Q-ANALOGUES OF SEVERAL $\pi$-FORMULAS

CHUANAN WEI

Department of Medical Informatics
Hainan Medical University, Haikou 571199, China

Abstract. According to the $q$-series method, a short proof for Hou and Sun’s identity, which is the $q$-analogue of a known $\pi$-formula, is offered. Furthermore, $q$-analogues of several other $\pi$-formulas are also established in terms of the $q$-series method and the telescoping method.

1. Introduction

For two complex numbers $x$, $q$ and an integer $n$ with $|q| < 1$, define $q$-shifted factorial to be

$$(x; q)_\infty = \prod_{i=0}^{\infty}(1 - xq^i), \quad (x; q)_n = \frac{(x; q)_\infty}{(xq^n; q)_\infty}.$$  

For convenience, we shall adopt the following notations:

$$(x_1, x_2, \cdots, x_r; q)_\infty = (x_1; q)_\infty(x_2; q)_\infty \cdots (x_r; q)_\infty,$$

$$(x_1, x_2, \cdots, x_r; q)_n = (x_1; q)_n(x_2; q)_n \cdots (x_r; q)_n.$$  

Following Gasper and Rahman [2], the basic hypergeometric series can be defined by

$$1 + \phi_s \left[ \begin{array}{c} a_0, a_1, \cdots, a_r \\ b_1, \cdots, b_s \end{array} \right] q; z = \sum_{k=0}^{\infty} \frac{(a_0, a_1, \cdots, a_r; q)_k}{(q, b_1, \cdots, b_s; q)_k} (-1)^k q^k \binom{k}{s} z^k.$$  

Recently, Guo and Liu [6] utilized WZ method to derive the two identities

$$\sum_{k=0}^{\infty} q^k \frac{1 - q^{4k+1}}{1 - q} \binom{q^2}{(q^2; q^4)_k} = \frac{(1 + q)(q^2; q^4)_\infty(q^6; q^8)_\infty}{(q^4; q^8)_\infty},$$ (1)

$$\sum_{k=0}^{\infty} (-1)^k q^{3k} \frac{1 - q^{4k+1}}{1 - q} \binom{q^3}{(q^3; q^4)_k} = \frac{(q^3; q^4)_\infty(q^6; q^8)_\infty}{(q^4; q^8)_\infty},$$ (2)

which are $q$-analogues of two formulas due to Ramanujan [12]

$$\sum_{k=0}^{\infty} \frac{(6k+1)}{k!} \frac{(\frac{1}{2})_k^3}{3^k 4^k} = \frac{4}{\pi},$$

$$\sum_{k=0}^{\infty} (-1)^k (6k+1) \frac{(\frac{1}{2})_k^3}{k!^3 8^k} = \frac{2\sqrt{2}}{\pi}.$$  

Here, we have employed the Pochhammer symbol

$$(x)_0 = 1 \quad \text{and} \quad (x)_n = x(x+1) \cdots (x+n-1) \quad \text{when} \quad n = 1, 2, \cdots.$$  

Hou, Krattenthaler, and Sun [9] showed that (1) and (2) can be deduced through the intelligent use of a quadratic transformation formula from [2] p. 92 and gave $q$-analogues

2010 Mathematics Subject Classification: Primary 11B65 and Secondary 05A10.

of the classical Leibniz series and a Zeilberger-type series. Later, Guo and Zudilin [7] also proved the two formulas in accordance with a quadratic summation formula of Rahman [11] and established $q$-analogues of several other Ramanujan-type formulas via the WZ-method. Recall three simple $\pi$-formulas

\[
\sum_{k=1}^{\infty} \frac{1}{k^2} = \frac{\pi^2}{6},
\]

\[
\sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)^3} = \frac{\pi^3}{32},
\]

\[
\sum_{k=1}^{\infty} \frac{1}{k^4} = \frac{\pi^4}{90}.
\]

Sun [13] found two $q$-analogues of (3) and a $q$-analogue of (4). Hou and Sun [10] offered the following $q$-analogue of (4):

\[
\sum_{k=0}^{\infty} (-1)^k q^{2k}(1 + q^{2k+1}) \frac{1}{(1 - q^{2k+1})^2} = \frac{(q^2; q^4)_{\infty}^2 (q^4; q^4)_{\infty}^0}{(q, q^2)_{\infty}^3}.
\]

More $q$-analogues of $\pi$-formulas can be seen in the papers [5] and [8].

In the literature of $\pi$-formulas, there exist five interesting results

\[
\sum_{k=0}^{\infty} \frac{k!}{(\frac{\pi}{2})_k} \frac{1}{2^k} = \frac{\pi}{2},
\]

\[
\sum_{k=0}^{\infty} \frac{k!}{(\frac{\pi}{2})_k} \frac{1}{4^k} = \frac{2\pi}{3\sqrt{3}},
\]

\[
\sum_{k=0}^{\infty} \frac{k!}{(\frac{\pi}{2})_k} \frac{3k + 2}{4^k} = \frac{\pi^2}{4},
\]

\[
\frac{\sin(\pi x) \sin(\pi y)}{\pi^2} = \sum_{k=0}^{\infty} \frac{(x)_k (1 - x)_k (y)_{k+1} (1 - y)_k}{k!^{12} (k+1!)^2} \times \left\{ (k^2 + k)(x + y - x^2 - y^2) + xy(1 - x)(1 - y) \right\},
\]

\[
\frac{\pi^2}{\sin(\pi x) \sin(\pi y)} = \frac{1}{(1 - x)(1 - y)} + \sum_{k=0}^{\infty} \frac{k!^4}{(x)_{k+1} (1 - x)_{k+2} (y)_k (1 - y)_{k+2}} \times \left\{ (k^2 + 2k)(2 - 2x + 2y + x^2 + y^2) + 1 - xy(2 - x)(2 - y) \right\},
\]

where (7-8) can be found in Weisstein [15]. (9) can be seen in Guillera [3], and (10-11) are due to Wei et al. [14]. It should be mentioned that the case $x = y = \frac{1}{2}$ of (11) is exactly the result of Guillera [3]:

\[
\frac{2}{\pi^2} = \sum_{k=0}^{\infty} \frac{(1/2)_k^4}{k!^{12} (k+1!)^2} \{k^2 + k + 1/8\}.
\]

The structure of the paper is arranged as follows. In Section 2, we shall prove (1), construct a new $q$-analogue of (3), and derive $q$-analogues of (7-8) by means of the $q$-series method. $q$-Analogues of (10-12) will be established through the telescoping method in Section 3.

2. $q$-Series Method and $q$-Analogues of $\pi$-Formulas

Above all, we shall give a simple proof of (3) in this section. Subsequently, a new $q$-analogue of (3) will be deduced in Theorem 2. Then $q$-analogue of (7-11) will respectively be established in Theorems 3-5.

Theorem 1.

\[
\sum_{k=0}^{\infty} (-1)^k q^{2k}(1 + q^{2k+1}) \frac{1}{(1 - q^{2k+1})^2} = \frac{(q^2; q^4)_{\infty}^2 (q^4; q^4)_{\infty}^0}{(q, q^2)_{\infty}^3}.
\]
Proof. We begin with the summation formula for \(\psi_2\)-series (cf. [24] p. 355])

\[
\psi_2 \left[ a, q\sqrt{a}, -q\sqrt{a}, b, c, d, e, f \right] = (aq, aq/e, aq/f; q)_{\infty}.
\]

Fix \(a = q^{\frac{1}{2}}, c = -q, d = -q^{\frac{1}{2}}\) to obtain

\[
\psi_4 \left[ q, -q^2, q^2, q^2, q^2 \right] = (q, q^2; q)_{\infty}^4 / (q^2; q)_{\infty}^4.
\]

Replacing \(q\) by \(q^2\) in the last equation, we get Theorem 1.

Theorem 2.

\[
\sum_{k=0}^{\infty} \frac{1 + q^{2k+2}}{(1 + q^{2k+1})^2 (1 - q^{2k+1})^2} = \frac{(-q^2; q^2)_{\infty}^2 (q; q^2)_{\infty}^4}{(q^2; q^2)_{\infty}^8}.
\]

Proof. A transformation formula for \(\psi_2\)-series (cf. [24] p. 361]) can be stated as

\[
\psi_2 \left[ a, q\sqrt{a}, -q\sqrt{a}, b, c, d, e, f \right] = (aq, aq/e, aq/f; q)_{\infty}.
\]

where \(\lambda = qa^2/bcde\). Let \(a = q, b = -q, c = d = e = f = q^{\frac{1}{2}}\) to gain

\[
\sum_{n=0}^{\infty} \frac{1 + q^{n+\frac{1}{2}}}{1 + q^{\frac{1}{2}} (1 - q^{n+\frac{1}{2}})^3} (q; q)_{\infty}^4 = \frac{(-q^2, q^2; q)_{\infty}^4}{(-q, q^2; q)_{\infty}^4} \sum_{k=0}^{\infty} (-1)^k q^{2n} (1 + q^{2k+n+1})^3.
\]

Calculating the series on the right hand side by Theorem 1 we achieve Theorem 2.

Theorem 3.

\[
\sum_{k=0}^{\infty} \frac{(q; q)_{k} \phi_{k+1}^{(k+1)^2}}{(q; q^2)_{k+1} (q^2; q)_{\infty}} = \frac{(q^2; q^2)_{\infty}}{(q; q^2)_{\infty}}.
\]

Proof. We start with the summation formula for \(\psi_2\)-series (cf. [24] p. 355])

\[
\psi_2 \left[ a^2, b^2 \atop abq^{\frac{1}{2}}, -abq^{\frac{1}{2}} \right] = \frac{(a^2 q, b^2 q; q^2)_{\infty}}{(q, a^2 b^2 q; q^2)_{\infty}}.
\]

Take \(a = b = q^{\frac{1}{2}}\) to attain

\[
\sum_{k=0}^{\infty} \frac{(q; q)_{k} \phi_{k+1}^{(k+1)^2}}{(q^2; q)_{k} (q^2; q^2; q)_{\infty}} = \frac{(q^2; q^2)_{\infty}}{(q, q^2; q^2)_{\infty}}.
\]

Multiplying both sides by \(1/(1 - q)\), we obtain Theorem 3.

Theorem 4.

\[
\sum_{k=0}^{\infty} \frac{(q^2; q^2)_{k} \phi_{k+1}^{(k+1)^2}}{(q; q^2)_{2k+1} (q^2; q^2)_{\infty}} = \frac{(q^2; q^2)_{\infty}}{(q, q^2; q^2)_{\infty}}.
\]
Theorem 5. The terminating form of it due to Chu [1, p. 65] is

\[
\mathcal{A} \sum_{k=0}^{\infty} \frac{1 - a^2 q^{2k}}{1 - a^2} \frac{1 - a^2 q^{2k} (a^2 q^2 / b; q)^{k+1} (a^2 q^2 / c; q)^{k+1}}{(1 - a^2 q^2 / b, a^2 q^2 / c; q)^{k+1}} q^{2k} = \frac{(bq^2, q^2/b, bq^2, q^2/c, q^2/a^2, q^2/a^2, q^2/a^2; q^4)_\infty}{(bq^2, q^2/c, q^2/a^2, q^2/c, q^2/a^2, q^2/a^2, q^2/a^2; q^4)_\infty}
\]

\[
\quad \times \begin{pmatrix}
   b a^2 c^3 q^2 / a^2 b & c^3 q^2 / a^2 b & q^2 / a^2 c^3 q^2 / a^2 b
\end{pmatrix}.
\]

The terminating form of it due to Chu [1, p. 65] is

\[
\mathcal{A} \sum_{k=0}^{\infty} \frac{1 - a^2 q^{2k}}{1 - a^2} \frac{(bq^2, q^2/b; q)^{k+1} (a^2 q^2 / a^2 q^2 / b; q)^{k+1}}{(1 - a^2 q^2 / b, a^2 q^2 / b; q)^{k+1}} q^{2k} = \frac{(a^2 q^2, q^2/a^2, a^2 q^2 / b, a^2 q^2 / b; q)^{n+1}}{(a^2 q^2, q^2/a^2, a^2 q^2 / b, a^2 q^2 / b; q)^{n}}
\]

Let \( n \to \infty \) to get

\[
\mathcal{A} \sum_{k=0}^{\infty} \frac{1 - a^2 q^{2k}}{1 - a^2} \frac{(bq^2, q^2/b; q)^{k+1} (a^2 q^2 / a^2 q^2 / b; q)^{k+1}}{(1 - a^2 q^2 / b, a^2 q^2 / b; q)^{k+1}} q^{2k} = \frac{(a^2 q^2, q^2/a^2, a^2 q^2 / b, a^2 q^2 / b; q)^{\infty}}{(a^2 q^2, q^2/a^2, a^2 q^2 / b, a^2 q^2 / b; q)^{\infty}}
\]

Fixing \( a = 0, b = q \) in the last equation, we gain Theorem 4 \( \square \)

**Theorem 5.**

\[
\mathcal{A} \sum_{k=0}^{\infty} \frac{1 - q^{2k+2}}{1 - q^2} \frac{(q^2; q^2)_k}{(q^2; q^2)_k} q^{k+1} = \frac{(q^2; q^2)_\infty}{(q^2; q^2)_\infty} \frac{(q^2; q^2)_\infty}{(q^2; q^2)_\infty}
\]

**Proof.** Recall Chu’s identity (cf. [1, p. 63])

\[
\mathcal{A} \sum_{k=0}^{\infty} \frac{1 - a q^{2k}}{1 - a^q} \frac{(a^{-q} q a, q^{1 - q} a; q)_k (q^{1 - q} a, q^{1 - q} v, qa/uv q^{1 - q}); q)_{k+1} q^{2k}}{(a^{-q} q a, q^{1 - q} a; q)_k (q^{1 - q} a, q^{1 - q} v, qa/uv q^{1 - q}); q)_{k+1} q^{2k}}
\]

Let \( n \to \infty \) of it reads

\[
\mathcal{A} \sum_{k=0}^{\infty} \frac{1 - a q^{2k}}{1 - a q^{2k}} \frac{(a^{-q} q a, q^{1 - q} a; q)_k (q^{1 - q} a, q^{1 - q} v, qa/uv q^{1 - q}); q)_{k+1} q^{2k}}{(a^{-q} q a, q^{1 - q} a; q)_k (q^{1 - q} a, q^{1 - q} v, qa/uv q^{1 - q}); q)_{k+1} q^{2k}}
\]

The case \( n \to \infty \) of it reads

\[
\mathcal{A} \sum_{k=0}^{\infty} \frac{1 - a q^{2k}}{1 - a q^{2k}} \frac{(a^{-q} q a, q^{1 - q} a; q)_k (q^{1 - q} a, q^{1 - q} v, qa/uv q^{1 - q}); q)_{k+1} q^{2k}}{(a^{-q} q a, q^{1 - q} a; q)_k (q^{1 - q} a, q^{1 - q} v, qa/uv q^{1 - q}); q)_{k+1} q^{2k}}
\]

Set \( e^{q} = q^2, u = v = q \) to achieve

\[
\mathcal{A} \sum_{k=0}^{\infty} \frac{1 - q^{2k+2}}{1 - q^2} \frac{(q^2; q^2)_k (q^2; q^2)_k}{(q^2; q^2)_k (q^2; q^2)_k} q^{2k+1} = \frac{(q^2; q^2)_\infty (q^2; q^2)_\infty}{(q^2; q^2)_\infty (q^2; q^2)_\infty}
\]

Replacing \( q \) by \( q^2 \) in the last equation, we attain Theorem 5 \( \square \)

---

3. Telescoping method and \( q \)-analogues of \( \pi \)-formulas

For a complex sequence \( \{\tau_k\}_{k \in \mathbb{Z}} \), define the difference operator to be

\[
\nabla \tau_k = \tau_k - \tau_{k-1}.
\]
Then the telescoping method can offer the following relation:

\[ \sum_{k=0}^{n} \nabla \tau_k = \tau_n - \tau_{-1}. \]  \hfill (13)

According to (13), we shall establish a general identity in this section. Subsequently, it will be utilized to deduce \( q \)-analogues of (10), (12).

**Theorem 6.** Let \( \{x_i\}_{i=1}^{t} \) and \( \{y_i\}_{i=1}^{t} \) be complex numbers. Then

\[
\sum_{k=0}^{\infty} \frac{(x_1, x_2, \ldots, x_s; q)_k}{(qy_1, qy_2, \ldots, qy_s; q)_k} \left\{ \prod_{i=1}^{s} (1 - q^k x_i) - \prod_{i=1}^{s} (1 - q^k y_i) \right\} = \frac{(x_1, x_2, \ldots, x_s; q)_{n+1}}{(qy_1, qy_2, \ldots, qy_s; q)_{n}} - \prod_{i=1}^{s} (1 - y_i). \]

**Proof.** Taking

\[ \tau_k = \frac{(qx_1, qx_2, \ldots, qx_s; q)_k}{(qy_1, qy_2, \ldots, qy_s; q)_k}, \]

we obtain

\[
\nabla \tau_k = \frac{(x_1, x_2, \ldots, x_s; q)_k}{(qy_1, qy_2, \ldots, qy_s; q)_k} \left\{ \prod_{i=1}^{s} (1 - q^k x_i) - \prod_{i=1}^{s} (1 - q^k y_i) \right\} = \frac{(x_1, x_2, \ldots, x_s; q)_{n+1}}{(qy_1, qy_2, \ldots, qy_s; q)_{n}} - \prod_{i=1}^{s} (1 - y_i). \]

Substituting the expressions of \( \tau_k \) and \( \nabla \tau_k \) into (13), the result can be written as

\[
\sum_{k=0}^{n} \frac{(x_1, x_2, \ldots, x_s; q)_k}{(qy_1, qy_2, \ldots, qy_s; q)_k} \left\{ \prod_{i=1}^{s} (1 - q^k x_i) - \prod_{i=1}^{s} (1 - q^k y_i) \right\} = \frac{(x_1, x_2, \ldots, x_s; q)_{n+1}}{(qy_1, qy_2, \ldots, qy_s; q)_{n}} - \prod_{i=1}^{s} (1 - y_i). \]  \hfill (14)

Notice that

\[
\prod_{i=1}^{s} (1 - q^k x_i) - \prod_{i=1}^{s} (1 - q^k y_i) = \left\{ 1 + a_1 q^k + a_2 q^{2k} + \cdots + a_s q^{sk} \right\} - \left\{ 1 + b_1 q^k + b_2 q^{2k} + \cdots + b_s q^{sk} \right\} = (a_1 - b_1) q^k + (a_2 - b_2) q^{2k} + \cdots + (a_s - b_s) q^{sk}.
\]

The case \( n \to \infty \) of (13) reads

\[
\sum_{k=0}^{\infty} \frac{(x_1, x_2, \ldots, x_s; q)_k}{(qy_1, qy_2, \ldots, qy_s; q)_k} \left\{ \prod_{i=1}^{s} (1 - q^k x_i) - \prod_{i=1}^{s} (1 - q^k y_i) \right\} = \frac{(x_1, x_2, \ldots, x_s; q)_{\infty}}{(qy_1, qy_2, \ldots, qy_s; q)_{\infty}} - \prod_{i=1}^{s} (1 - y_i). \]

\[ \square \]

Performing the the replacements \( y_i \to 1, x_{m+i} \to q/x_i, y_{m+i} \to q \) with \( 1 \leq i \leq m \) in Theorem 6 when \( s = 2m \), we get the following identity.

**Corollary 7.** Let \( \{x_i\}_{i=1}^{m} \) be complex numbers. Then

\[
\prod_{i=1}^{m} (x_i, q/x_i; q)_{\infty} = \sum_{k=0}^{\infty} \frac{\prod_{i=1}^{m} (x_i, q/x_i; q)_k}{(q, q^2; q^m)_k} \times \left\{ \prod_{i=1}^{m} (1 - q^k x_i) (1 - q^{k+1}/x_i) - (1 - q^k)^m (1 - q^{k+1})^m \right\}.
\]
Substituting $q^{-i}$ for $x_i$ and then letting $q \to 1$, Corollary 7 becomes
\[
\prod_{i=1}^{m} \sin(\pi x_i) = \sum_{k=0}^{\infty} \prod_{i=1}^{m} (1-x_i) k \left\{ \prod_{i=1}^{m} (k+x_i)(k+1-x_i) - k^m (k+1)^m \right\}.
\]
When $m = 2$, Corollary 7 reduces to the following $q$-analogue of (10):
\[
\frac{(x,y,q/x,q/y;q)_{\infty}}{(q,q^2;q^2)_{\infty}} = \sum_{k=0}^{\infty} \frac{(x,y,q/x,q/y;q)_k}{(q,q^2;q^2)_k} \times \left\{ (1-q^k x)(1-q^k y)(1-q^{k+1}/x)(1-q^{k+1}/y) - (1-q^k)^2(1-q^{k+1})^2 \right\}.
\]
When $x = y = q^{1/2}$, the last equation reduces to the following $q$-analogue of (12):
\[
\frac{(q^{1/2};q)_{\infty}^4}{(q,q^2;q^2)_{\infty}} = \sum_{k=0}^{\infty} \frac{(q^{1/2};q)_k^4}{(q,q^2;q^2)_k} \left\{ (1-q^{k+1/2})^4 - (1-q^k)^2(1-q^{k+1})^2 \right\}.
\]
Performing the replacements $x_i \to q$, $y_i \to x_i, x_{m+i} \to q$, $y_{m+i} \to q^2/x_i$ with $1 \leq i \leq m$ in Theorem 6 when $s = 2m$, we gain the following identity.

**Corollary 8.** Let $\{x_i\}_{i=1}^{m}$ be complex numbers. Then
\[
\frac{(q;q)_{\infty}^{2m}}{\prod_{i=1}^{m} (x_i,q/x_i;q)_{\infty}} = \frac{(q;q)_{\infty}^{2m}}{\prod_{i=1}^{m} (1-q/x_i)} + \sum_{k=0}^{\infty} \frac{(q;q)_{\infty}^{2m}}{\prod_{i=1}^{m} (x_i q^k/x_i,q)_{k+2}} \times \left\{ (1-q^{k+1})^{2m} - \prod_{i=1}^{m} (1-q^k x_i)(1-q^{k+2}/x_i) \right\}.
\]
Substituting $q^{-i}$ for $x_i$ and then letting $q \to 1$, Corollary 8 becomes
\[
\prod_{i=1}^{m} \sin(\pi x_i) = \frac{1}{\prod_{i=1}^{m} (1-x_i)} + \sum_{k=0}^{\infty} \frac{k!^{2m}}{\prod_{i=1}^{m} (x_i q^k/x_i,1-x_i)_{k+2}} \times \left\{ (k+1)^{2m} - \prod_{i=1}^{m} (k+x_i)(k+2-x_i) \right\}.
\]
When $m = 2$, Corollary 8 reduces to the following $q$-analogue of (11):
\[
\frac{(q;q)_{\infty}^{4}}{(x,y,q/x,q/y;q)_{\infty}} = \frac{1}{(1-q/x)(1-q/y)} + \sum_{k=0}^{\infty} \frac{(q;q)_{\infty}^{4}}{(x,y,q)_{k+1}(q/x,q/y;q)_{k+2}} \times \left\{ (1-q^{k+1})^4 - (1-q^k x)(1-q^k y)(1-q^{k+2}/x)(1-q^{k+2}/y) \right\}.
\]
