronoi tessellation. The methods being very close to what has already been done in the proofs of Theorem 1.1 and Theorem 1.2, we will omit several technical details.

Let $V_s \subset T_{x_0}M$ be a vector space of dimension $s$ and recall that $M_s = \exp_{x_0}(V_s)$.

7.1 Proof of Theorem 1.4 (i)

By Fubini’s theorem, the mean $s$-content of $C_{x_0, \lambda}^{(M)} \cap M_s$ is

$$
\mathbb{E}[\text{vol}^{(M_s)}(C_{x_0, \lambda}^{(M)} \cap M_s)] = \int_{M_s} e^{-\lambda \text{vol}^{(M)}(B^{(M)}(x, d^{(M)}(x_0, x)))} \, d\text{vol}^{(M_s)}(x).
$$

(7.1)

As in the proof of Theorem 1.1, we calculate this integral by discriminating between points $x$ close to $x_0$ and points $x$ far from $x_0$. Indeed, the volume $\text{vol}^{(M)}(B^{(M)}(x, d^{(M)}(x_0, x)))$ and the volume element $d\text{vol}^{(M_s)}$ can be expanded when the distance between $x$ and $x_0$ tends to 0, using Lemmas 2.3 and 2.2 while the contribution of the points $x$ far from $x_0$ is expected to decrease exponentially fast.

Step 1: decomposition of $\mathbb{E}[\text{vol}^{(M_s)}(C_{x_0, \lambda}^{(M)} \cap M_s)]$ into two integrals. Let $r_{\lambda} = \lambda^{-\frac{1}{n^2+4}}$ and let us write the integral in (7.1) as

$$
\mathbb{E}[\text{vol}^{(M_s)}(C_{x_0, \lambda}^{(M)} \cap M_s)] = I_\lambda + I_\lambda
$$

(7.2)

where

$$
I_\lambda = \int_{B^{(M)}(x_0, r_{\lambda}) \cap M_s} e^{-\lambda \text{vol}^{(M)}(B^{(M)}(x, d^{(M)}(x_0, x)))} \, d\text{vol}^{(M_s)}(x)
$$

(7.3)

and

$$
I_\lambda = \int_{M_s \setminus B^{(M)}(x_0, r_{\lambda})} e^{-\lambda \text{vol}^{(M)}(B^{(M)}(x, d^{(M)}(x_0, x)))} \, d\text{vol}^{(M_s)}(x).
$$

(7.4)

Step 2: $I_\lambda$ is negligible. We prove that $I_\lambda$ given at (7.3) is negligible in front of $\frac{1}{r_{\lambda}}$. Observe that $M_s$ is compact since it is included in $M$, thus the same arguments as in Step 2 of Section 4 imply that

$$
I_\lambda \leq \text{vol}^{(M_s)}(M_s)e^{-c\lambda^{1+\frac{n+1}{n^2+4}}},
$$

29
hence
\[ I_\lambda = o \left( \frac{1}{\lambda^{n+1}} \right). \] (7.5)

**Step 3: estimate of \( I_\lambda \).** We prove now that when \( \lambda \to \infty \)
\[ I_\lambda = \nu_n, s \frac{1}{\lambda^n} + \left( u_n, S_{x_0}^{(M)} - u_n, S_{x_0}^{(M')} \right) \frac{1}{\lambda^n} + o \left( \frac{1}{\lambda^n} \right), \] (7.6)
where the constants \( u_n, s, \nu_n, s \) and \( w_n, s \) are given in the statement of Theorem 1.4. To this end, we apply in \( I_\lambda \), the spherical change of variables given by
\[ \varphi_{x_0, V_s} : \begin{cases} (0, R_{u_0}) \times \{ u \in V_s : \| u \|_{x_0} = 1 \} \quad \rightarrow \quad M_s \\ (r, u) \quad \rightarrow \quad \exp_{x_0}(ru) \end{cases} \] (7.7)
which is the restriction to \( V_s \) of \( \varphi_{x_0} \) given by (2.11). Let us denote by \( J_{x_0, s} \) the Jacobian determinant of this change of variables. Thus, we get
\[ I_\lambda = \int_{0}^{\lambda} \int e^{-\lambda \text{vol}^{(M)}(B^{(M)}(x, r))} |J_{x_0, s}(r, u)| \text{dvol}^{(S^{n-1})}(u). \] (7.8)

We now need to replace \( \text{vol}^{(M)}(B^{(M)}(x, r)) \) and \( J_{x_0, s}(r, u) \) by suitable approximations. Let \( \varepsilon > 0 \). The same arguments as in the proof of Lemma 2.2 imply that \( J_{x_0, s} \) satisfies, when \( r \to 0 \),
\[ J_{x_0, s}(r, u) = r^{s-1} - \frac{\text{Ric}_{x_0}^{(M)}(u)}{6} r^{s+1} + o(r^{s+1}), \] (7.9)
where \( \text{Ric}_{x_0}^{(M)}(u) \) is the Ricci curvature of the submanifold \( M_s \) at \( u \), that is
\[ \text{Ric}_{x_0}^{(M)}(u) = \sum_{i=2}^{s} K_{x_0}^{(M)}(u, u_i), \]
and \( \{ u_1 = u, u_2, \ldots, u_s \} \) is an orthonormal basis of \( V_s \). It follows that, for \( \lambda \) large enough, \( 0 < r < r_\lambda \), \( u \in V_s \) with norm 1,
\[ r^{s-1} - \frac{\text{Ric}_{x_0}^{(M)}(u)}{6} r^{s+1} - \varepsilon r^{s+1} \leq J_{x_0, s}(r, u) \leq r^{s-1} - \frac{\text{Ric}_{x_0}^{(M)}(u)}{6} r^{s+1} + \varepsilon r^{s+1}. \] (7.10)
Moreover, the inequalities (4.11) still hold, that is
\[ e^{-\lambda \kappa_n r^n} \left[ 1 + \left( \frac{\kappa_n S_{x_0}^{(M)}}{6(n+2)} - \varepsilon \right) \lambda r^{n+2} \right] \leq e^{-\lambda \text{vol}^{(M)}(B^{(M)}(x, r))} \leq e^{-\lambda \kappa_n r^n} \left[ 1 + \left( \frac{\kappa_n S_{x_0}^{(M)}}{6(n+2)} + 2\varepsilon \right) \lambda r^{n+2} \right]. \] (7.11)
Inserting (7.10) and (7.11) into (7.8), we obtain
\[ I_{\lambda_-} \leq I_\lambda \leq I_{\lambda_+}, \] (7.12)
where
\[ I_{\lambda_-} = \int_{0}^{-}\frac{1}{\lambda^{n+1}} \int e^{-\lambda \kappa_n r^n} \left[ 1 + \left( \frac{\kappa_n S_{x_0}^{(M)}}{6(n+2)} - \varepsilon \right) \lambda r^{n+2} - \frac{\text{Ric}_{x_0}^{(M)}(u)}{6} + \varepsilon \right] r^2 \text{dvol}^{(S^{n-1})}(u) r^{s-1} \text{d}r \]
and
\[ I_{\lambda_+} = \int_{0}^{\lambda} \frac{1}{\lambda^{n+1}} \int e^{-\lambda \kappa_n r^n} \left[ 1 + \left( \frac{\kappa_n S_{x_0}^{(M)}}{6(n+2)} + 2\varepsilon \right) \lambda r^{n+2} - \frac{\text{Ric}_{x_0}^{(M)}(u)}{6} - \varepsilon \right] r^2 \text{dvol}^{(S^{n-1})}(u) r^{s-1} \text{d}r. \]
In order to derive upper bounds for $I_{\lambda,+}$, we proceed analogously to the proof of Theorem 1.1 that is

- we start by applying the change of variables $y = \lambda x r^n$, taking $y$ from 0 to $\infty$,
- we use Assumption (A_1) to show that the integral of the last term of $I_{\lambda,+}$ is bounded by $\lambda^{-\frac{1}{2}} \cdot \frac{1}{\lambda^{0.5}}$ up to a multiplicative constant,
- we calculate the integral of the remaining terms over $u$ first, using (2.6) applied to the manifold $M_\delta$ and then over $y$.

Thus, for any $\varepsilon > 0$, we obtain that, for $\lambda$ large enough

$$I_{\lambda,+} \leq v_{n,s} \frac{1}{\lambda^{0.5}} + \left( u_{n,s} S_{x_0}^{(M)} - w_{n,s} S_{x_0}^{(M_s)} \right) \frac{1}{\lambda^{0.5}} + \varepsilon \frac{\varepsilon}{\lambda^{0.5}}$$

and similarly

$$I_{\lambda,-} \geq v_{n,s} \frac{1}{\lambda^{0.5}} + \left( u_{n,s} S_{x_0}^{(M)} - w_{n,s} S_{x_0}^{(M_s)} \right) \frac{1}{\lambda^{0.5}} - \varepsilon \frac{\varepsilon}{\lambda^{0.5}}.$$  (7.13)

Now, (7.13) and (7.14) implies (7.6) and combining with (7.5) and (7.2), we obtain Theorem 1.4 (i).

### 7.2 Proof of Theorem 1.4 (ii)

We now derive the explicit formulas in the particular cases $M = S^k_\delta$ and $M = H^k_\delta$. Again, the proof follows from the fact that the Jacobian determinant of the change of variables given by (7.7) and the volume of geodesic balls have exact expressions.

**Case $M = S^k_\delta$.** In (7.7), let us apply the spherical change of variables given by (7.7) with $0 \leq r \leq \frac{1}{2}$. For $M = S^k_\delta$, the Jacobian determinant of this change of variables satisfies

$$J_{x_0,s}(r, u) = \left( \frac{\sin(kr)}{k} \right)^{s-1}. \quad (7.15)$$

Moreover recall that,

$$\text{vol}^{(S^k_\delta)}(B^{(S^k_\delta)}(x, r)) = \sigma_{n-1} \int_{r=0}^{r} \left( \frac{\sin(kt)}{k} \right)^{n-1} dt \quad (7.16)$$

Combining (7.1) for $M = S^k_\delta$, (7.15) and (7.16), we obtain

$$\text{E}[\text{vol}^{(M)}(C^{(S^k_\delta)}(x, \lambda) \cap M_\delta)] = \frac{\pi}{r} \int_{r=0}^{r} \int_{u \in S^{s-1}} e^{-\lambda \sigma_{n-1} \int_{t=0}^{r} \frac{\sin(ku)}{k} n-1} \left( \frac{\sin(kr)}{k} \right)^{s-1} dt \, dr \, d\text{vol}^{(S^s-1)}(u)$$

$$= \text{vol}^{(S^s-1)}(S^{s-1}) \int_{r=0}^{r} e^{-\lambda \sigma_{n-1} \int_{t=0}^{r} \frac{\sin(ku)}{k} n-1} \left( \frac{\sin(kr)}{k} \right)^{s-1} dr,$$

as claimed.

**Case $M = H^k_\delta$.** We proceed in exactly the same way as in the case of the sphere. In (7.7), we apply the change of variables given by (7.7), that the Jacobian satisfies, when $M = H^k_\delta$.

$$J_{x_0,s}(r, u) = \left( \frac{\sinh(kr)}{k} \right)^{s-1}. \quad (7.17)$$

Moreover recall that,

$$\text{vol}^{(H^k_\delta)}(B^{(H^k_\delta)}(x, r)) = \sigma_{n-1} \int_{r=0}^{r} \left( \frac{\sinh(kt)}{k} \right)^{n-1} dt \quad (7.18)$$
Combining (7.1) for $M = \mathcal{H}_n^0$, (7.14) and (7.18), we obtain

$$
\mathbb{E}[\text{vol}^{(M)}(\mathcal{C}_{x_0,\lambda}^{(M)} \cap M_s)] = \int_{r \geq 0} \int_{u \in S^{s-1}} e^{-\lambda\sigma_{n-1} \int_{r=0}^r \left(\frac{\sinh(kr)}{k}\right)^{n-1} dt} \left(\frac{\sinh(kr)}{k}\right)^{s-1} dr \text{dvol}^{(S^{s-1})}(u)
$$

$$
= \text{vol}^{(S^{s-1})}(S^{s-1}) \int_{r \geq 0} e^{-\lambda\sigma_{n-1} \int_{r=0}^r \left(\frac{\sinh(kr)}{k}\right)^{n-1} dt} \left(\frac{\sinh(kr)}{k}\right)^{s-1} dr.
$$

This concludes the proof of Theorem 1.4 (ii).

### 7.3 Proof of Theorem 1.5 (i)

Observe that a vertex of $\mathcal{C}_{x_0,\lambda}^{(M)} \cap M_s$ is the intersection of $M_s$ and a $(n-s)$-face of the cell of $\mathcal{C}_{x_0,\lambda}^{(M)}$. Such a $(n-s)$-face is itself the intersection of $\mathcal{C}_{x_0,\lambda}^{(M)}$ and the cells of $s$ points of the process $\mathcal{P}_\lambda$. As in the proof of Theorem 1.2, the expansion of the mean number of vertices of $\mathcal{C}_{x_0,\lambda}^{(M)} \cap M_s$ relies on the rewriting of the volume element $\text{dvol}^{(M)}(x_1) \ldots \text{dvol}^{(M)}(x_s)$ in the spirit of Theorem 5.2. More precisely, let us define the application $\Phi_{x_0}: (r, u, u_1, \ldots, u_s) \mapsto (x_1, \ldots, x_s)$ by the identity

$$
x_i = \exp(x_0) \exp(r_{uu_i}(ru)) = \exp(x_0) \exp(r_{uu_i}(ru)).
$$

where $r > 0$, $u$ is a unit vector of $V_s$ and $u_1, \ldots, u_s$ are unit vectors of $T_{\exp(x_0)(ru)}M$. When $r \to 0$, we can show that the Jacobian determinant $J^{s}_{x_0}$ of $\Phi_{x_0}$, satisfies the expansion

$$
\frac{\partial J^{s}_{x_0}}{\partial r} = \prod_{i=1}^s \exp \left( \frac{L^{s}_{x_0}(u_i)}{6} r^{n+1} + o(r^{n+1}) \right)
$$

(7.19)

where $L^{s}_{x_0}(u, u_1, \ldots, u_s) = R^{(M)}(x_0, u) + \sum_{i=1}^s R^{(M)}(u_i)$ and $\Delta_s(u, u_1, \ldots, u_s)$ is the volume of the simplex spanned by $-u$ and the projection of $u_1, \ldots, u_s$ on $V_s$. We omit the proof of (7.19) since it is very similar to the proof of Theorem 5.2. Note that for $r$ small enough, the Jacobian $J^{s}_{x_0}$ is different from zero almost everywhere. Then, from the inverse function theorem, the function $\Phi_{x_0}$ defines a change of variables. Consequently, a reasoning along the lines of the beginning of Section 6 implies that without loss of generality, for almost all $(x_1, \ldots, x_s) \in M$, there is at most one circumscribed ball of $x_0, \ldots, x_s$ centered in $M_s$, denoted by $B^s(x_0, \ldots, x_s)$.

The expectation of the number of vertices can be written as

$$
\mathbb{E}[N(\mathcal{C}_{x_0,\lambda}^{(M)} \cap M_s)] = \mathbb{E}\left[ \sum_{\{x_1, \ldots, x_s\} \subset \mathcal{P}_\lambda} \mathbb{I}\{B^s(x_0, x_1, \ldots, x_s) \text{ exists and } B^s(x_0, x_1, \ldots, x_s) \cap \mathcal{P}_\lambda = \emptyset\}\right].
$$

Then applying the Mecke-Slivnyak formula, we get that

$$
\mathbb{E}[N(\mathcal{C}_{x_0,\lambda}^{(M)} \cap M_s)] = \frac{\lambda^s}{\mathcal{M}^s} \int_{\mathcal{M}^s} e^{-\lambda \text{vol}^{(M)}(B^s(x_0, x_1, \ldots, x_s))} \text{dvol}^{(M)}(x_1) \ldots \text{dvol}^{(M)}(x_s).
$$

(7.20)

where

$$
\mathcal{M}^s = \{(x_1, \ldots, x_s) \in M^s, B^s(x_0, x_1, \ldots, x_s) \text{ exists}\}.
$$

Let $r_\lambda = \lambda^{-\frac{n+1}{2s-1}}$ and let us define $M_\lambda^{(s)}$ by

$$
M_\lambda^{(s)} = \{(x_1, \ldots, x_s) \in \mathcal{M}^s, \text{the radius of } B^s(x_0, \ldots, x_s) \text{ is smaller than } r_\lambda\}.
$$

The expansion of $\mathbb{E}[N(\mathcal{C}_{x_0,\lambda}^{(M)} \cap M_s)]$ is derived by following the same strategy as in the proof of Theorem 1.2 that is

- we decompose the integral in (7.20) and isolate the contribution of points $(x_1, \ldots, x_s) \in M_\lambda^{(s)}$,
- we show that the integral over $M^s \setminus M_\lambda^{(s)}$ is negligible in front of $\lambda^{-\frac{s}{2}}$,
- we apply the change of variables given by $\Phi_{x_0}$ in the integral over $M_\lambda^{(s)}$ and use the approximations of the Jacobian and of the volume of a ball provided by (7.19) and Lemma 2.3 respectively,
- we apply the change of variables $y = \lambda \kappa r n$, taking $y$ from 0 to $\infty$,
- we deduce the expansion of $\mathbb{E}[N(\mathcal{C}_{x_0,\lambda}^{(M)} \cap M_s)]$ from the integration over $u, u_1, \ldots, u_s$ and then over $y$. 

32
7.4 Proof of Theorem 1.5 (ii)

We now derive exact formulas for $\mathbb{E}[N(\psi_{x,\lambda}^{(M)} \cap M_s)]$, in the particular cases $M = S^n_k$ and $M = \mathcal{H}^n_k$. Again, these results come from the exact expressions of the Jacobian determinant of the change of variables given by $\Phi^{s_a}$ and of the volume of geodesic balls in these two cases.

**Case $M = S^n_k$.** Observe that for each $(x_1, \ldots, x_s) \in (S^n_k)^s$, there are exactly two balls in $S^n_k$, with center in $M_s$ and containing $x_0, \ldots, x_s$ on their boundaries: the smallest one denoted by $B_1(s)(x_0, \ldots, x_s)$, with radius $r \leq \frac{\pi}{2}$ and $B_2(s)(x_0, \ldots, x_s) = S^n_k \setminus B_1(s)(x_0, \ldots, x_s)$. Then, applying the Mecke-Slivnyak formula, we obtain

$$
\mathbb{E}[N(\mathcal{C}_{x_0,\lambda}^{(S^n_k)} \cap M_s)] = \mathbb{E}\left[ \sum_{\{x_1, \ldots, x_s\} \subset \mathcal{P}_\lambda} I\{B_1(s)(x_0, \ldots, x_s) \cap \mathcal{P}_\lambda = \emptyset\} + I\{B_2(s)(x_0, \ldots, x_s) \cap \mathcal{P}_\lambda = \emptyset\}\right]
$$

$$
= \int_{(S^n_k)^s} e^{-\lambda v(\mathcal{P}_\lambda)(B_1(s)(x_0, \ldots, x_s))} + e^{-\lambda v(\mathcal{P}_\lambda)(B_2(s)(x_0, \ldots, x_s))} \, dv(\mathcal{P}_\lambda)(x_1) \ldots dv(\mathcal{P}_\lambda)(x_s)
$$

(7.21)

Let us make the change of variables given by $\Phi^{s_a}$ in (7.21), with $r \leq \frac{\pi}{2}$, in the case $M = S^n_k$. Then, the Jacobian determinant $J_{x_0}^{s_a}$ is given by

$$
J_{x_0}^{s_a}(r, u, u_1, \ldots, u_s) = s! \Delta_s(u, u_1, \ldots, u_s) \left(\frac{\sin(kr)}{k}\right)^{ns-1}.
$$

(7.22)

In these new coordinates, (6.15) and (6.19) are still valid for the balls $B_1(s)(x_0, \ldots, x_s)$ and $B_2(s)(x_0, \ldots, x_s)$. The expression of $\mathbb{E}[N(\mathcal{C}_{x_0,\lambda}^{(S^n_k)} \cap M_s)]$ then follows by inserting (6.15), (6.19) and (7.22) into (7.21) and integrating over $u, u_1, \ldots, u_s$ as in the proof of Theorem 1.5 (ii).

**Case $M = \mathcal{H}^n_k$.** Contrary to the case of the sphere, for each $(x_1, \ldots, x_s) \in (\mathcal{H}^n_k)^s$, there exists exactly one ball, denoted by $B(s)(x_0, \ldots, x_s)$ in $\mathcal{H}^n_k$, centered in $M_s$ and containing $x_0, \ldots, x_s$ on its boundary. Then applying the Mecke-Slivnyak

$$
\mathbb{E}[N(\mathcal{C}_{x_0,\lambda}^{(\mathcal{H}^n_k)} \cap M_s)] = \mathbb{E}\left[ \sum_{\{x_1, \ldots, x_s\} \subset \mathcal{P}_\lambda} I\{B(s)(x_0, \ldots, x_s) \cap \mathcal{P}_\lambda = \emptyset\}\right]
$$

$$
= \int_{(\mathcal{H}^n_k)^s} e^{-\lambda v(\mathcal{P}_\lambda)(B(s)(x_0, \ldots, x_s))} \, dv(\mathcal{P}_\lambda)(x_1) \ldots dv(\mathcal{P}_\lambda)(x_s).
$$

(7.23)

We make the change of variables given by $\Phi^{s_a}$ in (7.23). The Jacobian of the change of variables given by $\Phi^{s_a}$ when $M = \mathcal{H}^n_k$ satisfies

$$
J_{x_0}^{s_a}(r, u, u_1, \ldots, u_s) = s! \Delta_s(u, u_1, \ldots, u_s) \left(\frac{\sinh(kr)}{k}\right)^{ns-1}.
$$

(7.24)

Moreover in the new coordinates, the expression for the volume of the ball provided by (6.2) is still valid for $B(s)(x_0, \ldots, x_s)$. Thus inserting (7.24) and (7.23) into (7.24), and then integrating over $u, u_1, \ldots, u_s$, we obtain the expected formula for $\mathbb{E}[N(\psi_{x_0,\lambda}^{(\mathcal{H}^n_k)} \cap M_s)]$. This concludes the proof of Theorem 1.5 (ii).

8 Probabilistic proof of the Gauss-Bonnet theorem

In this section, we consider a compact surface $S$ and we denote by $K : S \to \mathbb{R}$ the Gaussian curvature of $S$. The classical Gauss-Bonnet theorem states that the Euler characteristic of $S$, denoted by $\chi(S)$, satisfies the relation

$$
\chi(S) = \frac{1}{2\pi} \int_S K(x) \, dv(\mathcal{S})(x).
$$

(8.1)

We start by showing a slight reinforcement of Theorem 1.2 which is the uniformity of the two-term expansion of $\mathbb{E}[N(\mathcal{C}_{x_0,\lambda}^{(s)})]$ when $M$ is a compact Riemannian manifold.
Proposition 8.1. When $M$ is a compact Riemannian manifold, we get

$$\sup_{x_0 \in M} \lambda^{\frac{n}{2}} \left( E[N(C_{x_0,\lambda}^M)] - e_n + d_n \frac{S(C_{x_0,\lambda}^M)}{\lambda^{\frac{n}{2}}} \right) \to 0.$$  

Proof. Looking closely at the proof of Theorem 1.2, we observe that the approximation of $E[N(C_{x_0,\lambda}^M)]$ comes from two consecutive estimates inside the integral at (6.8): the expansion of the Jacobian provided by Theorem 5.2 and the expansion of the volume of small balls given at (2.5). As soon as these two estimates are showed to be uniform with respect to $x_0$, the uniformity of the expansion in (1.5) follows.

The uniformity of the Jacobian and volume approximations are guaranteed by Proposition 5.4 and Lemma 2.3 (ii) respectively. This completes the proof of Proposition 8.1.

We can now proceed with the proof of (8.1). Let us denote by $F$ (resp. $E$ and $V$), the total number of Voronoi cells in $S$ (resp. the total number of edges and vertices). Euler’s relation applied to the Voronoi graph states that

$$\chi(S) = F - E + V.$$  

(8.2)

Since the Voronoi tessellation is a normal tessellation, see [Mol94, p. 43], each vertex is contained in three cells and each edge is contained in two cells, thus

$$2E = 3V.$$  

(8.3)

Inserting (8.3) into (8.2), we obtain

$$\chi(S) = F - \frac{1}{2}V.$$  

(8.4)

Taking now the expectation of (8.4), we deduce that

$$\chi(S) = E[F] - \frac{1}{2}E[V].$$  

(8.5)

It remains to calculate both expectations in the right-hand side of (8.5). In particular, the number $F$ of Voronoi cells is the number of points of $P_\lambda$ in $S$, hence

$$E[F] = E[\#(P_\lambda \cap S)] = \lambda \text{vol}^{(S)}(S).$$  

(8.6)

Now, since each vertex is in three cells, we have

$$E[V] = \frac{1}{3} \sum_{x \in P_\lambda} N(C^{(S)}(x, P_\lambda)), $$  

(8.7)

An application of the Mecke-Slivnyak formula in (8.7) provides the identity

$$E[V] = \frac{\lambda}{3} \int_S E[N(C^{(S)}(x, P_\lambda \cup \{x\}))] \text{dvol}^{(S)}(x).$$  

(8.8)

Applying now Proposition 8.1 to the compact surface $S$ and using the fact that $S^{(S)} = 2K(x)$, we get that

$$\sup_{x \in S} \lambda \left( E[N(C^{(S)}(x, P_\lambda \cup \{x\}))] - 6 + \frac{3K(x)}{\pi \lambda} \right) \to 0.$$  

(8.9)

Let $\varepsilon > 0$. The convergence (8.9) implies that there exists $\lambda_0$ such that for all $\lambda \geq \lambda_0$ and every $x \in S$,

$$\left| E[N(C^{(S)}(x, P_\lambda \cup \{x\}))] - 6 + \frac{3K(x)}{\pi \lambda} \right| \leq \frac{\varepsilon}{\lambda}.$$  

(8.10)

Combining (8.10) with (8.8), we get that

$$\left| E[V] - \frac{\lambda}{3} \int_S \left( 6 - \frac{3K(x)}{\lambda \pi} \right) \text{dvol}^{(S)}(x) \right| \leq \frac{\varepsilon}{3} \int_S \text{dvol}^{(S)}(x).$$  

(8.11)
which means that

\[ \left| \frac{1}{2} E[V] - \lambda \text{vol}^{(S)}(S) + \frac{1}{2\pi} \int_{S} K(x) \text{dvol}^{(S)}(x) \right| \leq \frac{\text{vol}^{(S)}(S)}{6} \varepsilon. \]

This together with (8.3) and (8.6), implies that for every \( \varepsilon > 0, \)

\[ |\chi(S) - \frac{1}{2\pi} \int_{S} K(x) \text{dvol}^{(S)}(x) | \leq \frac{\text{vol}^{(S)}(S)}{6} \varepsilon. \]

which concludes the proof of (8.1).

9 Appendix

This section contains the proofs of Lemmas 2.2, 2.3, 2.4, 3.2, 3.3.

Proof of Lemma 2.2

(i) Let \( V = \{ u = u_1, u_2, \ldots, u_n \} \) be an orthonormal basis of \( T_{x_0} M \). By parallel transport of \( V \) along \( \gamma(s) = \exp_{x_0}(su) \), we get a basis \( V(s) = \{ u(s) = u_1(s), \ldots, u_n(s) \} \) of \( T_{\gamma(s)} M \). By definition of \( \gamma \), the derivative of \( \exp_{x_0}(ru) \) with respect to \( r \) is \( u(r) \), parallel transport of \( u \) along \( \gamma \) so that the first column of the Jacobian matrix of \( \varphi_{x_0} \) is the vector \((1, 0, \ldots, 0)^T\). For \( i = 2, \ldots, n \), applying Lemma 2.1 with \( v(s) = u + su_i \), it follows that the derivative of \( \exp_{x_0}(tu) \) with respect to \( u \) in the direction \( u_i \) is

\[ \frac{\partial \exp_{x_0}(ru)}{\partial u_i} = J_i(r) \] (9.1)

where \( J_i \) is the Jacobi field along \( \gamma \) such that \( J_i(0) = 0 \) et \( J_i'(0) = u_i \). Such a Jacobi field is a normal vector field, that is \( \langle u_1(s), J_i(s) \rangle_{\gamma(s)} = 0 \) for all \( s \). It follows from (9.1) that the Jacobian determinant of \( h \) is

\[ J^{(M)}_{x_0}(r, u) = \det \begin{pmatrix} 1 & 0 & \cdots & 0 \\ 0 & \ddots & \cdots & 0 \\ \vdots & \ddots & \ddots & \vdots \\ 0 & \cdots & \cdots & A(r, u) \end{pmatrix} \] (9.2)

where \( A(r, u) \) is a matrix of size \((n - 1) \times (n - 1)\) with entries \( A_{i,j}(r, u) = \langle u_{i+1}(r), J_{j+1}(r) \rangle_{\gamma(r)} \). Even though the dependency is not visible, we emphasize here the fact that \( A_{i,j} \) does depend on \( u \) through the construction of the orthonormal basis \( V \), its parallel transported \( V(r) \) and the Jacobi field \( J_{j+1} \). In order to get an asymptotic expansion of the Jacobian determinant, we first develop the coefficients of the matrix \( A \) using Taylor’s formula for fixed \( u \). Let us determine the successive derivatives of \( A_{i,j} \) with respect to \( r \): the vector \( u_i(r) \) being a parallel transport, its derivative with respect to \( r \) is 0 so that for every \( m \geq 1 \) and every couple \((u, r)\),

\[ \frac{\partial^m A_{i,j}}{\partial r^m}(r, u) = \langle u_{i+1}(r), J_{j+1}^{(m)}(r) \rangle_{x_0} \] (9.3)

where \( J_{j+1}^{(m)} \) is the \( m \)-th covariant derivative of \( J_{j+1} \) with respect to \( \gamma' \). In particular, (9.3) applied to \( m = 0 \) and \( m = 1 \) in the particular case \( r = 0 \) provides

\[ A_{i,j}(0, u) = \langle u_{i+1}, J_{j+1}(0) \rangle_{x_0} = 0, \] (9.4)

and

\[ \frac{\partial A_{i,j}}{\partial r}(0, u) = \langle u_{i+1}, J_{j+1}'(0) \rangle_{x_0} = \delta_{i,j}. \] (9.5)

Moreover, since \( J \) satisfies the Jacobi equation (2.7), we get

\[ \frac{\partial^2 A_{i,j}}{\partial r^2}(0, u) = \langle u_{i+1}, J_{j+1}''(0) \rangle_{x_0} = -\langle u_{i+1}, R_{x_0}^{(M)}(J_{j+1}(0), u)u \rangle_{x_0} = 0. \] (9.6)
The calculation of the third derivative of $J_{j+1}$ is more delicate but thanks to the identity $J_{j+1}(0) = 0$ and to the trick explained in [DC92, p.115], we can show that $J''_{j+1}(0) = -K^{(M)}_{x_0}(J_{j+1}(0), u)u$. Inserting that result into (9.3) with $m = 3$, we obtain

$$\frac{\partial^3 A_{i,j}}{\partial r^3}(0, u) = -\langle u_{i+1}, R^{(M)}_{x_0}(J_{j+1}(0), u)u\rangle_{x_0} = -\langle u_{i+1}, R^{(M)}_{x_0}(u_{j+1}, u)u\rangle_{x_0}. \tag{9.7}$$

Observe that in the particular case $i = j$, the definition of the sectional curvature given at (2.2) implies that

$$\frac{\partial^3 A_{i,i}}{\partial r^3}(0, u) = -K^{(M)}_{x_0}(u, u_{i+1}). \tag{9.8}$$

We may now insert (9.1), (9.5), (9.6), (9.7) and (9.8) into Taylor’s formula applied to the function $A_{i,j}$ as a function of $r$ for fixed $u$, at the second order for $i \neq j$ and at the third order for $i = j$. We obtain the two expansions

$$A_{i,j}(r, u) = \varepsilon_{i,j}(r, u)r^2, \quad i \neq j, \tag{9.9}$$

$$A_{i,i}(r, u) = r - \frac{K^{(M)}_{x_0}(u, u_{i+1})}{6}r^3 + \varepsilon_{i,i}(r, u)r^3, \tag{9.10}$$

where $\varepsilon_{i,j}(r, u)$ tends to 0 when $r$ tends to 0 for fixed $u$.

Next, we prove that the terms $\varepsilon_{i,j}(r, u)$ tend to 0 independently of $u$. To do so, we aim at applying Taylor’s inequality, which only requires to show uniform bounds on the third and fourth derivatives with respect to $r$ of $A_{i,j}(r, u)$, $i \neq j$, and $A_{i,i}(r, u)$ respectively. Using both the Jacobi equation (2.7) and the fact that $u'_{i+1}(r) = u'_{j+1}(r) = u'(r) = 0$, we get

$$\frac{\partial^2 A_{i,j}}{\partial r^2}(r, u) = \langle u_{i+1}(r), R^{(M)}_{x_0}(J_{j+1}(r), u(r))u(r)\rangle_{x_0}. \tag{9.11}$$

This implies that

$$\frac{\partial^3 A_{i,j}}{\partial r^3}(r, u) = \langle u_{i+1}(r), \frac{\partial}{\partial r} R^{(M)}_{x_0}(J_{j+1}(r), u(r))u(r)\rangle_{x_0},$$

and

$$\frac{\partial^4 A_{i,j}}{\partial r^4}(r, u) = \langle u_{i+1}(r), \frac{\partial^2}{\partial r^2} R^{(M)}_{x_0}(J_{i+1}(r), u(r))u(r)\rangle_{x_0}. \tag{9.12}$$

Since the curvature tensor $R^{(M)}_{x_0}$ is a $C^\infty$ function of $x \in M$ and of its two entries, both functions $\frac{\partial^3 A_{i,j}}{\partial r^3}$ and $\frac{\partial^4 A_{i,j}}{\partial r^4}$ are continuous on the compact set $[0, R_{m+1}] \times S^{n-1}$, where we use a slight abuse of notation by denoting by $S^{n-1}$ the unit sphere of $T_{x_0}M$. Consequently, there exists positive constants $c_{i,j}$ such that

$$\left| \frac{\partial^3 A_{i,j}}{\partial r^3}(r, u) \right| \leq c_{i,j}, \quad i \neq j \tag{9.11}$$

$$\left| \frac{\partial^4 A_{i,j}}{\partial r^4}(r, u) \right| \leq c_{i,i}. \tag{9.12}$$

Inserting (9.11) and (9.12) into Taylor’s inequality applied at the third order for $i \neq j$ and at the fourth order for $i = j$, we obtain that there exists a positive constant $c > 0$ such that for every $(r, u)$ with $r \leq R_{m+1}$,

$$|\varepsilon_{i,j}(r, u)|r^2 \leq \sup_{(r, u) \in [0, R_{m+1}] \times S^{n-1}} \left| \frac{\partial^3 A_{i,j}}{\partial r^3}(r, u) \right| \frac{r^3}{3} \leq cr^3,$$

and

$$|\varepsilon_{i,i}(r, u)|r^3 \leq \sup_{(r, u) \in [0, R_{m+1}] \times S^{n-1}} \left| \frac{\partial^4 A_{i,i}}{\partial r^4}(r, u) \right| \frac{r^4}{24} \leq cr^4$$

for every $i$.}

36
It then follows that there exists a positive constant not depending on \( u \) such that for every \( i, j \) and \( (r, u) \) with \( r \leq R_{\text{maj}} \),
\[
|\varepsilon_{ij}(r, u)| \leq cr. \tag{9.13}
\]
We now expand the determinant of the matrix \( A(r, u) \). Let us denote by \( \mathcal{S}_{n-1} \) the group of permutation of \( \{2, \ldots, n\} \), by \( \text{Id} \) the identity permutation of \( \mathcal{S}_{n-1} \) and by \( \text{sgn}(\sigma) \) the signature of the permutation \( \sigma \). Leibniz formula for the determinant of matrices states that
\[
\det(A(r, u)) = \sum_{\sigma \in \mathcal{S}_{n-1}} \text{sgn}(\sigma) \prod_{j=1}^{n-1} A_{\sigma(j), j}(r, u)
\]
\[
= \prod_{j=1}^{n-1} \langle u_{j+1}(r), J_{j+1}(r) \rangle_x + \sum_{\sigma \in \mathcal{S}_{n-1} \setminus \{\text{Id}\}} \text{sgn}(\sigma) \prod_{j=1}^{n-1} \langle u_{\sigma(j+1)}(r), J_{j+1}(r) \rangle_x. \tag{9.14}
\]
It is expected that the first term in (9.14) is dominant in the expansion of \( \det(A(r, u)) \). Let us expand this particular term: using (9.10), the fact that \( V \) is an orthonormal basis and the definition of the Ricci curvature at \( x \), we get
\[
\prod_{j=1}^{n-1} \langle u_{j+1}(r), J_{j+1}(r) \rangle_x = \prod_{j=1}^{n-1} \left( r - \frac{K_{x_0}^{(M)}(u, u_{j+1})}{6} r^3 + \varepsilon_{j,j}(r, u) r^3 \right) = r^{n-1} - \frac{\text{Ric}(M)(u)}{6} r^{n+1} + \varepsilon_1(r, u) r^{n+1}, \tag{9.15}
\]
where \( \varepsilon_1(r, u) \) tends to 0 when \( r \) tends to 0. Moreover, this convergence is independent of \( u \) since \( \varepsilon_1(r, u) \) is simply a linear combination of remainders \( \varepsilon_{i,i} \) and of terms of the form (9.10), for all \( i = 2, \ldots, n \). It remains to show that the second term in (9.14) satisfies
\[
\lim_{r \to 0} \frac{1}{r^{n+1}} \sum_{\sigma \in \mathcal{S}_{n-1} \setminus \{\text{Id}\}} \text{sgn}(\sigma) \prod_{j=1}^{n-1} \langle u_{\sigma(j+1)}(r), J_{j+1}(r) \rangle_x = 0 \tag{9.16}
\]
and that this convergence is uniform with respect to \( u \).

Indeed, let \( \sigma \in \mathcal{S}_{n-1} \setminus \{\text{Id}\} \). There are at least two indices \( j \) such that \( \sigma(j) \neq j \). Without loss of generality, we assume that \( \sigma(2) \neq 2 \) and \( \sigma(3) \neq 3 \). Then,
\[
\prod_{j=1}^{n-1} |\langle u_{\sigma(j+1)}(r), J_{j+1}(r) \rangle_x| = |\langle u_{\sigma(2)}(r), J_2(r) \rangle_x| |\langle u_{\sigma(3)}(r), J_3(r) \rangle_x| \prod_{j=1}^{n-1} |\langle u_{\sigma(j+1)}(r), J_{j+1}(r) \rangle_x| \leq r^4 |\varepsilon_{\sigma(2),2}(r, u) \varepsilon_{\sigma(3),3}(r, u)| \prod_{j=1}^{n-1} |\langle u_{\sigma(j+1)}(r), J_{j+1}(r) \rangle_x|. \tag{9.17}
\]
Let \( j \neq 1, 2 \). If \( \sigma(j+1) = j + 1 \) then by (9.10), for every \( u \) and \( r \leq R_{\text{maj}} \)
\[
|\langle u_{\sigma(j+1)}(r), J_{j+1}(r) \rangle_x| = \left| r - \frac{K_{x_0}^{(M)}(u, u_{j+1})}{6} r^3 + \varepsilon_{j,j}(r, u) r^3 \right|
\leq r \left| 1 - \frac{K_{x_0}^{(M)}(u, u_{j+1})}{6} r^2 + \varepsilon_{j,j}(r, u) r^2 \right|
\leq c r \tag{9.18}
\]
for some positive constant \( c \), independent of \( u \), thanks to Assumption (A1) and (9.13).

If \( \sigma(j+1) \neq j + 1 \), we deduce from (9.9) and (9.13) that (9.18) still holds.

Inserting (9.18) into (9.17), we obtain that for every \( r \leq R_{\text{maj}} \) and every \( u \), there exists a positive constant \( c \) such that
\[
\prod_{j=1}^{n-1} |\langle u_{\sigma(j+1)}(r), J_{j+1}(r) \rangle_x| \leq c |\varepsilon_{\sigma(2),2}(r) \varepsilon_{\sigma(3),3}(r)| r^{n+1}.
\]
Thus we get (9.16) which, combined with (9.15) and (9.14) provides the required expansion
\[ J^{(M)}_{x_0}(r, u) = \det(A(r, u)) = r^{n-1} - \frac{\Ric^{(M)}(u)}{6} r^{n+1} + \varepsilon_2(r) r^{n+1} \]
where \( \varepsilon_2(r) \) goes to 0 independently of \( u \) when \( r \) tends to 0.

(ii) Only a slight modification of (i) is needed here. The dependency with respect to \( x_0 \) of both the Jacobian \( J^{(M)}_{x_0} \) and its coefficients has been overlooked in the proof of (i) and is now relevant. In particular, both functions \( \frac{\partial A_{i,j}}{\partial u^i} \) and \( \frac{\partial A_{i,j}}{\partial u^j} \) are continuous on the compact set \( M \times [0, R_{x_0}] \times \mathbb{S}^{n-1} \), which implies that the bounds from (9.11) and (9.12) are uniform with respect to both \( x_0 \) and \( u \). The rest of the proof is then identical by line to line to the proof of (i).

(iii) Again, the method goes along similar lines as the proof of (i). From now on, we carefully discuss the uniformity of each estimate with respect to \( x_0 \in M \).

Thanks to (9.3) and to the Jacobi equation given at (2.7), we get for every couple \((u, r) \) and \( x_0 \in M \)
\[ \frac{\partial^2 A_{i,j}}{\partial^2 r}(r, u) = (u_{i+1}(r), J^{(M)}_{j+1}(r))_{x_0} = - (u_{i+1}(r), R^{(M)}_{\gamma(r)}(J^{(M)}_{j+1}(r), u(r)) u(r))_{\gamma(r)}. \]

Consequently, when \( J_{j+1}(r) \neq 0 \), we obtain that
\[ \left| \frac{\partial^2 A_{i,j}}{\partial^2 r}(r, u) \right| \leq \| J_{j+1}(r) \|_{\gamma(r)} \left| (u_{i+1}(r), R^{(M)}_{\gamma(r)}(J^{(M)}_{j+1}(r), u(r)) u(r))_{\gamma(r)} \right|. \]

In particular, Assumption \((A1)\) implies that the second term in the right hand side of (9.19) is uniformly bounded with respect to \((r, u) \) and \( x_0 \in M \). Indeed, any scalar product of the form \( \langle v_1, R^{(M)}_{\gamma(r)}(v_2, v_3, v_4(\cdot), x) \rangle \) where \( x \in M \) and \( v_1, v_2, v_3, v_4 \) are unit vectors in \( T_x M \), can be written as a linear combination of sectional curvatures, see e.g. [CE08, Formula 1.10 p. 16]. Moreover, since Assumption \((A1)\) is satisfied, we can also apply Rauch’s theorem, see e.g. [DC92, Theorem 2.3], which shows that the first term \( \| J_{j+1}(r) \|_{\gamma(r)} \) is bounded from above by the norm of a Jacobi field in a Riemannian manifold with constant curvature. Such a Jacobi field is known explicitly, see for instance [DC92, Example 2.3]. It does not depend on \( x_0 \) or \( u \) and its norm is bounded by a fixed constant as soon as \( r \leq r_1 \) for some fixed \( r_1 > 0 \). Consequently, we deduce from (9.19) that there exist \( r_1 > 0 \) and a positive constant \( c > 0 \) such that for every \( x_0 \in M \), \( u \in T_{x_0} M \) with \( \| u \|_{x_0} = 1 \) and \( r \in [0, r_1] \),
\[ \left| \frac{\partial^2 A_{i,j}}{\partial^2 r}(r, u) \right| \leq c. \]

Inserting (9.4), (9.5) and (9.20) into Taylor’s inequality at the second order applied to \( A_{i,j}(r, u) \) seen as a function of \( r \) for fixed \( u \), we obtain that there exists a positive constant \( c \) such that for every \( x_0 \in M \), \( r \leq r_1 \) and \( u \),
\[ |A_{i,j}(r, u) - \delta_{i,j} r| \leq cr^2. \]

We proceed now as in the proof of (i), that is we use the rewriting of \( \det(A(r, u)) \) given at (9.14), then replace each coefficient by its estimate obtained at (9.21). The term in the sum obtained for \( \sigma = \Id \) is equal to \( r^{n-1} \) up to \( cr^n \) for some positive constant \( c \) and the remaining sum for \( \sigma \neq \Id \) is equal to zero up to \( cr^{n+2} \). Consequently, for \( r \) small enough, we get
\[ |J^{(M)}_{x_0}(r, u) - r^{n-1}| \leq cr^n \]
for every \( x_0 \) and \( u \). This implies the required result when choosing \( r_1 \leq \frac{1}{c}. \)

\[ \square \]

Proof of Lemma 2.3. (i) Let \( \varepsilon > 0 \). We fix \( r_1 \) small enough such that the ball \( B^{(M)}(x_0, r_1) \) is a compact set. We then apply point (ii) of Lemma 2.2 to the manifold \( B^{(M)}(x_0, r_1) \) and take \( r_0 < r_1 \) such that for \( r \leq r_0 \),
\[ \sup_{x \in B^{(M)}(x_0, r_1)} \sup_{u \in T_x M, \|u\|_{x_0} = 1} r^{-(n+1)} |J^{(M)}_{x}(r, u) - r^{n-1}| + \frac{\Ric^{(M)}(u)}{6} r^{n+1} \leq \varepsilon. \]
Because of point (iii) of Lemma 2.2, we may assume that $\mathcal{J}_{x}^{(M)}(r, u)$ is non-negative for every $x \in \mathcal{B}^{(M)}(x_0, r)$, $r \leq r_0$ and $u \in T_{x_0}M$ with $||u||_{x_0} = 1$. In particular, the rewriting of the volume element given at (2.11) implies that

$$\text{vol}^{(M)}(B(x, r)) = \int_{t=0}^{r} \int_{u \in S^{n-1}} \mathcal{J}_{x}^{(M)}(t, u) dtdv^{(S^{n-1})}(u). \quad (9.23)$$

Inserting (9.22) into (9.23) and integrating over $t$ and $u$, we get

$$r^{-(n+2)} \left( \text{vol}^{(M)}(B^{(M)}(x, r)) - \kappa_n r^n + \frac{1}{6(n+2)} \int \text{Ric}_{x}^{(M)}(u) dv^{(S^{n-1})}(u) r^{n+2} \right) \leq \frac{\varepsilon}{2(n+2)}. \quad (9.24)$$

Recalling (2.6), we may replace the integral in (9.24) by $\kappa_n \text{Sc}_{x}^{(M)}$. Even if it means taking $r_0$ smaller, we may then assume by continuity of the function $x \mapsto \text{Sc}_{x}^{(M)}$ at $x_0$ that for $x \in \mathcal{B}^{(M)}(x_0, r_0)$, we have

$$|\text{Sc}_{x}^{(M)} - \text{Sc}_{x_0}^{(M)}| \leq \varepsilon. \quad (9.25)$$

Combining now (9.24), (2.6) and (9.25) provides the required result.

(ii) The proof is almost identical to the proof of (i), save for the fact that we apply now point (ii) of Lemma 2.3 to the whole manifold $M$ and that we use the uniform continuity of the function $x \mapsto \text{Sc}(x)$ on the compact set $M$ instead of the standard continuity.

□

**Proof of Lemma 2.4.** Let $x_0 \in M$ and $r > 0$. Since $M$ is non-compact and complete, there exists a unit speed geodesic $\gamma$ of length $r$ which emanates from $x_0$ and such that $d^{(M)}(\gamma(0), \gamma(r)) = r$. Indeed, if not, the closure of the ball $\mathcal{B}^{(M)}(x_0, r)$ would be a closed and bounded subset equal to $M$ so a compact set by Hopf-Rinow theorem [Ber03, Theorem 52].

Let us fix $\varepsilon \in (0, r/2)$ and let us choose a set $\{x_1, \ldots, x_N\}$ of $N = \lfloor \frac{r}{4\varepsilon} \rfloor$ points on the first half of $\gamma$ such that $d^{(M)}(x_i, x_{i+1}) = 2\varepsilon$. The union $\bigcup_{i=1}^{N} \mathcal{B}^{(M)}(x_i, \varepsilon)$ is constituted of $N$ balls which are all included in $\mathcal{B}^{(M)}(x_0, r)$ because of the triangular inequality. Moreover, these balls are disjoint: indeed, if not, let $y \in \mathcal{B}^{(M)}(x_i, \varepsilon) \cap \mathcal{B}^{(M)}(x_j, \varepsilon)$ with $j > i$. In particular,

$$d^{(M)}(x_0, x_j) \leq d^{(M)}(x_0, x_i) + d^{(M)}(x_i, y) + d^{(M)}(y, x_j) < d^{(M)}(x_0, x_i) + 2\varepsilon$$

which contradicts the fact that the distance measured along $\gamma$ is the actual distance $d^{(M)}$.

Consequently, we get that

$$\text{vol}^{(M)}(\mathcal{B}^{(M)}(x_0, r)) \geq \sum_{i=1}^{N} \text{vol}^{(M)}(\mathcal{B}^{(M)}(x_i, \varepsilon)). \quad (9.26)$$

Now let us choose $\varepsilon$ smaller than the $r_0$ provided by Lemma 2.2 (iii). Applying the change of variables given at (2.11), we obtain for every $1 \leq i \neq N$,

$$\text{vol}^{(M)}(\mathcal{B}^{(M)}(x_i, \varepsilon)) = \int_{S^{n-1}} \int_{0}^{\varepsilon} |\mathcal{J}_{x}^{(M)}(r, u)| dr dv^{(S^{n-1})}(u) \geq \frac{1}{2} \sigma_{n-1} \int_{0}^{\varepsilon} r^{n-1} dr = \frac{1}{2n} \sigma_{n-1} \varepsilon^n. \quad (9.27)$$

We conclude by considering two cases:

- either $r > r_0$, in which case we insert (9.27) into (9.24) for $\varepsilon = r_0/4$ and we use the fact that $N = \lfloor \frac{r}{4\varepsilon} \rfloor$ to get a linear lower bound for $\text{vol}^{(M)}(\mathcal{B}^{(M)}(x_0, r))$,
- or $r \leq r_0$, in which case we apply (9.27) to the ball $\mathcal{B}^{(M)}(x_0, r)$ and we get a lower bound proportional to $r^n$.

This completes the proof of Lemma 2.4.

□
Proof of Lemma 2.2 We start by proving (3.4). It is enough to show that \( \mathbb{E}[\text{vol}^2(M)\langle C_{x_0, \lambda} \rangle^2] \) is bounded as the same result for \( \mathbb{E}[\text{vol}^2(M)\langle C_{x_0, \lambda} \rangle^2] \) follows along similar lines. By Fubini’s theorem, we can rewrite the second moment of \( \text{vol}^2(M)\langle C_{x_0, \lambda} \rangle^2 \) in the following way:

\[
\mathbb{E}[\text{vol}^2(M)\langle C_{x_0, \lambda} \rangle^2] = \int \int P[x_1, x_2 \in C_{x_0, \lambda}^2] \text{vol}^2(M)(x_1) \text{dvol}^2(M)(x_2)
\]

Inserting (9.30) and (9.31) into (9.29) and using again Fubini’s theorem, we obtain that

\[
\text{vol}^2(M)(B^{(M)}(x_1, d^{(M)}(x_0, x_1)) \cup B^{(M)}(x_2, d^{(M)}(x_0, x_2))) = \emptyset \text{ dvol}^2(M)(x_1) \text{dvol}^2(M)(x_2)
\]

Let \( r_0 \) be given by Lemma 2.2 (iii). Thanks to Lemma 2.4, we get that there exists a positive constant \( c \) such that for every \( x_1, x_2 \in M \setminus B^{(M)}(x_0, r_0) \)

\[
\text{vol}^2(M)(B^{(M)}(x_1, d^{(M)}(x_0, x_1)) \cup B^{(M)}(x_2, d^{(M)}(x_0, x_2))) \geq c \left( d^{(M)}(x_0, x_1) + d^{(M)}(x_0, x_2) \right)
\]

and for every \( x_1, x_2 \in B^{(M)}(x_0, r_0) \),

\[
\text{vol}^2(M)(B^{(M)}(x_1, d^{(M)}(x_0, x_1)) \cup B^{(M)}(x_2, d^{(M)}(x_0, x_2))) \geq c \left( d^{(M)}(x_0, x_1) + d^{(M)}(x_0, x_2) \right)
\]

Inserting (9.30) and (9.31) into (9.29) and using again Fubini’s theorem, we obtain that

\[
\sqrt{\mathbb{E}[\text{vol}^2(M)\langle C_{x_0, \lambda} \rangle^2]} \leq \int_{B^{(M)}(x_0, r_0)} e^{-\lambda \frac{d^{(M)}(x_0, x_1)}{r_0}} \text{dvol}^2(M)(x_1) + \int_{M \setminus B^{(M)}(x_0, r_0)} e^{-\lambda \frac{d^{(M)}(x_0, x_1)}{r_0}} \text{dvol}^2(M)(x_1)
\]

We bound separately each of the two terms from the right-hand side of (9.32). The first term is treated thanks to Lemma 2.2 (iii):

\[
\int_{B^{(M)}(x_0, r_0)} e^{-\lambda \frac{d^{(M)}(x_0, x_1)}{r_0}} \text{dvol}^2(M)(x_1) = \int_{S^{n-1}} \int_0^{r_0} e^{-\lambda \frac{d^{(M)}(x_0, x_1)}{r_0}} |H_x(M)(r, u)| \text{dvol}S^{n-1}(u)
\]

We turn now to the second term which can be decomposed in the following way.

\[
\int e^{-\lambda \frac{d^{(M)}(x_0, x_1)}{r_0}} \text{dvol}^2(M)(x_1) \leq \sum_{l=0}^{\infty} \text{vol}^2(M)(\{x_1 \in M : l \leq d(M)(x_0, x_1) \leq l + 1\}) e^{-\lambda \frac{d}{2}}
\]

Because of the assumption (A_1), the manifold \( M \) has a Ricci curvature bounded from below by some constant \( (n-1)\delta \). Without loss of generality, we can assume that \( \delta < 0 \). Thanks to the Bishop-Gromov theorem, see e.g. [Ber03, Theorem 107], this implies that the volume \( \text{vol}^2(M)(B^{(M)}(x_0, l+1)) \) is bounded from above by the volume of a ball with same radius in a manifold of constant curvature \( \delta \). In other words, this means that for some constants \( c, c' > 0 \), we get

\[
\text{vol}^2(M)(B^{(M)}(x_0, l+1)) \leq \text{vol}^2(M)(B^{(M)}(x_0, l)) \leq c e^{\delta l}.
\]

Inserting (9.35) into (9.34), we deduce that for \( \lambda \) large enough, there exists a positive constant \( c \) such that

\[
\int e^{-\lambda \frac{d^{(M)}(x_0, x_1)}{r_0}} \text{dvol}^2(M)(x_1) \leq \frac{c}{\lambda}.
\]
Combining (9.32), (9.33) and (9.36), we deduce the required result (3.4).

We turn now to (9.35) and prove that $\mathbb{E}[N(C_{x₀, λ}^{(M)})^2]$ is bounded. We first rewrite $N(C_{x₀, λ}^{(M)})$ in a convenient way: each vertex of the Voronoi cell $C_{x₀, λ}^{(M)}(x₀, P_λ \cup \{x₀\})$ belongs to that cell and to exactly $n$ other Voronoi cells. In other words, it is the center of an open geodesic ball which does not meet $P_λ$ and contains $(n + 1)$ distinct points $x₀, \ldots, xₙ$ of $P_λ$ on its boundary. Actually, the circumscribed ball of $(n + 1)$ fixed points needs not to be unique but Assumption (A₃) guarantees that its number $n(x₀, \ldots, xₙ)$ is bounded by $c > 0$. If $B₁^{(M)}(x₀, \ldots, xₙ), \ldots, Bₙ^{(M)}(x₀, \ldots, xₙ)$ are these balls, then

$$N(C_{x₀, λ}^{(M)}) = \sum_{x₁, \ldots, xₙ \in P_λ} \sum_{i=1}^{n(x₀, \ldots, xₙ)} 1_{[Bᵢ^{(M)}(x₀, \ldots, xₙ) \cap P_λ = \emptyset]}$$

and

$$N(C_{x₀, λ}^{(M)})^2 = \sum_{x₁, \ldots, xₙ \in P_λ} \sum_{x_{n+1}, \ldots, x_{2n} \in P_λ} \sum_{i=1}^{n(x₀, \ldots, xₙ)} \sum_{j=1}^{n(x₀, \ldots, x₂ₙ)} 1_{[(Bᵢ^{(M)}(x₀, \ldots, xₙ) \cup Bⱼ^{(M)}(x₀, xₙ+1, \ldots, x₂ₙ)) \cap P_λ = \emptyset]}.$$  

We may as of now assume that circumscribed ball of $(n + 1)$ fixed points is unique and is denoted by $B^{(M)}(x₀, \ldots, xₙ)$.  

Using the Mecke-Slivnyak formula [Mol94 Proposition 4.1.1], we get

$$\mathbb{E}(N(C_{x₀, λ}^{(M)})^2) = \sum_{k=0}^{n} \frac{\lambda^{n+k}}{(n+k)!} \binom{n}{k} \mathbb{P}([B^{(M)}(x₀, \ldots, xₙ) \cup B^{(M)}(x₀, x₁, \ldots, xₙ-k, x₂ₙ-k+1, \ldots, x₂ₙ)] \cap P_λ = \emptyset)$$

$$= \sum_{k=0}^{n} \frac{1}{(n+k)!} \binom{n}{k} Iₖ(λ)$$

where

$$Iₖ(λ) = \lambda^{n+k} \int e^{-λ \text{vol}^{(M)}(B(x₀, \ldots, xₙ) \cup B(x₀, x₁, \ldots, xₙ-k, x₂ₙ-k+1, \ldots, x₂ₙ))}$$

$$\times \text{vol}^{(M)}(x₁) \ldots \text{vol}^{(M)}(xₙ) \text{vol}^{(M)}(x₂ₙ-k+1) \ldots \text{vol}^{(M)}(x₂ₙ).$$

Let us treat separately each integral $Iₖ(λ)$. Thanks again to Lemma 2.24 for some constant $c > 0$, we have

$$\text{vol}^{(M)}(B^{(M)}(x₀, \ldots, xₙ) \cup B^{(M)}(x₀, x₁, \ldots, xₙ-k, x₂ₙ-k+1, \ldots, x₂ₙ))$$

$$\geq \frac{c}{n+k} \sum_{i \in \{1, \ldots, n, 2n-k+1, \ldots, 2n\}} (d^{(M)}(x₀, xᵢ) \mathbb{1}_{[xᵢ \in B^{(M)}(x₀, r₀)]} + d^{(M)}(x₀, xᵢ) \mathbb{1}_{[xᵢ \notin B^{(M)}(x₀, r₀)]}).$$

Inserting (9.39) into (9.38) then using Fubini’s theorem and a decomposition similar to (9.34), we obtain that

$$Iₖ(λ) \leq \lambda \left( \int (d^{(M)}(x₀, r₀))^n \text{vol}^{(M)}(x₁) + \int e^{-λ \frac{c}{n+k} d^{(M)}(x₀, xᵢ)} \text{vol}^{(M)}(x₁) \right).$$

We treat each of the two terms in the exact same way as for (9.32) and conclude that $Iₖ(λ)$ is bounded from above by a constant. Using finally (9.37), we get the required result (3.5).
Proof of Lemma 3.3. Let us define the Voronoi flower $F^{(M)}_{x_0,\lambda}$ associated with the cell $C^{(M)}_{x_0,\lambda}$ as

$$F^{(M)}_{x_0,\lambda} = \bigcup_{y \in C^{(M)}_{x_0,\lambda}} B^{(M)}(y, d^{(M)}(y, x_0)).$$

In particular, the set $F^{(M)}_{x_0,\lambda}$ does not meet $\mathcal{P}_\lambda$ and contains all the Voronoi neighbors of $x_0$ on its boundary. In particular, only the intersection of $\mathcal{P}_\lambda$ with $F^{(M)}_{x_0,\lambda}$ is needed to construct the Voronoi cell $C^{(M)}_{x_0,\lambda}$. Consequently, if the sets $C^{(M)}_{x_0,\lambda}$ and $\tilde{C}^{(M)}_{x_0,\lambda}$ differ, then the set $F^{(M)}_{x_0,\lambda}$ is not included in $B^{(M)}(x_0, r)$. This implies that there exists an empty ball $B^{(M)}(y, d^{(M)}(y, x_0))$ of radius at least $r/2$. In other words,

$$P(C^{(M)}_{x_0,\lambda} \neq \tilde{C}^{(M)}_{x_0,\lambda}) \leq P(\exists y \in M \setminus B^{(M)}(x_0, r/2) : B^{(M)}(y, d^{(M)}(y, x_0)) \cap \mathcal{P}_\lambda = \emptyset). \quad (9.40)$$

Recalling Assumption (A1), we can use Gromov’s packing lemma, see e.g. [Gro81, Lemma 2.2.1] which implies that for $r$ small enough, there exist $m$ points where $m$ is independent of $r$ such that the ball $B^{(M)}(x_0, r)$ is covered by the balls $B_1, \ldots, B_m$ centered at the $m$ points and of radius $r/8$. In particular, any ball $B^{(M)}(y, d^{(M)}(y, x_0))$ with $d^{(M)}(x_0, y) \geq r/2$ contains one of the $B_i$. Consequently,

$$P(\exists y \in M \setminus B^{(M)}(x_0, r/2) : B^{(M)}(y, d^{(M)}(y, x_0)) \cap \mathcal{P}_\lambda = \emptyset) \leq P(\exists i \in \{1, \ldots, m\} \text{ s.t. } B_i \cap \mathcal{P}_\lambda = \emptyset) \leq \sum_{i=1}^{m} P(B_i \cap \mathcal{P}_\lambda = \emptyset) \leq m e^{-\lambda r^n} \quad (9.41)$$

where the estimate $\text{vol}^{(M)}(B_i) \geq cr^n$ comes from the combination of (2.11) and Lemma 2.2(iii). Inserting (9.41) into (9.40), we obtain the statement of Lemma 3.3.
