ON STUDY OF A METRIC ON $C(S^1, S^1)$

RB YADAV AND SRIKANTH KV

Abstract. In this article we define a metric on $C(S^1, S^1)$. Also, we give some density results in $C(S^1, S^1)$.

1. Introduction

M. H. Stone gave the Stone-Weierstrass Theorem [3], which is a density result with respect to uniform topology. This result is a generalization of the Weierstrass Approximation Theorem by lightening the restrictions imposed on the domain over which the given functions are defined. By taking the co-domain of the given functions to be the complex plane in place of real line, he went further and gave a complex version of the latter result as Stone-Weierstrass Theorem [4]. In this paper our aim is to seek density results for $C(S^1, S^1)$, the class of continuous functions from the unit circle $S^1$, given by $S^1 = \{(x, y) \in \mathbb{R}^2 : x^2 + y^2 = 1\}$, to itself.

2. Preliminaries

In this section we recall some basic notions. Let $X$ be a compact houderff space. Define

$$C(X, \mathbb{R}) = \{f : X \to \mathbb{R} : f \text{ is continuous}\}.$$ 

Definition 2.1. (1) An algebra is a bimodule together with a bilinear product.

(2) If $A$ and $A_1$ are algebras such that $A_1 \subset A$ and module and product structures on $A_1$ are the induced ones from $A$.

Example 2.0.1. (1) $\mathbb{R}$ and $\mathbb{C}$ are algebras.

(2) $C(X, \mathbb{R})$ and $C(X, \mathbb{C})$ are algebras.

(3) Set of polynomials is subalgebra of $C([a,b], \mathbb{R})$.

Definition 2.2. (1) A subalgebra $A \subset C(X, \mathbb{R})$ is said to be unital if $1 \in A$.

(2) $A \subset C(X, \mathbb{R})$ is said to separate points of $X$ if $\forall a,b \in X$ with $a \neq b$ there exists $f \in A$ such that $f(a) \neq f(b)$.

Theorem 2.1 (Stone-Weierstrass theorem). If $A$ is a unital sub-algebra of $C(X, \mathbb{R})$ which separates points then $A$ is dense in $C(X, \mathbb{R})$ in the topology induced by sup metric.

Next we recall some basic notions related to covering spaces. Let $E$ and $X$ be topological spaces, and let $q : E \to X$ be a continuous map.
**Definition 2.3.** An open set \( U \subset X \) is said to be evenly covered by \( q \) if \( q^{-1}(U) \) is a disjoint union of connected open subsets of \( E \) (called the sheets of the covering over \( U \)), each of which is mapped homeomorphically onto \( U \) by \( q \).

**Definition 2.4.** A covering map or projection map is a continuous surjective map \( q : E \to X \) such that \( E \) is connected and locally path-connected, and every point of \( X \) has an evenly covered neighborhood. If \( q : E \to X \) is a covering map, we call \( E \) a covering space of \( X \) and \( X \) the base of the covering.

**Example 2.0.2.** The exponential quotient map \( p : \mathbb{R} \to S^1 \), given by \( p(x) = \exp(2\pi x) \), is a covering map.

**Example 2.0.3.** The \( n \)th power map \( p_n : S^1 \to S^1 \) given by \( p_n(z) = z^n \) is also a covering map.

**Example 2.0.4.** Let \( T^n = S^1 \times S^1 \times ... \times S^1 \). Define \( p^n : \mathbb{R}^n \to T^n \) by

\[
p^n((x_1, ..., x_n)) = (p(x_1), ..., p(x_n)),
\]

where \( p \) is exponential map of Example 2.0.2. It can be verified that \( p^n \) is a covering map.

**Definition 2.5.** If \( f : E \to X \) is a covering map and \( \phi : Y \to X \) is any continuous map, a lift of \( \phi \) is a continuous map \( \tilde{\phi} : Y \to E \) such that \( q \circ \tilde{\phi} = \phi \).

From [2] we have the following result called as Path Lifting Property:

**Lemma 2.1.** Let \( q : E \to X \) be a covering map. Suppose \( f : [0, 1] \to X \) is any path, and \( e \in E \) is any point in the fiber of \( q \) over \( f(0) \). Then there exists a unique lift \( \tilde{f} : I \to E \) of \( f \) such that \( \tilde{f}(0) = e \).

3. A metric on \( C(S^1, S^1) \)

Let \( C(S^1, S^1) \) denote the collection of all continuous functions from \( S^1 \) to \( S^1 \). Further let \( I = [0, 1] \) and \( \hat{C}(I, \mathbb{R}) = \{ f | f : I \to \mathbb{R} \text{ is continuous with } f(0) \in [0, 1) \text{ and } f(1) - f(0) \in \mathbb{Z} \} \). Consider the function \( \alpha : [0, 1] \to S^1 \) given by \( \alpha(t) = (\cos 2\pi t, \sin 2\pi t) \) and the covering space \( \mathbb{R} \) of \( S^1 \) with projection map \( p \) given by \( p(t) = (\cos 2\pi t, \sin 2\pi t) \).

For \( f \in C(S^1, S^1) \), let \( \tilde{f}_\alpha \) be the unique lift \( \tilde{f} \) of \( f \circ \alpha \) such that \( \tilde{f}_\alpha(0) \in [0, 1) \).

Clearly \( \tilde{f}_\alpha \in \hat{C}(I, \mathbb{R}) \).

For \( f \in C(S^1, S^1) \) and \( g \in C(S^1, S^1) \), define

\[
d_0(f, g) = 2\pi \sup_{x \neq (1,0)} |\tilde{f}_\alpha(\alpha^{-1}(x)) - \tilde{g}_\alpha(\alpha^{-1}(x))|
\]

Let \( \hat{C}(I, \mathbb{R}) \) be equipped with the metric \( d_1 \) induced by sup norm on it.

**Proposition 3.1.** \( d_0 \) is a metric on \( C(S^1, S^1) \) and there exists a homeomorphism \( \phi : C(S^1, S^1) \to \hat{C}(I, \mathbb{R}) \) such that \( d_0(f, g) = 2\pi d_1(\phi(f), \phi(g)) \), for all \( f \) and \( g \) in \( C(S^1, S^1) \).

**Proof.** Define \( \phi : C(S^1, S^1) \to \hat{C}(I, \mathbb{R}) \) by \( \phi(f)(t) = \tilde{f}_\alpha(t), \forall t \in I \).

Now, \( \forall t \in I, \phi(f) = \phi(g) \Rightarrow \tilde{f}_\alpha(t) = \tilde{g}_\alpha(t) \Rightarrow p \circ \tilde{f}_\alpha(t) = p \circ \tilde{g}_\alpha(t) \Rightarrow f \circ \alpha(t) = g \circ \alpha(t) \). Again, \( \forall t \in I, f \circ \alpha(t) = g \circ \alpha(t) \Rightarrow f(x) = f(x), \forall x \in S^1 \Rightarrow f = g \). So \( \phi \) is injective.
Given any \( g \in \hat{C}(I, \mathbb{R}) \), define \( f \) by

\[
    f(x) = \begin{cases} 
        p \circ g \circ \alpha^{-1}(x) & \text{if } x \in S^1 - \{(1,0)\} \\
        p \circ g(0) = p \circ g(1) & \text{otherwise}
    \end{cases}
\]

Clearly \( f \in C(S^1, S^1) \) and \( \phi(f) = g \). So \( \phi \) is onto.

\[
    d_0(f, g) = 2\pi \sup_{x \in S^1, x \neq (1,0)} |\tilde{f}_\alpha(\alpha^{-1}(x)) - \tilde{g}_\alpha(\alpha^{-1}(x))| \\
    = 2\pi \sup_{x \in S^1, x \neq (1,0)} |\phi(f)(\alpha^{-1}(x)) - \phi(g)(\alpha^{-1}(x))| \\
    = 2\pi \sup_{t \in (0,1)} |\phi(f)(t) - \phi(g)(t)| \\
    = 2\pi \sup_{t \in [0,1]} |\phi(f)(t) - \phi(g)(t)| \\
    = 2\pi d_1(\phi(f), \phi(g))
\]

So \( d_0 \) is a metric space and \( \phi \) is a homeomorphism. \( \square \)

### 3.1. Density results using PL functions and polynomials

Recall that a function \( f : [a, b] \to \mathbb{R} \) is said to be piecewise linear (PL) if there exist sets of points \( \{p_i\}_{i=1}^k \in [a, b] \) and \( \{q_i\}_{i=1}^{k-1} \in \mathbb{R} \) such that \( p_1 = a, \ p_k = b \) and \( \forall t \in [p_i, p_{i+1}], \ f(t) = q_i + (q_{i+1} - q_i) \frac{(t - p_i)}{p_{i+1} - p_i} \), for every \( 1 \leq i \leq k - 1 \).

For \( a, b \in \mathbb{R} \) define

\[
    PL_{a,b}(I, \mathbb{R}) = \{ f | f : I \to \mathbb{R} \text{ is PL and } f(0) = a, \ f(1) = b \} \\
    C_{a,b}(I, \mathbb{R}) = \{ f \in C(I, \mathbb{R}) | f(0) = a, \ f(1) = b \}
\]

\[
    P_{a,b}(I, \mathbb{R}) = \{ p(x) | p(x) \text{ is a polynomial on } \mathbb{R} \text{ with } p(0) = a, \ p(1) = b \}
\]

Note that \( PL_{a,b}(I, \mathbb{R}) \) is dense in \( C_{a,b}(I, \mathbb{R}) \).

**Lemma 3.1.** Given \( a \in \mathbb{R} \), the set \( P_{0,a}(I, \mathbb{R}) \) is dense in \( C_{0,a}(I, \mathbb{R}) \) with \( \sup \) metric.

**Proof.** Let \( f \in C_{0,a}(I, \mathbb{R}) \). By Weierstrass approximation theorem a sequence of polynomials \( \{p_n\} \) in \( [a, b] \) such that \( p_n \to f \) uniformly. Now define \( \tilde{p}_n \) by

\[
    \tilde{p}_n(x) = p_n(x) - p_n(0) + x(f(1) - p_n(1) + p_n(0)).
\]

Clearly \( \tilde{p}_n \to f \) uniformly and \( \tilde{p}_n(0) = 0, \ \tilde{p}_n(1) = a \). \( \square \)

**Theorem 3.1.** Given \( a, b \in \mathbb{R} \), the set \( P_{a,b}(I, \mathbb{R}) \) is dense in \( C_{a,b}(I, \mathbb{R}) \) with \( \sup \) metric.

**Proof.** Define \( \psi : C_{a,b}(I, \mathbb{R}) \to C_{0,b-a}(I, \mathbb{R}) \) via \( \psi(f)(x) = f(x) - a \). Clearly \( \psi \) is a homeomorphism and \( \psi(P_{a,b}(I, \mathbb{R})) = P_{0,b-a}(I, \mathbb{R}) \). So, since \( P_{0,b-a}(I, \mathbb{R}) \) is dense in \( C_{0,b-a}(I, \mathbb{R}) \), \( P_{a,b}(I, \mathbb{R}) \) is dense in \( C_{a,b}(I, \mathbb{R}) \). \( \square \)

**Definition 3.1.** Let \( f : S^1 \to S^1 \) be a continuous function. Then winding number \( W(f) \) of \( f \) is the integer \( \tilde{f}_\alpha(1) - \tilde{f}_\alpha(0) \).

For \( q \in S^1 \) and \( m \in \mathbb{Z} \) define

\[
    C^q_m(S^1, S^1) = \{ f \in C(S^1, S^1) | f(1,0) = q \text{ and } W(f) = m \} \\
    PL^q_m(S^1, S^1) = \{ f \in C(S^1, S^1) | \tilde{f}_\alpha \in PL_{q,q+m}(I, \mathbb{R}), \ p \circ \tilde{f}_\alpha(0) = q \} \\
    P^q_m(S^1, S^1) = \{ f \in C(S^1, S^1) | \tilde{f}_\alpha \in P_{q,q+m}(I, \mathbb{R}), \ p \circ \tilde{f}_\alpha(0) = q \}.
\]

**Theorem 3.2.** The set \( PL^q_m(S^1, S^1) \) is dense in \( C^q_m(S^1, S^1) \).
Now define \( \tilde{f}_n(0) = \tilde{q} \), then clearly \( \phi^{-1}(C_{\tilde{q}, \tilde{q}+m}(I, \mathbb{R})) = C_{\tilde{m}}(S^1, S^1) \) and \( \phi^{-1}(PL_{\tilde{q}, \tilde{q}+m}(I, \mathbb{R})) = PL_m(S^1, S^1) \).

So, since \( PL_{\tilde{q}, \tilde{q}+m}(I, \mathbb{R}) \) is dense in \( C_{\tilde{q}, \tilde{q}+m}(I, \mathbb{R}) \) and \( \phi \) is a homeomorphism, \( PL_m(S^1, S^1) \) is dense in \( C_m(S^1, S^1) \).

\[ \square \]

**Theorem 3.3.** The set \( P_m^q(S^1, S^1) \) is dense in \( C_m^q(S^1, S^1) \).

**Proof.** Proof is similar to the proof of Theorem 3.2 \( \square \)

4. **Stone-Weierstrass type theorem for \( C(S^1, S^1) \)**

Let \( X \) be a compact metric space. Fix \( u, v \in X \) with \( u \neq v \), \( a, b \in \mathbb{R} \) and \( A \subset C(X, \mathbb{R}) \). Define

\[
C_{u, v}^{a, b}(X, \mathbb{R}) = \{ f \in C(X, \mathbb{R}) | f(u) = a, f(v) = b \}
\]

\[
A_{u, v}^{a, b}(X, \mathbb{R}) = \{ f \in A | f(u) = a, f(v) = b \}.
\]

**Lemma 4.1.** If \( A \) is a unital sub-algebra of \( C(X, \mathbb{R}) \) which separates points and \( a, b \) are any two distinct real numbers then \( A_{u, v}^{a, b}(X, \mathbb{R}) \) is dense in \( C_{u, v}^{a, b}(X, \mathbb{R}) \).

**Proof.** Since \( A \) is a unital sub-algebra of \( C(X, \mathbb{R}) \) which separates points, by Stone-Weierstrass theorem \( A \) is dense in \( C(X, \mathbb{R}) \). So, for each \( f \in C(X, \mathbb{R}) \) there exists a sequence \( f_n \) in \( A \) such that \( f_n \to f \) uniformly. Since \( a \neq b \) we can choose \( f_n \) in such a way that \( f_n(v) - f_n(u) \neq 0, \forall n \).

Now define

\[
\hat{f}_n = a + \frac{(b-a)(f_n(x) - f_n(u))}{f_n(v) - f_n(u)}
\]

Clearly \( \hat{f}_n(u) = a \) and \( \hat{f}_n(v) = b, \forall n \) and \( \hat{f}_n \to f \) uniformly. \( \square \)

**Theorem 4.1.** If \( A \) is a unital sub-algebra of \( C(X, \mathbb{R}) \) which separates points and \( a, b \) are any two real number then \( A_{u, v}^{a, b}(X, \mathbb{R}) \) is dense in \( C_{u, v}^{a, b}(X, \mathbb{R}) \).

**Proof.** When \( a \neq b \) the result is true by above lemma. So let \( f \in C_{u, v}^{a, b}(X, \mathbb{R}) \). First let \( a \neq 0 \). By Urysohn Lemma there exists \( g \in C(X, \mathbb{R}) \) such that \( g(u) = -\frac{a}{4} \) and \( g(v) = \frac{b}{4} \). Now define \( f_1 \) and \( f_2 \) by \( f_1 = \frac{1}{4}f + g \) and \( f_2 = \frac{3}{4}f - g \). Clearly \( f_1 \in C_{u, v}^{-\frac{a}{4}, \frac{b}{4}}(X, \mathbb{R}) \) and \( f_2 \in C_{u, v}^{\frac{a}{4}, \frac{b}{4}}(X, \mathbb{R}) \) and \( f_1 + f_2 = f \). So by above lemma there exist sequences \( f_{1,n} \in A_{u, v}^{-\frac{a}{4}, \frac{b}{4}}(X, \mathbb{R}) \) and \( f_{2,n} \in A_{u, v}^{\frac{a}{4}, \frac{b}{4}}(X, \mathbb{R}) \) such that \( f_{1,n} \to f_1 \) and \( f_{2,n} \to f_2 \) uniformly. Now define \( f_n = f_{1,n} + f_{2,n} \). Clearly \( f_n \in A_{u, v}^{a, b}(X, \mathbb{R}) \) and \( f_n \to f \) uniformly. Again proof for the case when \( a = 0 \), can be given in the same way as was given in Theorem 3.1. \( \square \)

Let \( X \) be a compact hausdorff space. Let \( F \) denotes either the field of real numbers \( \mathbb{R} \) or the field of complex numbers \( \mathbb{C} \), \( C(X, F) \) denotes the collection of \( F \)-valued continuous functions on \( X \) with the sup–norm. And, let \( A \) denote a subset of \( C(X, F) \).

Let \( k \) be any natural number. Let \( S = \{ x_1, x_2, \ldots, x_k \} \subset X \) (with \( x_i \neq x_j \) for distinct \( i \) and \( j \)) and let \( V = \{ v_1, v_2, \ldots, v_k \} \subset F \). Define

\[
C_S^V(X, F) = \{ f \in C(X, F) | f(x_1) = v_1, f(x_2) = v_2, \ldots, f(x_k) = v_k \}
\]

\[
A_S^V(X, F) = \{ f \in A | f(x_1) = v_1, f(x_2) = v_2, \ldots, f(x_k) = v_k \}.
\]

Theorem 4.1 is a particular case of the following theorem from [1].
ON STUDY OF A METRIC ON $C(S^1, S^1)$

**Theorem 4.2** (Stone-Weierstrass with finitely many interpolatory constraints). For a natural number $k$, let $S = \{x_1, x_2, \ldots, x_k\} \subset X$ (with $x_i \neq x_j$ for distinct $i$ and $j$) and let $V = \{v_1, v_2, \ldots, v_k\} \subset \mathbb{R}$. If $\mathcal{A}$ is a unital sub–algebra of $C(X, \mathbb{R})$ which separates points then $\mathcal{A}^V_S(X, \mathbb{R})$ is dense in $C^V_S(X, \mathbb{R})$.

For $q \in S^1$, $m \in \mathbb{Z}$ and a unital sub-algebra $\mathcal{A}$ of $C(I, \mathbb{R})$ which separates points, define

$$P_{m,q}^A(S^1, S^1) = \{f \in C(S^1, S^1) | \tilde{f}_0 \in \mathcal{A}_{0,1}^{q + m}(I, \mathbb{R}), p \circ \tilde{f}_0(0) = q\}.$$

**Theorem 4.3.** For $m \in \mathbb{Z}$ and $q \in S^1$, $P_{m,q}^A(S^1, S^1)$ is dense in $C^q_m(S^1, S^1)$.

**Proof.** Proof is similar to the proof of Theorem 3.2.
