DOUBLE EXTENSIONS OF RESTRICTED LIE (SUPER)ALGEBRAS

SAÏD BENAYADI, SOFIANE BOUARROUDJ, AND MOUNIR HAJLI

Abstract. A double extension (D-extension) of a Lie (super)algebra \( a \) with a non-degenerate invariant supersymmetric bilinear form \( B \), briefly a NIS-(super)algebra, is an enlargement of \( a \) by means of a central extension and a derivation; the affine Kac-Moody algebras are the best known examples.

Let \( a \) be a restricted Lie (super)algebra with a NIS \( B \). Suppose \( a \) has a restricted derivation \( D \) such that \( B \) is \( D \)-invariant. We show that the double extension of \( a \) caries a \( p \)-structure constructed by means of \( B \) and \( D \). We show that, the other way round, any restricted NIS-(super)algebra can be obtained as a \( D \)-extension of another restricted NIS-(super)algebra of codimension 2 provided the center is non-trivial together with an extra condition on the central element.

We give examples of \( D \)-extensions of restricted Lie (super)algebras in small characteristic related to Manin triples for the Heisenberg algebra, Lie superalgebras of rank 2, and selected examples for vectorial Lie superalgebras. Almost all of them are new.

Keywords. restricted Lie (super)algebra, \( p \)-structure, double extension, vectorial Lie (super)algebra

1. Introduction

Let \( \mathfrak{a} \) be a Lie superalgebra (in particular, a Lie algebra) equipped with a non-degenerate invariant supersymmetric bilinear form \( \mathcal{B}_\mathfrak{a} \), suggestively abbreviated to NIS superalgebra in [BKLS], defined over a field \( \mathbb{K} \) of positive characteristic \( p \). The notion of a double extension of the Lie superalgebra \( \mathfrak{a} \), called \( \mathcal{D} \)-extension in [BeBou], was introduced by Medina and Revoy [MR] in the case of Lie algebras. This notion has been superized and studied in a series of papers [ABB, ABBQ, BBB, BB, B2, BeBou]. The double extension of \( \mathfrak{a} \), denoted by \( \mathfrak{g} \), simultaneously involves three ingredients:

- a central extension \( \mathfrak{a}_x \) of \( \mathfrak{a} \) with the center spanned by \( x \).
- a derivation \( \mathcal{D} \) of \( \mathfrak{a} \) extendable to \( \mathfrak{a}_x \) such that \( \mathfrak{g} = \mathbb{K}\mathcal{D} \ltimes \mathfrak{a}_x \) is a semidirect sum.
- a \( \mathcal{D} \)-invariant NIS \( \mathcal{B}_\mathfrak{a} \) on \( \mathfrak{a} \).

Note that the 2-cocycle needed to construct the central extension \( \mathfrak{a}_x \) is of the form \( \mathcal{B}_\mathfrak{a}(\mathcal{D}(\cdot), \cdot) \). Under certain conditions NIS can be extended from \( \mathfrak{a} \) to \( \mathfrak{g} \). It turns out that for \( \mathfrak{g} \) to be ‘interesting’, i.e. not the direct sum of \( \mathfrak{a} \) and 2-dimensional ideals \( \mathbb{K}x \oplus \mathbb{K}\mathcal{D} \), the central extension must be non-trivial and the derivation \( \mathcal{D} \) outer, moreover, if \( \mathcal{D} \) is odd, then \( \mathcal{D}^2 = \frac{1}{2}\text{ad}_b \) together with \( \mathcal{D}(b) = 0 \) are a must.

The double extensions constructed by Median and Revoy were originally carried out for Lie algebras defined over the field \( \mathbb{R} \). But it turns out that the construction holds also for modular Lie algebras, i.e., for Lie algebras defined over any field of characteristic \( p > 0 \). The inductive description à la Medina and Revoy becomes, however, the most challenging part, because Lie’s theorem and the Levi decomposition do not hold if \( p > 0 \).

Favre and Santharoubane [FS] introduced an important ingredient in the study of double extensions of NIS-algebras: they suggested to consider them up to an isometry; namely an isomorphism \( \pi : \mathfrak{g} \to \tilde{\mathfrak{g}} \), where \( \mathfrak{g} \) and \( \tilde{\mathfrak{g}} \) are double extensions of the same Lie algebra \( \mathfrak{a} \), such that

\[
\mathcal{B}_\tilde{\mathfrak{g}}(\pi(f), \pi(g)) = \mathcal{B}_\mathfrak{g}(f, g) \text{ for any } f, g \in \mathfrak{g}.
\]

The equivalence of double extensions up to isomorphisms turns out to be a very important and useful notion, as demonstrated in [BeBou, BE, BDRS] by several new examples. In §3.4.2, we superize this notion to the case of Lie superalgebras for any \( p > 2 \), completing the results of [BeBou] in the case where \( p = 2 \).
Observe that even for Lie algebras over fields of characteristic $p > 0$, the bilinear form we are studying is not necessarily the Killing form, since the later turns out to be degenerate in some cases, and therefore does not help to study the structure of many simple Lie algebras, cf. [SF] [GP] [BKLS]. Unlike the Killing form, other non-degenerate bilinear forms do not play an important role in the classification theory of simple Lie algebras of prime characteristic, see [BGP] [S] [Fa]; their significance primarily rests on cohomology theory. NIS-superalgebras having outer derivations turn out to be abundant in positive characteristic (see [Dz, Fa, BKLS, B]) and therefore might be double extended if they have non-trivial central extensions, see [BGLL1].

As far as we know, the notion of a restricted Lie algebra was introduced by Jacobson [J]. Roughly speaking, one requires the existence of an endomorphism on the modular Lie algebra that enjoys the same basic properties as the $p$-th power mapping $x \mapsto x^p$ in the case of associative algebras. Lie algebras associated with algebraic groups over fields of positive characteristic turn out to be restricted, and this class has the strongest resemblance with the characteristic 0 case; for instance, the description of Cartan subalgebras can be done by means of maximal tori, see [SF] [S]. Superization of the notion of restrictedness has been studied by several authors, see [P] [BGL] [Z] [YSL] [WL] [Fa2] and especially [BLLSq] where new phenomena were observed.

Let $(\mathfrak{a}, \mathcal{B}_a)$ be a restricted NIS-(super)algebra with a restricted derivation $\mathcal{D}$ such that the bilinear form $\mathcal{B}_a$ is $\mathcal{D}$-invariant, namely,

$$\mathcal{B}_a(\mathcal{D}(a), b) + (-1)^{p(a)p(\mathcal{D})} \mathcal{B}_a(a, \mathcal{D}(b)) = 0 \text{ for all } a, b \in \mathfrak{a}.$$  

Suppose further, in the case where $\mathcal{D}$ is odd, that $\mathcal{D}^2 = \frac{1}{2} \text{ad}_b$ and $\mathcal{D}(b) = 0$, for some $b \in \mathfrak{a}_0$, to be able to double extend $(\mathfrak{a}, \mathcal{B}_a)$. The questions we consider in this paper are the following:

(i) Under what condition can the $p$-structure on $\mathfrak{a}$ be extended to a $p$-structure on the double extension of $(\mathfrak{a}, \mathcal{B}_a)$?

(ii) Under what conditions a restricted NIS-superalgebra is a result of a double extension of a restricted Lie (super)algebra of codimension 2?

We answer question (i) for all characteristics provided the restricted derivation $\mathcal{D}$ satisfies the following conditions:

(a) In the case of Lie algebras, $\mathcal{D}$ must satisfy condition (2) which says that the derivations $\mathcal{D}^p$ and $\gamma \mathcal{D}$, where $\gamma \in K$, have to be cohomologous in the Hochschild cohomology, see §2.1.2 for more details.

(b) In the case of Lie superalgebras with $p(\mathcal{B}_a) = 0$ and $p(\mathcal{D}) = 0$, no extra conditions on $\mathcal{D}$ is required and the $p$-structure on $\mathfrak{a}$ can be trivially extended to $\mathfrak{g}$, see Theorem 3.11.

(c) In the case of Lie superalgebras with $p(\mathcal{B}_a) = 0$ or $p(\mathcal{D}) = 0$, the derivative $\mathcal{D}$ must satisfy the condition (3), a superversion of condition (2), see Theorems 3.7, 3.13, 3.15.
It is worth mentioning that there is a large class of derivations of restricted Lie algebras that satisfy the condition \((\mathcal{R})\). For instance, nilpotent restricted Lie algebras necessarily satisfy condition \((\mathcal{R})\), due to a result of \([FSW]\). In addition to nilpotent Lie algebras, the restricted derivations of the simple restricted Lie algebras we provide as examples in \(\S 4\) also satisfy this condition.

We will also answer question (ii) and show that, the other way round, any restricted NIS-superalgebra \(g\) can be obtained as a double extension of a restricted NIS-superalgebra \(a\) of codimension 2 provided the center of \(g\) is not trivial, and the orthogonal complement of the central element is a \(p\)-ideal.

We introduce the notion of equivalent double extensions that takes the \(p\)-structures into account, see Theorems 3.19, 3.22, 3.23, 3.24, 3.25.

The last section is devoted to some examples in low dimensions and small characteristics. These examples are classified up to an isometry using Theorems (3.17), (3.20), (3.21). We have found several new restricted Lie (super)algebras that are double extensions. The table below summarizes our results.

**Notation.** The calculations performed with the aid of SUPERLIE code \([Gr]\) are called Claims. The 1-cochain \(\hat{x} \in C^1(\mathfrak{g})\) denotes the dual of \(x \in \mathfrak{g}\), we assume that \(p(x) = p(\hat{x})\).

2. Main definitions

Hereafter, \(\mathbb{K}\) is an arbitrary field of characteristic \(\text{char}(\mathbb{K}) = p\). Throughout this section, \(\mathfrak{a}\) stands for a finite-dimensional modular Lie algebra over \(\mathbb{K}\). For a comprehensive study on modular Lie algebras, see \([S, SF]\).

2.1. Restricted Lie algebras. Following \([J, SF]\), a mapping \([p] : \mathfrak{a} \rightarrow \mathfrak{a}, \quad a \mapsto a^{[p]}\) is called a \(p\)-structure if

\[(R1) \quad \text{ad}_{a^{[p]}} = (\text{ad}_a)^p \quad \text{for all } a \in \mathfrak{a}.\]
(R2) \((aa)^{[p]} = a^p a^{[p]}\) for all \(a \in \mathfrak{a}\) and \(\alpha \in \mathbb{K}\).

(R3) \((a + b)^{[p]} = a^{[p]} + b^{[p]} + \sum_{1 \leq i \leq p - 1} s_i(a, b)\), where the coefficients \(s_i(a, b)\) can be obtained from 
\[(\text{ad}_{\lambda a + b})^{p-1}(a) = \sum_{1 \leq i \leq p - 1} is_i(a, b)\lambda^{i-1}.
\]

The pair \((\mathfrak{a}, [p])\) is referred to as a restricted Lie algebra.

The following theorem, due to Jacobson, is very useful to us.

**Theorem 2.1.** [J] Let \((e_j)_{j \in J}\) be a basis of \(\mathfrak{a}\) such that there are \(f_j \in \mathfrak{a}\) satisfying \((\text{ad}_{e_j})^{p} = \text{ad}_{f_j}\). Then there exists exactly one \(p\)-mapping \([p] : \mathfrak{a} \to \mathfrak{a}\) such that 
\[e_j^{[p]} = f_j \quad \text{for all } j \in J.\]

Let \((\mathfrak{a}, [p]_{\mathfrak{a}})\) and \((\bar{\mathfrak{a}}, [p]_{\bar{\mathfrak{a}}})\) be two restricted Lie algebras. A linear map \(\pi : \mathfrak{a} \to \bar{\mathfrak{a}}\) is called a \(p\)-homomorphism if \(\pi\) is a homomorphism of Lie algebras and 
\[\pi(x^{[p]_{\mathfrak{a}}}) = (\pi(x))^{[p]_{\bar{\mathfrak{a}}}} \quad \text{for all } x \in \mathfrak{a}.\]

An ideal \(I\) of \(\mathfrak{a}\) is called a \(p\)-ideal if \(x^{[p]} \in I\) for all \(x \in I\).

For an arbitrary subset \(S \subseteq \mathfrak{a}\), we denote 
\[S^{[p]_i} := \{x^{[p]_i} \mid x \in S\},\]
where the expression \([p]_i\) stands for the composition \([p] \circ \cdots \circ [p]\) applied \(i\) times.

For an arbitrary ideal \(I\), we denote 
\[I_p := \sum_{i \geq 0} \text{Span}(I^{[p]_i}).\]

One can show that \(I_p\) is a \(p\)-ideal of \((\mathfrak{a}, [p])\) (see, e.g., [SF, Prop. 1.3]). By definition, \(I_p\) is the smallest \(p\)-ideal containing the ideal \(I\). In particular, \(\mathfrak{z}(\mathfrak{a})_p = \mathfrak{z}(\mathfrak{a})\), where \(\mathfrak{z}(\mathfrak{a})\) is the center of \(\mathfrak{a}\), a consequence of the condition (R1).

If \(I\) is a \(p\)-ideal, then the quotient Lie algebra \(\mathfrak{a}/I\) has a \(p\)-structure defined by 
\[(a + I)^{[p]} := a^{[p]} + I \quad \text{for any } a \in \mathfrak{a},\]
and the natural map \(\pi : \mathfrak{a} \to \mathfrak{a}/I\) is a \(p\)-homomorphism.

For each restricted Lie algebra \(\mathfrak{a}\), one can construct its \(p\)-enveloping algebra 
\[u(\mathfrak{a}) := U(\mathfrak{a})/I,\]
where \(I\) is the ideal generated by the central elements \(a^{[p]} - a^p \in U(\mathfrak{a})\).

For more details, we refer to [J, SF].

An \(\mathfrak{a}\)-module \(M\) is called restricted if 
\[a(\cdots (a \cdot m) \cdots) = a^{[p]} \cdot m \quad \text{for all } a \in \mathfrak{a} \text{ and any } m \in M.\]
A derivation $\mathcal{D} \in \mathcal{der}(a)$ is called restricted if

$$\mathcal{D}(a^{[p]}) = (\text{ad}_a)^{p-1}(\mathcal{D}(a)) \quad \text{for all } a \in a.$$  

Denoted the space of restricted derivations by $\mathcal{der}_p(a)$. Every inner derivation $\text{ad}_a$, where $a \in a$, is a restricted derivation. Denote by $\mathbf{out}_p(a) := \mathcal{der}_p(a)/\text{ad}_a$ the space of restricted outer derivations.

2.1.1. Restricted Hochschild cohomology. We denote by $H^*(a; M)$ the usual Chevalley-Eilenberg cohomology of the Lie algebra $a$ with coefficient in the $a$-module $M$. Following Hochschild [Ho], the restricted cohomology of a restricted Lie algebra $a$ with coefficients in a restricted module $M$ is given by

$$H^*_\text{res}(a; M) := \text{Ext}^n_{u(a)}(\mathbb{K}, M),$$

where $n \geq 0$.

In [Ho], Hochschild showed that there is a six-term exact sequence given by

$$0 \to H^1_{\text{res}}(a; M) \to H^1(a; M) \to S(a; M^a) \to H^2_{\text{res}}(a; M) \to H^2(a; M) \to S(a; H^1(a; M)),$$

where $S(X, Y)$ is the space of $p$-semi-linear maps $X \to Y$, and $M^a := \{m \in M \mid a \cdot m = 0\}$ is the space of $a$-invariants.

An explicit description of the space of cochains $C^k(a; M)$ for $k \leq 3$ was carried out in [EF]. This description was used to classify extensions of restricted modules and infinitesimal deformations of restricted Lie algebras.

The canonical homomorphism

$$H_{\text{res}}(a; M) \to H(a; M)$$

maps $H^1_{\text{res}}(a; M)$ isomorphically into the subspace of $H^1(a; M)$ whose elements are represented by the 1-cocycles which satisfy the relation

$$x^{p-1} \cdot f(x) = f(x^{[p]} a),$$

see [Ho, Theorem 2.1, page 563]. In particular, $H^1_{\text{res}}(a; a) \simeq H^1(a; a)$ if $\mathfrak{j}(a) = 0$.

2.1.2. Restricted outer derivations. In this paper, our tool is the space of restricted outer derivations (see [Ho, EF])

$$\mathbf{out}_p(a) \simeq H^1_{\text{res}}(a; a).$$

In all the examples we provide in §4, we do have $\mathbf{out}_p(a) \neq 0$.

Observe that for non-toral nilpotent restricted Lie algebras, the space $\mathbf{out}_p(a) \neq 0$, (see [FSW, Theorem 3.6]).

---

A map $f : X \to Y$ is called $p$-semi-linear if $f(x + \lambda y) = f(x) + \lambda^p f(y)$ for all $x, y \in X$ and for all $\lambda \in \mathbb{K}$.
Now, let us impose one more condition on $D \in \text{der}_p(a)$. Suppose that there exist $\gamma \in \mathbb{K}$ and $a_0 \in a$ such that the condition below is fulfilled:

\[ D^p = \gamma D + \text{ad}_{a_0}, \quad \text{(or, equivalently, } D^p \simeq \gamma D \text{ in } H^1_{\text{res}}(a;a)) \]

\[ D(a_0) = 0. \]

The restricted outer derivations we provide as main examples in §4 do satisfy the condition (2). Moreover, for nilpotent Lie algebras the existence of such derivations can be guaranteed by the following results of [FSW]:

- A restricted derivation of a torus identically vanishes (see [FSW, Prop. 3.1]);
- Every restricted derivation of $\mathfrak{hei}(2)$ for $p = 2$ is inner (see [FSW, Prop. 3.2]);
- Apart from a torus and $\mathfrak{hei}(2)$ for $p = 2$, every outer restricted derivation $D$ of any nilpotent restricted Lie algebra satisfies $D^2 = 0$ (see [FSW, Theorem 3.3]).

2.2. Restricted Lie superalgebras. Let $a$ be a Lie superalgebra defined over a field of characteristic $p > 2$. We denote the parity of a non-zero homogenous element $a \in a$ by $p(a)$; no confusion with the characteristic of the ground field is possible.

Following [BGL, P], we say that $a$ has a $p|2p$-structure if there exists a mapping $[p] : a_0 \rightarrow a_0$, $a \mapsto a^{[p]}$ such that

(SR1) $\text{ad}_{a^{[p]}}(b) = (\text{ad}_a)^p(b)$ for all $a \in a_0$ and $b \in a$.

(SR2) $(\alpha a)^{[p]} = \alpha^p a^{[p]}$ for all $a \in a_0$ and $\alpha \in \mathbb{K}$.

(SR3) $(a + b)^{[p]} = a^{[p]} + b^{[p]} + \sum_{1 \leq i \leq p-1} s_i(a, b)$, where the coefficients $s_i(a, b)$ can be obtained from

\[ (\text{ad}_{\lambda a + b})^{p-1}(a) = \sum_{1 \leq i \leq p-1} i s_i(a, b) \lambda^{i-1}. \]

We set

\[ [2p] : a_1 \rightarrow a_0 \quad a \mapsto (a^2)^{[p]}, \quad \text{where } a^2 = \frac{1}{2}[a, a] \quad \text{for any } a \in a_1. \]

The pair $(a, [p|2p])$ is referred to as a restricted Lie superalgebra.

The following theorem is a straightforward superization of Jacobson’s theorem.

**Theorem 2.2.** Let $(e_j)_{j \in J}$ be a basis of $a_0$ such that there are $f_j \in a_0$ satisfying $(\text{ad}_{e_j})^p = \text{ad}_{f_j}$. Then there exists exactly one $p|2p$-mapping $[p|2p] : a \rightarrow a$ such that

\[ e_j^{[p]} = f_j \quad \text{for all } j \in J. \]

\[ \text{Recall that the Heisenberg Lie algebra } \mathfrak{hei}(2n) \text{ is spanned by elements } c_i, a_i \text{ for } i = 1, \ldots, n, \text{ and a central element } z \text{ with the only non-zero relations } [c_i, a_i] = z. \]
2.2.1. Restricted outer derivations. A derivation $D \in \mathfrak{der}(a)$ is called restricted if

$$D(a[a]) = (\text{ad}a)^{p-1}(D(a)) \quad \text{for all } a \in a_0.$$ 

As in the non-supper setting, the space of restricted derivation is denoted by $\mathfrak{der}^p(a)$.

Now, let us impose one more condition on $D \in \mathfrak{der}^p(a)$. Suppose further that there exist $\gamma \in K$ and $a_0 \in a_0$ such that the condition below is fulfilled:

$$D^p = \gamma D + \text{ad}_{a_0}, \quad D(a_0) = 0.$$ 

2.2.2. Restricted Hochschild cohomology. As far as we know, restricted Hochschild cohomology theory for Lie superalgebras has not been developed yet. We believe that the six-term exact sequence (1) can be superized, and the condition (3) is cohomological. This will be the subject of a future work.

2.3. Lie superalgebras with NIS. Let $B$ be a bilinear form on $a$. We say that

(SA) $B$ is supersymmetric if $B(a, b) = (-1)^{p(a)p(b)}B(b, a)$ for any $a, b \in a$.

(SB) $B$ is invariant if $B([a, b], c) = B(a, [b, c])$ for any $a, b, c \in a$.

(SC) $B$ is even if $B(a_0, a_1) = 0$.

(SD) $B$ is odd if $B(a_0, a_0) = B(a_1, a_1) = 0$.

(SE) $B$ is $D$-invariant if

$$B(D(a), b) + (-1)^{p(D)p(a)}B(a, D(b)) = 0 \text{ for all } a, b \in a.$$ 

We call the Lie superalgebra $a$ a NIS-superalgebra (sometimes used to be called quadratic in the literature) if it admits a non-degenerate, invariant and supersymmetric bilinear form $B$. We denote such a superalgebra by $(a, B)$.

For a list of non-degenerate, invariant and symmetric bilinear forms on a wide class of simple modular Lie superalgebras, see [BKLS].

A NIS-superalgebra $(a, B)$ is said to be reducible if it can be decomposed into a direct sum of ideals, namely $a = \oplus I_i$, such that the ideals $I_i$ are mutually orthogonal.

3. The main results

3.1. The case of Lie algebras. The following theorem was proved in [MR] for $K = \mathbb{R}$. Passing to a field of characteristic $p \neq 2$, the proof is absolutely the same. The case where $p = 2$ has been studied in [BeBou].

**Theorem 3.1.** [MR, BeBou] Let $(a, B_a)$ be a NIS-algebra in characteristic $p$. Let $D \in \mathfrak{der}(a)$ be a derivation satisfying the following conditions:

$$B_a(D(a), b) + B_a(a, D(b)) = 0 \text{ for any } a, b \in a;$$

If $p = 2$, we additionally require $B_a(D(a), a) = 0 \text{ for any } a \in a.$
Let $\mathcal{K}$ and $\mathcal{K}^*$ be two copies of a one-dimensional vector space which are spanned by the vector $x$ and the vector $x^*$, respectively. Then there exists a NIS-algebra structure on $g := \mathcal{K} \oplus a \oplus \mathcal{K}^*$, where the bracket is defined by
\[(\mathcal{K}, g)_b := 0, \quad [a, b]_g := [a, b]_a + B_a(D(a), b)x, \quad [x^*, a]_g := D(a) \text{ for any } a, b \in a.\]
The non-degenerate symmetric bilinear form $B_g$ on $g$ is defined as follows:
\[B_g\big|_{a \times a} := a, \quad B_g(x, x^*) := 1, \quad B_g(a, x) = B_g(a, x^*) = B_g(x, x) := 0, \quad B_g(x^*, x^*) := \begin{cases} \text{arbitrary} & \text{if } p = 2 \\ 0 & \text{if } p > 2 \end{cases}\]
Moreover, the form $B_g$ is $g$-invariant.

We call the Lie algebra $(g, B_g)$ constructed in Theorem 3.1 a $D$-extension of $(a, B_a)$ by means of $D$.

**Remark 3.2.** If the derivation $D$ is inner, the double extension is isomorphic to $a \oplus c$, where $c$ is a 2-dimensional center, see Theorem 3.17.

The converse of Theorem 3.1 is given by the following.

**Theorem 3.3.** [MR] If $\mathfrak{j}(g) \neq 0$, then $(g, B_g)$ can be obtained from a NIS-algebra by means of a $D$-extension.

The following definition is essential to us. Denote by $\sigma_i(a, b)$ the coefficient that can be obtained from the expansion
\[B_a(D(\lambda a + b), (\text{ad}_{\lambda a + b}^g)^{p-2}(a)) = \sum_{1 \leq i \leq p-1} i\sigma_i^g(a, b)\lambda^{i-1}.\]
For instance,
- If $p = 2$, then $\sigma_1^g(a, b) = B_a(D(b), a)$.
- If $p = 3$, then $\sigma_1^g(a, b) = B_a(D(b), [b, a])$ and $\sigma_2^g(a, b) = 2B_a(D(a), [b, a])$.
We will need the following lemma.

**Lemma 3.4.** Under assumptions of Theorem 3.1, we have
\[s_i^g(a, b) = s_i^a(a, b) + \sigma_i^g(a, b)x \quad \text{for all } a, b \in a.\]

**Proof.** Indeed,
\[(\text{ad}_{\lambda a + b}^g)^{p-1}(a) = (\text{ad}_{\lambda a + b}^g)^{p-1}(a) + B_a(D(\lambda a + b), (\text{ad}_{\lambda a + b}^g)^{p-2}(a))x.\]
The result follows immediately. \[\square\]
3.1.1. The $p$-structures on double extensions.

**Theorem 3.5.** Let $(a, \mathcal{B}_a)$ be a restricted NIS-algebra. Let $\mathcal{D} \in \mathfrak{dev}^p(a)$ satisfy the conditions (2) and (5). For arbitrary $m, l \in \mathbb{K}$, the $p$-structure on $a$ can be extended to its $\mathcal{D}$-extension $\mathfrak{g} = \mathcal{K} \oplus a \oplus \mathcal{K}^*$ as follows (for any $a \in a$, and $s, t \in \mathbb{K}$):

$$a^{[p]} := a^{[p]} + q(a)x, \quad (tx^*)^{[p]} := tp_a + tp_lx + tp_yx^*, \quad (sx)^{[p]} := s^p(mx + b_0),$$

where $b_0 \in \mathfrak{z}(a)$ such that $\mathcal{D}(b_0) = 0$, and $q$ is a map satisfying (for any $a, b \in a$ and any $\lambda \in \mathbb{K}$):

$$q(\lambda a) = \lambda^p q(a),$$

$$q(a + b) - q(a) - q(b) = \sum_{1 \leq i \leq p-1} \sigma_i^p(a, b).$$

**Proof.** Using Jacobson’s Theorem 2.1 it suffices to show that

$$(ad^q_{a})^p = ad_{a^{[p]} + q(a)x}, \quad (ad^q_{x, x} )^p = ad_{a^{[p]} + tx + yx^*}, \quad (ad^q_{x, x} )^p = ad_{m^p + b_0}.$$

Indeed, let $f = ux + b + vx^* \in \mathfrak{g}$. We have

$$ad^q_{mx + b_0}(f) - (ad^q_{x} )^p(f) = [mx + b_0, f]_a - (ad^q_{x} )^p(f) = [b_0, [a, b]_a + \mathcal{B}_a(\mathcal{D}(b_0), b)x - v\mathcal{D}(b_0) = 0,$$

since $x$ and $b_0$ are central, and $\mathcal{D}(b_0) = 0$. Besides, using condition (2) we get

$$ad^q_{a^{[p]} + tx + yx^*}(f) - (ad^q_{x, x} )^p(f) = [a^{[p]} + tx + yx^*, f]_a - \mathcal{D}^p(b) = [a, b]_a + \mathcal{B}_a(\mathcal{D}(a), b)x - v\mathcal{D}(a) + \gamma\mathcal{D}(b) - \mathcal{D}^p(b) = 0,$$

and

$$ad^q_{a^{[p]} + q(a)x}(f) - (ad^q_{x, x} )^p(f) = [a^{[p]} + q(a)x, f]_a - (ad^q_{x} )^p(b) + v(ad^q_{x} )^{p-1}(\mathcal{D}(a)) = [a^{[p]} + q(a)x, b]_a + \mathcal{B}_a(\mathcal{D}(a^{[p]}), b)x - v\mathcal{D}(a^{[p]}x) - (ad^q_{x} )^p(b) + v(ad^q_{x} )^{p-1}(\mathcal{D}(a)) = [a^{[p]} + q(a)x, b]_a + \mathcal{B}_a(\mathcal{D}(a^{[p]}), b)x - v\mathcal{D}(a^{[p]}x) - (ad^q_{x} )^p(b) - v\mathcal{B}_a(\mathcal{D}(a), (ad^q_{x} )^{p-1}(\mathcal{D}(a))x + v(ad^q_{x} )^{p-2}(\mathcal{D}(a))x = 0,$$

because

$$\mathcal{B}_a(\mathcal{D}(a), (ad^q_{x} )^{p-1}(b)) = (-1)^{p-1}\mathcal{B}_a((ad^q_{x} )^{p-1} \circ \mathcal{D}(a), b),$$
and also (using again conditions (2) and (5)):

\[
\mathcal{B}_a(\mathcal{D}(a), (\text{ad}_a)^{p-2}(\mathcal{D}(a))) = \begin{cases} 
\mathcal{B}_a(\mathcal{D}(a), (\text{ad}_a)^{p-2} \circ \text{ad}_a \circ (\text{ad}_a)^{p-2}(\mathcal{D}(a))) & \text{if } p > 2 \\
\mathcal{B}_a(\mathcal{D}(a), \mathcal{D}(a)) & \text{if } p = 2 \\
(\mathcal{B}_a((\text{ad}_a)^{p-2}(\mathcal{D}(a)), \text{ad}_a \circ (\text{ad}_a)^{p-2}(\mathcal{D}(a))) & \text{if } p > 2 \\
\mathcal{B}_a(\gamma \mathcal{D}(a) + [a_0, a], a) & \text{if } p = 2 \\
0. 
\end{cases}
\]

Now, let \(a, b \in \mathfrak{a}\). Using Lemma 3.4, we have

\[
(a + b)^{[p]} = (a + b)^{[p]_0} + q(a + b)x \\
= a^{[p]_0} + b^{[p]_0} + \sum_{1 \leq i \leq p-1} s_i^a(a, b) + q(a + b)x \\
= a^{[p]_0} + b^{[p]_0} + \sum_{1 \leq i \leq p-1} s_i^a(a, b) + q(a + b)x - q(a)x - q(b)x - \sum_{1 \leq i \leq p-1} \sigma_i^a(a, b)x.
\]

By virtue of Eq. (7), it follows that \([p]_0\) is a \(p\)-mapping.

The proof is now complete. \(\square\)

The converse of Theorem 3.5 is the following.

**Theorem 3.6.** Let \((\mathfrak{g}, \mathcal{B}_\mathfrak{g})\) be an irreducible restricted NIS-algebra of \(\dim > 1\) such that \(\mathfrak{z}(\mathfrak{g}) \neq 0\). Let \(0 \neq x \in \mathfrak{z}(\mathfrak{g})\) be such that \((\mathcal{H}^\perp)_p = \mathcal{H}^\perp\), where \(\mathcal{H} := \text{Span}\{x\}\). Then \((\mathfrak{g}, \mathcal{B}_\mathfrak{g})\) is a \(\mathcal{D}\)-extension of a restricted NIS-algebra \((\mathfrak{a}, \mathcal{B}_\mathfrak{a})\), where \(\mathcal{D}\) is a restricted derivation satisfying condition (2).

**Proof.** The subspace \(\mathcal{H} := \text{Span}\{x\}\) is an ideal in \((\mathfrak{g}, \mathcal{B}_\mathfrak{g})\) because \(x\) is central in \(\mathfrak{g}\). Moreover, \(\mathcal{H}^\perp\) is also an ideal in \((\mathfrak{g}, \mathcal{B}_\mathfrak{g})\), see [BeBou, MR]. Since \(\mathfrak{g}\) is irreducible, it follows that \(\mathcal{H} \subset \mathcal{H}^\perp\) and \(\dim(\mathcal{H}^\perp) = \dim(\mathfrak{g}) - 1\). Therefore, there exists a non-zero \(x^* \in \mathfrak{g}\) such that

\[
\mathfrak{g} = \mathcal{H}^\perp \oplus \mathcal{H}^*, \quad \text{where } \mathcal{H}^* := \text{Span}\{x^*\}.
\]

This \(x^*\) can be normalized so that \(\mathcal{B}_\mathfrak{g}(x, x^*) = 1\). Besides, \(\mathcal{B}_\mathfrak{g}(x, x) = 0\) since \(\mathcal{H} \cap \mathcal{H}^\perp = \mathcal{H}\).

Set \(\mathfrak{a} := (\mathcal{H} + \mathcal{H}^*)^\perp\). We then obtain a decomposition \(\mathfrak{g} = \mathcal{H} \oplus \mathfrak{a} \oplus \mathcal{H}^*\).

There exists a NIS-algebra structure on the vector space \(\mathfrak{a}\) for which \(\mathfrak{g}\) is its double extension by Theorem 3.3. We denote a NIS on \(\mathfrak{a}\) by \(\mathcal{B}_\mathfrak{a}\).

It remains to show that there is a \(p\)-structure on \(\mathfrak{a}\). Since \(\mathfrak{a} \subset \mathcal{H}^\perp\), then

\[
a^{[p]} \in \mathcal{H}^\perp = \mathcal{H}^\perp = \mathcal{H} \oplus \mathfrak{a} \quad \text{for any } a \in \mathfrak{a}.
\]

It follows that

\[
a^{[p]} = q(a)x + s(a), \quad \text{where } s(a) \in \mathfrak{a}.
\]
We will show that the map 
\[ s : a \rightarrow a, \quad a \mapsto s(a), \]
derines a $p$-structure on $a$.
The fact that $(\lambda a)^{[p]} = \lambda^p(a^{[p]})$ implies $s(\lambda a) = \lambda^p s(a)$ and $q(\lambda a) = \lambda^p q(a)$. Besides,
\[
0 = [a^{[p]}, b]_g - (\text{ad}_a^p)(b) = [s(a), b]_a + B_a(\mathcal{D}(s(a)), b)x - (\text{ad}_a^p)(b) - B_a(\mathcal{D}(a), (\text{ad}_a^p)^{-1}(b))x.
\]
Therefore,
\[
\mathcal{D}(s(a)) = (\text{ad}_a^p)^{p-1} \circ (\mathcal{D}(a)), \quad [s(a), b]_a = (\text{ad}_a^p)(b).
\]
Now, since
\[
\sum_{1 \leq i \leq p-1} i s_i^0(a, b) \lambda^{i-1} = (\text{ad}_{\lambda a+b}^p)^{p-1}(a),
\]
\[
= (\text{ad}_{\lambda a+b}^p)^{p-1}(a) + B_a(\mathcal{D}(\lambda a + b), (\text{ad}_{\lambda a+b}^p)^{p-2}(a))x,
\]
it follows that
\[
s_i^0(a, b) = s_i^0(a, b) + \sigma_i^0(a, b)x.
\]
Moreover,
\[
0 = (a + b)^{[p]} - a^{[p]} - b^{[p]} - \sum_{1 \leq i \leq p-1} s_i^0(a, b) = (q(a + b) - q(a) - q(b) - \sum_{1 \leq i \leq p-1} \sigma_i^0(a, b))x + s(a + b) - s(a) - s(b) - \sum_{1 \leq i \leq p-1} s_i^0(a, b).
\]
Consequently,
\[
s(a + b) = s(a) + s(b) + \sum_{1 \leq i \leq p-1} s_i^0(a, b),
\]
\[
q(a + b) - q(a) - q(b) = \sum_{1 \leq i \leq p-1} \sigma_i^0(a, b).
\]
It follows that $s$ defines a $p$-mapping on $a$, that $\mathcal{D}$ is a restricted derivation of $a$ (relative to the $p$-mapping $s$), and $q$ is a map on $a$ satisfying Eq. (7).

Suppose that
\[
(x^*)^{[p]} = a_0 + \beta x + \gamma x^*, \quad \text{where} \quad a_0 \in a \quad \text{and} \quad \beta, \gamma \in \mathbb{K}.
\]
For all $a \in a$, we have
\[
0 = [(x^*)^{[p]}, a]_g - (\text{ad}_a^p)^{p}(a) = [a_0, a] + B_a(\mathcal{D}(a_0), a)x + \gamma \mathcal{D}(a) - \mathcal{D}^p(a).
\]
It follows that $\mathcal{D}^p \gamma \mathcal{D} + \text{ad}_a^{p-1}$ and $\mathcal{D}(a_0) = 0$ ($\mathcal{B}_g$ is non-degenerate).

Suppose now that
\[
x^{[p]} = b_0 + mx + \delta x^*, \quad \text{where} \quad m, \delta \in \mathbb{K} \quad \text{and} \quad b_0 \in a.
\]
For any $b \in a$, we have
\[ 0 = [x^{[p]_\theta}, b]_g - (\text{ad}^g_\theta)^p(b) = [b_0, b]_a + B_a(\mathcal{D}(b_0), b)x - \delta \mathcal{D}(b). \]

It follows that $-\delta \mathcal{D}(b) + [b_0, b]_a = 0$ and $\mathcal{D}(b_0) = 0$ (since $B_a$ is non-degenerate).

The case where $\mathcal{D} \not\equiv 0$ in $H^1_{\text{res}}(a; a)$: It follows that $\delta = 0$ and $b_0 \in \mathfrak{z}(a)$. Therefore, $g$ can be obtained from the restricted Lie algebra $a$ by means of the restricted derivation $\mathcal{D}$ as in Theorem 3.3.

The case where $\mathcal{D} \simeq 0$ in $H^1_{\text{res}}(a; a)$: Without loss of generality, we can assume that $\mathcal{D} = 0$, cf. Theorem 3.17. In this case, $g \simeq a \oplus c$, where $c$ is the center generated by $x$ and $x^*$, and the $p$-structure is given by Eqs. (8), (9), where $a_0, b_0 \in \mathfrak{z}(a)$, $\gamma, \delta, m$ and $\beta$ are arbitrary.

The proof now is complete. $\Box$

3.2. The case of Lie superalgebras: $p(B_a) = 0$. Let $(a, B_a)$ be a NIS-superalgebra in characteristic $p \neq 2$. Throughout this section, we will assume that the bilinear form $B_a$ is even. A double extension by means of an even derivation is called a $\mathcal{D}_0$-extension, while a double extension by means of an odd derivation is called a $\mathcal{D}_1$-extension.

3.2.1. The case of a $\mathcal{D}_0$-extension. Let $\mathcal{D} \in \mathfrak{der}_{\mathcal{D}_0}(a)$ be a derivation satisfying (1). Let $\mathcal{H}$ and $\mathcal{H}^*$ be two copies of a one-dimensional vector space which are spanned by the even vector $x$ and the even vector $x^*$, respectively.

Following [BB], there exists a NIS-superalgebra structure on $g := \mathcal{H} \oplus a \oplus \mathcal{H}^*$, where the bracket is defined by
\begin{equation}
[a, b]_g := [a, b]_a + B_a(\mathcal{D}(a), b)x, \quad [x^*, a]_g := \mathcal{D}(a)
\end{equation}
for any $a, b \in a$. The non-degenerate supersymmetric bilinear form $B_g$ on $g$ is defined as follows:

$B_g|_{a \times a} := B_a, \quad B_g(x, x^*) := 1, \quad B_g(a, \mathcal{H}) = B_g(\mathcal{H}, a) = B_g(x, x) = B_g(x^*, x^*) := 0$.

Moreover, the form $B_g$ is invariant on $g$.

**Theorem 3.7.** Let $\mathcal{D} \in \mathfrak{der}_{\mathcal{D}_0}(a)$ satisfying the conditions (3) and (4). For arbitrary $m, l \in \mathbb{K}$, the $p|2p$-structure on $a$ can be extended to its double extension $g$ as follows (for any $a \in a_0$, and $s, t \in \mathbb{K}$):

\[ a^{[p]_\theta} := a^{[p]_0} + q(a)x, \quad (tx^*)^{[p]_\theta} := t^pa_0 + t^plx + t^p\gamma x^* \quad (sx)^{[p]_\theta} := s^p(mx + b_0). \]

where $b_0 \in \mathfrak{z}(a)$ such that $\mathcal{D}(b_0) = 0$, and $q$ is a form satisfying (for any $a, b \in a_0$ and for any $\lambda \in \mathbb{K}$):

\begin{equation}
q(\lambda a) = \lambda^p q(a),
\end{equation}

\begin{equation}
q(a + b) - q(a) - q(b) = \sum_{1 \leq i \leq p-1} \sigma_i^q(a, b).
\end{equation}
We need the following two lemmas.

**Lemma 3.8.** If \( p(\mathcal{B}_a) = p(\mathcal{D}) = 0 \), then
\[
s_i^a(a, b) = s_i^a(a, b) + \sigma_i^a(a, b)x \quad \text{for all } a, b \in a_0.\]

**Proof.** Indeed,
\[
(ad_{\lambda a+b}^a)^{-1}(a) = (ad_{\lambda a+b}^a)^{-1}(a) + \mathcal{B}_a(\mathcal{D}(\lambda a + b), (ad_{\lambda a+b}^a)^{-1}(a))x.
\]
The result follows immediately. \(\square\)

**Lemma 3.9.** For all \( a \in a_0 \) and for all \( b \in a \), we have
\[
\mathcal{B}_a(\mathcal{D}(a^{|p|a}), b) = \mathcal{B}_a(\mathcal{D}(a), (ad_a)^{-1}(b)) \quad \text{and} \quad \mathcal{B}_a(\mathcal{D}(a), (ad_a)^{-2}(\mathcal{D}(a))) = 0.
\]

**Proof.** Indeed,
\[
\mathcal{B}_a(\mathcal{D}(a), (ad_a)^{-1}(b)) = (-1)^{p-1}\mathcal{B}_a((ad_a)^{-1} \circ \mathcal{D}(a), b) = \mathcal{B}_a(\mathcal{D}(a^{|p|a}), b).
\]
Besides,
\[
\mathcal{B}_a(\mathcal{D}(a), (ad_a)^{-2}(\mathcal{D}(a))) = \mathcal{B}_a(\mathcal{D}(a), (ad_a)^{\frac{p-2}{2}} \circ ad_a \circ (ad_a)^{\frac{p-2}{2}}(\mathcal{D}(a)))
\]
\[
= (-1)^{\frac{p-2}{2}}\mathcal{B}_a((ad_a)^{\frac{p-2}{2}} \circ \mathcal{D}(a), ad_a \circ (ad_a)^{\frac{p-2}{2}} \circ \mathcal{D}(a)) = 0.
\]

Let us prove Theorem 3.7.

**Proof.** Using Jacobson’s Theorem 2.2, it is enough to show that
\[
(ad_{a}^{g})^{p} = ad_{a[p] + q(a)x}, \quad (ad_{x}^{g})^{p} = ad_{x + lx + \gamma x^*}, \quad (ad_{x}^{g})^{p} = ad_{mx + b_0}.
\]
Indeed, let \( f = ux + b + vx^* \in g \). We have
\[
ad_{mx + b_0}^{g}(f) - (ad_{x}^{g})^{p}(f) = [mx + b_0, f]_g - (ad_{x}^{g})^{p}(f)
\]
\[
= [b_0, b]_a + \mathcal{B}_a(\mathcal{D}(b_0), b)x - v\mathcal{D}(b_0) = 0,
\]
since \( x \in \mathfrak{z}_0(g), b_0 \in \mathfrak{z}_0(a) \) and \( \mathcal{D}(b_0) = 0 \). Besides, using condition (3) we obtain
\[
ad_{a[p] + q(a)x}^{g}(f) - (ad_{x}^{g})^{p}(f) = [a_0 + lx + \gamma x^*, f]_g - \mathcal{D}(b)
\]
\[
= [a_0, b]_a + \mathcal{B}_a(\mathcal{D}(a_0), b)x - v\mathcal{D}(a_0) + \gamma\mathcal{D}(b) - \mathcal{D}(b)
\]
\[
= 0.
\]
By virtue of Lemma 3.9 we show by a direct computation that \( ad_{a[p] + q(a)x}^{g} - (ad_{a}^{g})^{p} = 0. \)
Now, let $a, b \in \mathfrak{a}_0$. Using Lemma 3.4, we have

\[(a + b)[p] = (a + b)[p] + \mathfrak{q}(a + b)\]

\[= a[p] + b[p] + \sum_{1 \leq i \leq p - 1} s_i(a, b) + \mathfrak{q}(a + b)x\]

\[= a[p] + b[p] + \sum_{1 \leq i \leq p - 1} s_i(a, b) + (\mathfrak{q}(a + b) - \mathfrak{q}(a) - \mathfrak{q}(b) - \sum_{1 \leq i \leq p - 1} s_i(a, b))x\]

By virtue of Eq. (11), it follows that $[p]_g$ defines a $p$-structure on $\mathfrak{g}$.

The proof is now complete. $\square$

**Theorem 3.10.** Let $(\mathfrak{g}, \mathcal{B}_g)$ be an irreducible restricted NIS-superalgebra of dim $> 1$ such that $\mathfrak{z}_0(\mathfrak{g}) \neq 0$. Let $0 \neq x \in \mathfrak{z}_0(\mathfrak{g})$ be such that $(\mathcal{H}^\perp)_p = \mathcal{H}^\perp$, where $\mathcal{H} := \text{Span}\{x\}$. Then $(\mathfrak{g}, \mathcal{B}_g)$ is a $\mathcal{D}$-extension of a restricted NIS-superalgebra $(\mathfrak{a}, \mathcal{B}_a)$, where $\mathcal{D}$ is a restricted derivation satisfying condition (3).

**Proof.** Let $0 \neq x \in \mathfrak{z}_0(\mathfrak{g})$ such that $(\mathcal{H}^\perp)_p = \mathcal{H}^\perp$, where $\mathcal{H} := \text{Span}\{x\}$. Because $x$ is central, the subspace $\mathcal{H}$ is an ideal in $(\mathfrak{g}, \mathcal{B}_g)$. Moreover, $\mathcal{H}^\perp$ is also an ideal in $(\mathfrak{g}, \mathcal{B}_g)$. Indeed, let us show first that $(\mathcal{H}^\perp)_1 = \mathfrak{g}_1$. This is true because $x$ is orthogonal to any odd element since $\mathcal{B}_g$ is even. On the other hand, if $f \in \mathcal{H}^\perp$ and $g \in \mathfrak{g}$, then $[f, g]_g \in \mathcal{H}^\perp$ because

\[\mathcal{B}_g(x, [f, g]_g) = \mathcal{B}_g([x, f]_g, g) = \mathcal{B}_g(0, g) = 0.\]

Since $\mathcal{H}$ is 1-dimensional, then either $\mathcal{H} \cap \mathcal{H}^\perp = \{0\}$ or $\mathcal{H} \cap \mathcal{H}^\perp = \mathcal{H}$. The first case is to be disregarded because otherwise $\mathfrak{g} = \mathcal{H} \oplus \mathcal{H}^\perp$ and the Lie superalgebra $\mathfrak{g}$ will not be irreducible. Hence, $\mathcal{H} \cap \mathcal{H}^\perp = \mathcal{H}$. It follows that $\mathcal{H} \subset \mathcal{H}^\perp$ and $\dim(\mathcal{H}^\perp) = \dim(\mathfrak{g}) - 1$. Therefore, there exists $x^* \in \mathfrak{z}_0(\mathfrak{g})$ such that

\[\mathfrak{g} = \mathcal{H}^\perp \oplus \mathcal{H}^*, \quad \text{where } \mathcal{H}^* := \text{Span}\{x^*\}.\]

This $x^*$ can be normalized to have $\mathcal{B}_g(x, x^*) = 1$. Besides, $\mathcal{B}_g(x, x) = 0$ since $\mathcal{H} \cap \mathcal{H}^\perp = \mathcal{H}$.

Let us define $\mathfrak{a} := (\mathcal{H} + \mathcal{H}^*)^\perp$. We then have a decomposition $\mathfrak{g} = \mathcal{H} \oplus \mathfrak{a} \oplus \mathcal{H}^*$. Let us define a bilinear form on $\mathfrak{a}$ by setting:

\[\mathcal{B}_a = \mathcal{B}_g|_{\mathfrak{a} \times \mathfrak{a}}.\]

The form $\mathcal{B}_a$ is non-degenerate on $\mathfrak{a}$. Indeed, suppose there exists an $a \in \mathfrak{a}$ such that

\[\mathcal{B}_a(a, f) = 0 \quad \text{for any } f \in \mathfrak{a}.\]

But $a$ is also orthogonal to $x$ and $x^*$. It follows that $\mathcal{B}_g(a, f) = 0$ for any $f \in \mathfrak{g}$. Hence, $a = 0$, since $\mathcal{B}_g$ is nondegenerate.

Following [BB], there exists a NIS-superalgebra structure on the vector space $\mathfrak{a}$ for which $\mathfrak{g}$ is its double extension.
It remains to show that there is a $p|2p$-structure on $a$. Since $a \subset \mathcal{H}^\perp$, then $a^{[p]} \in (\mathcal{H}^\perp)_p = \mathcal{H}^\perp = \mathcal{H} \oplus a$, for any $a \in a_0$. It follows that
\[ a^{[p]} = q(a)x + s(a), \text{ where } s(a) \in a_0. \]

We will show that the map
\[ s : a_0 \to a_0, \quad a \mapsto s(a), \]
defines a $p|2p$-structure on $a$. The fact that $(\lambda a)^{[p]} = \lambda^p(a^{[p]})$ implies that $s(\lambda a) = \lambda^p s(a)$ and $q(\lambda a) = \lambda^p q(a)$. Besides, for any $b \in a$ we have
\[ 0 = [a^{[p]}, b] - (\text{ad}_a^2)^p(b) = [s(a), b]_a + B_a(D(s(a)), b)x - (\text{ad}_a^p)(b) - B_a(D(a), (\text{ad}_a)^p(b)x). \]

Therefore,
\[ D(s(a)) = (\text{ad}_a^p)^{-1} \circ (D(a)), \quad [s(a), b]_a = (\text{ad}_a^p)(b). \]

For any $a, b \in a_0$, we have
\[ \sum_{1 \leq i \leq p-1} i s_i^a(a, b) \lambda_i^{-1} = (\text{ad}_{\lambda a+b}^p)^{-1}(a), \]
\[ = (\text{ad}_{\lambda a+b}^p)^{-1}(a) + B_a(D(\lambda a, b), (\text{ad}_{\lambda a+b}^p)^{-2}(a)x, \]

it follows that
\[ s_i^a(a, b) = s_i^a(a, b) + \sigma_i^a(a, b)x. \]

Moreover,
\[ 0 = (a + b)^{[p]} - a^{[p]} - b^{[p]} - \sum_{1 \leq i \leq p-1} s_i^a(a, b) \]
\[ = (q(a + b) - q(a) - q(b) - \sum_{1 \leq i \leq p-1} s_i^a(a, b))x + s(a + b) - s(a) - s(b) \]
\[ - \sum_{1 \leq i \leq p-1} \sigma_i^a(a, b). \]

Consequently,
\[ s(a + b) = s(a) + s(b) + \sum_{1 \leq i \leq p-1} s_i^a(a, b), \text{ and } q(a + b) - q(a) - q(b) = \sum_{1 \leq i \leq p-1} \sigma_i^a(a, b). \]

It follows that $s$ defines a $p|2p$-structure on $a$, that $D$ is a restricted derivation on $a$ (relative to the $p|2p$-mapping $s$) and $q$ is map on $a_0$ satisfying Eq. (\text{11}).

Suppose now that (where $a_0 \in a_0$, and $\beta, \gamma \in \mathbb{K}$):
\[ (x^*)^{[p]} = a_0 + \beta x + \gamma x^*. \]

We have
\[ 0 = [(x^*)^{[p]}, a]_b - (\text{ad}_a^p)^p(a) = [a_0, a] + B_a(D(a), a)x + \gamma D(a) - D^p(a), \text{ for all } a \in a. \]

It follows that $D^p = \gamma D + \text{ad}_{a_0}$ and $D(a_0) = 0$ ($B_a$ is non-degenerate).
Suppose now that
\begin{equation}
\tag{13}
x^{[p]} = b_0 + mx + \delta x^*, \quad \text{where } m, \delta \in \mathbb{K} \text{ and } b_0 \in \mathfrak{a}_0.
\end{equation}

For any $b \in \mathfrak{a}$, we have
\[ 0 = [x^{[p]}, b] - (\text{ad}_x^p)^p(b) = [b_0, b]_{\mathfrak{a}} + \mathcal{B}_a(\mathcal{D}(b_0), b)x - \delta \mathcal{D}(b). \]

It follows that $-\delta \mathcal{D}(b) + [b_0, b]_{\mathfrak{a}} = 0$ and $\mathcal{D}(b_0) = 0$ (since $\mathcal{B}_a$ is non-degenerate).

The case where $\mathcal{D} \not\equiv 0$: It follows that $\delta = 0$ and $b_0 \in \mathfrak{z}_0(\mathfrak{a})$. Therefore, $\mathfrak{g}$ can be obtained from the restricted Lie superalgebra $\mathfrak{a}$ by means of the restricted derivation $\mathcal{D}$ as in Theorem 3.7.

The case where $\mathcal{D} \equiv 0$: Without loss of generality, we can assume that $\mathcal{D} = 0$. In this case, $\mathfrak{g} \cong \mathfrak{a} \oplus \mathfrak{c}$, where $\mathfrak{c}$ is the center generated by $x$ and $x^*$, and the $p|2p$-structure is given by Eqs. (12), (13), where $a_0, b_0 \in \mathfrak{z}(\mathfrak{a})$, $\gamma, \delta, m$ and $\beta$ are arbitrary.

The proof now is complete. \hfill \Box

### 3.2.2. The case of a $\mathcal{D}_1$-extension

Let $\mathcal{D} \in \mathfrak{der}_1^p(\mathfrak{a})$ be a derivation satisfying (14) and the following conditions:
\begin{equation}
\tag{14}
\begin{align*}
\mathcal{D}(b_0) &= 0, \\
\mathcal{D}^2 &= \frac{1}{2}\text{ad}_{b_0}, \text{ where } b_0 \in \mathfrak{a}_0, \\
\mathcal{B}_a(b_0, b_0) &= 0.
\end{align*}
\end{equation}

Let $\mathcal{K}$ and $\mathcal{K}^*$ be two copies of a one-dimensional vector space which are spanned by the odd vector $x$ and the odd vector $x^*$, respectively. Following [ABB], there exists a NIS-superalgebra structure on $\mathfrak{g} := \mathcal{K} \oplus \mathfrak{a} \oplus \mathcal{K}^*$, where the bracket is defined by
\[ [\mathcal{K}, \mathfrak{g}]_{\mathfrak{g}} := 0, \quad [x^*, x^*]_{\mathfrak{g}} = b_0, \quad [a, b]_{\mathfrak{g}} := [a, b]_{\mathfrak{a}} - \mathcal{B}_a(\mathcal{D}(a), b)x, \quad [x^*, a]_{\mathfrak{g}} := \mathcal{D}(a) - \mathcal{B}_a(a, b_0)x \text{ for any } a \in \mathfrak{a}. \]

The non-degenerate supersymmetric bilinear form $\mathcal{B}_g$ on $\mathfrak{g}$ is defined as follows:
\[ \mathcal{B}_g|_{\mathfrak{a} \times \mathfrak{a}} := \mathcal{B}_a, \quad \mathcal{B}_g(x, x^*) := 1, \quad \mathcal{B}_g(\mathcal{K}, \mathcal{K}) = \mathcal{B}_g(\mathcal{K}^*, \mathcal{K}^*) = \mathcal{B}_g(x, x) = \mathcal{B}_g(x^*, x^*) := 0. \]

Moreover, the form $\mathcal{B}_g$ is invariant on $\mathfrak{g}$.

**Theorem 3.11.** Let $\mathcal{D} \in \mathfrak{der}_1^p(\mathfrak{a})$ satisfying the conditions (14) and (14). Then the $p|2p$-structure on $\mathfrak{a}$ can be extended to its double extension $\mathfrak{g}$ as follows:
\[ a^{[p]} := a^{[p]}_{\mathfrak{a}} \text{ for any } a \in \mathfrak{a}_0. \]

**Proof.** Similar to that of Theorem 3.7 \hfill \Box

**Theorem 3.12.** Let $(\mathfrak{g}, \mathcal{B}_g)$ be an irreducible restricted NIS-superalgebra of dim $> 1$. Suppose there exists $0 \neq x \in \mathfrak{z}_1(\mathfrak{g})$. Then $(\mathfrak{g}, \mathcal{B}_g)$ is a $\mathcal{D}_1$-extension of a restricted NIS-superalgebra $(\mathfrak{a}, \mathcal{B}_a)$. \hfill \Box
3.3. The case of Lie superalgebras: $p(\mathcal{B}a) = \bar{1}$. Let $(a, \mathcal{B}a)$ be a NIS-Lie superalgebra in characteristic $p \neq 2$. Throughout this section, we will assume that the bilinear form $\mathcal{B}a$ is odd. A double extension by means of an even derivation is called a $D_0$-extension, while a double extension by means of an odd derivation is called a $D_1$-extension.

3.3.1. The case of $D_1$-extension. Let $(a, \mathcal{B}a)$ be a NIS-superalgebra in characteristic $p$. Let $\mathcal{D} \in \mathfrak{der}^0_1(a)$ be a derivation satisfying the following conditions:

(15)\[ \mathcal{D}(b_0) = 0 \]
\[ \mathcal{D}^2 = \frac{1}{2}\text{ad}_{b_0}. \]

Following [ABQQ], then there exists a NIS-superalgebra structure on $g := \mathcal{K} \oplus a \oplus \mathcal{K}^*$, where $\mathcal{K} := \text{Span}\{x\}$ and $x$ is even, and where $\mathcal{K}^* := \text{Span}\{x^*\}$ and $x^*$ is odd. The bracket is defined by (where $\lambda_0 \in \mathbb{K}$):

(16)\[ [\mathcal{K}, g]_g := 0, \quad [a, b]_g := [a, b]_a + \mathcal{B}a(\mathcal{D}(a), b)x, \]
\[ [x^*, x^*]_g = b_0 + \lambda_0 x, \quad [x^*, a]_g := \mathcal{D}(a) - (-1)^{p(a)}\mathcal{B}a(a, b_0)x \text{ for any } a \in a. \]

The non-degenerate supersymmetric bilinear form $\mathcal{B}_g$ on $g$ is defined as follows:

$\mathcal{B}_g|_{a \times a} := \mathcal{B}_a, \quad \mathcal{B}_g(x, x^*) := 1, \quad \mathcal{B}_g(a, x) = \mathcal{B}_g(a, x^*) = \mathcal{B}_g(x, x) = \mathcal{B}_g(x^*, x^*) := 0$

Moreover, the form $\mathcal{B}_g$ is invariant on $g$.

**Theorem 3.13.** Let $\mathcal{D} \in \mathfrak{der}^0_1(a)$ satisfying the conditions (\[\]) and (15). Then the $p|2p$-structure on $a$ can be extended to $g$ as follows (for any $a \in a_0$, and $m \in \mathbb{K}$):

$a^{[p]} := a^{[p]}_a + q(a)x, \quad (sx)^{[p]} := spmx.$

where $q$ is a map on $a_0$ satisfying (for any $a, b \in a_0$ and for any $\lambda \in \mathbb{K}$):

(17)\[ q(\lambda a) = \lambda^p q(a), \]
\[ q(a + b) - q(a) - q(b) = \sum_{1 \leq i \leq p-1} \sigma_i^a(a, b). \]

**Proof.** Similar to that of Theorem 3.10 \[\]

**Theorem 3.14.** Let $(g, \mathcal{B}_g)$ be an irreducible restricted NIS-superalgebra of dim $> 1$ such that $\mathcal{Z}_0(g) \neq 0$. Let $0 \neq x \in \mathcal{Z}_0(g)$ be such that $(\mathcal{K}^\perp)_p = \mathcal{K}^\perp$, where $\mathcal{K} := \text{Span}\{x\}$. Then $(g, \mathcal{B}_g)$ is a $D_1$-extension of a restricted NIS-superalgebra $(a, \mathcal{B}a)$, where $\mathcal{D}$ is an odd restricted derivation.

**Proof.** Similar to that of Theorem 3.10 \[\]
Theorem 3.15. Let \((a, B_a)\) be a restricted NIS-superalgebra. Let \(\mathcal{D} \in \mathfrak{der}_0^p(a)\) conditions (3) and (4). The \(p\bar{p}\)-structure on \(a\) can be extended to \(g\) as follows (for any \(a \in a_\bar{0}\), and \(t \in \mathbb{K}\)):

\[ a^{[p]} := a^{[p]_0}, \quad (tx^*)^{[p]_0} := t^p(\gamma x^* + a_0). \]

Theorem 3.16. Let \((g, B_g)\) be an irreducible restricted NIS-superalgebra of dim > 1. Suppose there exists \(0 \neq x \in \mathcal{J}_1(g)\). Then \((g, B_g)\) is a \(\mathcal{D}_0\)-extension of a restricted NIS-superalgebra \((a, B_a)\), where \(\mathcal{D}\) is a restricted derivation satisfying condition (3).

Proof. Similar to that of Theorem 3.10.

3.4. Isometries of NIS-superalgebras. Following [FS, BeBou], for a NIS-superalgebra \(a\) with a bilinear form \(B_a\), denote by \(g\) (resp. \(\tilde{g}\)) the double extension of \(a\) by means of a derivation \(\mathcal{D}\) (resp. \(\tilde{\mathcal{D}}\)). An isometry between \(g\) and \(\tilde{g}\) is an isomorphism \(\pi : g \rightarrow \tilde{g}\) such that:

\[ \pi([f, g]_0) = [\pi(f), \pi(g)]_0 \quad \text{for any } f, g \in g, \]
\[ B_{\tilde{g}}(\pi(f), \pi(g)) = B_{\tilde{g}}(f, g) \quad \text{for any } f, g \in g. \]

We will assume further that the isometry satisfies \(\pi(\mathcal{K} \oplus a) = \tilde{\mathcal{K}} \oplus a\), and call it an adapted isometry, see [FS, BeBou]. We will see how the derivations \(\mathcal{D}\) and \(\tilde{\mathcal{D}}\) are related with each other when \(g\) and \(\tilde{g}\) are isometric. Hereafter, \(\mathcal{K} = \text{Span}\{x\}, \mathcal{K}^* = \text{Span}\{x^*\}\), \(\tilde{\mathcal{K}} = \text{Span}\{\tilde{x}\}\), and \(\tilde{\mathcal{K}}^* = \text{Span}\{\tilde{x}^*\}\).

3.4.1. The case of Lie algebras. The following theorem was proved in [FS] in the case where \(\mathbb{K} = \mathbb{R}\). The passage to any \(p \neq 2\), the proof is absolutely the same. The case where \(p = 2\) was studied in [BeBou].

Theorem 3.17. [FS, BeBou] Let \((a, B_a)\) be a NIS-algebra, and \(\mathcal{D}, \tilde{\mathcal{D}} \in \mathfrak{der}(a)\) satisfying condition (5). There exists an adapted isometry \(\pi : g \rightarrow \tilde{g}\) if and only if there exists an
isometry $\pi_0 : a \to a, \lambda \in \mathbb{K}^\times$ and $\mathfrak{r} \in a$ (all unique) such that

\begin{equation}
\pi_0^{-1} \circ \tilde{\mathcal{D}} \circ \pi_0 = \lambda \mathcal{D} + \text{ad}_\mathfrak{r};
\end{equation}

\begin{equation}
(\text{Only when } p = 2) \mathcal{B}_\mathfrak{g}(x^*, x^*) = \lambda^{-2}(\mathcal{B}_a(\mathfrak{r}, \mathfrak{r}) + \mathcal{B}_\mathfrak{g}(\tilde{x}^*, \tilde{x}^*));
\end{equation}

\begin{align*}
\pi &= \pi_0 + \mathcal{B}_a(\mathfrak{r}, \cdot)\tilde{x} \text{ on } a; \\
\pi(x) &= \lambda \tilde{x}; \\
\pi(x^*) &= \lambda^{-1}(\tilde{x}^* - \pi_0(\mathfrak{r}) - \rho \tilde{x}), \text{ where}
\end{align*}

\begin{equation}
\rho = \begin{cases} 
\text{arbitrary} & \text{if } p = 2, \\
\frac{1}{2} \mathcal{B}_a(\mathfrak{r}, \mathfrak{r}) & \text{if } p \neq 2.
\end{cases}
\end{equation}

Remark 3.18. If $\pi_0 = \text{Id}_a$, the condition (19) means that $\mathcal{D} \simeq \tilde{\mathcal{D}}$ in $H^1(a; a)$. Moreover, if the derivations are restricted, then condition (19) means $\mathcal{D} \simeq \tilde{\mathcal{D}}$ in $H^1_{\text{res}}(a; a)$.

Suppose now that $a$ is restricted with a $p$-structure $[p]_a$. In Theorem 3.5 we proved that it is possible to extend the $p$-structure to any double extension. Let us denote by $[p]_\mathfrak{g}$ (resp. $[p]_\tilde{\mathfrak{g}}$) the $p$-structure on $\mathfrak{g}$ (resp. $\tilde{\mathfrak{g}}$) written in terms of $m, l, a_0, b_0, \gamma$ and $q$ (resp. $\tilde{m}, \tilde{l}, a_0, b_0, \tilde{\gamma}$ and $\tilde{q}$). The following theorem characterizes the equivalence class of $p$-structures on double extensions, but we prove it only for $p = 2, 3$. The formula for $p > 3$ is still out of reach.

Theorem 3.19. The adapted isometry $\pi : \mathfrak{g} \to \tilde{\mathfrak{g}}$ given in Theorem 3.17 defines a $p$-structure, for $p = 2, 3$, if and only if

$$
\pi_0([p]_a) = (\pi_0([\mathfrak{g}]) |p]_a + \mathcal{B}_a(\mathfrak{r}, a) |p]_a,
$$

and

\begin{align*}
\tilde{m} &= \lambda^{-p}(\lambda m + \mathcal{B}_a(\mathfrak{r}, b_0)), \\
\tilde{b}_0 &= \lambda^{-p} \pi_0(b_0), \\
\tilde{q} \circ \pi_0 &= \lambda q + \mathcal{B}_a(\mathfrak{r}, [\mathfrak{g}]) - \mathcal{B}_a(\mathfrak{r}, \cdot) \rho \tilde{m} \\
\tilde{\gamma} &= \lambda^{p-1} \gamma, \\
\tilde{l} &= \lambda^p(\mathcal{B}_a(\mathfrak{r}, a_0) + l - \lambda^{-1} \gamma p) + \rho \tilde{m} + q(\pi_0(\mathfrak{r})) - \mathcal{B}_a(\tilde{\mathcal{D}}^{p-1}(\pi_0(\mathfrak{r})), \pi_0(\mathfrak{r})), \\
\tilde{a}_0 &= \lambda^p(\pi_0(a_0) - \lambda^{-1} \gamma \pi_0(\mathfrak{r})) + (\pi_0(\mathfrak{r}) |p]_a + \rho \tilde{b}_0 + \tilde{\mathcal{D}}^{p-1}(\pi_0(\mathfrak{r})) \\
&- \left\{ \begin{array}{ll} 
\lambda \pi_0(\mathcal{D}(\mathfrak{r}, [\mathfrak{g}]), & \text{if } p=3, \\
0, & \text{if } p=2.
\end{array} \right.
\end{align*}

Moreover, if $\mathfrak{g}(a) = 0$, then the isometry $\pi_0$ of $a$ is a also a $p$-mapping.
Proof. Let us study the $p$-structure. We have
\[
\pi((x)^{p}) - (\pi(x))^{p} = \pi(mx + b_0) - (\lambda x)^{p} = m\lambda x + \pi_0(b_0) + \mathcal{B}_a(x, b_0)x - \lambda^p(m\tilde{x} + \tilde{b}_0).
\]
Therefore, $\tilde{m} = \lambda^{-p}(\lambda m + \mathcal{B}_a(x, b_0))$, and $\tilde{b}_0 = \lambda^{-p}\pi_0(b_0)$.

Let $a \in \mathfrak{g}$. We have
\[
\pi((a)^{p}) = \pi(a)^{p} + q(a)x = \pi_0(a)^{p} + \mathcal{B}_a(x, a)^{p}x + q(a)\lambda x.
\]
On the other hand,
\[
(\pi(a))^{p} = (\pi_0(a) + \mathcal{B}_a(x, a)^{p}) - q(a)\lambda = 0, \text{ and}
\]
\[
(22) \quad \pi_0(a)^{p} + \mathcal{B}_a(x, a)^{p} = (\pi_0(a))^{p} + \mathcal{B}_a(x, a)^{p}\tilde{b}_0.
\]
Moreover,
\[
\pi((x^*)^{p}) = \pi(a_0 + lx + \gamma x^*) = \pi_0(a_0) + \mathcal{B}_a(x, a_0)x + l\lambda x + \gamma\lambda^{-1}(x^* - \pi_0(x) - \rho x)
\]
\[
= (\mathcal{B}_a(x, a_0) + \lambda l - \lambda^{-1}\gamma\rho)\tilde{x} - \lambda^{-1}\gamma\pi_0(x) + \pi_0(a_0) + \lambda^{-1}\gamma x^*.
\]
On the other hand,
\[
(\pi(x^*))^{p} = \lambda^{-p}(\tilde{x}^* - \pi_0(x) - \rho\tilde{x})^{p}
\]
\[
= \lambda^{-p}(\tilde{a}_0 + \gamma\tilde{x}^* - \pi_0(x)^{p} - \rho\tilde{b}_0 - \tilde{\mathcal{B}}^{p-1}(\pi_0(x)) + (\tilde{l} - \rho\tilde{m} - \tilde{q}(\pi_0(x)))\tilde{x})
\]
\[
+ \lambda^{-p}\mathcal{B}_a(x, \tilde{\mathcal{B}}^{p-1}(\pi_0(x)), \pi_0(x))\tilde{x} + \left\{ \begin{array}{ll} \lambda^{-p}[\tilde{\mathcal{B}}(\pi_0(x)), \pi_0(x)]_{\pi_0(x)} & \text{if } p = 3, \\ 0 & \text{if } p = 2. \end{array} \right.
\]
Therefore,
\[
\lambda^{-1}\gamma = \lambda^{-p}\gamma,
\]
\[
\mathcal{B}_a(x, a_0) + \lambda l - \lambda^{-1}\gamma\rho = \lambda^{-p}(\tilde{l} - \rho\tilde{m} - q(\pi_0(x)) + \mathcal{B}_a(x, \tilde{\mathcal{B}}^{p-1}(\pi_0(x)), \pi_0(x)))
\]
\[
\pi_0(a_0) - \lambda^{-1}\gamma\pi_0(x) = \lambda^{-p}(\tilde{a}_0 - \pi_0(x)^{p} - \rho\tilde{b}_0 - \tilde{\mathcal{B}}^{p-1}(\pi_0(x)))
\]
\[
+ \left\{ \begin{array}{ll} \lambda^{-p}[\tilde{\mathcal{B}}(\pi_0(x)), \pi_0(x)]_{\pi_0(x)} & \text{if } p = 3, \\ 0 & \text{if } p = 2. \end{array} \right.
\]
If $\tilde{a}(a) = 0$, we have $b_0 = \tilde{b}_0 = 0$ and the isometry $\pi_0$ becomes a $p$-mapping. The proof is now complete. \qed
3.4.2. *The case of Lie superalgebras.* Let $\text{pr} : \mathcal{H} \oplus \mathfrak{a} \to \mathfrak{a}$ be the projection, and $\pi_0 := \text{pr} \circ \pi$. The map $\pi_0$ is obviously linear. Let $a \in \mathfrak{a}$. Since $\pi(a) - \pi_0(a) \in \text{Ker}(\text{pr})$, it follows that $\pi(a) - \pi_0(a) \in \mathcal{H}$. Since $\mathcal{B}_a$ is nondegenerate, there exists a unique $t_\pi \in \mathfrak{a}_{p(\tilde{D})}$ (depending only in $\pi$) such that

$$\pi(a) - \pi_0(a) = \mathcal{B}_a(t_\pi, a)\tilde{x} \quad \text{for any } a \in \mathfrak{a}.$$ 

Besides, $\pi(x) = \lambda \tilde{x}$ for some $\lambda$ in $\mathbb{K}$. Indeed, let us write $\pi(x) = \lambda \tilde{x} + a$, where $a \in \mathfrak{a}$. We have

$$0 = \mathcal{B}_a(x, b) = \mathcal{B}_a(\pi(x), \pi(b)) = \mathcal{B}_a(\lambda \tilde{x} + a, \pi_0(b) + \mathcal{B}_a(t_\pi, b)\tilde{x}) = \mathcal{B}_a(a, \pi_0(b)).$$

Since $\pi_0$ is surjective and $\mathcal{B}_a$ is nondegenerate, it follows that $a = 0$. Let us show that $\pi_0$ preserves $\mathcal{B}_a$. Indeed, for any $a, b \in \mathfrak{a}$ we have

$$\mathcal{B}_a(a, b) = \mathcal{B}_a(\pi(a), \pi(b)) = \mathcal{B}_a(\pi_0(a) + \mathcal{B}_a(t_\pi, a)\tilde{x}, \pi_0(b) + \mathcal{B}_a(t_\pi, b)\tilde{x}) = \mathcal{B}_a(\pi_0(a), \pi_0(b)).$$

Let us show that $\pi_0$ is an isometry on $(\mathfrak{a}, \mathcal{B}_a)$. Let $a, b \in \mathfrak{a}$ we get

$$\pi([a, b]_\mathfrak{g}) = \pi([a, b]_\mathfrak{a}) + (-1)^{p(D)(p(\mathcal{B}_a)+1)}\lambda \mathcal{B}_a(D(a), b)\tilde{x}$$

$$= \pi_0([a, b]_\mathfrak{a}) + \mathcal{B}_a(t_\pi, [a, b]_\mathfrak{a})\tilde{x} + (-1)^{p(D)(p(\mathcal{B}_a)+1)}\lambda \mathcal{B}_a(D(a), b)\tilde{x}.$$ 

and

$$[\pi(a), \pi(b)]_\mathfrak{g} = [\pi_0(a) + \mathcal{B}_a(t_\pi, a)\tilde{x}, \pi_0(b) + \mathcal{B}_a(t_\pi, b)\tilde{x}]_\mathfrak{g}$$

$$= [\pi_0(a), \pi_0(b)]_\mathfrak{g} + (-1)^{p(D)(p(\mathcal{B}_a)+1)}\mathcal{B}_a(D(\pi_0(a)), \pi_0(b))\tilde{x}.$$ 

It follows that

$$\mathcal{B}_a(\pi_0^{-1}D(\pi_0(a)), b) = (-1)^{p(D)(p(\mathcal{B}_a)+1)}\mathcal{B}_a([t_\pi, a]_\mathfrak{a}, b) + \lambda \mathcal{B}_a(D(a), b).$$

Therefore

$$\pi_0^{-1} \circ D \circ \pi_0 = (-1)^{p(D)(p(\mathcal{B}_a)+1)}\mathcal{B}_a([t_\pi, a]_\mathfrak{a}, b) + \lambda D.$$ 

Let us write

$$\pi(x^*) = \mu \tilde{x}^* + a + \nu \tilde{x},$$

where $a \in \mathfrak{a}$ and $\nu = 0$ if $\mathcal{B}_a$ is odd.

Because $\pi$ is an isometry, we have

$$1 = \mathcal{B}_a(\pi(x), \pi(x^*)) = \mathcal{B}_a(\lambda \tilde{x}, \mu \tilde{x}^* + a + \nu \tilde{x}) = \lambda \mu.$$
Therefore $\mu = \lambda^{-1}$. Besides,

\[
0 = \mathcal{B}_{\tilde{g}}(\pi(x^*), \pi(b)) = \mathcal{B}_{\tilde{g}}(\tilde{x}^* + a + \nu \tilde{x}, \pi_0(b) + \mathcal{B}_a(t_{\pi}, b)\tilde{x}) = \mu(-1)^{p(\tilde{x})}p(\tilde{x}^*)\mathcal{B}_a(t_{\pi}, b) + \mathcal{B}_a(a, \pi_0(b)).
\]

It follows that $\mathcal{B}_a(\mu(-1)^{p(\tilde{x})}p(\tilde{x}^*)t_{\pi} + \pi_0^{-1}a, b) = 0$. Therefore, $\mu(-1)^{p(\tilde{x})}p(\tilde{x}^*)t_{\pi} + \pi_0^{-1}(a) = 0$ which implies that

\[
(24) \quad a = -(-1)^{p(\tilde{x})}p(\tilde{x}^*)\mu\pi_0(t_{\pi}).
\]

Finally, we get

\[
\pi(x^*) = \lambda^{-1}(\tilde{x}^* - (-1)^{p(\tilde{x})}p(\tilde{x}^*)\pi_0(t_{\pi})) + \nu \tilde{x}.
\]

Besides,

\[
0 = \mathcal{B}_{\tilde{g}}(\pi(x^*), \pi(x^*)) = \mathcal{B}_{\tilde{g}}(\mu \tilde{x}^* + a + \nu \tilde{x}, \mu \tilde{x}^* + a + \nu \tilde{x}) = \mu \nu (1 + (-1)^{p(\tilde{x})}p(\tilde{x}^*)) + \mathcal{B}_a(a, a).
\]

We distinguish two cases: (i) If $\mathcal{B}_a$ is odd then $\nu = 0$ and therefore $\mathcal{B}_a(a, a) = 0$; (ii) If $\mathcal{B}_a$ is even then $\mathcal{B}_a(a, a) = 0$ and $\nu$ is arbitrary, except when $p(x) = p(x^*) = 0$. In this case

\[
\nu = -\frac{1}{2}\lambda^{-1}\mathcal{B}_a(t_{\pi}, t_{\pi}).
\]

Let us study the case where $x^*$ is odd.

We have

\[
[\pi(x^*), \pi(x^*)]_{\tilde{g}} = [\mu \tilde{x}^* + a + \nu \tilde{x}, \mu \tilde{x}^* + a + \nu \tilde{x}]_{\tilde{g}} = 2\mu(\tilde{\mathcal{D}}(a) - (-1)^{p(a)p(\tilde{x})}\mathcal{B}_a(a, \tilde{b}_0)\tilde{x}) + [a, a]_a + (-1)^{p(\tilde{x})p(\tilde{x}^*)+1}\mathcal{B}_a(\tilde{\mathcal{D}}(a), a)\tilde{x} + \mu^2[\tilde{x}^*, \tilde{x}^*]_{\tilde{g}}.
\]

On the other hand,

\[
\pi([x^*, x^*]_{\tilde{g}}) = \begin{cases} 
\pi_0(b_0) + \mathcal{B}_a(t_{\pi}, b_0)\tilde{x} + \lambda \pi_0 \tilde{x} & \text{if } p(\mathcal{B}_a) = \bar{1}, \\
\pi_0(b_0) & \text{if } p(\mathcal{B}_a) = \bar{0}.
\end{cases}
\]

It follows that

\[
(25) \quad \tilde{b}_0 = \mu^{-2}(\pi_0(a_0) - [a, a]_a - 2\mu \tilde{\mathcal{D}}(a)).
\]

Therefore,

\[
(26) \quad \tilde{b}_0 = \lambda^2\pi_0(b_0) + 2(-1)^{p(x)}\lambda \pi_0(\tilde{\mathcal{D}}(t)) + \pi_0([t_{\pi}, t_{\pi}]_a).
\]

In addition, in the case where $p(\mathcal{B}_a) = \bar{1}$ we have

\[
\lambda_0 \lambda + \mathcal{B}_a(t, b_0) = \mu^2 \tilde{\lambda}_0 + 2\mu \mathcal{B}_a(a, \tilde{b}_0) + \mathcal{B}_a(\tilde{\mathcal{D}}(a), a).
\]

After computation, we get

\[
\tilde{\lambda}_0 = \lambda_0 \lambda^3 + \mathcal{B}_a(t_{\pi}, [t_{\pi}, t_{\pi}]) + 3\lambda \mathcal{B}_a(t_{\pi}, \tilde{\mathcal{D}}(t_{\pi})) + 3\lambda^2 \mathcal{B}_a(t_{\pi}, b_0).
\]
We arrive at the following theorems.

**Theorem 3.20.** Let \((a, \mathfrak{B}_a)\) be a NIS-superalgebra, and \(\mathfrak{D}, \tilde{\mathfrak{D}} \in \text{det}_0(a)\) satisfying condition [5]. There exists an adapted isometry \(\pi : \mathfrak{g} \to \tilde{\mathfrak{g}}\) if and only if there exists an isometry \(\pi_0 : a \to a, \lambda \in \mathbb{K}^x\) and \(\nu \in a\) (all unique) such that

\[
\pi_0^{-1} \circ \tilde{\mathfrak{D}} \circ \pi_0 = \lambda \mathfrak{D} + \text{ad}_\nu;
\]

\[
\mathfrak{B}_a(\nu, \nu) = (-1)^p(\mathfrak{B}_a(\nu, \nu));
\]

and

\[
\pi = \pi_0 + \mathfrak{B}_a(\nu, \cdot)\tilde{x};
\]

\[
\pi(x) = \lambda\tilde{x};
\]

\[
\pi(x^*) = \lambda^{-1}(\tilde{x}^* - \pi_0(x) - \frac{1}{4}(1 + (-1)^p(\mathfrak{B}_a) \nu x), \quad \text{where} \nu \text{ is arbitrary.}
\]

Moreover,

\[
\tilde{b}_0 = \lambda^2\pi_0(b_0) + (-1)^p(x^*) \nu(x^*); \quad \text{and} \quad \pi_0(\nu, \nu) = 0.
\]

Additionally, we have for \(p(\mathfrak{B}_a) = 1\)

\[
\tilde{\lambda}_0 = -\lambda_0\lambda^3 + \mathfrak{B}_a(\nu, \nu) + 3\lambda \mathfrak{B}_a(\nu, \nu) + 3\lambda^2 \mathfrak{B}_a(\nu, b_0).
\]

**Proof of Theorem 3.20 and Theorem 3.21.** To check that \(\pi\) preserves the Lie bracket, it is enough to check the conditions below.

To check that \(\pi([x^*, a]_\mathfrak{g}) = [\pi(x^*), \pi(a)]_\mathfrak{g}\), we distinguish two cases:

(i) The cases where \(p(x^*) = 1\). We have

\[
\pi([x^*, a]_\mathfrak{g}) = \pi(\mathfrak{D}(a) - (-1)^p(\mathfrak{B}_a) \nu a, \tilde{a}b_0)x = \pi_0(\mathfrak{D}(a)) + \mathfrak{B}_a(\nu, \mathfrak{D}(a))\tilde{x} - (-1)^p(\mathfrak{B}_a) \lambda \mathfrak{B}_a(a, b_0)\tilde{x}.
\]

On the other hand,
\[ [\tilde{\pi}(x^*), \pi(a)]_\tilde{g} = [\pi(x^*), \pi_0(a) + \mathcal{B}_\tilde{a}(\varpi, a) \tilde{x}]_\tilde{g} \]
\[ = \lambda^{-1}[\tilde{x}^*, \pi_0(a)]_\tilde{g} - (-1)^p(x) \lambda^{-1}[\pi_0(\varpi), \pi_0(a)]_\tilde{g} \]
\[ = \lambda^{-1} \left( \tilde{\mathcal{D}}(\pi_0(a)) - (-1)^p(a)p(\mathcal{B}_a) \mathcal{B}_a(\pi_0(a), \tilde{b}_0) \tilde{x} \right) \]
\[ - (-1)^p(x) \lambda^{-1} \pi_0(\varpi), \pi_0(a)]_a + (-1)^p(x)p(\mathcal{B}_a) \mathcal{B}_a(\tilde{\mathcal{D}}(\lambda^{-1} \pi_0(\varpi)), \pi_0(a)) \tilde{x} \]
\[ = \lambda^{-1} \left( \tilde{\mathcal{D}}(\pi_0(a)) - (-1)^p(x)\pi_0([\varpi, a]_a) \right) \]
\[ + \lambda^{-1}(-(-1)^p(a)p(\mathcal{B}_a) \mathcal{B}_a(\pi_0(a), \tilde{b}_0) \tilde{x} - \mathcal{B}_a(\pi_0(a), \tilde{\mathcal{D}}(\pi_0(\varpi)))) \tilde{x} \]
\[ = \pi_0(\mathcal{D}(a)) + \lambda^{-1}(-(-1)^p(a)p(\mathcal{B}_a) \mathcal{B}_a(\pi_0(a), \lambda^2 \pi_0(b_0)) \]
\[ + 2(-1)^p(x) \lambda(\pi_0(\mathcal{D}(\varpi)))\pi_0([\varpi, \varpi]_a)) \tilde{x} \]
\[ - \lambda^{-1}\mathcal{B}_a(a, \lambda \mathcal{D}(\varpi) - (-1)^p(\mathcal{B}_a)[\varpi, \varpi]_a)) \tilde{x} \]
\[ = \pi_0(\mathcal{D}(a)) - (-1)^p(a)p(\mathcal{B}_a) \lambda \mathcal{B}_a(a, b_0) \tilde{x} \]
\[ + (-2(-1)^p(x)p(\mathcal{B}_a) - 1) \mathcal{B}_a(a, \mathcal{D}(\varpi)) \tilde{x} \]
\[ + \lambda^{-1}(-(-1)^p(\mathcal{B}_a) - (-1)^p(a)p(\mathcal{B}_a)) \mathcal{B}_a(a, [\varpi, \varpi]_a)) \tilde{x}. \]

The result follows since \( p(\mathcal{B}_a) = p(x) + p(x^*) = p(x) + 1 \), and the fact that (for all \( a \in \mathfrak{a} \))
\[ ((-1)^p(\mathcal{B}_a) - (-1)^p(a)p(\mathcal{B}_a)) \mathcal{B}_a(a, [\varpi, \varpi]_a) = 0, \]
\[ \text{(ii) The case where } p(x^*) = 0. \text{ Similar computation.} \]

There is no need to check the remaining brackets because they are certainly satisfied as shown by the previous computations prior the statement of Theorem 3.20 and Theorem 3.21.

Let us show that \( \pi \) preserves \( \mathcal{B}_\tilde{a} \). For every element \( a \in \mathfrak{a} \), we have \( \mathcal{B}_\tilde{a}(x^*, a) = 0 \). On the other hand,
\[ \mathcal{B}_\tilde{a}(\pi(a), \pi(x^*)) = \mathcal{B}_\tilde{a}(\pi_0(a) + \mathcal{B}_\tilde{a}(\varpi, a) \tilde{x}, \pi(x^*)) \]
\[ = \lambda^{-1} \mathcal{B}_a(\varpi, a) - (-1)^p(x)p(x^*) \mathcal{B}_a(\pi_0(a), \lambda^{-1} \pi_0(\varpi)) \]
\[ = \lambda^{-1}((-1)^p(x)p(a) - (-1)^p(x)p(x^*)) \mathcal{B}_a(\varpi, a) \]
\[ = 0. \]

Suppose that \( \mathcal{D}(b_0) = 0 \). Let us show that \( \tilde{\mathcal{D}}(\tilde{a}_0) = 0 \). Indeed, let us apply \( \pi_0^{-1} \) to \( \tilde{\mathcal{D}}(\tilde{a}_0) \):
\[ \pi_0^{-1} \tilde{\mathcal{D}}(\tilde{a}_0) = \pi_0^{-1} \left( \tilde{\mathcal{D}}(\lambda^2 \pi_0(b_0) + 2(-1)^p(x)p(x^*) \lambda(\pi_0(\mathcal{D}(\varpi)))) + \pi_0([\varpi, \varpi]_a) \right) \]
\[ = (\lambda \mathcal{D} + (-1)^p(\mathcal{D})p(\mathcal{B}_a) + 1) \mathcal{D}(\lambda^2 b_0 + 2(-1)^p(x)p(x^*) \lambda \mathcal{D}(\varpi) + [\varpi, \varpi]_a) \]
\[ = 0. \]
Let us denote by 
\[ \tilde{G}^2 = \frac{1}{2} \text{ad}_{\gamma_0}. \] 
Indeed,
\[
\tilde{G}^2 = \pi_0(\lambda D + (-1)^p(\rho(\mathcal{B}_a) + 1)\text{ad}_\gamma)^2\pi_0^{-1} \\
= \pi_0(\lambda^2 \tilde{G}^2 + (-1)^p(\rho(\mathcal{B}_a) + 1)(\lambda \text{ad}_\gamma + \lambda \text{ad}_\gamma D) + \lambda^2 D^2)\pi_0^{-1} \\
= \pi_0(\lambda^2 \frac{1}{2} \text{ad}_{\gamma_0} + \lambda(-1)^p(\rho(\mathcal{B}_a) + 1)\text{ad}_\gamma + \lambda^2 D^2)\pi_0^{-1} \\
= \frac{1}{2} \text{ad}_{\gamma_0}.
\]

Besides, (since \( \tilde{b}_0 = \lambda^2 \pi_0(b_0) + (-1)^p(\gamma_0(\mathcal{D}(\mathfrak{z}))) + \pi_0([\mathfrak{z}, \mathfrak{z}]_\mathfrak{a}) \) and \( \pi_0 \) is an isometry):
\[
\mathcal{B}_\mathfrak{q}(\tilde{b}_0, \tilde{b}_0) = \lambda^4 \mathcal{B}_\mathfrak{a}(b_0, b_0) + 2\lambda^2 \mathcal{B}_\mathfrak{a}(b_0, [\mathfrak{z}, \mathfrak{z}]_\mathfrak{a}) + 4\lambda^2 \mathcal{B}_\mathfrak{a}(\mathcal{D}(\mathfrak{z}), \mathcal{D}(\mathfrak{z})) + (-1)^p(\gamma_0(\mathcal{D}(\mathfrak{z}))) + [\mathfrak{z}, \mathfrak{z}]_\mathfrak{a} = 0.
\]

Suppose now that \( \mathfrak{a} \) is restricted with a \( p \mid 2p \) structure. In Theorems \ref{thm:3.7} \ref{thm:3.13} \ref{thm:3.11} \ref{thm:3.13} we proved that it is possible to extend the \( p \mid 2p \) structure to any double extension. Let us denote by \([p|2p]_\mathfrak{g}\) (resp. \([p|2p]_\tilde{\mathfrak{g}}\)) the \( p \mid 2p \) structure on \( \mathfrak{g} \) (resp. \( \tilde{\mathfrak{g}} \)) written in terms of \( m, l, a_0, b_0, \gamma \) and \( q \) (resp. \( \tilde{m}, \tilde{l}, \tilde{a}_0, \tilde{b}_0, \tilde{\gamma} \) and \( \tilde{q} \)). The following theorem characterizes the equivalence class of \( p \) structures on double extensions, but we prove it only for \( p = 3 \). The formula for \( p > 3 \) is still out of reach.

**Theorem 3.22.** If \( p(\mathcal{B}_a) = 0 \), the adapted isometry \( \pi : \mathfrak{g} \to \tilde{\mathfrak{g}} \) given in Theorem \ref{thm:3.20} defines a \( p \mid 2p \) structure on \( \mathfrak{g} \), for \( p = 3 \), if and only if
\[
\pi_0(a^{[p]} \mathfrak{a}) = (\pi_0(a))^{[p]} \mathfrak{a} + \mathcal{B}_\mathfrak{a}(\mathfrak{z}, a)^{p} \tilde{b}_0 \quad \text{for all } a \in \mathfrak{a}_0.
\]

and
\[
\tilde{m} = \lambda^{-p}(\lambda m + \mathcal{B}_\mathfrak{a}(\mathfrak{z}, b_0)), \\
\tilde{b}_0 = \lambda^{-p(\gamma_0)}(b_0), \\
\tilde{q} \circ \pi_0 = \lambda q + \mathcal{B}_\mathfrak{a}(\mathfrak{z}, (\cdot)^{[p]} \mathfrak{a}) - \mathcal{B}_\mathfrak{a}(\mathfrak{z}, \cdot)^{p} \tilde{m} \text{ on } \mathfrak{a}_0 \\
\tilde{\gamma} = \lambda^{p-1} \gamma, \\
\tilde{l} = \lambda^p(\mathcal{B}_\mathfrak{a}(\mathfrak{z}, a_0) + \lambda l - \lambda^{-1} \gamma \rho) + \rho^p \tilde{m} + q(\pi_0(\mathfrak{z}))(\mathcal{B}_\mathfrak{a}(\mathcal{D}^{p-1}(\pi_0(\mathfrak{z})), \pi_0(\mathfrak{z}))), \\
\tilde{\alpha}_0 = \lambda^p(\pi_0(a_0) - \lambda^{-1} \gamma \pi_0(\mathfrak{z})) + (\pi_0(\mathfrak{z}))^{[p]} \mathfrak{a} + \rho^p \tilde{b}_0 + \mathcal{D}^{p-1}(\pi_0(\mathfrak{z})) - \lambda \pi_0([\mathcal{D}(\mathfrak{z}), \mathfrak{z}]_\mathfrak{a}).
\]

Moreover, if \( \tilde{\gamma}(\mathfrak{a}) = 0 \), then the isometry \( \pi_0 \) of \( \mathfrak{a} \) is also a \( p \mid 2p \) mapping.

**Proof.** Similar to that of Theorem \ref{thm:3.19} minding the sign rule \( \square \).
Theorem 3.23. If \( p(\mathcal{B}_a) = \bar{1} \), the adapted isometry \( \pi : \mathfrak{g} \to \tilde{\mathfrak{g}} \) given in Theorem 3.21 defines a \( p \| 2p \)-structure on \( \mathfrak{g} \), if and only if
\[
\pi_0(a[p|a]) = (\pi_0(a))[p|a] \quad \text{for all } a \in \mathfrak{a}_0.
\]
and
\[
\tilde{q} \circ \pi_0 = \lambda q + \mathcal{B}_a(x, (\cdot)[p|a]) - \mathcal{B}_a(x, \cdot)^p \tilde{m} \quad \text{on } \mathfrak{a}_0
\]
\[
\lambda_0^p \tilde{m} = \bar{m} \lambda^{-2p-1} (\lambda_0^p - 3 \mathcal{B}_a(D(x), x) - \mathcal{B}_a(x, [x, x]_a)) - \bar{m} \mathcal{B}_a(x, b_0)^p
\]
Proof. Similar to that of Theorem 3.19, minding the sign rule.

\[\square\]

Theorem 3.24. If \( p(\mathcal{B}_a) = \bar{1} \), the adapted isometry \( \pi : \mathfrak{g} \to \tilde{\mathfrak{g}} \) given in Theorem 3.20 defines a \( p \| 2p \)-structure on \( \mathfrak{g} \), if and only if
\[
\pi_0(a[p|a]) = (\pi_0(a))[p|a] \quad \text{for all } a \in \mathfrak{a}_0.
\]
and
\[
\tilde{m} = \lambda^{p-1} m
\]
\[
\tilde{a}_0 = \pi_0(x[p|a]) + \lambda^2 \pi_0(D^2(x)) - m \lambda^{-1} \pi_0(x) + \lambda^p \pi_0(a_0) + 2 \lambda \pi_0([x, D(x)]_a)
\]
Proof. Similar to that of Theorem 3.19, minding the sign rule.

\[\square\]

Theorem 3.25. If \( p(\mathcal{B}_a) = 0 \), the adapted isometry \( \pi : \mathfrak{g} \to \tilde{\mathfrak{g}} \) given in Theorem 3.21 defines a \( p \| 2p \)-structure on \( \mathfrak{g} \), if and only if \( \pi_0 \) defines a \( p \| 2p \) structure on \( \mathfrak{a} \).

Proof. Similar to that of Theorem 3.19, minding the sign rule.

\[\square\]

4. Examples in small characteristic

4.1. Rank 2 Lie (super)algebras.

4.1.1. \( \mathfrak{psl}(3) \) for \( p = 3 \). Let us fix a basis of \( \mathfrak{psl}(3) \) generated by the root vectors \( x_1, x_2, x_3 = [x_1, x_2] \) (positive) and \( y_1, y_2, y_3 = [y_1, y_2] \) (negative). The Lie algebra \( \mathfrak{psl}(3) \) admits a NIS given in the ordered basis \( e_1 = [x_1, y_1], e_2 = x_1, e_3 = x_2, e_4 = x_3, e_5 = y_1, e_6 = y_2, e_7 = y_3 \) by the Gram matrix
\[
\mathcal{B}_{\mathfrak{psl}(3)} = \begin{pmatrix}
2 & 0 & 0 \\
0 & 0 & I_{2,1} \\
0 & I_{2,1} & 0
\end{pmatrix},
\]
where \( I_{r,s} = \text{diag}(1, \ldots, 1, -1, \ldots, -1) \) with \( r \)-many 1s and \( s \) many \(-1\)s. The 3-structure on \( \mathfrak{psl}(3) \) is given as follows:
\[
e^{[3]}_1 = e_1, \quad e^{[3]}_i = 0 \quad \text{for all } i > 1.
\]
Claim 4.1. The space \( H^1_{\text{red}}(\mathfrak{psl}(3); \mathfrak{psl}(3)) \) is spanned by the cocycles:

\[
\begin{align*}
\text{deg} = -3 : & \quad D_1 = y_1 x_3 + y_3 x_1, \quad D_2 = y_2 x_3 + y_3 x_2, \\
\text{deg} = 0 : & \quad D_3 = 2 x_2 x_1 + y_1 y_2, \quad D_4 = 2 x_1 x_2 + y_2 y_1, \quad D_5 = x_1 x_3 + x_3 x_1 + 2 y_1 y_1 + 2 y_3 y_3, \\
\text{deg} = 3 : & \quad D_6 = x_1 y_3 + x_3 y_1, \quad D_7 = x_2 y_3 + x_3 y_2.
\end{align*}
\]

An easy computation shows that \( \mathcal{B}_{\mathfrak{psl}(3)} \) is \( \mathcal{D} \)-invariant for any derivation \( \mathcal{D} \) given as in (27).

The Cartan matrix associated with \( \mathfrak{psl}(3) \), or rather of \( \mathfrak{gl}(3) \), as explained in [BGL], is symmetric, so the isometry

\[
x_1 \longleftrightarrow x_2, \quad x_3 \longleftrightarrow -x_3, \quad y_1 \longleftrightarrow y_2, \quad y_3 \longleftrightarrow -y_3,
\]

sends the derivation \( D_3 \) to \( D_4 \), sends the derivation \( D_1 \) to \( D_2 \) and sends the derivation \( D_6 \) to \( D_7 \). Moreover, the the isometry

\[
y_1 \longleftrightarrow x_1, \quad y_2 \longleftrightarrow x_2, \quad y_1 \longleftrightarrow y_2, \quad y_3 \longleftrightarrow -y_3,
\]

sends the derivation \( D_1 \) to \( D_6 \).

Now, we define three cubic forms on \( a \) as follows:

\[
\begin{align*}
q_1(\sum_{1 \leq i \leq 7} \lambda_i e_i) & \equiv \lambda_6 \lambda_4^2 + 2 \lambda_1 \lambda_2 \lambda_4 + 2 \lambda_3 \lambda_5^2, \\
q_4(\sum_{1 \leq i \leq 7} \lambda_i e_i) & \equiv \lambda_7 \lambda_3^2 + 2 \lambda_1 \lambda_5 \lambda_3 + \lambda_4 \lambda_5^2, \\
q_5(\sum_{1 \leq i \leq 7} \lambda_i e_i) & \equiv \lambda_1 \lambda_2 \lambda_5 + \lambda_4 \lambda_6 \lambda_5 + 2 \lambda_2 \lambda_3 \lambda_7 + \lambda_1 \lambda_4 \lambda_7.
\end{align*}
\]

Now, let \( a = \sum_{1 \leq i \leq 7} \lambda_i e_i, \ b = \sum_{1 \leq i \leq 7} \mu_i e_i \in \mathfrak{psl}(3) \). We have

\[
\begin{align*}
\mathcal{B}_{\mathfrak{psl}(3)}(D_5(a - b), [a, b]) & = (\lambda_2 - \mu_2)(\lambda_1 \mu_5 + \lambda_7 \mu_3 - \lambda_5 \mu_1 - \lambda_3 \mu_7) \\
& \quad - (\lambda_4 - \mu_4)(\lambda_7 \mu_1 + \lambda_5 \mu_6 - \lambda_1 \mu_7 - \lambda_6 \mu_5) \\
& \quad - (\lambda_5 - \mu_5)(\lambda_2 \mu_1 + \lambda_4 \mu_6 - \lambda_1 \mu_2 - \lambda_6 \mu_4) \\
& \quad + (\lambda_7 - \mu_7)(\lambda_2 \mu_3 + \lambda_1 \mu_4 - \lambda_3 \mu_2 - \lambda_4 \mu_1).
\end{align*}
\]

Besides,

\[
\begin{align*}
\mathcal{B}_{\mathfrak{psl}(3)}(D_4(a - b), [a, b]) & = - (\lambda_3 - \mu_3)(\lambda_1 \mu_5 + \lambda_7 \mu_3 - \lambda_5 \mu_1 - \lambda_3 \mu_7) \\
& \quad + (\lambda_5 - \mu_5)(\lambda_3 \mu_1 + \lambda_5 \mu_4 - \lambda_1 \mu_3 - \lambda_4 \mu_5) \\
\mathcal{B}_{\mathfrak{psl}(3)}(D_1(a - b), [a, b]) & = - (\lambda_2 - \mu_2)(\lambda_1 \mu_4 + \lambda_2 \mu_3 - \lambda_3 \mu_2 - \lambda_4 \mu_1) \\
& \quad + (\lambda_4 - \mu_4)(\lambda_2 \mu_1 + \lambda_4 \mu_6 - \lambda_1 \mu_2 - \lambda_6 \mu_4).
\end{align*}
\]

It is easy to see that

\[
\begin{align*}
q_1(a + b) - q_1(a) - q_1(b) & = \mathcal{B}_{\mathfrak{psl}(3)}(D_1(a - b), [a, b]) \\
q_4(a + b) - q_4(a) - q_4(b) & = \mathcal{B}_{\mathfrak{psl}(3)}(D_4(a - b), [a, b]) \\
q_5(a + b) - q_5(a) - q_5(b) & = \mathcal{B}_{\mathfrak{psl}(3)}(D_5(a - b), [a, b]).
\end{align*}
\]
Let us summarize:

<table>
<thead>
<tr>
<th>Derivation</th>
<th>q(a)</th>
<th>γ</th>
<th>a₀</th>
<th>Double extension</th>
</tr>
</thead>
<tbody>
<tr>
<td>( D_4 )</td>
<td>( \lambda_2^2 \alpha_7 + 2 \alpha_1 \alpha_3 \alpha_4 + \lambda_4^2 \lambda_2 )</td>
<td>0</td>
<td>0</td>
<td>( \mathfrak{gl}(3) )</td>
</tr>
<tr>
<td>( D_1 )</td>
<td>( \lambda_2^2 \alpha_6 + 2 \alpha_1 \alpha_3 \alpha_4 + 2 \lambda_2^2 \alpha_3 )</td>
<td>0</td>
<td>0</td>
<td>( \mathfrak{gl}(3) )</td>
</tr>
<tr>
<td>( D_5 )</td>
<td>( \lambda_1 \lambda_2 \alpha_5 + \lambda_4 \alpha_6 \alpha_5 + 2 \alpha_2 \alpha_3 \alpha_7 + \alpha_1 \lambda_4 \alpha_7 )</td>
<td>1</td>
<td>0</td>
<td>( \mathfrak{gl}(3) )</td>
</tr>
</tbody>
</table>

Claim 4.2. \( \dim H^2(\mathfrak{gl}(3)) = 0, \dim H^2(\tilde{\mathfrak{gl}}(3)) = 3 \) and \( \dim H^2(\tilde{\mathfrak{gl}}(3)) = 4 \), hence \( \mathfrak{gl}(3), \tilde{\mathfrak{gl}}(3) \) and \( \tilde{\mathfrak{gl}}(3) \) are mutually not isomorphic.

4.1.2. \( \mathfrak{br}(2;3) \) for \( p = 3 \). Let us realize \( \mathfrak{br}(2;3) \) (see [BGL] BoGL for more details) by the Cartan matrix and the positive root vectors

\[
\begin{pmatrix}
0 & -1 \\
-2 & 1
\end{pmatrix}
\]

\( x_1, x_2, x_3 = [x_1, x_2], x_4 = [x_2, x_2], x_5 = [x_2, x_3], \)

\( x_6 = [x_3, x_4], x_7 = [x_4, x_5], x_8 = [x_5, x_5]. \)

Following [BKLS], the Lie superalgebra \( \mathfrak{br}(2;3) \) admits a NIS given in the ordered basis

\[ [x_1, y_1], [x_2, y_2], x_1, \ldots, x_8, y_1, \ldots, y_8. \]

by the Gram matrix

\[
\mathcal{B}_{\mathfrak{br}(2;3)} = \begin{pmatrix}
A & 0 & 0 \\
0 & 0 & B \\
0 & C & 0
\end{pmatrix},
\]

where \( A = \begin{pmatrix} 0 & 1 & 1 \\ 1 & 0 & 2 \end{pmatrix}, B = \text{diag}\{1, 2, 2, 2, 2, 2, 1, 1\} \) and \( C = \text{diag}\{2, 1, 2, 2, 1, 2, 2, 1\} \).

There exists a 3|6 structure on \( \mathfrak{br}(2;3) \) given by

\[
([x_1, y_1])^3 = [x_1, y_1], \quad ([x_2, y_2])^3 = [x_2, y_2],
\]

\[
x_1^6 = x_2^6 = x_3^6 = x_4^6 = x_5^6 = x_6^6 = x_7^6 = x_8^6 = 0,
\]

\[
y_1^6 = y_2^6 = y_3^6 = y_4^6 = y_5^6 = y_6^6 = y_7^6 = y_8^6 = 0.
\]

Claim 4.3. The space \( H^1(\mathfrak{br}(2;3); \mathfrak{br}(2;3)) \) is spanned by the odd cocycles:

\[
\text{deg } = -3 : \quad \mathcal{D}_1 = x_1 \otimes \bar{x}_6 + x_3 \otimes \bar{x}_7 + 2 y_2 \otimes \bar{x}_1 + y_4 \otimes \bar{x}_{\bar{x}} + 2 y_6 \otimes \bar{y}_1 + y_7 \otimes \bar{y}_3,
\]

\[
\text{deg } = 3 : \quad \mathcal{D}_2 = x_2 \otimes \bar{y}_4 + x_4 \otimes \bar{y}_2 + x_6 \otimes \bar{x}_1 + 2 x_7 \otimes \bar{x}_3 + y_1 \otimes \bar{y}_6 + y_3 \otimes \bar{y}_7.
\]

Let us show that \( \mathcal{B}_{\mathfrak{br}(2;3)} \) is not \( \mathcal{D}_1 \)-invariant. Indeed,

\[
\mathcal{B}_{\mathfrak{br}(2;3)}(\mathcal{D}_1(x_2), x_4) + (-1)^{p(x_2)} \mathcal{B}_{\mathfrak{br}(2;3)}(x_2, \mathcal{D}_1(x_4)) = 1 \neq 0.
\]

Similarly, \( \mathcal{B}_{\mathfrak{br}(2;3)} \) is not \( \mathcal{D}_2 \)-invariant.

It follows that \( \mathfrak{br}(2;3) \) is not suitable for a non-trivial double extension.
4.1.3. $\mathfrak{sl}(1|2)$, $\mathfrak{osp}(2|3)$, $\mathfrak{osp}(1|4)$ for $p > 2$, the Brown algebra $\mathfrak{brj}(2)$ for $p = 3$, and $\mathfrak{brj}(2; 5)$ for $p = 5$.

Claim 4.4. For $a = \mathfrak{sl}(1|2)$, $\mathfrak{osp}(2|3)$, $\mathfrak{osp}(1|4)$, $\mathfrak{brj}(2)$ (for $p = 3$), and $\mathfrak{brj}(2; 5)$ (for $p = 5$) the space $H^1(a; a) = 0$.

Therefore, these Lie superalgebras are not suitable for a non-trivial double extension.

4.2. Manin triples ($p = 2$). Let $(\mathfrak{h}, [2]_{\mathfrak{h}})$ be a finite-dimensional restricted Lie algebra (not necessarily “NIS”), and let the dual space have the structure of an abelian Lie algebra. A NIS-algebra structure on $\mathfrak{g} := \mathfrak{h} \oplus \mathfrak{h}^*$ is naturally defined as follows. First, the 2-structure on $\mathfrak{g}$ is defined as follows (for any $h \in \mathfrak{h}$ and $\pi \in \mathfrak{h}^*$, hence for any $h + \pi \in \mathfrak{g}$):

$$ (h + \pi)^{[2]} := h^{[2]} + \pi \circ \text{ad}_h^\mathfrak{h}. $$

The bracket of two elements is defined as follows:

$$ [h + \pi, h' + \pi']_{\mathfrak{g}} := [h, h']_{\mathfrak{h}} + \pi \circ \text{ad}_{h'} + \pi' \circ \text{ad}_h $$

for any $h + \pi$, $h' + \pi' \in \mathfrak{g}$.

It is easy to show that the bracket $[\cdot, \cdot]_{\mathfrak{g}}$ defined by Eq. (30) satisfies the Jacobi identity. Let us show that the map defined by Eq. (30) is a 2-mapping. Indeed,

$$ [h + \pi, [h + \pi, h' + \pi']]_{\mathfrak{g}} = [h + \pi, [h, h']_{\mathfrak{h}} + \pi \circ \text{ad}_{h'} + \pi' \circ \text{ad}_h]_{\mathfrak{g}} $$

$$ = [h, [h, h']_{\mathfrak{h}}]_{\mathfrak{h}} + \pi \circ \text{ad}_{[h, h']_{\mathfrak{h}}} - (\pi \circ \text{ad}_{h'} - \pi' \circ \text{ad}_h) \circ \text{ad}_h $$

$$ = [h^{[2]} + \pi \circ \text{ad}_{h'}, h']_{\mathfrak{g}} + \pi \circ \text{ad}_{h'} \circ \text{ad}_h + \pi' \circ \text{ad}_h \circ \text{ad}_h $$

$$ = [h^{[2]} + \pi \circ \text{ad}_{h'} \circ \text{ad}_h + \pi' \circ \text{ad}_h + \pi' \circ \text{ad}_{h^{[2]}}]_{\mathfrak{g}} $$

$$ = [(h + \pi)^{[2]}, h' + \pi']_{\mathfrak{g}}. $$

On the other hand,

$$ (h + \pi + h' + \pi')^{[2]} = (h + h')^{[2]} + (\pi + \pi') \circ \text{ad}_{h+h'} $$

$$ = h^{[2]} + h'\text{[2]} + [h, h']_{\mathfrak{h}} + \pi \circ \text{ad}_{h'} + \pi' \circ \text{ad}_h + \pi' \circ \text{ad}_{h'} $$

$$ = (h + \pi)^{[2]} + (h' + \pi')^{[2]} + [h + \pi, h' + \pi']_{\mathfrak{g}}. $$

We define a bilinear form on $\mathfrak{g}$ as follows:

$$ B_\mathfrak{g}(h + \pi, h' + \pi') := \pi(h') + \pi'(h) $$

for any $h + \pi$, $h' + \pi' \in \mathfrak{g}$.

It is easy to show that the bilinear form $B_\mathfrak{g}$ is NIS.
4.2.1. Heisenberg algebra $\mathfrak{hei}(2)$. Consider the Heisenberg algebra $\mathfrak{hei}(2)$ spanned by $p, q$ and $z$, with the only nonzero bracket: $[p, q] = z$. Let us consider a 2-structure given by

$$p^{[2]} = q^{[2]} = 0, \quad z^{[2]} = z.$$

We consider the NIS-algebra $\mathfrak{a} := \mathfrak{hei}(2) \oplus \mathfrak{hei}(2)^*$ constructed as in §4.2. A direct computation using Eq. (30) shows that (for any $s, w, u, v \in \mathbb{K}$)

$$(rz + sp + wq + up^* + vq^* + tz^*)^{[2]}_{\mathfrak{a}} = swz + s(up^* + vq^* + tz^*) \circ \text{ad}_p + w(uq^* + vq^* + tz^*) \circ \text{ad}_q + r(uq^* + vq^* + tz^*) \circ \text{ad}_z = swz + stq^* + wtp^*.$$

A direct computation using Eqs. (30) and (31) shows that the only nonzero brackets are

$$[p, q]_{\mathfrak{a}} = z, \quad [p, q^*]_{\mathfrak{a}} = q^*, \quad [q, z^*]_{\mathfrak{a}} = p^*.$$

Claim 4.5. The space $H^1_{\text{res}}(\mathfrak{a}; \mathfrak{a})$ is spanned by the (classes of the) following cocycles:

$$\mathcal{D}_1 = q^* \otimes \hat{p}, \quad \mathcal{D}_2 = q^* \otimes \hat{q}, \quad \mathcal{D}_3 = q^* \otimes \hat{z}^*,$$

$$\mathcal{D}_4 = p^* \otimes \hat{p}, \quad \mathcal{D}_5 = p^* \otimes \hat{q}, \quad \mathcal{D}_6 = z \otimes \hat{z}^*,$$

$$\mathcal{D}_7 = p \otimes \hat{p} + q^* \otimes \hat{q} + z \otimes \hat{z}, \quad \mathcal{D}_8 = q \otimes \hat{q} + p^* \otimes \hat{p} + z \otimes \hat{z},$$

$$\mathcal{D}_9 = q^* \otimes \hat{q}^* + p^* \otimes \hat{p}^* + z^* \otimes \hat{z}^*.$$

Let us fix an ordered basis as follows: $p, q, z, p^*, q^*, z^*$. In this basis, the Gram matrix of the bilinear form $\mathcal{B}_\mathfrak{a}$ in (32) is as follows (here $I_n$ denotes the identity $n \times n$-matrix)

$$\begin{pmatrix} 0 & I_3 \\ I_3 & 0 \end{pmatrix}.$$

Any derivation $\mathcal{D}$ has the following matrix representation:

$$\mathcal{D} = \begin{pmatrix} A & B \\ C & F \end{pmatrix}.$$

An easy but boring check shows that $\mathcal{B}_\mathfrak{a}$ is $\mathcal{D}$-invariant if and only if $F = A^t, B^t = B$ and $C^t = C$. Let us consider the most general derivation $\mathcal{D} = \sum_{1 \leq i \leq 9} \mu_i \mathcal{D}_i$, where $\mathcal{D}_i$ are the cocycles given in Claim 4.5. In the same basis $p, q, z, p^*, q^*, z^*$, we have

$$\mathcal{D} = \begin{pmatrix} \mu_1 \mathcal{D}_1 & \mu_2 \mathcal{D}_2 + \mu_4 \mathcal{D}_4 + \mu_6 \mathcal{D}_6 + \mu_7 \mathcal{D}_7 + \mu_8 \mathcal{D}_8 + (\mu_7 + \mu_8) \mathcal{D}_9 \\ \mu_1 E^{1,1} + (\mu_7 + \mu_8) E^{3,3} + \mu_8 E^{2,2} & \mu_6 E^{3,3} + \mu_7 E^{2,2} + \mu_3 E^{2,3} + \mu_5 E^{1,3} + \mu_9 I \end{pmatrix},$$

where $E^{i,j}$ is the $(i,j)$th $3 \times 3$ matrix unit.

It follows that $\mathcal{B}_\mathfrak{a}$ is $\mathcal{D}$-invariant if and only if $\mu_1 = \mu_3 = \mu_5 = 0$ and $\mu_9 = \mu_7 + \mu_8$.

The most general derivation is of the form $\mu_2 \mathcal{D}_2 + \mu_4 \mathcal{D}_4 + \mu_6 \mathcal{D}_6 + \mu_7 \mathcal{D}_7 + \mu_8 \mathcal{D}_8 + (\mu_7 + \mu_8) \mathcal{D}_9.$
Now, we define two quadratic forms on $a$ as follows:

\[ q_1(rz + sp + wq + tz^* + up^* + vq^*) = rt + su, \]
\[ q_2(rz + sp + wq + tz^* + up^* + vq^*) = rt + vw. \]

Let us check the condition (5). Let $a = rz + sp + wq + up^* + vq^* + tz^* \in \mathfrak{a}$. The fact that

\[ B_a(a, P(a)) = B_a(a, (\mu_2w + \mu_8v)q^* + (\mu_4s + u\mu_7)p^* + (\mu_6t + \mu_7r + \mu_8r)z + \mu_7sp + \mu_8wq + (\mu_7 + \mu_8)tz^*) = (\mu_2w)v + (\mu_4s)s + (\mu_6t)t = 0, \]

implies that $\mu_2 = \mu_4 = \mu_6 = 0$. Now, let $b = rz + sp + wq + up^* + vq^* + tz^*$, $a = \tilde{r}z + \tilde{s}p + \tilde{w}q + \tilde{u}p^* + \tilde{v}q^* + \tilde{t}z^* \in \mathfrak{a}$. We have

\[ B_a(a, P(b)) = B_a(a, \frac{1}{2}(s\tilde{s} + u\tilde{u} + \mu_7\tilde{r}\tilde{t} + \mu_8(w\tilde{v} + \tilde{v}\tilde{w})). \]

It follows that we have two $\mathcal{D}$-extensions given by the following data (where $\alpha, \beta \in \mathbb{K}$):

\[ (\mathcal{D} = \mathcal{D}_7 + \mathcal{D}_9, a_0 = \beta q^*, b_0 = \alpha q^*, q_1, m, l, \gamma = 1), \]
\[ (\mathcal{D} = \mathcal{D}_8 + \mathcal{D}_9, a_0 = \beta p^*, b_0 = \alpha p^*, q_2, \tilde{m}, \tilde{l}, \tilde{\gamma} = 1). \]

Let us show that these two $\mathcal{D}$-extensions are isometric if $m, l, \tilde{m}$ and $\tilde{l}$ are suitably chosen. Indeed, the isometry is given by (for notation, see Theorem 3.17)

\[ \pi_0(z) = z, \quad \pi_0(z^*) = z^*, \quad \pi_0(p) = q, \]
\[ \pi_0(q) = p, \quad \pi_0(q^*) = p^*, \quad \pi_0(p^*) = q^*, \]
\[ \lambda = 0, \quad \rho = 1, \quad \rho = 0. \]

On the other hand, let us show that the $\mathcal{D}$-extension by means of $\mathcal{D}_7 + \mathcal{D}_9$ is not a trivial one; namely, it is not isometric to the one by means of ad$_T$ for some $T \in \mathfrak{a}$. Suppose there is an isometry, say $\pi$. Let us write

\[ \pi_0(z) = mz, \quad \pi_0(z^*) = m_1z + m_2p + m_3q + m_4p^* + m_5q^* + m^{-1}z^*. \]

Now, because $q^* = [z^*, p]$, it follows that

\[ \pi_0(q^*) = [m_1z + m_2p + m_3q + m_4p^* + m_5q^* + m^{-1}z^*, \pi_0(p)] = c_1p^* + c_2q^* + c_3z \quad \text{for some} \ c_1, c_2, c_3 \in \mathbb{K}. \]

Similarly, since $p^* = [z^*, q]$, it follows that

\[ \pi_0(p^*) = [m^{-1}z^*, \pi_0(q)] = \tilde{c}_1p^* + \tilde{c}_2q^* + \tilde{c}_3z \quad \text{for some} \ \tilde{c}_1, \tilde{c}_2, \tilde{c}_3 \in \mathbb{K}. \]
We have (here \( T = W_1p + W_2p^* + W_3q + W_4q^* + W_5z + W_6z^* \), where \( W_i \in \mathbb{K} \)):
\[
((\mathcal{D}_7 + \mathcal{D}_9) \circ \pi_0 - \pi_0 \circ \text{ad}_T)(z^*) = (\mathcal{D}_7 + \mathcal{D}_9)(m_1z + m_2p + m_3q + m_4p^* + m_5q^* + m^{-1}z^*) - \pi_0[T, z^*]
\]
\[
= m^{-1}z^* + m_1z + m_2p + m_4p^* - W_1\pi_0(q^*) - W_3\pi_0(p^*)
\]
\[
= m^{-1}z^* + m_1z + m_2p + m_4p^* - W_1(c_1p^* + c_2q^* + c_3z)
\]
\[
- W_3(\tilde{c}_1p^* + \tilde{c}_2q^* + \tilde{c}_3z).
\]

But this is never zero, hence a contradiction.

4.3. Vectorial Lie (super)algebras. Over any field \( \mathbb{K} \) of characteristic \( p > 0 \), consider not polynomial coefficients but divided powers in \( n \) indeterminates, whose powers are bounded by the shearing vector \( \mathcal{N} = (N_1, ..., N_n) \). We get a commutative algebra (here \( p^\infty := \infty \))
\[
\mathcal{O}(n; \mathcal{N}) := \mathbb{K}[u; \mathcal{N}] := \text{Span}_\mathbb{K}(u^{(r)} | 0 \leq r < p^{N_i}),
\]
where \( u^{(r)} = \prod_{1 \leq i \leq n} u_i^{(r_i)} \). The addition in \( \mathcal{O}(n; \mathcal{N}) \) is the natural one; the multiplication is defined by
\[
\left( u_i^{(r_i)} \cdot u_i^{(s_i)} \right) = \left( r_i + s_i \right) u_i^{(r_i+s_i)}.
\]
Set \( \mathbf{1} := (1, ..., 1) \) and set \( \tau(\mathcal{N}) := (p^{N_1} - 1, ..., p^{N_n} - 1) \).

Let us introduce distinguished partial derivatives \( \partial_i \) each of them serving as several partial derivatives at once, for each of the generators \( u_i, u_i^{(p)}, u_i^{(p^2)}, \cdots \) (or, in terms of \( y_{i,j} := u_i^{(p^{j-1})} \)):
\[
\partial_i(u_j^{(k)}) := \delta_{ij}u_j^{(k-1)} \text{ for all } k, \text{ i.e., } \partial_i = \sum_{j \geq 1} (-1)^{j-1} y_{i,1}^{p-1} \cdots y_{i,j-1}^{p-1} \partial_{y_{i,j}}.
\]

4.3.1. \( \text{vect}(n; \mathcal{N}) \). The general vectorial Lie algebra, known as the Jacobson-Witt algebra:
\[
\text{vect}(n; \mathcal{N}) := \{ \sum_i f_i \partial_i | f_i \in \mathcal{O}(n, \mathcal{N}) \},
\]
where the bracket is given by the Lie bracket of vector fields. The Lie algebra \( \text{vect}(n; \mathcal{N}) \) has a NIS ([SE Theorems 6.3 and 6.4 in Ch. 4]) if and only if either \( n = 1 \) and \( p = 3 \) when NIS is
\[
\mathcal{B}(u^{(a)} \partial, u^{(b)} \partial) := \int u^{(a)} u^{(b)} du,
\]
or \( n = p = 2 \) in which case NIS is
\[
\mathcal{B}(u^{(a)} \partial_i, u^{(b)} \partial_j) := (i + j) \int u^{(a)} u^{(b)} du_1 \wedge du_2,
\]
where \( \int f(u) du_1 \wedge \cdots \wedge du_n := \text{coefficient of } u^{\tau(\mathcal{N})} \) and \( \tau(\mathcal{N}) := (p^{N_1} - 1, ..., p^{N_n} - 1) \).

Remark 4.6. There is no NIS on simple Lie algebras \( \text{svect}_{exp}(n; \mathcal{N}) \) and \( \text{svect}^{(1)}_{1+u}(n; \mathcal{N}) \), see [BKLS, W]. For the classification of non-degenerate invariant symmetric bilinear forms on simple \( \mathbb{Z} \)-graded vectorial Lie algebras in characteristic \( p > 0 \), see [Dz, Fa].

Claim 4.7. ([SE Theorem 8.5]) For \( p = 3 \), we have \( H^1(\text{vect}(1; 1); \text{vect}(1; 1)) = 0 \).
It follows that $\text{vect}(1; 1)$ can have only a trivial double extension, given by $\text{vect}(1; 1) \oplus c$, where $c$ is a 2-dimensional center. Recall that $\text{vect}(1; N)$ is restricted if and only if $N = 1$, see [SF, Theorem 2.4, page 149].

**Claim 4.8.** For $p = 2$, the space $H^1(\text{vect}(2; 1); \text{vect}(2; 1)) = 0$.

Again, no non-trivial double extensions for $\text{vect}(2; 1)$.

### 4.3.2. $\text{svect}(3; N)$ for $p = 2$.

The divergence-free Lie algebra is defined as:

$$\text{svect}(n; N) := \{ D \in \text{vect}(n; N) \mid \text{div}(D) = 0 \}.$$ 

This Lie algebra is not simple; however its first derived subalgebra $\text{svect}^{(1)}(n; N)$ is simple for $n \geq 3$, see [S, SF]. Consider the map

$$\mathcal{O}(n, N) \rightarrow \text{vect}(n; N) \quad f \mapsto D_{i,j}(f) = \partial_j(f)\partial_i - \partial_i(f)\partial_j.$$ 

Clearly,

$$\text{svect}^{(1)}(n; N) = \text{Span}\{ D_{i,j}(f) \mid f \in \mathcal{O}(n, N), 1 \leq i < j \leq n \}.$$ 

The Lie algebra $\text{svect}^{(1)}(n; N)$ has a NIS if and only if $n = 3$; explicitly

$$B(\partial_i, D_{jk}(u^{(\tau(N))})) = \text{sign}(i, j, k),$$

and extending the form to other pairs of elements by invariance and linearity.

We have the following exceptional isomorphisms

$$\text{svect}^{(1)}(3; 1) \cong h^{(1)}(4; 1) \cong \mathfrak{psl}(4) \quad \text{for } p = 2 \quad (\text{as shown in } [CK]).$$

This case has been studied in [BLJ].
Claim 4.9. $H^1_{\mathcal{R}}(\text{svect}^{(1)}(3;1);\text{vect}^{(1)}(3;1))$ is spanned by the cocycles

$$
\text{deg} = 3 : \mathcal{R}_2 = 2D_{1,3}(u(\tau)) \otimes (D_{2,3}(u(\tilde{\tau}-2\tilde{c})) + D_{1,2}(u(\tau)) \otimes (D_{2,3}(u(\tilde{\tau}-3\tilde{c}))) + (2D_{1,3}(u(\tau-\partial_1)) + 2D_{1,2}(u(\tau-\partial_2))) \otimes (D_{1,3}(u(\tau-\partial_3))) + D_{1,3}(u(\tau-\partial_1) \otimes \partial_1 + D_{1,2}(u(\tau-\partial_2) \otimes \partial_2).
$$

$$
\text{deg} = 0 : \mathcal{R}_1 = (D_{1,2}(u(\tau-\partial_3)) + 2D_{1,3}(u(\tau-\partial_1)) \otimes (D_{1,2}(u(\tau-\partial_2))) + (2D_{1,3}(u(\tau-\partial_3)) + D_{1,2}(u(\tau-\partial_2))) \otimes (D_{1,3}(u(\tau-\partial_1))) + (D_{1,3}(u(\tau-\partial_2)) + D_{2,3}(u(\tau-\partial_3))) \otimes (D_{1,3}(u(\tau-\partial_1))) + D_{1,3}(u(\tau-\partial_1) \otimes (D_{1,3}(u(\tau-\partial_1)) \otimes (D_{1,3}(u(\tau-\partial_3)) + 2D_{1,2}(u(\tau-\partial_3)) \otimes (D_{1,2}(u(\tau-\partial_3))) + (2D_{1,3}(u(\tau-\partial_3)) \otimes (D_{1,2}(u(\tau-\partial_3))) + (D_{1,3}(u(\tau-\partial_3)) \otimes (D_{1,3}(u(\tau-\partial_3)) + 2D_{1,2}(u(\tau-\partial_3)) \otimes (D_{1,2}(u(\tau-\partial_3))).
$$

A direct computation shows that the bilinear form given in Eq. (34) is not $\mathcal{R}_2$-invariant. Therefore, the Lie algebra $\text{svect}^{(1)}(3;1)$ cannot be double extended by means of $\mathcal{R}_2$. However, a direct computation shows that this bilinear form is $\mathcal{R}_1$-invariant and, moreover, $\mathcal{R}_1^3 = 0$. Therefore, $a_0 = \gamma = 0$, see §2.1.2.

Now we define the cubic form

$$
q(\sum_{1 \leq i \leq 52} \lambda_i e_i) = 2\lambda_2^2 + \lambda_9\lambda_{12}\lambda_2 + \lambda_{10}\lambda_{17}\lambda_2 + 2\lambda_4\lambda_{20}\lambda_2 + 2\lambda_8\lambda_{21}\lambda_2 + \lambda_3\lambda_{37}\lambda_2 + \lambda_7\lambda_8^2 + \lambda_2^2\lambda_9 + \lambda_4\lambda_8\lambda_{10} + 2\lambda_4\lambda_8\lambda_{11} + 2\lambda_1\lambda_8\lambda_{12} + \lambda_3\lambda_{11}\lambda_{12} + \lambda_3\lambda_8\lambda_{15} + \lambda_1\lambda_4\lambda_{17} + 2\lambda_3\lambda_7\lambda_{17} + 2\lambda_3\lambda_4\lambda_{22} + 2\lambda_3^2\lambda_{28},
$$

$$
where it suffices to describe the \( e_i \) that appear in the expression of \( q(a) \):

\[
\begin{align*}
e_2 &= \partial_2, & e_3 &= \partial_3, & e_4 &= 2D_{1,2}(u^{(r-2c_1-2c_2)}), \\
e_7 &= D_{2,3}(u^{(r-2c_1-2c_2)}), & e_8 &= D_{1,3}(u^{(r-2c_1-2c_3)}), & e_9 &= D_{2,3}(u^{(r-2c_1-2c_3)}), \\
e_{10} &= D_{1,2}(u^{(r-\epsilon_1-\epsilon_2-2c_3)}), & e_{11} &= D_{1,3}(u^{(r-\epsilon_2-\epsilon_3-\epsilon_1)}), & e_{12} &= D_{2,3}(u^{(r-\epsilon_3-\epsilon_2)}), \\
e_{15} &= 2D_{1,2}(u^{(r-\epsilon_3-\epsilon_2)}), & e_{17} &= D_{2,3}(u^{(r-\epsilon_3-\epsilon_2)}), & e_{20} &= D_{1,3}(u^{(r-\epsilon_3-\epsilon_2)}), \\
e_{21} &= D_{1,2}(u^{(r-2\epsilon_3-\epsilon_2)}), & e_{22} &= D_{1,3}(u^{(r-\epsilon_3-\epsilon_2)}), & e_{28} &= D_{2,3}(u^{(r-\epsilon_2)}), \\
e_{32} &= D_{2,3}(u^{(r-\epsilon_3)}), & e_{37} &= D_{2,3}(u^{(r-\epsilon_3-\epsilon_2)}).
\end{align*}
\]

A direct computation shows that (here \( \mathcal{B} \) is the bilinear form in Eq. (34))

\[
q(a + b) - q(a) - q(b) = \mathcal{B}(\mathcal{D}_1(a - b), [a, b]) \quad \text{for all } a, b \in \text{svect}^{(1)}(3; 1).
\]

Therefore, the \( \mathcal{D}_1 \)-extension of \( \text{svect}^{(1)}(3; 1) \) is a Lie algebra of dimension 54 that we denote by \( \text{svect}^{(1)}(3; 1) \).

Let us summarize:

<table>
<thead>

4.3.3. The Hamiltonian Lie algebra \( h_B^{(1)}(a; 1|b) \) for \( a + b = 4 \) and \( p = 2 \). For \( p = 2 \), there are four series of Hamiltonian Lie (super)algebras for \( B = I I, I II, II I \) or \( II II \) as shown by Lebedev [LeD]. Their double extensions were described in [BLJ] completing the result of [BeBou].

There are other Hamiltonian Lie algebras \( h_o(2n; N) \) (for \( p > 2 \)) classified by Skryabin [Sk] that have a NIS, see [BKLS].

4.3.4. Special Leites superalgebra \( \text{sl}(2; 1|2) \) for \( p = 3 \). The Leites superalgebra (also known as “odd” Hamiltonian) is defined on the tensor product of Grassmann algebra by the algebra of truncated polynomials generated by \( n \) even generators \( q_1, \ldots, q_n \) and \( n \) odd generators \( \xi_1, \ldots, \xi_n \). More generally,

\[
\text{sl}(n; N|n) := \text{Span}(\text{Le}_f \mid f \in \mathcal{O}(q_i; N|\xi)), \quad \text{Le}_f := \sum_{i \leq n} \left( \frac{\partial f}{\partial q_i} \frac{\partial}{\partial q_i} + (-1)^{p(f)} \frac{\partial f}{\partial \xi_i} \frac{\partial}{\partial \xi_i} \right).
\]

The Lie bracket \( [\text{Le}_f, \text{Le}_g] = \text{Le}_{\{f, g\}} \) is given by the Buttin bracket: Observe that \( p(\text{Le}_f) = p(f) + 1 \).
The Buttin bracket or Schouten bracket a.k.a. antibracket \( \{ \cdot , \cdot \}_{B.b.} \) is given by the formula

\[
\{ f, g \}_{B.b.} := \sum_{i \leq n} \left( \frac{\partial f}{\partial q_i} \frac{\partial g}{\partial \xi_i} + (-1)^{p(f)} \frac{\partial f}{\partial \xi_i} \frac{\partial g}{\partial q_i} \right)
\]
for any \( f, g \in \mathcal{O}(q; N|\xi) \).

The special subalgebra is defined as

\[
\mathfrak{sl}(n; N|n) = \text{Span}(\mathcal{D} \in \mathfrak{le}(n; N|n) | \text{Div} \mathcal{D} = 0).
\]

The Lie superalgebra \( \mathfrak{sl}(2; 1|2) \) admits a NIS given in the ordered basis above by the Gram matrix (here \( s, t \in \mathbb{K} \)):

\[
\mathcal{B}_{\mathfrak{sl}(2; 1|2)} = s \mathcal{B}^1 + t \mathcal{B}^2,
\]
where

\[
\mathcal{B}^1 = \text{antidiag}\{2, 1, 1, 1, 2, 1, 2, 1, 1, 2, 1, 1, 2\},
\]
\[
\mathcal{B}^2 = (E^{13, 5} + E^{5, 13} + E^{14, 8} + E^{8, 14} + E^{11, 9} + E^{9, 11} + 2E^{12, 12}).
\]

The bilinear form \( \mathcal{B}_{\mathfrak{sl}(2; 1|2)} \) is non-degenerate if and only if \( s \neq 0 \).

There is a 3|6-structure on \( \mathfrak{sl}(2; 1|2) \) given by

\[
(\text{Le}_{a_{12}})^{[3]} = \text{Le}_{a_{12}}, \text{ and for } i \neq 12, (\text{Le}_{a_i})^{[3]} = 0 \text{ (whenever } p(\text{Le}_{a_i}) = 0).}
\]
Claim 4.10. (i) For \( p = 3 \), the space \( H^1(\mathfrak{sl}(2,1)\mathfrak{e}(2);\mathfrak{sl}(2,1)\mathfrak{e}(2)) \) is spanned by the cocycles (odd cocycles are underlined):

\[
\begin{align*}
\text{deg} = -2: & \quad D_1 = a_1 \otimes \tilde{a}_{13} + a_2 \otimes \tilde{a}_{14}, \\
\text{deg} = -2: & \quad D_2 = a_1 \otimes \tilde{a}_{10} + 2a_2 \otimes \tilde{a}_7 + 2a_5 \otimes \tilde{a}_{14} + a_8 \otimes \tilde{a}_{13}, \\
\text{deg} = -1: & \quad D_3 = a_1 \otimes \tilde{a}_{11} + 2a_4 \otimes \tilde{a}_{14}, \\
\text{deg} = -1: & \quad D_4 = a_2 \otimes \tilde{a}_9 + 2a_6 \otimes \tilde{a}_{13}, \\
\text{deg} = -1: & \quad D_5 = a_2 \otimes \tilde{a}_4 + a_5 \otimes \tilde{a}_9 + a_6 \otimes \tilde{a}_{10} + 2a_{11} \otimes \tilde{a}_{13}, \\
\text{deg} = -1: & \quad D_6 = a_1 \otimes \tilde{a}_6 + a_4 \otimes \tilde{a}_7 + a_8 \otimes \tilde{a}_{11} + 2a_9 \otimes \tilde{a}_{14}, \\
\text{deg} = 0: & \quad D_7 = 2a_5 \otimes \tilde{a}_2 + a_8 \otimes \tilde{a}_1 + a_9 \otimes \tilde{a}_4 + 2a_{11} \otimes \tilde{a}_6 + a_{12} \otimes \tilde{a}_3 + 2a_{13} \otimes \tilde{a}_{10} + a_{14} \otimes \tilde{a}_7, \\
\text{deg} = 0: & \quad D_8 = a_1 \otimes \tilde{a}_8 + a_4 \otimes \tilde{a}_9 + a_6 \otimes \tilde{a}_{11} + 2a_7 \otimes \tilde{a}_{14}, \\
\text{deg} = 0: & \quad D_9 = a_1 \otimes \tilde{a}_1 + a_2 \otimes \tilde{a}_2 + a_3 \otimes \tilde{a}_3 + a_4 \otimes \tilde{a}_4 + a_6 \otimes \tilde{a}_6 + a_7 \otimes \tilde{a}_7 + a_{10} \otimes \tilde{a}_{10}, \\
\text{deg} = 0: & \quad D_{10} = 2a_2 \otimes \tilde{a}_2 + a_4 \otimes \tilde{a}_4 + a_5 \otimes \tilde{a}_5 + 2a_6 \otimes \tilde{a}_6 + 2a_9 \otimes \tilde{a}_9 + a_{10} \otimes \tilde{a}_{10} + a_{11} \otimes \tilde{a}_{11} + 2a_{13} \otimes \tilde{a}_{13}, \\
\text{deg} = 1: & \quad D_11 = a_4 \otimes \tilde{a}_5 + a_{10} \otimes \tilde{a}_{11}, \\
\text{deg} = 1: & \quad D_12 = a_6 \otimes \tilde{a}_8 + a_7 \otimes \tilde{a}_9, \\
\text{deg} = 1: & \quad D_{13} = a_4 \otimes \tilde{a}_2 + a_5 \otimes \tilde{a}_5 + a_{10} \otimes \tilde{a}_6 + 2a_{13} \otimes \tilde{a}_{11}, \\
\text{deg} = 1: & \quad D_{14} = a_6 \otimes \tilde{a}_1 + a_7 \otimes \tilde{a}_4 + a_{11} \otimes \tilde{a}_8 + 2a_{14} \otimes \tilde{a}_9, \\
\text{deg} = 2: & \quad D_{15} = a_7 \otimes \tilde{a}_5 + a_{10} \otimes \tilde{a}_8, \\
\text{deg} = 2: & \quad D_{16} = a_7 \otimes \tilde{a}_2 + 2a_{10} \otimes \tilde{a}_1 + 2a_{13} \otimes \tilde{a}_8 + a_{14} \otimes \tilde{a}_5.
\end{align*}
\]

(38)

The bilinear form \( \mathcal{B}_{\mathfrak{sl}(2,1)\mathfrak{e}(2)} \) is not \( \mathfrak{D} \)-invariant for the even derivations given in (38). However, it is \( \mathfrak{D} \)-invariant for the odd ones, except for the derivation \( \mathfrak{D}_7 \) for which \( s \) must be zero. Moreover, all these odd derivations satisfy \( \mathfrak{D}^2 = 0 \).

Besides, the isometry

\[ x_1 \leftrightarrow x_2, \quad \xi_1 \leftrightarrow \xi_2, \]

sends the derivative \( \mathfrak{D}_3 \) to \( \mathfrak{D}_4 \) and \( \mathfrak{D}_{11} \) to \( \mathfrak{D}_{12} \).

Let us classify the double extensions of \( (\mathfrak{sl}(2,1)\mathfrak{e}(2);\mathfrak{sl}(2,1)\mathfrak{e}(2)) \) up to isometries.

Claim 4.11. For \( \lambda_0 = 0 \) (see Eq. (16)), the table

<table>
<thead>
<tr>
<th>Derivation</th>
<th>( \mathfrak{D}_1 )</th>
<th>( \mathfrak{D}_3 )</th>
<th>( \mathfrak{D}_7 )</th>
<th>( \mathfrak{D}_8 )</th>
<th>( \mathfrak{D}_{11} )</th>
<th>( \mathfrak{D}_{15} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \mathfrak{g} )</td>
<td>( \mathfrak{sl}(2,1)\mathfrak{e}(2) )</td>
<td>( \mathfrak{sl}(2,1)\mathfrak{e}(2) )</td>
<td>( \mathfrak{sl}(2,1)\mathfrak{e}(2) )</td>
<td>( \mathfrak{sl}(2,1)\mathfrak{e}(2) )</td>
<td>( \mathfrak{sl}(2,1)\mathfrak{e}(2) )</td>
<td>( \mathfrak{sl}(2,1)\mathfrak{e}(2) )</td>
</tr>
<tr>
<td>( \dim H^1(\mathfrak{g}) )</td>
<td>52</td>
<td>51</td>
<td>25</td>
<td>38</td>
<td>43</td>
<td>53</td>
</tr>
</tbody>
</table>

shows that all double extensions by means of the derivations given in (38) are mutually non-isometric. Conjecturally, they are mutually non-isometric for \( \lambda_0 \neq 0 \).

4.4. \( \mathfrak{osp}(1|2) \) for \( p = 3 \). Let us fix a basis of \( \mathfrak{osp}(1|2) \) generated by the root vectors \( x_1, x_2 = [x_1, x_1] \) (positive) and \( y_1, y_2 = [y_1, y_1] \) (negative). The Lie superalgebra \( \mathfrak{osp}(1|2) \) admits a NIS
given in the ordered basis $e_1 = [x_1, y_1], e_2 = x_1, e_3 = x_2, e_4 = y_1, e_5 = y_2$, by the Gram matrix

$$B_{\text{osp}(1|2)} = \begin{pmatrix} 2 & 0 & 0 & 0 & 0 \\ 0 & 0 & 2 & 0 \\ 0 & 0 & 0 & 2 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 2 & 0 \end{pmatrix}. $$

There is a 3|6-structure on $\text{osp}(1|2)$ given by

$$e_1^{[3]} = e_1, \quad e_2^{[6]} = e_3^{[3]} = e_4^{[6]} = e_5^{[3]} = 0. $$

**Claim 4.12.** (i) For $p = 3$, the space $H^1(\text{osp}(1|2); \text{osp}(1|2))$ is spanned by the odd cocycles:

$$\deg = -3: \quad D_1 = 2y_1 \otimes x_2 + y_2 \otimes x_1, $$

$$\deg = 3: \quad D_2 = x_1 \otimes y_2 + x_2 \otimes y_1. $$

(ii) For $p > 3$, $H^1(\text{osp}(1|2); \text{osp}(1|2)) = 0.$

A long but easy computation shows that $B_{\text{osp}(1|2)}$ is $\mathcal{D}_1$-invariant and $\mathcal{D}_2$-invariant. Moreover, it is easy to show that $\mathcal{D}_1^2 = \mathcal{D}_2^2 = 0$. Therefore, Eqs. (14) are satisfied because $\text{osp}(1|2)$ is simple.

We define an isometry of $\text{osp}(1|2)$ given by $\pi_0(x_1) = 2y_1$ and $\pi_0(y_1) = x_1$. It satisfies the conditions of Theorem 3.20 for $\lambda = 1$ and $\kappa = 0$. Besides,

$$\mathcal{D}_1 \circ \pi_0 = \pi_0 \circ \mathcal{D}_2. $$

Let us summarize:

<table>
<thead>
<tr>
<th>Derivation</th>
<th>$\mathcal{D}_0$</th>
<th>Double extension</th>
<th>$p$</th>
<th>Restrictedness</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\mathcal{D}_1$ (odd)</td>
<td>0</td>
<td>$\text{osp}(1</td>
<td>2)$</td>
<td>3</td>
</tr>
</tbody>
</table>

4.5. $\text{psq}(2)$ for $p > 2$. Following [ABBQ], the Lie superalgebra $\text{psq}(2) := \text{sl}(2) \oplus \Pi(\text{sl}(2))$ has a basis $h, e, f, h^*, e^*, f^*$ where the bracket is given by

$$[h, e] = e, \quad [h, e^*] = -e^*, \quad [e, e^*] = h^* $$

$$[h, f] = -f, \quad [h, f^*] = f^*, \quad [f, h^*] = 2e^* $$

$$[e, f] = 2h, \quad [e, h^*] = -2f^*, \quad [f, f^*] = -h^* $$

There exists an odd NIS on it given by

$$\mathcal{B}_{\text{psq}(2)}(h, h^*) = \mathcal{B}_{\text{psq}(2)}(e, e^*) = \mathcal{B}_{\text{psq}(2)}(f, f^*) = 1. $$

Moreover, a $p|2p$-structure is given by

$$h^{[p]} = h, \quad x^{[p]} = y^{[p]} = 0. $$

**Claim 4.13.** The space $H^1(\text{psq}(2); \text{psq}(2))$ is spanned by the two cocycles:

$$\text{Odd:} \quad \mathcal{D}_1 = x \otimes y^* + y \otimes x^* + 2h \otimes h^*, $$

$$\text{Even:} \quad \mathcal{D}_2 = x^* \otimes x^* + y^* \otimes y^* + h^* \otimes h^*. $$
An easy computation shows that $\mathfrak{p}_{sq}(2)$ is $\mathcal{D}_1$-invariant; however, it is not $\mathcal{D}_2$-invariant. Indeed,

$$1 = \mathfrak{p}_{sq}(2)(\mathcal{D}_2(h^*), h) \neq -\mathfrak{p}_{sq}(2)(h^*, \mathcal{D}_2(h)) = 0.$$ 

Moreover, it is easy to show that $\mathcal{D}_1^2 = 0$. Therefore, Eqs. (15) are satisfied because $\mathfrak{a}$ has no center. Let us summarize:

<table>
<thead>
<tr>
<th>Derivation</th>
<th>$b_0$</th>
<th>Double extension</th>
<th>$p$</th>
<th>Restrictedness</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\mathcal{D}_1$</td>
<td>0</td>
<td>$q(n)$</td>
<td>$p &gt; 2$</td>
<td>Yes</td>
</tr>
</tbody>
</table>
