THE HOMOMORPHISM OF PRESHEAVES $K^*_{\mathrm{MW}} \to \pi^*_s$ OVER A BASE.

A. DRUZHININ

Abstract. We construct the homomorphism of presheaves $K^*_{\mathrm{MW}} \to \pi^*_s$ over an arbitrary base scheme $S$, where $K^*_{\mathrm{MW}}$ is the (naive) Milnor-Witt $K$-theory presheave defined as a graded ring with generators $[a] \in K^*_{\mathrm{MW}}$, $\forall a \in G_m$, and $\eta \in K^-_{\mathrm{MW}}$, and relations

1. Introduction

The presheaf of the (naive) Milnor-Witt $K$-theory $K^*_{\mathrm{MW}}$ is defined as a graded ring with generators $[a] \in K^*_{\mathrm{MW}}$, $\forall a \in G_m$ and $\eta \in K^-_{\mathrm{MW}}$ and relations

(Steinberg relation) $[x][1-x] = 0$, $\forall x \in (G_m - \{1\})$,

(1.1) $\eta[x][y] = [xy] - [x] - [y]$, $\forall x, y \in G_m$

$\eta[\eta[-1] + 2] = 0$.

As shown in [2, section 4.2.1] the result [7, theorem 6.3] implies that the Zariski sheafification $\underline{K}^*_{\mathrm{MW}}$ of the presheaf $K^*_{\mathrm{MW}}$ over an infinite filed $k$ of odd characteristic is equal to the unramified Milnor-Witt $K$-theory sheaf $K^*_{\mathrm{MW}}$ defined in [10, section 3], which is by defined as an unramified sheaf that is equal to the (naive) $K^*_{\mathrm{MW}}$ on fields. The stable version of the Morel’s theorem [10, theorem 19, cor. 21] states isomorphism of sheaves $K^*_{\mathrm{MW}} \simeq \pi^*_s$ for a (perfect) base field $k$ of an arbitrary characteristic.

The result of the paper is the following

Theorem 1.2. The assignment

$[x] \mapsto [pt \mapsto x] \in [pt, G^1_m]_{\mathrm{SH}(S)}$

$\eta \mapsto \Sigma^- 2[m - p_1 - p_2] \in [pt, G^1_m]_{\mathrm{SH}(S)}$

where $m: G^2_m \to G_m: (x, y) \mapsto xy$, and $p_1, p_2: G^2_m \to G_m$ are the projections, induces the homomorphism of presheaves $K^*_{\mathrm{MW}} \to \pi^*_s$ for any base scheme $S$.

The theorem follows directly from

Proposition 1.3. The following equalities hold in the stable motivic homotopy category $\mathrm{SH}(S)$ for all $S$

(1.4) $\\begin{align*} & [x, 1-x] = 0 \in [(A^1 - \{0, 1\})_+ \cup G^1_m]_{\mathrm{SH}(S)}, \\
& \Sigma \eta (\Sigma \eta)^{-2}[m - p_1 - p_2] \in [G^2_m \cup G^2_m]_{\mathrm{SH}(S)}, \\
& [x, \Sigma \eta] \Sigma \eta = \Sigma \eta (\Sigma \eta)^{-2} \in [G^2_m \cup G^2_m]_{\mathrm{SH}(S)} \\
& (\Sigma \eta)^{-2} [-1] + 2 \Sigma \eta = 0 \in [G^2_m \cup pt]_{\mathrm{SH}(S)} \\
\end{align*}$

where the products in equalities are the external product with respect to the monoidal structure, and

- $\Sigma \eta$ denotes $\Sigma \eta^2 \eta$,

- $(1-x,x): (A^1 - \{0,1\}) \times S \to G_m \times G_m$ is a regular map, and $[(1-x,x)]$ is its class in $\mathrm{SH}(S)$,

- $(x),(y): G_m \to G_m$ denote two copies on the identity map, $[(x)], [(y)] \in [(G_m)_+, G^1_m]$ denote their classes, and $[-1]: [pt, G^1_m]$ denotes the class of $pt \to G_m$ given by $-1$,

- $m, p_1, p_2: G^2_m \to G_m$ are the product map and the projection maps, and $[m], [p_1], [p_2]: [G^2_m, G^1_m]$ are the induced homomorphisms.

We should say that the Steinberg relation in $\mathrm{SH}$ (the first one in the list above) is proven originally by Po Hu and Igor Kriz in [9]. The proof is written for the base filed base but it works as well for an arbitrary base. To keep the text being complete we present here the short alternative argument. From what the author understands this argument is essentially equivalent to the original proof.

1.1. Strategy of the proof.
1.1. **Steinberg relation.** The Steinberg relation follows from that the class of a morphism \(c: U \to G_m \times G_m\) in the group \([C_+, G_m^{\wedge 2}]_{\text{SH}(S)}\) is equal to a composition \(C_+ \to pt_+ \to G_m^{\wedge 2}\), if \(c\) fits into a diagram

\[
\begin{array}{ccc}
U & \xrightarrow{X} & X \\ & \downarrow & \downarrow \\ G_m^{\wedge 2} & \xrightarrow{\Delta^2} & (A^1 \times \{1\}) \cup \{(1) \times A^1\}
\end{array}
\]

such that \(X \simeq pt \in \text{SH}(S)\). Then applying this to \(U = (A^1 \setminus \{0,1\}) \amalg G_m = Z(x+y-1) \amalg Z(x-1) \subseteq G_m^\wedge 2\), we see that the classes of the maps \((A^1 \setminus \{0,1\})_+ \to G_m^{\wedge 2}; (t) \mapsto (t, 1-t)\), and \((G_m)_+ \to G_m^{\wedge 2}; (t) \mapsto (1, t)\) both are equal to the same constant. But the class of the second one is trivial, hence the class of the first one too.

In non-stable case our the first argument requires the stabilisation by one \(S^1\) suspension.

1.1.2. **Other relations.** The image of the homomorphism \(K_{n}^{\text{MW}} \to \pi_{n,n}(S)\) are the sum of class \(\Sigma^{m}f\) for a regular morphisms \(f \in G_m^{\wedge 1} \to G_m^{\wedge n}\). Let \(\bullet\) denotes the external product (composition) of morphisms with respect to the monoidal structure, and \(\circ\) denotes the composition of morphisms in the categorical sense. The last three relations from (1.1) follows from the following observations:

\[\text{(prop 3.11)} \Sigma^{m}_G[f \circ g] = (-1)^{mn}f \bullet g = \Sigma^{m}_G[-1)^{m(m-1)}(g \circ \Sigma^{m}f)\]

for any \(f \in \text{Map}(G_m^{\wedge 1}, G_m^{\wedge m})\), \(g \in \text{Map}(G_m^{\wedge m}, G_m^{\wedge n})\) for some \(r_1, r_2 \in \mathbb{Z}\);

\[\text{(lm 3.10)} [T] = \Sigma^{2}_G(-1) \in [G_m^{\wedge 1}, G_m^{\wedge 1}]_{\text{SH}(S)}\]

where \(T\) is a permutation on \(G_m^{\wedge 1}\), and \(\Sigma^{1}G(-1) \in [G_m^{\wedge 1}, G_m^{\wedge 1}]_{\text{SH}(S)}\) is the class of the map \(G_m \to G_m; t \mapsto -t\).

\[\text{(rem 3.9)} m \circ T = m, \text{where } m: G_m^{\wedge 1} \to G_m^{\wedge 1}\]

The first equality is a variant of the fact that two groupoid operations satisfying the property \((f_1 \circ f_2) \bullet (g_1 \circ g_2) = (f_1 \bullet g_1) \circ (f_2 \bullet g_2)\) are equal and commutative. Actually the first equality follows from the second one from the list above. The second equality can be proven either as a consequence of the fact that elementary transformation (over \(\mathbb{Z}\)) which permutes coordinates. In the nonstable case the argument with elementary transformations uses stabilisation by one \(S^2\). So the proof of other three relations holds after the smash with \(S^2\).

Note that alternatively the equality \(T = \Sigma^{1}_G(-1)\) can be obtained using the framed permutation homotopy on \(G_m^{\wedge 1}\) form \([1]\), but this argument requires \(P^1\) stabilisation.

1.2. **Proofs for the case of a base field.**

1.2.1. **(The universal strongly homotopy invariant theory).** In the Morel’s book [10] the homomorphism \(K_{n}^{\text{MW}} \to \pi_{n,n}\), where \(K_{n}^{\text{MW}}\) is the sheaf of the unramified Milnor-Witt \(K\)-theory, follows from the universal property of the sheaf \(K_{n}^{\text{MW}}\) in the class of strongly homotopy invariant sheaves over a field. In the case of non-zero dimensional base it is unknown does the sheaves \(\pi_{n,n}\) are strongly homotopy invariant sheaves. In the same time some key inner arguments from [10] in the proof of the last three relations (1.1) looks being general and should work over an arbitrary base. So the author doesn’t know entirely is it possible to prove these relations relations in \(\pi_{n,n}\) over any \(S\) using the arguments from [10].

1.2.2. **(The Steinberg relation).** The Steinberg relation in \(\text{SH}(k)\) for an arbitrary filed \(k\) was proven originally by Po Hu and Igor Kriz in [9], and reproven by Geoffrey M.L. Powell in [12]. The arguments of both proofs can be word by word repeated in the case of an arbitrary base.

The author apologize for the doubts in the correctness of the arguments [9], which he had wroted in previous version, now he had understand the original proof.

Nevertheless the author still do not understand the alternative proof in [12]. In [12] definition 3.0.7, proposition 3.0.8 nothing is mentioned about the base point in the \(\mathbb{A}^n\) for the morphism \(X \to \mathbb{A}^n\), and is the cone considered in [12] proposition 3.0.8 is just the cone of the morphism the unpointed varieties \(X \to \mathbb{A}^n\) then in \(\text{SH}\) it is equivalent to \(S^1 \wedge \text{Fib}_{\text{SH}}(X_+ \to pt_+)\), but not to to the suspension of \(X_+\). The author would appreciate if some one can explain what is meant there.
1.2.3. (Framed correspondences). Alternatively the relations of Milnor-Witt K-theory in the stable motivic homotopy groups over fields were proven in \textbf{[11]} by A. Neshitov. The prove is given by precise framed homotopies and the relations are proven in $H^0(\mathbb{Z}/\mathcal{F}(\Delta^n, G_n^m))$, which is formally stronger then relations in $\pi^{n,n}(k)$. In the same time the proof of Steinberg relation requires assumption that the base field is of characteristic different form 2 and 3. From what the author understands at least some of the framed homotopies used in the proof could be lifted at least to henselian local bases. If this is true for all homotopies, then this would imply the homomorphism of Nisnevich sheaves $K_{MW} \rightarrow \pi_{n, n}^{*, *}$ over $\mathbb{Z}[1/6]$.

1.3. Acknowledgement. The author is grateful to the J. I. Kylling for the discussions and comparing of the proofs of the Steinberg relation given in \textbf{[9]}, \textbf{[12]}, and the present one. The author is grateful for the participants of the Chebyshev laboratory seminar on K-theory and motivic homotopy theory and especially for A. Ananikov for the corrections and useful comments on the text. The author thanks M. Hoyois for the explanation and the reference for the construction on $\text{SH}(S)$ over an arbitrary scheme $S$.

1.4. Notation: All products, points, and schemes are considered relatively over the base scheme $S$.

2. Proof of the Steinberg relation

2.1. The reduced curve. In the subsection we prove the Steinberg relation up to some constant, i.e we prove that the morphism $(1-x,x): (\mathbb{A}^1-\{0,1\}) \rightarrow G_m^2$ can be passed in $\text{SH}(S)$ throw $(\langle \mathbb{A}^1-\{0,1\}\rangle)_+ \rightarrow pt \rightarrow G_m^2$ in $\text{SH}(S)$. We refer reader to \textbf{[8] Appendix C} for the definition of the stable motivic homotopy category $\text{SH}(S)$ over an arbitrary scheme $S$.

**Notation 2.1.** For any $X \in Sm_S$ denote by $X/pt$ the fibre of the morphism $X \rightarrow pt$ in $\text{SH}(S)$

$$X/pt \rightarrow X_+ \rightarrow pt_+ \rightarrow (C/pt) \wedge S^1.$$ 

So any morphism $X \rightarrow Y$ for $X,Y \in \text{SH}(S)$ induces the morphism $C/pt \rightarrow Y$ via the composition $C/pt \rightarrow C \rightarrow Y$.

**Lemma 2.2.** Let $X$ be a scheme over $S$, and assume that $X$ is $\mathbb{A}^1$ contractable, i.e. the canonical morphism $X \rightarrow pt$ is equivalence in $\text{SH}(S)$. Let $\xi: X \rightarrow \mathbb{A}^2$ be a morphism of schemes such that $X \times_{\mathbb{A}^2} (Z(xy)-Z(x+y-1)) = \emptyset$, where $x$ and $y$ denotes coordinate functions on $\mathbb{A}^2$ (and so $Z(xy)-Z(x+y-1) \simeq (\mathbb{A}^1-\{1\})\prod_{[0]}(\mathbb{A}^1-\{1\})$).

Denote $U = X \times_{\mathbb{A}^2} G_m^2$ and $c: U \rightarrow G_m^2$. Then the class of the morphism $c$ in $[U/pt, G_m \wedge G_m]$ is trivial.

**Proof.** It follows from the assumption on $\xi$ that $X \times_{\mathbb{A}^2} \{(0,0)\} = \emptyset$. Consider the diagram of the triangles in $\text{SH}(S)$

$$
\begin{array}{ccc}
G_m \times_{\{1\}} \mathbb{A}^1 & \longrightarrow & (\mathbb{A}^1 \times \{0\}) \cup \mathbb{A}^1 \\
\downarrow \alpha & & \downarrow \beta \\
G_m^2 \wedge G_m^2 & \longrightarrow & (\mathbb{A}^2-0)_+ \\
\gamma & \longrightarrow & \text{Cone}(\gamma) \\
\downarrow \delta & & \downarrow \text{Cone}(\gamma) \\
U_+ & \longrightarrow & X_+ \rightarrow X/U \wedge S^1 \\
\zeta & \longrightarrow & X/pt \rightarrow \text{Cone}(\zeta) \simeq C/pt \wedge S^1
\end{array}
$$

where $X/U = \text{Cone}(U \rightarrow X) = \text{Cone}(U_+ \rightarrow X_+)$. It follows form the assumption $\xi$ that $X/U \simeq X/U_1 \cup X/U_2 \simeq (X-Z_1)/(U-Z_1) \cup (X-Z_2)/(U-Z_2)$, where $Z_1 = (X \times_{\mathbb{A}^1} \mathbb{A}^1 \times \{0\})_{red} = X \times_{\mathbb{A}^2} \{(1,0)\}$, $Z_2 = X \times_{\mathbb{A}^1} \{0\} \times \mathbb{A}^1 = X \times_{\mathbb{A}^2} \{(0,1)\}$, and $U_1 = X-Z_1$, $U_2 = X-Z_2$, $U_2 = X-Z_1$.

Note that

$$\text{Cone}(\beta) \simeq ((G_m, 1) \wedge T) \cup (T \wedge (G_m, 1)) \simeq ((\mathbb{A}^2-0)/(G_m \times \mathbb{A}^1)) \cup ((\mathbb{A}^2-0)/((\mathbb{A}^1 \times G_m))).$$
Let \( \xi_1, \xi_2 \to X \to \mathbb{A}^1, \xi = (\xi_1, \xi_2) \). The homotopy

\[
(X - Z_1)/(U - Z_1) \times \mathbb{A}^1 \to (\mathbb{A}^2 - 0)/(G_m \times \mathbb{A}^1): p \mapsto (\xi_1(p), (1 - \lambda)\xi_2(p) + \lambda),
\]
implies that the morphism \( (X - Z_1)/(U - Z_1) \to \text{Cone}(\beta) \) induced by \( \xi \) in \( \text{SH}(S) \) is trivial. Similarly the morphism \( (X - Z_1)/(U - Z_1) \to \text{Cone}(\beta) \) is trivial. Hence the vertical arrow \( X/U \to \text{Cone}(\beta) \) in the diagram is trivial.

Since \( X \to pt \) is an isomorphism by assumption, it follows that the last arrow in the last row in the diagram is isomorphism; then since the second last vertical arrow in the diagram is isomorphism, it follows that the composition \( S^1 \land U/pt \to S^1 \land (U_+) \cong G_m \land G_m \) is trivial. The claim follows.

\[\square\]

**Proposition 2.3.** The class of the morphism \( (\mathbb{A}^1 - \{0, 1\}) \to G_m: (t) \mapsto (t, 1-t) \) in \( \langle [\mathbb{A}^1 - \{0, 1\}] \rangle \), \( G^2_m \mid \text{SH}(S) \) is trivial.

**Proof.** Applying lemma 2.2 to the closed subscheme \( X = Z((x-1)(x+y-1)) \subset \mathbb{A}^2 \) we see that the morphism \( c \Pi c': (\mathbb{A}^1 - \{0, 1\}) \amalg G_m \to G^2_m \) in \( \langle [\mathbb{A}^1 - \{0, 1\}] \rangle \), \( G^2_m \mid \text{SH}(S) \), where \( c: (\mathbb{A}^1 - \{0, 1\}) \to G^2_m: (t) \mapsto (t, 1-t), \) and \( c': G_m \to G^2_m: (t) \mapsto (t, 1) \), is trivial. Hence the class \([c \Pi c']\) of the morphism \( c \Pi c' \) is \( \text{SH}(S) \) can be passed throw

\[
((\mathbb{A}^1 - \{0, 1\}) \amalg G_m)_+ \to pt_+ \to G^2_m.
\]

Now since the class of the composition \( c' \circ 1 \), where \( 1: pt_+ \to (G_m)_+ \) is given by the point \( \{1\} \), defines the zero morphism in the group \( [pt_+, G^2_m]_{\text{SH}(S)} \), it follows that \([c \Pi c'] = 0 \in \langle [\mathbb{A}^1 - \{0, 1\}] \rangle \amalg G_m, G^2_m \mid \text{SH}(S) \rangle \). Hence the class of the morphism \( (\mathbb{A}^1 - \{0, 1\}) \to G_m: (t) \mapsto (t, 1-t) \) in \( \langle [\mathbb{A}^1 - \{0, 1\}] \rangle \), \( G^2_m \mid \text{SH}(S) \) is trivial.

\[\square\]

3. Proof of other relations of Milnor-Witt K-theory

Denote \( \text{SH} = \text{SH}(S), Sm = Sm_S \).

**Definition 3.1.** Let \( f \in \text{Map}(X, Y), g \in \text{Map}(X', Y') \), for \( X, Y, Z \in Sm_S \), (or \( f \in [X, Y]_{\text{SH}}, g \in [X', Y']_{\text{SH}}, X, Y, Z \in \text{SH}(S) \)),
- \( o: \) Then if \( Y = X' \), we can define the composition morphism in \( \text{Map}(X, Y') \) (or \([X, Y']_{\text{SH}}\)) which we denote by \( o \circ f \).
- \( \bullet: \) Denote by \( f \bullet g \in \text{Map}(X \times X', Y \times Y') \) the (external) product, which we also call as an external composition, the same notation we use for \( f \bullet g \in \text{Hom}_{\text{Sm}^{id}}(X \times X', Y \times Y') \) or \([X \times X', Y \times Y']_{\text{SH}}\); let us note that we use both notations \( fg \) and \( f \bullet g \) for the external products in \( \text{SH} \), but only \( f \bullet g \) for \( Sm \) and \( ZSm^{id} \);
- \( \Sigma G_m: \) denote \( \Sigma^l G_m = \text{id}_{G_m} \cdot f, f \Sigma^l G_m = f \cdot \text{id}_{G_m} \).
- \( \sim G_m: \) let us write \( f \sim ^G f, g \) iff \( \Sigma^l G_m f = \Sigma^l G_m g \) for some \( l', l'' \in \mathbb{Z} \).

**Remark 3.2.** For any \( f \in \text{Map}(G^m_n, G^m_m) \) \( g \in \text{Map}(G^m_n, G^m_m) \), \( f \Sigma^m G_m g = f \bullet g \in \text{Map}(G^m_n + n', G^m_{m + n'}) \) \( G^m_0 \).

**Remark 3.3.** If \( f \sim ^G f', g \sim ^G g', f' = g' \) then \( f = g \).

**Definition 3.4.** Define regular maps
- \( m: G_m \times G_m \to G_m: (x, y) \mapsto xy \),
- \( (a): pt \to G_m: pt \mapsto a \),
- \( m_a: G_m \to G_m: x \mapsto ax \).

Define \( \eta \in [pt, G^{m-2}_m]_{\text{SH}}, \eta = \Sigma^l G_m \eta, \) note that \( \Sigma^l \eta \) here is just a symbol;
- \( [a] \in [pt, G^m_m]_{\text{SH}}: pt \mapsto a \),
- \( [a] \in [pt, pt]_{\text{SH}}: (a) = \Sigma^l G_m (a) \).

**Definition 3.5.** Let \( G_m \cong G^m_1 \oplus pt \in \text{SH} \) be the isomorphism given by the point \( 1 \in G_m \). For a regular map \( f \in \text{Map}(G^m_m, G^m_m) \) denote by \( f \in \text{Hom}_{\text{Sm}^{id}}(G^m_m, G^m_m) \) the induced morphism in the Karoubi envelope of the linearisation of \( Sm \).

For any morphism \( f \in ZSm^{id} \), \( f \in \text{Hom}(X, Y) \) denote by \([f] \in [X, Y]_{\text{SH}}\) the class of the morphism in \( \text{SH} \).

**Example 3.6.** Let \( m: G_m \times G_m \to G_m: (a, b) \mapsto ab \) be the multiplication morphism,
- \( \bar{m} = \Sigma^2 G_m \eta \in [G^2_m, G^2_m]_1 \).
- \([a] \in [pt, G_m^{\Lambda_1}]_{\mathrm{SH}}\)
- \([\tau a] = \Sigma_G(a) \in [G_m^{\Lambda_1}, G_m^{\Lambda_1}]_{\mathrm{SH}}\).

**Remark 3.7.** Computing the composition of morphisms \(\overline{f} \circ \overline{f} \in \text{Map}(G_m^n, G_m^m), g \in \text{Map}(G_m^m, G_m^n)\),

it is useful to think about the morphisms induced by \(\overline{f} \) and \(\overline{f} \) in \([G_m^n, G_m^m]_{\mathrm{SH}}\), which is given by the formula \(P_n \circ f \circ P_m\) where \(P_n = \prod_{i=1, \ldots, n} (id_{G_m^n} - 1 \circ p_i)\), \(1: pt \to G_m^n, p_i : G_m^n \to G_m^{n-1}\) is the projection along the \(i\)-th multiplicand.

**Definition 3.8.** Let
- \(T\) be the permutation on \(G_m^2\),
- \(H = id_G + m \in \mathbb{Z}Sm(G_m^n, G_m^n)\),
- \(h = \Sigma_G(\overline{T}) = (1) + (-1) \in [pt, pt]_{\mathrm{SH}}\).

**Remark 3.9.** By commutativity we have \(m \circ T = m\).

**Lemma 3.10.** For a permutation \(P \in Aut_S(G_m^n)\) with the sign \(s\)

\[\overline{[P]} = \Sigma^N_G(\langle -1 \rangle^s) = \Sigma^1_G(\langle -1 \rangle^s) \Sigma^N_G.\]

**Proof.** Since \(G_m^n \wedge S^l = T^{|n|} = A^l/(A^l - 0)\) the claim follows from the fact that any permutation defines the matrix in the subgroup in \(GL(\mathbb{Z})\) generated by elementary matrices and the matrix the diagonal matrix \((-1, 1, \ldots, 1)\). Let us note in addition that the general case follows from the case of the twist on \(G_m^n\), linear homomorphism is equal to \(\square\)

**Proposition 3.11.** For any \(f \in [G_m^{\Lambda_1}, G_m^{\Lambda_1}]_{\mathrm{SH}}, g \in [G_m^{\Lambda_1}, G_m^{\Lambda_1}]_{\mathrm{SH}},\) we have

\[f \circ g \sim (\langle -1 \rangle^{m_n} f \circ g \sim (\langle -1 \rangle^{m+1}(g \circ \Sigma^{-m'} f)\]

**Proof.** The first equivalence forms follow

\[f \circ g \sim \Sigma^1_n f \circ \Sigma^{-1} g = \Sigma^1_g f \circ \Sigma^1_g g \circ \hat{P} = \Sigma^1_g f \circ (\langle -1 \rangle^{n(n+1)} \Sigma^1_g) \circ \Sigma^1_g g \circ (\langle -1 \rangle^{n(n+1)} \Sigma^1_g) = \langle -1 \rangle^{n} \circ f \circ g\]

where \(\hat{P} : G_m^{\Lambda_1} \wedge G_m^{\Lambda_1} \to G_m^{\Lambda_1} \wedge G_m^{\Lambda_1}\), and \(\hat{P} : G_m^{\Lambda_1} \wedge G_m^{\Lambda_1} \to G_m^{\Lambda_1} \wedge G_m^{\Lambda_1}\). Note that the sign of the permutation \((1, \ldots, l+1, \ldots, l+k) \to (l+1, \ldots, l+k, 1, \ldots, l)\) is equal to \(l(l + k + 1) = l^2 + l(k + 1) = l(1 + k + 1) = lk(mod2), \forall l, k \in \mathbb{Z}_{\geq 0}\). The second equivalence follows from the first one applied to \(\Sigma^{-m'} f\) and \(g\).

**Remark 3.12.** The sign in \([1,2,3] 2\) is the only one sign which we essentially use in the proof of relation of Milnor-Witt K-theory in \(\mathbb{SH}\).

The first relation in the list \((1,3)\) follows almost tautologically form proposition \((1,1)\) and the definition of \(\eta\).

**Lemma 3.13.** The following equality for morphisms in \(\mathbb{SH}\) holds

\[\Sigma_{\eta} \cdot [a] \cdot [b] = [p \circ (m - \overline{\pi} - \overline{\pi})] \in [G_m^{\Lambda_1}, G_m^{\Lambda_1}]_{\mathrm{SH}}.\]

where \(p_1, p_2 : G_m^{\Lambda_1} \to G_m^{\Lambda_1}\) are projections, and where \(a, b, p : G_m^{\Lambda_1} \to G_m^{\Lambda_1}\) denotes three copies of the canonical projection.

**Proof.** It follows from prop \((1,1)\) that

\[\Sigma_{\eta} \cdot [a] \cdot [b] = \Sigma_{\eta} \circ (\langle a \rangle \cdot [b]) \circ \overline{\tau} = p \circ (m - \overline{\pi} - \overline{\pi})\]

where \(\Sigma_{\eta} = \Sigma^2_G \eta\).

Now we prove the other two relation.

**Proposition 3.14.** The following equality holds

\([a] \Sigma_{\eta} = \Sigma_{\eta} [a] \in [G_m^{\Lambda_1}, G_m^{\Lambda_1}]_{\mathrm{SH}}.\)

**Proof.**

\[\langle a \rangle \pi = \langle (\overline{\pi} \cdot \overline{\pi}) \rangle \sim \overline{T} \circ (\overline{\pi} \cdot \overline{\pi} \circ \overline{T})\]

\[\sim \overline{T} \circ (\overline{\pi} \cdot \overline{\pi}) \circ \overline{T} \sim \overline{T} \circ \overline{T} \sim \overline{T} \sim \eta \]
Proposition 3.15. The following equality holds
\[ \eta^2[1] + 2\eta = 0 \in [pt, G_{m}^{\wedge,-2}]_{SH} \]

Proof. Recall \( \Sigma \eta = \Sigma_{G}^{2} \eta \). Using prop 3.11 we have
\[ \Sigma_{G}(\eta[1]) = [\overline{m} \circ (\overline{m} \bullet \overline{m})]^\circ[1,1] [\overline{m} \circ (\overline{m} \bullet \overline{m})] \]
and the straightforward computation in the Karoubi envelope of the linearisation of \( Sm \) in view of rem 3.7 shows that
\[ \overline{m} \circ (\overline{m} \bullet \overline{m} [1]) : G_{m}^{2} \rightarrow G_{m} : (x,y) \mapsto (-xy) - (-x) - (-y) -(xy) + (x) + (y) - (1). \]
So \( \eta \bullet (\eta \bullet [-1] + 2id_{G_{m}}^{2}) = \Sigma_{G}^{-2}[m \circ (m \bullet [-1]) + 2m] \), and
\[ \overline{m} \circ (\overline{m} \bullet \overline{m} [1]) + 2\overline{m} : G_{m}^{2} \rightarrow G_{m} : (x,y) \mapsto (-xy) + (xy) - ((-x) + (x)) - ((-y) + (y)) - ((-1) + (1)) = \overline{m}(xy) - (x) - (y) + (1) = \overline{m}(m(x,y)). \]
Thus we have got
\[ \eta \bullet \eta \bullet [-1] + 2\eta = \Sigma_{G}^{-2}[\overline{m} \circ \overline{m} (\text{prop } 3.11) h\eta]. \]
Now we see
\[ [\overline{m} \circ m] \text{ prop } 3.11 [\overline{m} \circ \Sigma_{G}^{1} \overline{m}] \text{ in } 3.10 [\overline{m} \circ [id_{G_{m}} - T]] \text{ rem } 3.9 = 0 \]
\]
4. Appendix B: The sign for the compositions in \([G_{m}^{\wedge}, G_{m}^{\wedge,n}].\)

Proposition 4.1. Let \( f \in [G_{m}^{\wedge,n}, G_{m}^{\wedge,n}']_{SH} g \in [G_{m}^{\wedge,n}, G_{m}^{\wedge,n}']_{SH} \), then
1. \( \Sigma_{G}^{n+1} f \circ \Sigma_{G}^{n} g \sim_{G} (-1)^{n} \bullet (\Sigma_{G}^{n+1} f \bullet \Sigma_{G}^{n} g) \), where \( s = (m' + n')(m' + n) \);
2. \( \Sigma_{G}^{n+1} f \circ \Sigma_{G}^{n+1} g \sim_{G} (-1)^{n} \bullet (\Sigma_{G}^{n+1} f \circ \Sigma_{G}^{n+1} g) \), where \( s = (m' + m)(m' + n) + n' + m \)

Proof of the proposition.
(1) The equality is provided by the permutation on the middle term of the composition and \( \text{lm } 3.10 \)
\[ \Sigma_{G}^{1+n+1} n f \circ \Sigma_{G}^{n} g = \left( \Sigma_{G}^{1+n} f \circ \Sigma_{G}^{n} g \right) \circ \left( \Sigma_{G}^{1+n} f \circ \Sigma_{G}^{n} g \right) = \]
\[ (\Sigma_{G}^{1+n} f \circ \Sigma_{G}^{n} g) \circ (\Sigma_{G}^{1+n} f \circ \Sigma_{G}^{n} g) = \]
\[ (\Sigma_{G}^{1+n} f \circ \Sigma_{G}^{n} g) \circ (\Sigma_{G}^{1+n} f \circ \Sigma_{G}^{n} g) \]
\[ (\Sigma_{G}^{1+n} f \circ \Sigma_{G}^{n} g) \circ (\Sigma_{G}^{1+n} f \circ \Sigma_{G}^{n} g) = \]
\[ (\Sigma_{G}^{1+n} f \circ \Sigma_{G}^{n} g) \circ (\Sigma_{G}^{1+n} f \circ \Sigma_{G}^{n} g) \]
where \( \hat{P} : G_{m}^{m+n} \land G_{m}^{n+1} \rightarrow G_{m}^{m+n+1} \land G_{m}^{n+1} \), \( \hat{P} : G_{m}^{m+n} \land G_{m}^{n+1} \rightarrow G_{m}^{m+n+1} \land G_{m}^{n+1} \) are the permutations which replace the multiplicands, sign \( \hat{P} = (n' + n)(n + n' + 1) = 0 \), sign \( \hat{P} = (n + n' + 1)(n + m) = s \).

(2) Since
\[ \hat{G} \circ (\Sigma_{G}^{n} f \bullet \Sigma_{G}^{m} g) \circ \hat{G} = \Sigma_{G}^{m} g \bullet \Sigma_{G}^{m} f, \]
where
\[ \hat{G} : G_{m}^{n} \land G_{m}^{n} \land G_{m}^{m} \land G_{m}^{m} \rightarrow G_{m}^{n} \land G_{m}^{n} \land G_{m}^{m} \land G_{m}^{m} \]
and \( \text{sign}(\hat{G}) \text{ sign}(\hat{G}) = (n + n')(m + m') + 1 \) the claim follows from point (1) and \( \text{lm } 3.10 \)
\]
Corollary 4.2. Let \( f \in [G_{m}^{\wedge}, G_{m}^{\wedge,n}]_{SH} g \in [G_{m}^{\wedge,n}, G_{m}^{\wedge,n}']_{SH} \), then
(0) \( f \bullet g \sim_{G} (-1)^{m+n} \bullet (\Sigma_{G}^{n} f) \bullet g \)
(1) \( \Sigma_{G}^{k+n} f \circ \Sigma_{G}^{k+n} g = (-1)^{k(n+n')} \left( \Sigma_{G}^{k+n} f \bullet \Sigma_{G}^{k+n} g \right) \) for any \( k \in \mathbb{Z} \) such that all terms in the formula are defined.

Proof. (0) The claim follows from lemma 3.10 (1) The claim follow form point (0) and prop 4.1(2);
THE HOMOMORPHISM OF PRESHEAVES $K^{MW}_{\ast} \to \pi^{\ast}_{\ast}$ OVER A BASE.
