ON EXISTENCE OF SHIFT-TYPE INVARIANT SUBSPACES FOR POLYNOMIALLY BOUNDED OPERATORS

MARIA F. GAMAL'

Abstract. A particular case of results from [K2] is as follows. Let the unitary asymptote of a contraction $T$ contain the bilateral shift (of finite or infinite multiplicity). Then there exists an invariant subspace $M$ of $T$ such that $T|_M$ is similar to the unilateral shift of the same multiplicity. The proof is based on the Sz.-Nagy–Foias functional model for contractions. In the present paper this result is generalized to polynomially bounded operators, but in the simplest case. Namely, it is proved that if the unitary asymptote of a polynomially bounded operator $T$ contains the bilateral shift of multiplicity 1, then there exists an invariant subspace $M$ of $T$ such that $T|_M$ is similar to the unilateral shift of multiplicity 1. The proof is based on a result from [B].

1. Introduction

Let $H$ be a (complex, separable) Hilbert space, and let $L(H)$ be the algebra of all (bounded, linear) operators acting on $H$. A (closed) subspace $M$ of $H$ is called invariant for an operator $T \in L(H)$, if $TM \subset M$. The complete lattice of all invariant subspaces of $T$ is denoted by $\text{Lat}_T$. For a (closed) subspace $M$ of a Hilbert space $H$, by $P_M$ and $I_M$ the orthogonal projection from $H$ onto $M$ and the identity operator on $M$ are denoted, respectively.

For Hilbert spaces $H$ and $K$, let $L(H,K)$ denote the space of (bounded, linear) transformations acting from $H$ to $K$. Suppose that $T \in L(H)$, $R \in L(K)$, $X \in L(H,K)$, and $X$ intertwines $T$ and $R$, that is, $XT = RX$. If $X$ is unitary, then $T$ and $R$ are called unitarily equivalent, in notation: $T \cong R$. If $X$ is invertible, that is, $X^{-1} \in L(K,H)$, then $T$ and $R$ are called similar, in notation: $T \approx R$. If $X$ is a quasiaffinity, that is, $\ker X = \{0\}$ and $\text{clos } XH = K$, then $T$ is called a quasiaffine transform of $R$, in notation: $T \prec R$. If $\text{clos } XH = K$, we write $T \overset{d}{\prec} R$. If $T \prec R$ and $R \prec T$, then $T$ and $R$ are called quasisimilar, in notation: $T \sim R$. Clearly, $T \prec R$ if and only if $R^* \prec T^*$. An operator $T$ is called power bounded, if $\sup_{n \geq 0} \|T^n\| < \infty$. An operator $T$ is called polynomially bounded, if there exists a constant $C$ such that $\|p(T)\| \leq C \max\{|p(z)| : |z| \leq 1\}$ for every (analytic) polynomial $p$. The smallest such constant is called the polynomial bound of $T$ and is denoted here by $C_{\text{pol},T}$.

Key words and phrases. Shift-type invariant subspace, polynomially bounded operator, similarity, unilateral shift.
Every polynomially bounded operator can be represented as a direct sum of an operator similar to a singular unitary operator and of an absolutely continuous (a.c.) polynomially bounded operator, that is, an operator which admits an $H^\infty$-functional calculus, see [M] or [K3, Theorems 13, 17 and 23]. In the present paper, absolutely continuous polynomially bounded operators are considered. (Although many results on polynomially bounded operators that will be used in the present paper were originally proved by Mlak [M], we will refer to [K3] for the convenience of references.)

An operator $T$ is called a contraction, if $\|T\| \leq 1$. Every contraction is polynomially bounded with the constant 1 by the von Neumann inequality (see, for example, [SFBK, Proposition I.8.3]). Clearly, every polynomially bounded operator is power bounded. (It is well known that the converse is not true, see [F] for the first example of a power bounded but not polynomially bounded operator, and [P] for the first example of a polynomially bounded operator which is not similar to a contraction.)

Let $T \in \mathcal{L}(\mathcal{H})$ be a power bounded operator. It is easy to see that the space

$$\mathcal{H}_{T,0} = \{ x \in \mathcal{H} : \| T^n x \| \to 0 \}$$

is invariant for $T$ (cf. [SFBK, Theorem II.5.4]). Classes $C_{ab}, a, b = 0, 1, \cdots$, of power bounded operators are defined as follows (see [SFBK, Sec. II.4] and [K1]). If $\mathcal{H}_{T,0} = \mathcal{H}$, then $T$ is of class $C_0$, while if $\mathcal{H}_{T,0} = \{ 0 \}$, then $T$ is of class $C_1$. Furthermore, $T$ is of class $C_a$, if $T^a$ is of class $C_a$, and $T$ is of class $C_{ab}$, if $T$ is of classes $C_a$ and $C_b$.

Let $T$ and $R$ be power bounded operators, and let $T \prec R$. It easily follows from the definition that if $R$ is of class $C_1$, or of class $C_0$, then $T$ is of class $C_1$, or of class $C_0$, too. Clearly, any isometry is of class $C_1$, a unitary operator is of class $C_{11}$, and the unilateral shift is of class $C_{10}$.

The notions of isometric and unitary asymptotes will be used. Although there exist further studies of these notions ([K3], [K4]), we restrict ourselves to the case of power bounded operators. For a power bounded operator $T \in \mathcal{L}(\mathcal{H})$ the isometric asymptote $(X_+, T_+^{(a)})$ can be defined using a Banach limit, see [K1]. Here $T_+^{(a)}$ is an isometry (on a Hilbert space), and $X_+$ is the canonical intertwining mapping: $X_+ T = T_+^{(a)} X_+$. Recall that $\ker X_+ = \mathcal{H}_{T,0}$, and the range of $X_+$ is dense. Thus, $T \prec T_+^{(a)}$. In particular, if $T$ is cyclic, then $T_+^{(a)}$ is cyclic, too. A power bounded operator $T$ is of class $C_{11}$ if and only if $T$ is quasisimilar to a unitary operator; then $T_+^{(a)}$ is unitary and $T \sim T_+^{(a)}$ (see [SFBK, Propositions II.3.4 and II.5.3]).

The unitary asymptote $(X, T^{(a)})$ of a power bounded operator $T \in \mathcal{L}(\mathcal{H})$ is a pair where $T^{(a)} \in \mathcal{L}(\mathcal{H}^{(a)})$ (here $\mathcal{H}^{(a)}$ is a some Hilbert space) is the minimal unitary extension of $T_+^{(a)}$, and $X$ is an extension of $X_+$. Therefore,

$$\bigvee_{n \geq 0} (T^{(a)})^{-n} X \mathcal{H} = \mathcal{H}^{(a)}.$$
In particular, if $T$ is cyclic, then $T^{(a)}$ is cyclic, too. If $T^{(a)}_+$ is unitary, then, of course, $(X_+, T^{(a)}_+)$ and $(X, T^{(a)})$. Note that $T^{(a)}_+$ and $T^{(a)}$ are defined up to unitarily equivalence.

Set $T_0 = T|_{H_{T,0}}$ and $T_1 = P_{H_{T,0}}T|_{H_{T,0}}$. By [K1, Lemma 1], $T_0$ and $T_1$ are of classes $C_0$ and $C_1$, respectively. Thus, every power bounded operator has the triangulations of the form

$$
\begin{pmatrix}
C_0 & * \\
\emptyset & C_1
\end{pmatrix}
\quad \text{and} \quad
\begin{pmatrix}
C_1 & * \\
\emptyset & C_0
\end{pmatrix}.
$$

By [K1, Theorem 3], $T^{(a)} \cong T^{(a)}_1$.

Let $T$ be a power bounded operator, let $U$ be a unitary operator, and let $T \prec U$. By [K1, Theorem 2], $T^{(a)}$ contains $U$ as an orthogonal summand, that is, there exists a unitary operator $V$ such that $T^{(a)} \cong U \oplus V$. On the other hand, it follows from (1.1) that $T \prec T^{(a)}$ (but this relation is not realized by the canonical intertwining mapping in general).

A particular case of [K2] is the following (see also [SFBK, Sec. IX.3] and references in [K2] and [SFBK] for the history of a question). Let $T$ be a contraction, and let $T^{(a)}$ contain the bilateral shift of finite or infinite multiplicity as an orthogonal summand. Then there exists $M \in \text{Lat} T$ such that $T|_M$ is similar to the unilateral shift of the same multiplicity. The proof is based on the Sz.-Nagy–Foias functional model for contractions, see [SFBK]. In the present paper this result is generalized to polynomially bounded operators, but in the simplest case. Namely, it is proved that if $T$ is a polynomially bounded operator and $T^{(a)}$ contains the bilateral shift of multiplicity 1, then there exists $M \in \text{Lat} T$ such that $T|_M$ is similar to the unilateral shift of multiplicity 1. The proof is based on a result from [B].

Before formulating the main result of the paper, we introduce some notation. $\mathbb{T}$ and $\mathbb{D}$ denote the unit circle and the open unit disc, respectively. $S$ is the unilateral shift of multiplicity 1, that is, $S$ is the operator of multiplication by the independent variable on the Hardy space $H^2$ on $\mathbb{T}$. The normalized Lebesgue measure on $\mathbb{T}$ is denoted by $m$. For a measurable set $\sigma \subset \mathbb{T}$ denote by $U_{\sigma}$ the operator of multiplication by the independent variable on $L^2(\sigma) := L^2(\sigma, m)$. Clearly, $U_T$ is the bilateral shift of multiplicity 1. It is well known and easy to see that $S$ and $U_{\sigma}$ are a.c. contractions.

**Theorem 1.1.** Suppose that $T$ is a cyclic a.c. polynomially bounded operator of class $C_1$, and $T^{(a)} \cong U_T$. Then there exists $M \in \text{Lat} T$ such that $T|_M \cong S$.

**Corollary 1.2.** Suppose that $T$ is a polynomially bounded operator such that $T \prec U_T$. Then for every $c > 0$ there exist $M \in \text{Lat} T$ and $W \in \mathcal{L}(H^2, M)$ such that $W$ is invertible, $WS = T|_M W$ and

$$
\|W\|\|W^{-1}\| \leq (1 + c)\left(\sqrt{2}(K^2 + 2)KC_{pol,T} + 1\right)\sqrt{K^2C_{pol,T}^2 + 1}KC_{pol,T}^2.
$$

**Remark 1.3.** Examples of polynomially bounded operators satisfying Theorem 1.1 and not similar to contractions can be found in [G]. Moreover, it follows from Theorem 1.1 and Corollary 1.2 that if $T$ is a polynomially bounded
bounded operator such that \( T \sim U_T \) and the product of intertwining quasi-affinities is an analytic function of \( U_T \), or if \( T \prec S \), then \( T \) is similar to an operator constructed in [G, Proposition 2.7 or Corollary 2.3], respectively.

**Remark 1.4.** Let \( T \) satisfy the assumption of Corollary 1.2. By [K1, Theorem 4], \( T \subset \sigma(T) \). By [R], \( T \) either has a nontrivial hyperinvariant subspace or is reflexive. Therefore, the result on existence of nontrivial invariant subspaces of \( T \) is not new. The reflexivity of contractions satisfying the assumptions of Corollary 1.2 is proved in [T1] and [T2], see also [SFBK, Theorem IX.3.8]. This proof can be generalized to polynomially bounded operators. We expect to give a detailed proof later elsewhere.

**Remark 1.5.** Suppose that \( N \in \mathbb{N} \) and \( T \) is a polynomially bounded operator such that \( T \prec \oplus_{n=1}^{N} U_T \). It is possible to prove by induction that there exists \( M \in \text{Lat}T \) such that \( T|_M \approx \oplus_{n=1}^{N} S \). In the case of infinite sum the question remains open.

The paper is organized as follows. In Sec. 2, Bourgain’s result [B] is cited, and its corollaries which hold true for arbitrary a.c. polynomially bounded operators are given. In Sec. 3 and 4, auxiliary results for some functions and for operators intertwined with unitaries, respectively, are given. The main part of the paper is Sec. 5, where Theorem 1.1 is proved. In Sec. 6 Corollary 1.2 is proved.

### 2. Bourgain’s result

\( \mathbb{A} \) denotes the disc algebra. For a positive finite Borel measure \( \mu \) on \( \mathbb{T} \) set \( P^2(\mu) = \text{clos}_{L^2(\mu)} \mathbb{A} \), and denote by \( S_\mu \) the operator of multiplication by the independent variable on \( P^2(\mu) \).

**Theorem A** ([B]). There exists a universal constant \( K \) with the following property. Let \( \mathcal{H} \) be a Hilbert space, and let \( W \in \mathcal{L}(\mathbb{A}, \mathcal{H}) \) (that is, \( W \) is a bounded linear transformation from \( \mathbb{A} \) to \( \mathcal{H} \)). Then there exists a positive Borel measure \( \mu \) on \( \mathbb{T} \) such that \( \mu(\mathbb{T}) = 1 \) and

\[
\|W\phi\| \leq K\|W\| \left( \int_{\mathbb{T}} |\varphi|^2d\mu \right)^{1/2} \quad \text{for every } \varphi \in \mathbb{A}.
\]

The following corollary is [BP, Lemma 2.1] emphasized for a.c. polynomially bounded operators.

**Corollary 2.1.** Suppose that \( \mathcal{H} \) is a Hilbert space, \( T \in \mathcal{L}(\mathcal{H}) \) is an a.c. polynomially bounded operator, \( C_{\text{pol},T} \) is the polynomial bound of \( T \), and \( x \in \mathcal{H} \). Then there exist \( \psi \in L^2(\mathbb{T}, m) \) such that \( \int_{\mathbb{T}} |\psi|^2dm \leq 1 \) and

\[
\|\varphi(T)x\| \leq KC_{\text{pol},T}\|x\| \left( \int_{\mathbb{T}} |\varphi|^2|\psi|^2dm \right)^{1/2} \quad \text{for every } \varphi \in H^\infty
\]

and \( W \in \mathcal{L}(P^2(|\psi|^2m), \mathcal{H}) \) such that

\[
WS|\psi|^2m = TW, \quad \|W\| \leq KC_{\text{pol},T}\|x\|
\]

and \( W\varphi = \varphi(T)x \) for every \( \varphi \in H^\infty \).
Proof. Define \( W \in \mathcal{L}(\mathcal{A}, \mathcal{H}) \) by the formula

\[
W \varphi = \varphi(T)x, \quad \varphi \in \mathcal{A}.
\]

Let \( \mu \) be the measure from Theorem A. Then \( \mu = |\psi|^2 m + \mu_s \), where \( \psi \in L^2(T, m) \) and \( \mu_s \) is a positive Borel measure on \( T \) singular with respect to \( m \). We have

\[
P^2(\mu) = P^2(|\psi|^2 m) \oplus L^2(\mu_s)
\]

([C, Proposition III.12.3] or [N, Corollary A.2.2.1]), \( S_{\mu_s} \) is a singular unitary operator, and \( W \) has a continuous extension on \( P^2(\mu) \) denoted by \( W \).

Clearly, \( WS_{\mu_s} = TW \). Therefore, \( W|_{L^2(\mu_s)} S_{\mu_s} = TW|_{L^2(\mu_s)} \). Since \( T \) is a.c.,

\[
W = \mathcal{P}_2(\mu)
\]

([K3, Proposition 15] or [M]). Thus, \( \mu \) can be replaced by \( |\psi|^2 m \).

Remark 2.2. For contractions \( T, C_{\text{pol}, T} = 1 \), and Corollary 2.1 is proved in [BT, Lemma 3] with \( K = 1 \). The proof is based on the existence of isometric dilations for contractions, see [SFBK, Theorem I.4.1].

Remark 2.3. Let \( \psi \in L^2(T) \). If \( \int_T \log |\psi| \, dm = -\infty \), then \( P^2(|\psi|^2 m) = L^2(|\psi|^2 m) \). If \( \int_T \log |\psi| \, dm > -\infty \), we accept that \( \psi \) is an outer function. Then

\[
P^2(|\psi|^2 m) = \frac{H^2}{\psi} = \left\{ \frac{h}{\psi}, \quad h \in H^2 \right\}, \quad \left\| \frac{h}{\psi} \right\|_{P^2(|\psi|^2 m)} = \| h \|_{H^2}, \quad h \in H^2,
\]

see [C, Ch. III.12, VII.10] or [N, Ch. A.4.1].

Lemma 2.4. Suppose that \( \mathcal{H} \) is a Hilbert space, \( T \in \mathcal{L}(\mathcal{H}) \) is an a.c. polynomially bounded operator, \( C_{\text{pol}, T} \) is the polynomial bound of \( T \). Given \( N \in \mathbb{N} \) and \( \{ \varphi_n \}_{n=1}^N \subset H^\infty \), define

\[
A \in \mathcal{L}(\mathcal{H}, \oplus_{n=1}^N \mathcal{H}), \quad Ax = \oplus_{n=1}^N \varphi_n(T)x, \quad x \in \mathcal{H}.
\]

Then

\[
\| A \| \leq KC_{\text{pol}, T} \text{ess sup} \left( \sum_{n=1}^N |\varphi_n(\zeta)|^2 \right)^{1/2}.
\]
Proof. For \( x \in \mathcal{H} \), let \( \psi_x \in L^2(T) \) be the function from Corollary 2.1 (applied to \( T \)). We have

\[
\|Ax\|^2 = \sum_{n=1}^{N} \|\varphi_n(T)x\|^2 \\
\leq \sum_{n=1}^{N} K^2 C_{pol,T}^2 \|x\|^2 \int_{T} |\varphi_n|^2|\psi_x|^2 \, dm \\
= K^2 C_{pol,T}^2 \|x\|^2 \int_{T} \sum_{n=1}^{N} |\varphi_n|^2|\psi_x|^2 \, dm \\
\leq K^2 C_{pol,T}^2 \|x\|^2 \text{ess sup} \sum_{n=1}^{N} |\varphi_n|^2 \int_{T} |\psi_x|^2 \, dm \\
\leq \left( K^2 C_{pol,T}^2 \text{ess sup} \sum_{n=1}^{N} |\varphi_n|^2 \right) \cdot \|x\|^2. 
\]

\( \square \)

**Theorem 2.5.** Suppose that \( \mathcal{H} \) is a Hilbert space, \( T \in \mathcal{L}(\mathcal{H}) \) is an a.c. polynomially bounded operator, \( C_{pol,T} \) is the polynomial bound of \( T \). Then

\[
\left\| \sum_{n \in \mathbb{N}} \varphi_n(T)x_n \right\| \leq K C_{pol,T} \text{ess sup}_{\zeta \in \mathbb{T}} \left( \sum_{n \in \mathbb{N}} |\varphi_n(\zeta)|^2 \right)^{1/2} \left( \sum_{n \in \mathbb{N}} \|x_n\|^2 \right)^{1/2}
\]

for every \( \{\varphi_n\}_{n \in \mathbb{N}} \subseteq H^\infty \) and every \( \{x_n\}_{n \in \mathbb{N}} \subseteq \mathcal{H} \) such that the right part of the above inequality is finite.

**Proof.** Let \( \{\varphi_n\}_{n \in \mathbb{N}} \subseteq H^\infty \) be such that

\[
\text{ess sup}_{\zeta \in \mathbb{T}} \sum_{n \in \mathbb{N}} |\varphi_n(\zeta)|^2 := a < \infty.
\]

Let \( N \in \mathbb{N} \). Let \( A \) be the transformation from Lemma 2.4 applied to \( T^* \) and \( \{\tilde{\varphi}_n\}_{n=1}^{N} \), where \( \tilde{\varphi}(\zeta) = \varphi(\zeta) \) (\( \zeta \in \mathbb{D}, \varphi \in H^\infty \)). Taking into account that \( \|A\| = \|A^*\| \) and \( \varphi(T)^* = \tilde{\varphi}(T^*) \) ([K3, Proposition 24] or [M]), we obtain that

\[
\left\| \sum_{n=1}^{N} \varphi_n(T)x_n \right\| = \|A^* (\oplus_{n=1}^{N} x_n)\| \\
\leq K C_{pol,T} \text{ess sup}_{\zeta \in \mathbb{T}} \left( \sum_{n=1}^{N} |\varphi_n(\zeta)|^2 \right)^{1/2} \left( \sum_{n=1}^{N} \|x_n\|^2 \right)^{1/2} \\
\leq K C_{pol,T} a^{1/2} \left( \sum_{n=1}^{N} \|x_n\|^2 \right)^{1/2}.
\]

Therefore, if \( \sum_{n \in \mathbb{N}} \|x_n\|^2 < \infty \), then \( \sum_{n \in \mathbb{N}} \varphi_n(T)x_n \) converges, and the theorem follows. \( \square \)

**Lemma 2.6.** Suppose that \( \mathcal{H} \) is a Hilbert space, \( T \in \mathcal{L}(\mathcal{H}) \) is an a.c. polynomially bounded operator, \( x \in \mathcal{H} \), \( \psi_k \in L^2(T, m) \), \( k = 1, 2 \), are such that
\[ \int T \log |\psi_k| \, dm > -\infty, \text{ and} \]

\[ \|\varphi(T)x\| \leq \left( \int_T |\varphi|^2 |\psi_k|^2 \, dm \right)^{1/2} \text{ for every } \varphi \in H^\infty, \quad k = 1, 2. \]

Set \(|\psi| = \min(|\psi_1(\zeta)|, |\psi_2(\zeta)|), \zeta \in T\). Then for every \(0 < \varepsilon < 1\) there exists an inner function \(\omega \in H^\infty\) such that

\[ \|\omega(T)\varphi(T)x\| \leq \frac{(2(1 + \varepsilon^2))^{1/2}}{1 - \varepsilon} \left( \int_T |\varphi|^2 |\psi|^2 \, dm \right)^{1/2} \text{ for every } \varphi \in H^\infty. \]

**Proof.** We have \(T = \tau_1 \cup \tau_2\), where \(\tau_1 \cap \tau_2 = \emptyset\) and \(|\psi| = |\psi_k|\) a.e. on \(\tau_k\), \(k = 1, 2\). There exist outer functions \(\eta_k \in H^\infty\), \(k = 1, 2\), such that

\[ |\eta_1| = \begin{cases} \frac{|\psi_1|}{|\psi_2|} & \text{on } \tau_1, \\ 1 & \text{on } \tau_2, \end{cases} \quad \text{and} \quad |\eta_2| = \begin{cases} \frac{|\psi_1|}{|\psi_2|} & \text{on } \tau_1, \\ 1 & \text{on } \tau_2. \end{cases} \]

Clearly,

\[ 1 - \varepsilon \leq |\eta_1 + \eta_2| \leq 1 + \varepsilon \quad \text{a.e. on } T. \]

Set \(\omega \eta = \eta_1 + \eta_2\), where \(\omega, \eta \in H^\infty\), \(\omega\) is inner, and \(\eta\) is outer. Let \(\varphi \in H^\infty\). We have

\[ \|\omega(T)\varphi(T)x\|^2 = \|\omega(T)\eta(T) \left( \frac{\varphi}{\eta} \right)(T)x\|^2 = \|\eta_1 + \eta_2(T) \left( \frac{\varphi}{\eta} \right)(T)x\|^2 \]

\[ \leq 2 \left( \left\| \eta_1(T) \left( \frac{\varphi}{\eta} \right)(T)x \right\|^2 + \left\| \eta_2(T) \left( \frac{\varphi}{\eta} \right)(T)x \right\|^2 \right) \]

\[ \leq 2 \left( \int_T |\eta_1|^2 \left| \frac{\varphi}{\eta} \right|^2 |\psi_1|^2 \, dm + \int_T |\eta_2|^2 \left| \frac{\varphi}{\eta} \right|^2 |\psi_2|^2 \, dm \right) \]

\[ \leq \frac{2}{(1 - \varepsilon)^2} \left( \int_T |\eta_1|^2 |\varphi|^2 |\psi_1|^2 \, dm + \int_T |\eta_2|^2 |\varphi|^2 |\psi_2|^2 \, dm \right) \]

\[ = \frac{2}{(1 - \varepsilon)^2} \left( \int_{\tau_1} |\varphi|^2 |\psi|^2 \, dm + \varepsilon^2 \int_{\tau_2} |\varphi|^2 |\psi|^2 \, dm \right) \]

\[ + \varepsilon^2 \int_{\tau_1} |\varphi|^2 |\psi|^2 \, dm + \int_{\tau_2} |\varphi|^2 |\psi|^2 \, dm \]

\[ = \frac{2(1 + \varepsilon^2)}{(1 - \varepsilon)^2} \int_T |\varphi|^2 |\psi|^2 \, dm. \]

**Remark 2.7.** Applying Theorem 2.5, it is possible to prove an analog of Lemma 2.6 for a finite family \(\{\psi_k\}_{k=1}^N\) with a constant not depended on \(N\), and for a countable family \(\{\psi_k\}_{k \in \mathbb{N}}\) under additional assumption \(\int T \log |\psi| \, dm > -\infty\), where \(|\psi(\zeta)| = \inf_{k \in \mathbb{N}} |\psi_k(\zeta)|\), \(\zeta \in T\). We do not prove these statements, because we will not apply them.

3. Preliminaries: function theory

**Lemma 3.1.** Suppose that \(\psi \in H^2\) is an outer function. For \(t > 0\) let \(\psi_t\) be an outer function such that \(|\psi_t| = \max(|\psi|, t)\). Then

\[ \left\| \frac{\psi}{\psi_t} - 1 \right\|_{H^2} \to 0 \quad \text{when } t \to 0. \]
Proof. For $0 < t < 1$ set $\sigma_t = \{ \zeta \in \mathbb{T} : |\psi(\zeta)| < t \}$. Since $|\psi| \neq 0$ a.e. on $\mathbb{T}$, $m(\sigma_t) \to 0$ when $t \to 0$. Therefore,

$$1 \geq \left\| \frac{\psi}{\psi_t} \right\|_{H^2}^2 \geq m(\mathbb{T} \setminus \sigma_t) \to 1 \quad \text{when} \ t \to 0.$$  

Furthermore,

$$0 \leq (-\log t) m(\sigma_t) \leq -\int_{\sigma_t} \log |\psi| dm \to 0 \quad \text{when} \ t \to 0,$$

because $m(\sigma_t) \to 0$ and $\int_{\sigma_t} \log |\psi| dm > -\infty$. Therefore,

$$\int_{\sigma_t} \log \frac{|\psi|}{t} dm \to 0 \quad \text{when} \ t \to 0.$$

Consequently,

$$\frac{\psi}{\psi_t}(0) = \exp \left( \int_{\sigma_t} \log \frac{|\psi|}{t} dm \right) \to 1 \quad \text{when} \ t \to 0.$$  

By (3.1) and (3.2),

$$\left\| \frac{\psi}{\psi_t} - \frac{\psi}{\psi_t}(0) \right\|_{H^2}^2 = \left\| \frac{\psi}{\psi_t} \right\|_{H^2}^2 - \left\| \frac{\psi}{\psi_t}(0) \right\|_{H^2}^2 \to 0 \quad \text{when} \ t \to 0.$$  

By (3.2) and (3.3),

$$\left\| \frac{\psi}{\psi_t} - 1 \right\|_{H^2} \leq \left\| \frac{\psi}{\psi_t} - \frac{\psi}{\psi_t}(0) \right\|_{H^2} + \left| \frac{\psi}{\psi_t}(0) - 1 \right| \to 0 \quad \text{when} \ t \to 0. \quad \square$$

**Proposition 3.2.** Suppose that $\sigma \subset \mathbb{T}$ is a measurable set, $\{\tau_n\}_{n \in \mathbb{N}}$ is a family of measurable sets such that $\sigma = \bigcup_{n \in \mathbb{N}} \tau_n$ and $\tau_n \cap \tau_k = \emptyset$, if $n \neq k$. Suppose that $C > 0$ and $\{\xi_n\}_{n \in \mathbb{N}}$ is a family of positive numbers such that $\sum_{n \in \mathbb{N}} \xi_n^2 < \infty$. Suppose that $\{\eta_n\}_{n \in \mathbb{N}}$, $\{\varphi_n\}_{n \in \mathbb{N}}$, and $\{\psi_n\}_{n \in \mathbb{N}}$ are families of functions from $L^2(\sigma)$ such that

$$|\eta_n| \leq \begin{cases} 1 & \text{on } \tau_n, \\ \xi_n & \text{on } \sigma \setminus \tau_n, \end{cases}$$

and $|\varphi_n| \leq C|\psi_n|$ a.e. on $\sigma$. For every $t > 0$ and $n \in \mathbb{N}$ let $\psi_{nt} \in L^2(\sigma)$ be such that $|\psi_{nt}| \leq |\psi_{nt}|$ a.e. on $\sigma$ and

$$\left\| \frac{\psi_{nt}}{\psi_n} - 1 \right\|_{L^2(\sigma)} \to 0 \quad \text{when} \ t \to 0 \quad \text{for every} \ n \in \mathbb{N}.$$  

Set

$$\alpha_t = \sum_{n \in \mathbb{N}} \eta_n^2 \frac{\varphi_n}{\psi_{nt}} \quad \text{and} \quad \alpha = \sum_{n \in \mathbb{N}} \eta_n^2 \frac{\varphi_n}{\psi_n}.$$  

Then $\sup_{t>0} \|\alpha_t\|_{L^\infty(\sigma)} < \infty$ and $\|\alpha_t - \alpha\|_{L^2(\sigma)} \to 0$ when $t \to 0$.  

**Proof.** Clearly, $|\frac{\psi_{nt}}{\psi_n} - 1| \leq 2$ a.e. on $\sigma$. Therefore,

$$|\alpha_t - \alpha| \leq \sum_{n \in \mathbb{N}} |\eta_n|^2 \left| \frac{\varphi_n}{\psi_{nt}} - \frac{\psi_n}{\psi_{nt}} \right| \leq 2C \left(1 + \sum_{k \neq n} \xi_k^2 \right) \text{ on } \tau_n.$$  

Take $\varepsilon > 0$. There exists $N \in \mathbb{N}$ such that

$$\sum_{n \geq N + 1} \xi_n^2 < \varepsilon \quad \text{and} \quad m \left( \bigcup_{n \geq N + 1} \tau_n \right) < \varepsilon.$$
We have
\[ \int_{\bigcup_{n\geq N+1} \tau_n} |\alpha_t - \alpha|^2 dm \leq 4C^2 \left( 1 + \sum_{n\in \mathbb{N}} \xi_n^2 \right) \varepsilon. \]

Let \( 1 \leq n \leq N \). We have
\[ |\alpha_t - \alpha| \leq C \left( \left| \frac{\psi_n}{\psi_{nt}} - 1 \right| + \sum_{k \neq n, k \leq N} \xi_k^4 \left| \frac{\psi_k}{\psi_{kt}} - 1 \right|^2 \right) + 2 \sum_{n \geq N+1} \xi_n^2 \]
on \( \tau_n \).

Therefore,
\[ |\alpha_t - \alpha|^2 \leq C^2 \left( 2N \left( \left| \frac{\psi_n}{\psi_{nt}} - 1 \right|^2 + \sum_{k \neq n, k \leq N} \xi_k^4 \left| \frac{\psi_k}{\psi_{kt}} - 1 \right|^2 \right) + 8\varepsilon^2 \right) \]
\[ \leq 2NC^2 \max(1, \sup_{k \leq N} \xi_k^4) \sum_{k=1}^N \left| \frac{\psi_k}{\psi_{kt}} - 1 \right|^2 + 8C^2\varepsilon^2 \]
on \( \bigcup_{n=1}^N \tau_n \).

There exists \( t_\varepsilon > 0 \) such that
\[ \int_{\sigma} \left| \frac{\psi_n}{\psi_{nt}} - 1 \right|^2 dm \leq \frac{\varepsilon}{2N^2C^2 \max(1, \sup_{k \leq N} \xi_k^4)} \]
for every \( 0 < t < t_\varepsilon \) and \( n = 1, \ldots, N \). Therefore,
\[ \int_{\bigcup_{n=1}^N \tau_n} |\alpha_t - \alpha|^2 dm \leq \varepsilon + 8C^2\varepsilon^2 \]
for every \( 0 < t < t_\varepsilon \). \( \square \)

4. Preliminaries: operators intertwined with unitaries

**Lemma 4.1.** Suppose that \( T \in \mathcal{L}(\mathcal{H}) \) is an a.c. polynomially bounded operator, \( C_{pol,T} \) is the polynomial bound of \( T \), \( x \in \mathcal{H} \), and \( \psi \in L^2(T) \) is from Corollary 2.1. Furthermore, suppose that \( \sigma \subset T \) is a measurable set, \( X \in \mathcal{L}(\mathcal{H}, L^2(\sigma)) \), \( XT = U_\sigma X \), and \( f = Xx \). Then
\[ |f| \leq \|X\| K_{pol,T} \|x\| |\psi| \quad \text{a.e. on } \sigma. \]

**Proof.** We have
\[ \int_\sigma |\varphi|^2 |f|^2 dm = \|\varphi(U_\sigma)Xx\|^2 = \|X\varphi(T)x\|^2 \leq \|X\|^2 \|\varphi(T)x\|^2 \]
\[ \leq \|X\|^2 K^2 C_{pol,T} \|x\|^2 \int_\mathbb{T} |\varphi|^2 |\psi|^2 dm \]
for every \( \varphi \in H_\infty \). It remains to apply standard reasons based on the fact that for every measurable set \( \tau \subset T \) and every \( a, b > 0 \) there exists \( \varphi \in H_\infty \) such that \( |\varphi| = a \) a.e. on \( \tau \) and \( |\varphi| = b \) a.e. on \( T \setminus \tau \). \( \square \)

**Lemma 4.2.** Suppose that \( \text{Lim} \) is a Banach limit, \( \mathcal{H} \) is a Hilbert space, \( T \in \mathcal{L}(\mathcal{H}) \) is a power bounded operator, \( X \) is the canonical intertwining mapping constructed using \( \text{Lim} \). If \( \mathcal{M} \in \text{Lat} T \) is such that \( T|_{\mathcal{M}} \) is not of class \( C_0 \), then \( \|X|_{\mathcal{M}}\| \geq 1 \).

**Proof.** We do not recall the construction of the canonical intertwining mapping from [K1] here. We recall only that \( \|Xx\|^2 = \text{Lim}_n \|T^n x\|^2 \) for every \( x \in \mathcal{H} \). By assumption, there exists \( x \in \mathcal{M} \) such that \( \inf_{n \geq 0} \|T^n x\| > 0 \). Therefore, \( \|Xx\| > 0 \). Since \( (T^{(a)})^n X = XT^n \) and \( T^{(a)} \) is unitary, we have
\[ \|Xx\| = \|(T^{(a)})^n X x\| = \|XT^n x\| \leq \|X|_{\mathcal{M}}\| \|T^n x\| \]
for every \( n \geq 0 \).
Consequently, 
\[ \|X x\|^2 \leq \|X\|_M^2 \lim_{n \to \infty} \|T^n x\|^2 = \|X\|_M^2 \|X x\|^2. \]
Since \( \|X x\| > 0 \), the conclusion of the lemma follows. \( \square \)

**Lemma 4.3.** Suppose that \( T \in \mathcal{L}(\mathcal{H}) \) is an a.c. polynomially bounded operator, \( C_{pol,T} \) is the polynomial bound of \( T \), \( X_\ast \) is the canonical intertwining mapping for \( T^* \) constructed using a Banach limit. Let \( X \) be any transformation acting from \( \mathcal{H} \) to some Hilbert space. For \( x \in \mathcal{H} \) let \( \psi \in L^2(T) \) be a function from Corollary 2.1. If \( \int_T |\psi| dm = -\infty \), then 
\[ \|X x\| \leq K C_{pol,T} \|XX_\ast\| \|x\|. \]

**Proof.** Denote by \( \mathcal{H}_\ast \) the space on which \( (T^*)^{(a)} \) acts. Let \( W \) be from Corollary 2.1. Since \( S_{|\psi|^2m} \) is unitary (see Remark 2.3), there exists \( B_\ast \in \mathcal{L}(\mathcal{H}_\ast, P^2(|\psi|^2m)) \) such that \( W^* = B_\ast X_\ast \) and \( \|B_\ast\| \leq \|W^*\| \) (see [K1, Theorem 2]). Set \( u = B_\ast^* 1 \), where \( 1(\zeta) = 1 (\zeta \in \mathbb{T}) \). We have 
\[ \|u\| \leq \|B_\ast^*\| \|1\|_{P^2(|\psi|^2m)} \leq \|W\| (\int_T |\psi|^2 dm)^{1/2} \leq K C_{pol,T} \|x\|, \]

because \( \int_T |\psi|^2 dm \leq 1 \). Taking into account that 
\[ X x = XW 1 = XX_\ast B_\ast^* 1 = XX_\ast u, \]
we conclude that 
\[ \|X x\| \leq \|XX_\ast\| \|u\| \leq \|XX_\ast\| K C_{pol,T} \|x\|. \] \( \square \)

**Proposition 4.4.** Suppose that \( T \in \mathcal{L}(\mathcal{H}) \) is an a.c. polynomially bounded operator, \( \sigma \subset \mathbb{T} \) is a measurable set, \( X \in \mathcal{L}(\mathcal{H}, L^2(\sigma)) \), \( XT = U_\sigma X \), \( x \in \mathcal{H} \) is such that \( \forall n \geq 0 T^n x = \mathcal{H}, f = X x, \psi_0 \in L^2(T), \) and \( \int_T |\psi_0|^2 dm \leq 1 \).

Furthermore, suppose that \( 0 < \varepsilon, \delta < 1, \tau \subset \sigma \) is a measurable set, \( m(\tau) > 0 \), 
\[ 0 \neq u \in \mathcal{H} \text{ is such that } Xu \in L^2(\tau) \text{ and } \|Xu\| \geq \delta \|u\|. \]

Set 
\[ \delta_0 = \frac{\delta \|u\| - \varepsilon \|X\|}{\|u\| + \varepsilon} \quad \text{and} \quad \gamma_0 = \left(1 - \frac{\varepsilon^2 \|X\|^2}{(\|u\| + \varepsilon)^2 \delta_0^2}\right)^{1/2} \]

(we assume that \( \varepsilon \) is so small that \( \gamma_0, \delta_0 > 0 \)). Let \( 0 < \gamma < \gamma_0 \). By assumption on \( x \), there exists \( \varphi_0 \in H^\infty \) such that \( \|\varphi_0(T)x - u\| \leq \varepsilon \). Then 
\[ \tau \not\subset \{\zeta \in \sigma : |\varphi_0(\zeta)f(\zeta)| \leq \gamma \delta_0 \|\varphi_0(T)x\| \|\psi_0(\zeta)\| \}. \]

**Proof.** We have \( \varphi_0 f = X \varphi_0(T)x \) and 
\[ (\varphi_0 f)|_{(\sigma \setminus \tau)} = P_{L^2(\sigma \setminus \tau)} X \varphi_0(T)x = P_{L^2(\sigma \setminus \tau)} X(\varphi_0(T)x - u). \]

Therefore, 
\[ \int_{(\sigma \setminus \tau)} |\varphi_0 f|^2 dm \leq \|X\|^2 \|\varphi_0(T)x - u\|^2 \leq \varepsilon^2 \|X\|^2. \]

Also, 
\[ \|X \varphi_0(T)x\| \geq \|Xu\| - \varepsilon \|X\| \geq \delta \|u\| - \varepsilon \|X\| \]

and \( \delta_0 \|\varphi_0(T)x\| \leq (\|u\| + \varepsilon) \delta_0 \).

Thus, 
\[ \|X \varphi_0(T)x\| \geq \delta_0 \|\varphi_0(T)x\|. \]
Let us assume that
\[ \tau \subset \{ \zeta \in \sigma : |\varphi_0(\zeta)f(\zeta)| \leq \gamma \delta_0 \| \varphi_0(T)x \| \| \psi_0(\zeta) \| \}. \]
Then
\[ \delta_0^2 \| \varphi_0(T)x \|^2 \leq \| X\varphi_0(T)x \|^2 = \int_\sigma |\varphi_0f|^2 \, dm \]
\[ = \int_{\sigma \setminus \tau} |\varphi_0f|^2 \, dm + \int_\tau |\varphi_0f|^2 \, dm \]
\[ \leq \varepsilon^2 \| X \|^2 + \int_\tau \gamma^2 \delta_0^2 \| \varphi_0(T)x \|^2 |\psi_0|^2 \, dm \]
\[ \leq \varepsilon^2 \| X \|^2 + \gamma^2 \delta_0^2 \| \varphi_0(T)x \|^2 \]
(because \( \int_\tau |\psi_0|^2 \, dm \leq \int_\tau |\psi_0|^2 \, dm \leq 1 \)). Thus,
\[ 1 - \gamma^2 \leq \frac{\varepsilon^2 \| X \|^2}{\delta_0^2 \| \varphi_0(T)x \|^2} \leq \frac{\varepsilon^2 \| X \|^2}{\delta_0^2 (\| u \| - \varepsilon)^2}, \]
a contradiction with assumption on \( \gamma \).

**Proposition 4.5.** Suppose that \( T \in L(\mathcal{H}) \) is an a.c. polynomially bounded operator, \( \sigma \subset T \) is a measurable set, \( T^{(n)} \equiv U_\sigma \), and \( X \) is the canonical intertwining mapping for \( T \) and \( U_\sigma \) constructed using a Banach limit. Suppose that \( V \in L(\mathcal{K}) \) is a unitary operator, \( Y \in L(\mathcal{K}, \mathcal{H}) \) is such that \( XY = TY \) and \( \text{cl} \, XY \mathcal{K} = \mathcal{L}^2(\sigma) \).

Furthermore, suppose that \( x \in \mathcal{H} \) and \( \{ \varphi_n \}_{n \in \mathbb{N}} \subset H^\infty \) are such that \( \{ \varphi_n(T)x \}_{n \in \mathbb{N}} \) is dense in \( \mathcal{H} \). Set \( f = Xx \). Suppose that \( \{ \psi_n \}_{n \in \mathbb{N}} \subset \mathcal{L}^2(T) \) are such that \( \int_T |\psi_n|^2 \, dm \leq 1 \) for all \( n \in \mathbb{N} \). For \( n \in \mathbb{N} \) and \( 0 < \varepsilon < 1 \) set
\[ \sigma_{n,\varepsilon} = \{ \zeta \in \sigma : |\varphi_n(\zeta)f(\zeta)| \leq c|\varphi_n(T)x||\psi_n(\zeta)| \}. \]
For \( 0 < \varepsilon_0, \delta_0, \gamma_0 < 1 \) set
\[ N_{\varepsilon_0, \delta_0} = \{ n \in \mathbb{N} : \| X\varphi_n(T)x \| \geq \delta_0 \| \varphi_n(T)x \| \}

and
\[ 1 - \varepsilon_0 \leq \| \varphi_n(T)x \| \leq 1 + \varepsilon_0 \}

and
\[ \tau_{\varepsilon_0, \delta_0, \gamma_0} = \bigcap_{n \in N_{\varepsilon_0, \delta_0}} \sigma_{n, \gamma_0 \delta_0}. \]

Finally, let \( 0 < \varepsilon_0, \delta_0, \gamma_0 < 1 \) be given. Then there exists \( 0 < \varepsilon_0 \leq \varepsilon_0 \) such that
\[ m(\tau_{\varepsilon_0, \delta_0, \gamma_0}) = 0. \]

**Proof.** Set \( E = \ker XY \). Then \( E \in \text{Lat} \, V \) and \( XY|_{\mathcal{K} \oplus E} \) realizes the relation
\[ (4.1) \quad P_{\mathcal{K} \oplus E} V|_{\mathcal{K} \oplus E} \prec U_\sigma. \]
Therefore, \( V^*|_{\mathcal{K} \oplus E} \) is of class \( C_1 \). Consequently, \( V^*|_{\mathcal{K} \oplus E} \) is unitary. Thus, \( \mathcal{K} \ominus E \in \text{Lat} \, V \) and \( V|_{\mathcal{K} \ominus E} \equiv U_\sigma \) by \( (4.1) \) and \([\text{SFBK}, \text{Proposition II.3.4}]\). Without loss of generality, \( \mathcal{K} \ominus E = \mathcal{L}^2(\sigma) \) and \( V|_{\mathcal{K} \ominus E} = U_\sigma \). We have \( \ker XY|_{\mathcal{L}^2(\sigma)} = \{ 0 \} \). Therefore, there exists \( g \in \mathcal{L}^\infty(\sigma) \) such that
\[ (4.2) \quad g \neq 0 \quad \text{a.e. on } \sigma \quad \text{and } XYh = gh \quad \text{for every } h \in \mathcal{L}^2(\sigma). \]
For $0 < \varepsilon_0, \delta < 1$ set
\[ \delta_1 = \frac{\delta - \varepsilon_0 \| X \|}{1 + \varepsilon_0} \quad \text{and} \quad \gamma_1 = \left(1 - \frac{\varepsilon_0^2 \| X \|^2}{(1 - \varepsilon_0)^2 \gamma_1^2}\right)^{1/2}. \]

Then $\gamma_1 \to 1$ and $\delta_1 \to 1$ when $\delta \to 1$ and $\varepsilon_0 \to 0$. Choose $0 < \varepsilon_0, \delta < 1$ such that $0 < \varepsilon_0 \leq \varepsilon_0^0, \gamma_0 \leq \gamma_1$ and $\delta_0 \leq \delta_1$. We claim that $m(\tau_{\varepsilon_0, \delta_0, \gamma_0}) = 0$.

Set $\tau = \tau_{\varepsilon_0, \delta_0, \gamma_0}$. Let us assume that $m(\tau) > 0$. Set $\mathcal{M} = \text{clos} Y L^2(\tau)$.

By (4.2), $X|\mathcal{M} \neq \emptyset$. By Lemma 4.2, $\| X|\mathcal{M} \| \geq 1$. Therefore, there exists $u \in \mathcal{M}$ such that $\| u \| = 1$ and $\| Xu \| \geq \delta$. We have
\[ Xu \in \text{clos} X \mathcal{M} = \text{clos} XY L^2(\tau) = L^2(\tau). \]

Since $\{ \varphi_n(T)x \}_{n \in \mathbb{N}}$ is dense in $\mathcal{H}$, there exists $n \in \mathbb{N}$ such that
\[ \| \varphi_n(T)x - u \| \leq \varepsilon_0. \]

Therefore, $n \in \mathbb{N}_{\varepsilon_0, \delta_0}$. By Proposition 4.4 applied to $x$ and $\varphi_n$ with $\varepsilon_0$ and $\delta$, taking into account that $\gamma_0 < \gamma_1$, we obtain $\tau \not\subset \sigma_{n, \gamma_0 \delta_1}$. By the definition of $\tau$, we have $\tau \subset \sigma_{n, \gamma_0 \delta_0} \subset \sigma_{n, \gamma_0 \delta_1}$, a contradiction. \qed

The following lemma is a version of [K1, Theorem 3].

**Lemma 4.6.** Suppose that $\text{Lim}$ is a Banach limit, $T$ is a power bounded operator, $\mathcal{M} \in \text{Lat} T$, $X_*$ and $Z$ are canonical intertwining mappings for $T^*$ and $(T|\mathcal{M})^*$ from their unitary asymptotes, respectively, constructed using $\text{Lim}$. Set
\[ \mathcal{L} = \bigvee_{n \geq 0} ((T^*)^{(n)})^{-n} X_* \mathcal{M}^\perp. \]

Then there exists a transformation $B$ such that
\[ Z = BP_{\mathcal{L}^\perp} X_* |\mathcal{M} \quad \text{and} \quad \| B \| \leq \sqrt{2} \| X_* \|. \]

**Proof.** By the constructions of $X_*$ and $Z$,
\[ \| Zx \|^2 = \lim_n \| ((T|\mathcal{M})^*)^n x \|^2 = \lim_n \| P_{\mathcal{M}} (T^*)^n x \|^2 \leq \lim_n \| (T^*)^n x \|^2 = \| X_* x \|^2 \]
for every $x \in \mathcal{M}$. Therefore, $\| Z \| \leq \| X_* \|$.

Following the proof of [K1, Theorem 3(b)] (applied to $T^*$) we obtain a transformation $\left( \begin{array}{cc} B_1 & B_2 \\ \hline 0 & B \end{array} \right)$ such that
\[ \left( \begin{array}{cc} B_1 & B_2 \\ \hline 0 & B \end{array} \right) \left( \begin{array}{cc} X_* |\mathcal{M}^\perp \\ \hline P_{\mathcal{L}} X_* |\mathcal{M} \end{array} \right) = \left( \begin{array}{cc} \left( X_* |\mathcal{M}^\perp \right) \\ \hline \left( P_{\mathcal{L}} X_* |\mathcal{M} \right) \end{array} \right) \]
and
\[ \left\| \left( \begin{array}{cc} B_1 & B_2 \\ \hline 0 & B \end{array} \right) \right\| \leq \left\| \left( \begin{array}{cc} X_* |\mathcal{M}^\perp \\ \hline P_{\mathcal{L}} X_* |\mathcal{M} \end{array} \right) \right\| \leq \sqrt{2} \| X_* \|. \]

Therefore, $BP_{\mathcal{L}^\perp} X_* |\mathcal{M} = Z$ and
\[ \| B \| \leq \left\| \left( \begin{array}{cc} B_1 & B_2 \\ \hline 0 & B \end{array} \right) \right\| \leq \sqrt{2} \| X_* \|. \]

**Proposition 4.7.** Set $\chi(\zeta) = \zeta$ and $1(\zeta) = 1$ ($\zeta \in \mathbb{T}$). Set
\[ H^2 = L^2(\mathbb{T}) \ominus H^2 \quad \text{and} \quad S_* = P_{H^2} U|_{H^2}. \]

Suppose that $\mathcal{N}$ and $\mathcal{K}$ are Hilbert spaces, $\text{Lim}$ is a Banach limit,
\[ T_0 \in \mathcal{L}(\mathcal{N}) \] is power bounded,
$V_0 \in \mathcal{L}(K)$, $Z_0 \in \mathcal{L}(N,K)$, $(Z_0,V_0)$ is the unitary asymptote of $T_0^*$ constructed using $\lim Y_0 \in \mathcal{L}(H^2,N)$, and $Y_0S = T_0Y_0$. Set

$$T = \begin{pmatrix} T_0 & (\cdot,Y_0) \mathbf{1} \\ \mathcal{O} & S_* \end{pmatrix} \quad \text{and} \quad X_* = \begin{pmatrix} Z_0 & \mathcal{O} \\ Y_0^* & \mathcal{O} \end{pmatrix} I_{H^2}.$$

Then

$$(4.3) \quad (Y_0 \oplus I_{H^2} U_T = T(Y_0 \oplus I_{H^2}),$$

$T$ is power bounded, and $(X_*,V_0 \oplus U_T^2)$ is the unitary asymptote of $T^*$ constructed using $\lim$. Furthermore, if $T_0$ is polynomially bounded, then $T$ is polynomially bounded, and if $T_0$ is a.c., then $T$ is a.c.

Moreover, let $(X_0,U_T)$ be the unitary asymptote of $T_0$ constructed using some Banach limit. Since $(X_0Y_0)S = U_T (X_0Y_0)$, there exists $g_1 \in L^\infty(\mathbb{T})$ such that $X_0Y_0h = g_1h$ for every $h \in H^2$. Let

$$X \in \mathcal{L}(N \oplus H^2, L^2(\mathbb{T}))$$

be defined by the formula

$$X(x \oplus h) = X_0 x + g_1 h \quad (x \in N, \ h \in H^2).$$

Then $(X,U_T)$ is the unitary asymptote of $T$ constructed using the same Banach limit as $X_0$. 

Proof. The equality (4.3) easy follows from the definition of $T$. Let $p$ be an (analytic) polynomial. It easy follows from (4.3) that

$$(4.4) \quad P_N p(T)|_{H^2} = Y_0 P_{H^2} p(U_T)|_{H^2}.$$

The conclusions on power boundedness and polynomial boundedness of $T$ follow from (4.4). Since the right part of (4.4) is defined for every $p \in H^\infty$, the conclusion on a.c. polynomial boundedness of $T$ follows from (4.4) and [K3, Theorem 23].

Let $x_1, x_2 \in N$, let $h_1, h_2 \in H^2$, and let $n \in \mathbb{N}$. It follows from (4.4) that

$$((T^*)^n(x_1 \oplus h_1), (T^*)^n(x_2 \oplus h_2))
= (h_1, h_2) + (P_{H^2} \overline{x}^0 Y_0^* x_1, P_{H^2} \overline{x}^0 Y_0^* x_2) + ((T_0^*)^n x_1, (T_0^*)^n x_2).$$

We have

$$\lim_n (P_{H^2} \overline{x}^0 Y_0^* x_1, P_{H^2} \overline{x}^0 Y_0^* x_2) = (Y_0^* x_1, Y_0^* x_2).$$

By the construction of $Z_0$,

$$(Z_0 x_1, Z_0 x_2) = \lim_n ((T_0^*)^n x_1, (T_0^*)^n x_2),$$

and by the construction of $X_*$,

$$(X_* (x_1 \oplus h_1), X_* (x_2 \oplus h_2)) = \lim_n ((T^*)^n (x_1 \oplus h_1), (T^*)^n (x_2 \oplus h_2)).$$

Therefore,

$$(X_* (x_1 \oplus h_1), X_* (x_2 \oplus h_2)) = (h_1, h_2) + (Y_0^* x_1, Y_0^* x_2) + (Z_0 x_1, Z_0 x_2).$$

From the latest equality and [K1, Theorem 3] we obtain the conclusion on the unitary asymptote of $T^*$.

Suppose that $(X_0, U_T)$ is the unitary asymptote of $T_0$ constructed using some Banach limit, and $X$ is defined as above. Clearly, $XT = U_T X$. Denote
by $X_T$ the canonical intertwining mapping for $T$ and $T^{(a)}$ constructed using the same Banach limit as $X_0$. By [K1, Theorem 3], $T^{(a)} \cong (T_0)^{(a)}$ and $X_0 = X_T|_\mathcal{N}$. Therefore, $T^{(a)} \cong U_T$, and it is easy to see from the definitions of $T$ and $X$ and the intertwining properties of $X$ and $X_T$ that $X_T = X$. □

5. Proof of Theorem 1.1

For convenience of applying Proposition 4.7, we denote the operator from Theorem 1.1 by $T_0$.

Suppose that $\mathcal{N}$ is a Hilbert space, $T_0 \in \mathcal{L}(\mathcal{N})$ is a power bounded operator of class $C_1$, and $(T_0)^{(a)} \cong U_T$. Let

$$T_0 = \begin{pmatrix} T_{11} & * \\ \ominus & T_{00} \end{pmatrix}$$

be the triangulation of $T_0$ of the form $\begin{pmatrix} C_1 & * \\ \ominus & C_0 \end{pmatrix}$, see Introduction and [K1]. Since $T_0$ is of class $C_1$, we have $T_{11}$ is of class $C_{11}$. By [K1, Theorem 3] and [SFKB], Propositions II.3.4 and II.5.3, $T_{11} \sim (T_{11})^{(a)}$, $(T_{00})^{(a)} \cong (T_{11})^{(a)}^*$, and there exists a measurable set $\tau \subset \mathbb{T}$ such that $(T_{11})^{(a)} \cong U_\tau$.

Two cases are possible. First case: $m(\tau) = 1$. Then $T_{11} \sim U_{\tau}$. Suppose that $T_0$ is polynomially bounded. We can consider $T_{11}$ instead of $T_0$. The proof becomes simpler. Proposition 4.7 is not used, because we need not to represent $T_{11}$ as a restriction of some operator of class $C_1$ on its invariant subspace $\mathcal{N}$. Lemma 2.6 is not used, because we need not to request that the needed shift-type invariant subspace is contained in the given subspace $\mathcal{N}$. The detailed proof can be deduced from the proof of second case and is not given here.

Second case: $m(\tau) < 1$.

Suppose that $T_0$ is a cyclic a.c. polynomially bounded operator. By Corollary 2.1, there exists a quasiaffinity $Y_0 \in \mathcal{L}(H^2, \mathcal{N})$ such that $Y_0S = T_0Y_0$. Denote by $X_0$ the canonical intertwining mapping for $T_0$ and $U_T$ constructed using a Banach limit. We have

$$X_0T_0 = U_TX_0 \quad \text{and} \quad \bigvee_{n \geq 0} U_{T_{\tau}}^{-n}X_0\mathcal{N} = L^2(\mathbb{T}).$$

Set $\mathcal{H} = \mathcal{N} \oplus H^2$. Let $T \in \mathcal{L}(\mathcal{H})$, $X \in \mathcal{L}(\mathcal{H}, L^2(\mathbb{T}))$, $g_1 \in L^\infty(\mathbb{T})$ be from Proposition 4.7 applied to $T_0$ and $Y_0$. Since $Y_0$ is a quasiaffinity, it follows from the second equality in (5.1) that $g_1 \neq 0$ a.e. on $\mathbb{T}$, and it follows from (4.3) that $T$ is of class $C_1$.

Let $X_\tau \in \mathcal{L}(\mathcal{H}, L^2(\tau) \oplus L^2(\mathbb{T}))$ be the canonical intertwining mapping for $T^*$ constructed in Proposition 4.7 with $V_0 = U_{\tau}^*$. Then

$$X_\tau^*(L^2(\tau) \oplus H^2) \subset \mathcal{N}.$$

Furthermore, there exists $g_2 \in L^\infty(\tau)$ such that

$$(XX_\tau^*)(h_2 \oplus h_1) = g_2h_2 + g_1h_1 \quad \text{for every} \ h_2 \in L^2(\tau) \text{and} \ h_1 \in L^2(\mathbb{T}).$$

Set

$$\theta_1 = \frac{g_1}{(|g_1|^2 + |g_2|^2)^{1/2}} \quad \text{and} \quad \theta_2 = \frac{g_2}{(|g_1|^2 + |g_2|^2)^{1/2}}.$$
and set
\[ \mathcal{E}_0 = \{ \theta_1 h \oplus (-\theta_2 h) : h \in L^2(\tau) \}. \]
Clearly, \( \mathcal{E}_0 = \ker XX^*_\tau \) and \( \mathcal{E}_0 \) is a reducing subspace for \( U_\tau \oplus U_\tau \), that is,
\[ \mathcal{E}_0 \in \text{Lat}(U_\tau \oplus U_\tau) \text{ and } (L^2(\tau) \oplus L^2(\tau)) \ominus \mathcal{E}_0 \in \text{Lat}(U_\tau \oplus U_\tau). \]
Define
\[ J \in \mathcal{L}(L^2(\mathbb{T}), (L^2(\tau) \oplus L^2(\tau)) \ominus \mathcal{E}_0) \]
by the formula
\[ Jh = \overline{\theta}_2 h|_\tau \oplus (\overline{\theta}_1 h|_\tau + h|_{\mathbb{T} \setminus \tau}) \quad (h \in L^2(\mathbb{T})). \]
Set
\[ g = \begin{cases} (|g_1|^2 + |g_2|^2)^{1/2} & \text{on } \tau, \\ g_1 & \text{on } \mathbb{T} \setminus \tau. \end{cases} \]
Then \( g \neq 0 \) a.e. on \( \mathbb{T} \), \( J \) is unitary, \( JU_\mathbb{T} = (U_\tau \oplus U_\mathbb{T})((L^2(\tau) \oplus L^2(\mathbb{T})) \ominus \mathcal{E}_0) \),
\[ XX^*_\tau Jh = gh \quad \text{for every } h \in L^2(\mathbb{T}) \text{ and } L^2(\tau) \oplus L^2(\mathbb{T}) = JL^2(\mathbb{T}) \ominus \mathcal{E}_0. \]
Take \( \sigma \subset \mathbb{T} \) such that
\[ \text{ess sup}_{\mathbb{T} \setminus \sigma} |g| < 1, \quad \text{ess inf}_{\mathbb{T} \setminus \sigma} |g| > 0 \text{ and } m(\tau \cup \sigma) < 1. \]
Let \( h_0 \in H^2 \) be such that
\[ |h_0| \propto 1 \text{ a.e. on } \mathbb{T}. \]
There exists \( \theta_0 \in L^\infty(\tau) \) such that \( |\theta_0| = 1 \) a.e. on \( \tau \) and
\[ \text{Re} \theta_1 \overline{\theta}_2 \theta_0 = 0 \text{ a.e. on } \tau. \]
Set
\[ h_{01} = (\theta_2 \theta_0 + \theta_1)h_0 \chi_\tau + h_0 \chi_{\mathbb{T} \setminus \tau} \quad \text{and} \quad h_{02} = (-\overline{\theta}_2 + \overline{\theta}_1 \theta_0)h_0|_{\mathbb{T} \setminus \tau}. \]
By (5.7),
\[ |h_{01}| = |h_0| \text{ a.e. on } \mathbb{T}. \]
Set
\[ F_{\tau,\sigma} = \overline{\theta}_2 h_{01}|_{\tau \setminus \sigma} + \theta_1 h_{02}, \]
\[ F_{\tau,\mathbb{T}\setminus\sigma} = \overline{\theta}_1 h_{01}|_{\tau \setminus \sigma} + h_0|_{\mathbb{T} \setminus \tau} - \theta_2 h_{02}, \]
\[ F_{\tau,\tau \setminus \sigma} = \overline{\theta}_2 h_{01}|_{\tau \setminus \sigma}, \]
\[ F_{\mathbb{T},\tau \setminus \sigma} = \overline{\theta}_1 h_{01}|_{\tau \setminus \sigma} + h_0|_{(\mathbb{T} \setminus \tau) \setminus \sigma}. \]
Then
\[ F_{\tau,\sigma} \oplus F_{\mathbb{T},\sigma} = Jh_{01}|_{\sigma} + \theta_1 h_{02} \oplus (-\theta_2 h_{02}), \quad \theta_1 h_{02} \oplus (-\theta_2 h_{02}) \in \mathcal{E}_0, \]
\[ F_{\tau,\mathbb{T} \setminus \sigma} \oplus F_{\mathbb{T},\mathbb{T} \setminus \sigma} = Jh_{01}|_{\mathbb{T} \setminus \sigma}, \]
and
\[ F_{\tau,\sigma} \oplus F_{\mathbb{T},\sigma} + F_{\tau,\mathbb{T} \setminus \sigma} \oplus F_{\mathbb{T},\mathbb{T} \setminus \sigma} = \theta_0 h_0|_{\tau} \oplus h_0 \in L^2(\tau) \oplus H^2. \]
Put
\[ x_0 = X^*_\tau (F_{\tau,\sigma} \oplus F_{\mathbb{T},\sigma}). \]
It follows from (5.11) and (5.4) that
\[(5.15)\quad Xx_0 = gh_{01}\]
Set \( \mathcal{M}_0 = \bigvee_{k \geq 0} T^k x_0 \) and \( \mathcal{K}_0 = \bigvee_{k \geq 0} (U_\tau \oplus U_\tau^*)^k (F_{r,\sigma} \oplus F_{r,\sigma}^*) \).

By (5.10), \( F_{r,\sigma} \oplus F_{r,\sigma}^* \in L^2(\tau) \oplus L^2(\tau \cup \sigma) \). It follows from third inequality in (5.5) that \( (U_\tau \oplus U_\tau^*)|_{\mathcal{K}_0} \) is unitary. It follows from (5.6), (5.9), (5.15), and the equality \( XT = U_\tau X \) that
\[\text{clos} \, XM_0 = L^2(\sigma).\]
By [K1, Theorem 3], \( (X|_{\mathcal{M}_0}, U_\sigma) \) is the unitary asymptote of \( T|_{\mathcal{M}_0} \) constructed using the same Banach limit as \( X \).

Set
\[(5.16)\quad \mathcal{L} = \bigvee_{n \geq 0} (U_\tau^* \oplus U_\tau^*)^{-n} X_* \mathcal{M}_0^\perp.\]
Denote by \( Z \) the canonical intertwining mapping for \( (T|_{\mathcal{M}_0})^* \) constructed using the same Banach limit as \( X_* \). Let \( B \) be the transformation from Lemma 4.6 applied to \( T \) and \( \mathcal{M}_0 \). We have
\[X|_{\mathcal{M}_0} Z^* = XP_{\mathcal{M}_0} X_* P_{\mathcal{L}} B^*.\]
Therefore,
\[\|X|_{\mathcal{M}_0} Z^*\| \leq \sqrt{2}\|X_*\||XP_{\mathcal{M}_0} X_*|_{\mathcal{L}}\|.
\]
It follows from (5.16) that \( X_* \mathcal{L}^\perp \subset \mathcal{M}_0 \). Therefore,
\[(5.17)\quad XP_{\mathcal{M}_0} X_*|_{\mathcal{L}} = XX_*|_{\mathcal{L}}^\perp \quad \text{and} \quad XX_*|_{\mathcal{L}} \subset L^2(\sigma).\]
Let \( u \in \mathcal{L}^\perp \). By (5.4), there exist \( h \in L^2(T) \) and \( v \in \mathcal{E}_0 \) such that \( u = Jh + v \).
By (5.4) and (5.17),
\[XX_*u = XX_*^* Jh = gh \in L^2(\sigma).\]
Therefore, \( h|_{T \setminus \sigma} = 0 \) and
\[\|XX_*u\| \leq \text{ess sup}_\sigma |g| \|h\|_{L^2(\sigma)} \leq \text{ess sup}_\sigma |g| (\|h\|_{L^2(T)}^2 + \|v\|^2)^{1/2}
= \text{ess sup}_\sigma |g| \|u\|
\]
(because \( J \) is unitary). We obtain that
\[\|XX_*|_{\mathcal{L}}\| \leq \text{ess sup}_\sigma |g|.
\]
Consequently,
\[\|X|_{\mathcal{M}_0} Z^*\| \leq \sqrt{2}\|X_*\| \text{ess sup}_\sigma |g|.
\]
By (5.5),
\[KC_{\text{pol},T} \|X|_{\mathcal{M}_0} Z^*\| < 1.
\]
Take
\[KC_{\text{pol},T} \|X|_{\mathcal{M}_0} Z^*\| < \delta_0 < 1 \quad \text{and} \quad 0 < \varepsilon_{00}, \gamma_0 < 1.
\]
Let \( \{\varphi_n\}_{n \in \mathbb{N}} \subset H^\infty \) be such that \( \{\varphi_n(T)x_0\}_{n \in \mathbb{N}} \) is dense in \( \mathcal{M}_0 \). Let \( \psi_n \) be constructed by Corollary 2.1 applied to \( \varphi_n(T)x_0 \) for every \( n \in \mathbb{N} \). Set
\[(5.18)\quad f = Xx_0.
\]
It is easy to see that \( T|_{\mathcal{M}_0}, X|_{\mathcal{M}_0}, (U_r \oplus U_T)|_{\mathcal{K}_0}, X^*_r|_{\mathcal{K}_0}, x_0, \{\psi_n\}_{n \in \mathbb{N}} \) satisfy Proposition 4.5. Let \( 0 < \varepsilon_0 \leq \varepsilon_{\text{I}0} \) be such that

\[
m(\tau_{\varepsilon_0,\varepsilon_{\text{I}0}}) = 0,
\]

where \( \tau_{\varepsilon_0,\varepsilon_{\text{I}0}} \) is from Proposition 4.5.

For convenience, relabel \( \{\varphi_n\}_{n \in N_{\varepsilon_0,\varepsilon_{\text{I}0}}} \) as \( \{\varphi_n\}_{n \in \mathbb{N}} \). Then

\[
\|X\varphi_n(T)x_0\| \geq \delta_0\|\varphi_n(T)x_0\| \quad \text{for every } n \in \mathbb{N}.
\]

By Lemma 4.3 applied to \( T|_{\mathcal{M}_0} \) and the choice of \( \delta_0 \) we have

\[
(5.19) \quad \int_T \log |\psi_n|dm > -\infty \quad \text{for every } n \in \mathbb{N}.
\]

We accept that \( \psi_n \) are outer functions (and \( \psi_n \in H^2 \)), see Remark 2.3. Set \( \sigma_n = \sigma_{\varepsilon_0,\varepsilon_{\text{I}0}}, n \in \mathbb{N} \).

By (5.18) and Lemma 4.1 applied to \( \varphi_n(T)x_0 \),

\[
|\varphi_nf| \leq \|X\| KC_{\text{pol},T}\||\varphi_n(T)x_0||\psi_n|
\leq (1 + \varepsilon_0)\|X\| KC_{\text{pol},T}\psi_n| \quad \text{a.e. on } \sigma \text{ for every } n \in \mathbb{N}.
\]

By Proposition 4.5,

\[
|\varphi_nf| > \gamma_0\delta_0\|\varphi_n(T)x_0||\psi_n| \geq (1 - \varepsilon_0)\gamma_0\delta_0|\psi_n| \quad \text{a.e. on } \sigma \setminus \sigma_n
\]

for every \( n \in \mathbb{N} \) and

\[
m(\bigcap_{n \in \mathbb{N}} \sigma_n) = 0.
\]

Set

\[
\tau_1 = \sigma \setminus \sigma_1, \quad \tau_n = (\sigma \setminus \sigma_n) \setminus \bigcup_{k=1}^{n-1} \tau_k, \quad n \geq 2.
\]

Then

\[
\bigcup_{n \in \mathbb{N}} \tau_n = \sigma, \quad \tau_n \cap \tau_k = \emptyset, \quad \text{if } n \neq k, \ n, k \geq 1,
\]

and

\[
(5.21) \quad |\varphi_nf| > (1 - \varepsilon_0)\gamma_0\delta_0|\psi_n| \quad \text{a.e. on } \tau_n, \ n \in \mathbb{N}.
\]

By (5.14),

\[
\varphi(T)\varphi_n(T)x_0 = \varphi(T)\varphi_n(T)X^*_r(F_{\tau,\sigma} \oplus F_{\tau,\sigma}) = X^*_r(\varphi\varphi_n F_{\tau,\sigma} \oplus \varphi\varphi_n F_{\tau,\sigma}).
\]

Therefore,

\[
\|\varphi(T)\varphi_n(T)x_0\|^2 \leq \|X^*_r\|^2(\|\varphi\varphi_n F_{\tau,\sigma}\|^2 + \|\varphi\varphi_n F_{\tau,\sigma}\|^2)
\leq \|X^*_r\|^2 \left( \int_T |\varphi\varphi_n F_{\tau,\sigma}|^2dm + \int_T |\varphi\varphi_n F_{\tau,\sigma}|^2dm \right)
\leq \|X^*_r\|^2 \left( \int_T |\varphi\varphi_n|^2(\chi_{\tau}|F_{\tau,\sigma}|^2 + |F_{\tau,\sigma}|^2)dm \right)
\leq \|X^*_r\|^2 \|\varphi\varphi_n\| \left( \sup_T (\chi_{\tau}|F_{\tau,\sigma}|^2 + |F_{\tau,\sigma}|^2) \right) \int_T |\varphi\varphi_n|^2dm.
\]

Easy calculation show that

\[
\sup_T (\chi_{\tau}|F_{\tau,\sigma}|^2 + |F_{\tau,\sigma}|^2) = \max(2 \sup_{\tau \cap \sigma} |h_0|^2, \sup_{(\tau \setminus \sigma) \cup (\sigma \setminus \tau)} |h_0|^2).
\]
Set
\[ C_1 = \frac{\|X^*\| (\max(2 \text{ ess sup}_{x \in \sigma} |h_0|^2, \text{ ess sup}_{(x, y) \in (\sigma \times T)} |h_0|^2))^{1/2}}{KC_{\text{pol}, T}(1 + \varepsilon_0)} \]

Then
\[ \|\varphi(T)\varphi_n(T)x_0\| \leq KC_{\text{pol}, T}(1 + \varepsilon_0) \left( \int_T |\varphi|^2 C_1^2 |\varphi_n|^2 dm \right)^{1/2} \]
for every \( \varphi \in H^\infty \) and every \( n \in \mathbb{N} \).

Take \( 0 < c_1 < 1 \). By Lemma 2.6, there exist inner functions \( \omega_n \in H^\infty \), \( n \in \mathbb{N} \), such that
\[ \|\varphi(T)\omega_n(T)\varphi_n(T)x_0\| \]
\[ \leq KC_{\text{pol}, T}(1 + \varepsilon_0)^{2(1 + \varepsilon_0)^{1/2}} \left( \int_T |\varphi|^2 \min(|\psi_n|, C_1|\varphi_n|)^2 dm \right)^{1/2} \]
for every \( \varphi \in H^\infty \) and every \( n \in \mathbb{N} \).

There exist outer functions \( \psi_{1n} \in H^2 \) such that
\[ (5.22) \quad |\psi_{1n}| = \begin{cases} |\psi_n| & \text{on } \sigma, \\ \min(|\psi_n|, C_1|\varphi_n|) & \text{on } T \setminus \sigma. \end{cases} \]

Since \( \min(|\psi_n|, C_1|\varphi_n|) \leq |\psi_{1n}| \) a.e. on \( T \), we have
\[ (5.23) \quad \|\varphi(T)\omega_n(T)\varphi_n(T)x_0\| \leq KC_{\text{pol}, T}(1 + \varepsilon_0)^{2(1 + \varepsilon_0)^{1/2}} \left( \int_T |\varphi|^2 |\psi_{1n}|^2 dm \right)^{1/2} \]
for every \( \varphi \in H^\infty \) and every \( n \in \mathbb{N} \).

It follows from (5.22) that
\[ (5.24) \quad \left| \phi_n \overline{\psi_{1n}} \right| \geq \frac{1}{C_1} \quad \text{on } T \setminus \sigma \quad \text{for every } n \in \mathbb{N}. \]

Let \( \{\xi_n\}_{n \in \mathbb{N}} \) be a sequence of positive numbers such that
\[ (5.25) \quad \xi := \sum_{n \in \mathbb{N}} \xi_n^2 < \infty, \quad \sum_{n \geq 2} \xi_n^2 < 1 \]
and
\[ (5.26) \quad (1 + \varepsilon_0)^{2} \|X\| KC_{\text{pol}, T} \xi < (1 - \varepsilon_0) \gamma_0 \delta_0. \]

For \( n \in \mathbb{N} \), define outer functions \( \eta_n \in H^\infty \) as follows:
\[ (5.27) \quad |\eta_n| = \begin{cases} |\psi_n|^{1/2} & \text{on } T \setminus \sigma, \\ 1 & \text{on } \tau_n, \\ \xi_n & \text{on } \sigma \setminus \tau_n, \end{cases} \]
\[ |\eta_n| = \begin{cases} \left| \frac{\psi_n}{\xi_n} \right|^{1/2} & \text{on } T \setminus \sigma, \\ 1 & \text{on } \tau_n, \quad n \geq 2. \end{cases} \]

By (5.24) and (5.25),
\[ \sum_{n \in \mathbb{N}} |\eta_n(\zeta)|^2 \leq \left( \frac{1 + \sum_{n \geq 2} \xi_n^2}{1 + \xi} \right) C_1 \quad \text{for a.e. } \zeta \in T \setminus \sigma, \]
\[ \quad \text{for a.e. } \zeta \in \sigma. \]

For every \( t > 0 \) and every \( n \in \mathbb{N} \) let \( \psi_{nt} \) be the outer function such that
\[ (5.28) \quad |\psi_{nt}| = \max(|\psi_{1n}|, t) \quad \text{a.e. on } T. \]
Put
\begin{equation}
\kappa_{nt}(\zeta) = \frac{\eta_n(\zeta)}{\psi_{nt}(\zeta)}, \quad \zeta \in T, \ n \in \mathbb{N}, \ t > 0.
\end{equation}

Since \(|\psi_{nt}| \geq t\ a.e.\ on T\), we have \(\kappa_{nt} \in H^\infty\) for every \(n \in \mathbb{N}\) and \(t > 0\). Set
\begin{equation}
x_{nt} = (\kappa_{nt}\omega_n\varphi_n)(T)x_0 = (\kappa_{nt}\omega_n\varphi_n)(T)X^*_{T,\sigma} + F_{T,\sigma}
\end{equation}
and
\begin{equation}
y_{nt} = X^*_{\kappa_{nt}\omega_n\varphi_n F_{T,T\setminus\sigma} + \kappa_{nt}\omega_n\varphi_n F_{T,T\setminus\sigma}}
= (\kappa_{nt}\omega_n\varphi_n)(T)X^*_{T,T\setminus\sigma} + F_{T,T\setminus\sigma}
\end{equation}
for every \(n \in \mathbb{N}\) and \(t > 0\).

We have
\begin{equation}
x_{nt} + y_{nt} = (\kappa_{nt}\omega_n\varphi_n)(T)X^*_{T,\sigma} + F_{T,\sigma} + F_{T,T\setminus\sigma} + F_{T,T\setminus\sigma}.
\end{equation}

By (5.13) and (5.2),
\begin{equation}
(5.31)
x_{nt} + y_{nt} \in \mathcal{N}.
\end{equation}

By (5.23) and (5.28),
\begin{equation}
\sum_{n \in \mathbb{N}} \|\varphi(T)x_{nt}\|^2 = \sum_{n \in \mathbb{N}} \|(\varphi\kappa_{nt}\omega_n\varphi_n)(T)x_0\|^2
\leq \left( KC_{pol,T}(1 + \varepsilon_0)^2 \left( \frac{2(1 + c_1^2)}{1 - c_1} \right) \right)^2 \sum_{n \in \mathbb{N}} \int_T |\varphi\kappa_{nt}|^2 |\psi_{nt}|^2 dm,
\end{equation}
and by (5.29),
\begin{equation}
\sum_{n \in \mathbb{N}} \int_T |\varphi\kappa_{nt}|^2 |\psi_{nt}|^2 dm = \sum_{n \in \mathbb{N}} \int_T |\varphi|^2 |\eta_n|^2 dm
\leq \int_T \sum_{n \in \mathbb{N}} |\eta_n|^2 |\varphi|^2 dm \leq \esssup_{T} \sum_{n \in \mathbb{N}} |\eta_n|^2 \int_T |\varphi|^2 dm.
\end{equation}

By Theorem 2.5, (5.32) and (5.33),
\begin{equation}
(5.34)
\| \sum_{n \in \mathbb{N}} (\eta_n\varphi)(T)x_{nt} \|
\leq K^2 C^2_{pol,T}(1 + \varepsilon_0)^2 \left( \frac{2(1 + c_1^2)}{1 - c_1} \right)^{1/2} \esssup_{T} \sum_{n \in \mathbb{N}} |\eta_n|^2 \left( \int_T |\varphi|^2 dm \right)^{1/2}
\end{equation}
for every \(t > 0\).

For \(t > 0\) put
\begin{equation}
\beta_t = \sum_{n \in \mathbb{N}} \frac{\omega_n\varphi_n}{\psi_{nt}} \quad \text{on } T \setminus \sigma.
\end{equation}

It follows from (5.27) and (5.28) that the series (5.35) converges in \(\|\cdot\|_{L^\infty(T\setminus\sigma)}\) and
\begin{equation}
\|\beta_t\|_{L^\infty(T\setminus\sigma)} \leq 1 + \sum_{n \geq 2} \varepsilon_n^2 \quad \text{for all } t > 0.
\end{equation}
For $t > 0$ and $\varphi \in H^\infty$ let

\begin{equation}
W_t \varphi = \sum_{n \in \mathbb{N}} (\eta_n \varphi)(T)x_{nt} + X^*_s(\beta_t \varphi F_{T,T\setminus \sigma} + \beta_t \varphi F_{T,T\setminus \sigma}^*).
\end{equation}

(5.37)

It follows from the convergence in $\| \cdot \|_{L^\infty(T\setminus \sigma)}$ of the series (5.35) that

\begin{equation}
X^*_s(\beta_t \varphi F_{T,T\setminus \sigma} + \beta_t \varphi F_{T,T\setminus \sigma}^*)
= \sum_{n \in \mathbb{N}} X^*_s \left( \eta_n^2 \omega_n \varphi_n \psi_{nt}^2 \right) \varphi F_{T,T\setminus \sigma} + \eta_n^2 \omega_n \varphi_n \psi_{nt}^2 \varphi F_{T,T\setminus \sigma}^*.
\end{equation}

(5.38)

It follows from the intertwining property of $X^*_s$ and (5.30) that

\begin{equation}
X^*_s \left( \eta_n^2 \omega_n \varphi_n \psi_{nt}^2 \right) \varphi F_{T,T\setminus \sigma} + \eta_n^2 \omega_n \varphi_n \psi_{nt}^2 \varphi F_{T,T\setminus \sigma}^* = (\varphi \eta_n)(T)y_{nt}.
\end{equation}

(5.39)

It follows from (5.37), (5.38), (5.39), and (5.31) that

$W_t \varphi \in \mathcal{N}$ for every $\varphi \in H^\infty$ and $t > 0$.

By (5.36) and (5.10),

\begin{equation}
\|X^*_s(\beta_t \varphi F_{T,T\setminus \sigma} + \beta_t \varphi F_{T,T\setminus \sigma})\|^2
\leq \|X^*_s\|^2(1 + \sum_{n \geq 2} \xi_n^2)^2 \text{ess sup}_{T\setminus \sigma} (x_{t}^*F_{T,T\setminus \sigma}^2 + |F_{T,T\setminus \sigma}|^2) \int_{T\setminus \sigma} |\varphi|^2 \text{d}m.
\end{equation}

(5.40)

By (5.9) and (5.10),

\[ \text{ess sup}_{T\setminus \sigma} (x_{t}^*F_{T,T\setminus \sigma}^2 + |F_{T,T\setminus \sigma}|^2) = \text{ess sup}_{T\setminus \sigma} |h_0|^2. \]

Set

\[ C_2 = K^2C_{pol,T}(1 + \varepsilon_0) \left( \frac{2(1 + c_1^2)}{1 - c_1} \right)^{1/2} \text{ess sup}_{T\setminus \sigma} \sum_{n \in \mathbb{N}} |\eta_n|^2 + \|X^*_s\|(1 + \sum_{n \geq 2} \xi_n^2) \text{ess sup}_{T\setminus \sigma} |h_0|. \]

It follows from (5.34) and (5.40) that the mapping $W_t$ defined on $H^\infty$ by (5.37) is extended onto $H^2$ for every $t > 0$. Denoting the extension by the same letter, we obtain

\begin{equation}
W_t \in \mathcal{L}(H^2, \mathcal{N}) \text{ such that } W_t S = T|\mathcal{X}W_t \\
\text{and } \|W_t\| \leq C_2 \text{ for every } t > 0.
\end{equation}

(5.41)

Put

\begin{equation}
\alpha_t = \sum_{n \in \mathbb{N}} \frac{\eta_n^2 \omega_n \varphi_n g_{h_{01}}}{\psi_{nt}} \text{ and } \alpha = \sum_{n \in \mathbb{N}} \frac{\eta_n^2 \omega_n \varphi_n g_{h_{01}}}{\psi_{1n}} \text{ on } T.
\end{equation}

(5.42)

By (5.37), (5.30), (5.29), (5.11), (5.12), (5.4), (5.35),

\begin{equation}
XW_t h = \alpha_t h \text{ for every } t > 0 \text{ and } h \in H^2.
\end{equation}

(5.43)

By (5.27), (5.20), (5.22), (5.18), (5.15), (5.28) and Lemma 3.1, $\alpha_t$ and $\alpha$ satisfy Proposition 3.2. By Proposition 3.2,

\begin{equation}
\sup_{t > 0} \|\alpha_t\|_{L^\infty(\sigma)} < \infty \text{ and } \|\alpha_t - \alpha\|_{L^2(\sigma)} \to 0 \text{ when } t \to 0.
\end{equation}

(5.44)
An analog of (5.44) for $T \setminus \sigma$ follows from (5.28), (5.27), (5.5), (5.6), (5.9) and Lemma 3.1. Therefore,

\[(5.45) \quad \sup_{t>0} \|\alpha_t\|_{L^\infty(T)} < \infty \quad \text{and} \quad \|\alpha_t - \alpha\|_{L^2(T)} \to 0 \quad \text{when} \quad t \to 0.\]

It follows from (5.41) that there exist a sequence $\{t_j\}$ and $W \in \mathcal{L}(H^2, \mathcal{N})$ such that $t_j \to 0$ and $W_{t_j} \to W$ in the weak operator topology, $WS = T|N W$ and $\|W\| \leq C_2$. It follows from (5.43) and (5.45) that

\[(5.46) \quad X f h = \alpha h \quad \text{for every} \quad h \in H^2.\]

We will show that

\[(5.47) \quad 1/\alpha \in L^\infty(T).\]

We have $\sigma = \bigcup_{n \in \mathbb{N}} \tau_n$. Fix $n \in \mathbb{N}$. By (5.20), (5.22), (5.25), (5.27), taking into account that $f = gh_{t_0}$ a.e. on $\sigma$ by (5.18) and (5.15), we obtain

\[\left| \sum_{k \in \mathbb{N}, k \neq n} \eta_k \frac{\omega_k \varphi_k f}{\psi_k} \right| \leq \sum_{k \in \mathbb{N}, k \neq n} |\eta_k| \frac{|\varphi_k f|}{|\psi_k|} \leq (1 + \varepsilon_0) \|X\|_{K \mathcal{P}_{\text{pol}} T} \sum_{k \in \mathbb{N}, k \neq n} \xi_k^2 \leq (1 + \varepsilon_0) \|X\|_{K \mathcal{P}_{\text{pol}} T} \xi \quad \text{a.e. on} \quad \tau_n.\]

From the latest estimate, (5.27) and (5.21) we conclude that

\[|\alpha| \geq \frac{|\varphi_n f|}{|\psi_n|} - \sum_{k \in \mathbb{N}, k \neq n} \eta_k \frac{\varphi_k f}{\psi_k} \geq (1 - \varepsilon_0) \gamma_0 \delta_0 - (1 + \varepsilon_0) \|X\|_{K \mathcal{P}_{\text{pol}} T} \xi \quad \text{a.e. on} \quad \tau_n.\]

It follows from (5.26) that

\[(5.48) \quad 1/\alpha \in L^\infty(\sigma).\]

It follows from (5.27) that

\[\left| \sum_{n \in \mathbb{N}} \eta_n \frac{\omega_n \varphi_n}{\psi_{1n}} \right| \geq \left| \eta_1 \frac{\omega_1 \varphi_1}{\psi_{11}} \right| - \sum_{n \geq 2} \left| \eta_n \frac{\omega_n \varphi_n}{\psi_{1n}} \right| = 1 - \sum_{n \geq 2} \xi_n^2 \quad \text{on} \quad T \setminus \sigma.\]

It follows from (5.25), (5.6), (5.9) and the second inequality in (5.5) that

\[(5.49) \quad 1/\alpha \in L^\infty(T \setminus \sigma).\]

Now (5.47) follows from (5.48) and (5.49).

Define $A \in \mathcal{L}(L^2(T))$ by the formula $Ah = h/\alpha$, $h \in L^2(T)$. Set

\[Z = AX.\]

It follows from (5.46) that

\[ZW h = h \quad \text{for every} \quad h \in H^2.\]

Set

\[M = WH^2.\]

Then $\mathcal{M} \subset \mathcal{N}$ and $T|M \approx S$. The conclusion of Theorem 1.1 for $T_0$ follows from the relation $T_0 = T|\mathcal{N}$. 

6. Proof of Corollary 1.2

**Lemma 6.1.** Suppose that $T \in \mathcal{L}(\mathcal{H})$ is an a.c. polynomially bounded operator, $X \in \mathcal{L}(\mathcal{H}, H^2)$, $Y \in \mathcal{L}(H^2, \mathcal{H})$, $XT = SX$, $YS = TY$,
\[
\text{clos } X\mathcal{H} = H^2 \quad \text{and} \quad \text{clos } YH^2 = \mathcal{H}.
\]
Then $\ker X = \{0\}$ and $\ker Y = \{0\}$.

**Proof.** Since $XY^*S = SYX$ and $\text{clos } XYH^2 = H^2$, there exists an outer function $g \in H^\infty$ such that $XY^* = g(S)$. Therefore, $\ker Y = \{0\}$. Since $YXY^* = Yg(S) = g(T)Y$ and $\text{clos } YH^2 = \mathcal{H}$, we obtain that $YX = g(T)$. By [M], $\ker g(T) = \{0\}$. Therefore, $\ker X = \{0\}$. \hfill \square

**Lemma 6.2.** Suppose that $T$ is a cyclic a.c. polynomially bounded operator such that $T \prec S$. Then $T \sim S$.

**Proof.** Since $T$ is cyclic, it follows from Corollary 2.1 that $S \prec T$. By Lemma 6.1, $T \sim S$. \hfill \square

**Lemma 6.3.** Suppose that $T$ is a cyclic a.c. polynomially bounded operator such that $T \prec U_T$. Then $T(a) \cong U_T$.

**Proof.** Since $T$ is an a.c. polynomially bounded operator, $T(a)$ is a.c. by [K3, Proposition 15]. By [K1, Theorem 2], $T(a)$ contains $U_T$ as an orthogonal summand. Since $T(a)$ is a.c. and cyclic, we conclude that $T(a) \cong U_T$. \hfill \square

**Lemma 6.4.** Suppose that $T \in \mathcal{L}(\mathcal{H})$ is an a.c. polynomially bounded operator;
\[
T = \begin{pmatrix} T_0 & \ast \\ \emptyset & T_1 \end{pmatrix}
\]
with respect to some decomposition of $\mathcal{H}$, and there exists $\mathcal{M}_1 \in \text{Lat } T_1$ such that $T_1|_{\mathcal{M}_1} \sim S$. Then there exists $\mathcal{M} \in \text{Lat } T$ such that $T|_{\mathcal{M}} \sim S$.

**Proof.** Let $x$ be a cyclic vector for $T_1|_{\mathcal{M}_1}$. Set $\mathcal{M} = \vee_{n \geq 0} T^n x$. It is easy to see that $P_{\mathcal{M}_1}|_{\mathcal{M}}$ realizes the relation $T|_{\mathcal{M}} \prec T_1|_{\mathcal{M}_1}$. By Lemma 6.2, $T|_{\mathcal{M}} \sim S$. \hfill \square

**Lemma 6.5.** Suppose that $T \in \mathcal{L}(\mathcal{H})$ is an a.c. polynomially bounded operator, $\sigma \subset \mathbb{T}$ is a measurable set, $X \in \mathcal{L}(\mathcal{H}, L^2(\sigma))$, $X = U_{\sigma}X$ and $\bigvee_{k \geq 0} U_{-k}X\mathcal{H} = L^2(\sigma)$. Then there exists $x \in \mathcal{H}$ such that $Xx =: f \neq 0$ a.e. on $\sigma$.

**Proof.** Let $\{x_n\}_{n=1}^N$ be such that $x_n \in \mathcal{H}$, $\|x_n\| = 1$ for all $n$, and
\[
\bigvee_{n=1}^N \bigvee_{k \geq 0} T^k x_n = \mathcal{H},
\]
where $1 \leq N \leq \infty$. Set $f_n = Xx_n$. Then
\[
m\left(\bigcap_{n=1}^N \{\zeta \in \sigma : f_n(\zeta) = 0\}\right) = 0.
\]
Take $\{a_n\}_{n=1}^N$ such that $a_n > 0$ for all $n$, and $\sum_{n=1}^N a_n < \infty$. Set $\sigma_{1n} = \{\zeta \in \sigma : |f_n(\zeta)| > 1\}$. 

Let \( \{ \varphi_n \}_{n=1}^N \subset H^\infty \) be such that

\[
|\varphi_n| = \begin{cases} 
  a_n / |a_n| & \text{on } T \setminus \sigma_{1n}, \\
  a_n & \text{on } \sigma_{1n}.
\end{cases}
\]

Set \( x_{1n} = \varphi_n(T)x_n \) and \( f_{1n} = Xx_{1n} \). Then \( \|x_{1n}\| \leq C_{\text{pol},T} a_n \) and \( |f_{1n}| \leq a_n \) a.e. on \( \sigma \). Set \( f_0 = \sup_n |f_{1n}| \). Then \( 0 < f_0 < \infty \) a.e. on \( \sigma \). Take \( 0 < \delta < 1 \). Set

\[
\sigma_{2n} = \{ \zeta \in \sigma : \delta f_0(\zeta) \leq |f_{1n}(\zeta)| \}.
\]

Set

\[
\tau_1 = \sigma_{21}, \quad \tau_n = \sigma_{2n} \setminus \cup_{k=1}^{n-1} \tau_k, \quad n \geq 2.
\]

Then

\[
\bigcup_{n=1}^N \tau_n = \sigma \quad \text{and} \quad \tau_n \cap \tau_k = \emptyset, \quad \text{if } n \neq k, \ n, k \geq 1.
\]

Take \( \{ \varepsilon_n \}_{n=1}^N \) such that \( \varepsilon_n > 0 \) for all \( n \), and \( \sum_{n=1}^N \varepsilon_n < \delta \). Let \( \{ \eta_n \}_{n=1}^N \subset H^\infty \) be such that

\[
|\eta_n| = \begin{cases} 
  1 & \text{on } \tau_n, \\
  \varepsilon_n & \text{on } T \setminus \tau_n.
\end{cases}
\]

Put

\[
x = \sum_{n=1}^N \eta_n(T)x_{1n}.
\]

Then

\[
f = \sum_{n=1}^N \eta_n f_{1n}.
\]

We have

\[
|f| \geq |f_{1n}| - \sum_{k \neq n} \varepsilon_k |f_{1k}| \geq \left( \delta - \sum_{k=1}^N \varepsilon_k \right) f_0 \quad \text{a.e. on } \tau_n.
\]

Thus, \( x \) satisfies the conclusion of the lemma. \( \square \)

**Theorem 6.6.** Suppose that \( T_1 \) is a polynomially bounded operator such that \( T_1 \sim S \). Then for every \( c > 0 \) there exist \( M \in \text{Lat} T_1 \) and \( W \in \mathcal{L}(H^2, \mathcal{M}) \) such that \( W \) is invertible, \( WS = T_1 M W \) and \( \|W\|\|W^{-1}\| \leq (1 + c) \left( \sqrt{2} (K^2 + 2) KC_{\text{pol},T_1} + 1 \right) \sqrt{K^2 C_{\text{pol},T_1}^2 + 1} \)

\[\text{pol},T_1.\]

**Proof.** Applying [K1, Theorem 1], it is easy to see that \((T_1)^{(a)}_+ \cong S\). Denote by \( X_+ \) the canonical intertwining mapping for \( T_1 \) and \( S \) constructed using a Banach limit. Denote by \( \mathcal{H}_1 \) the space in which \( T_1 \) acts. Let \( \frac{1}{1+c} \leq c_3 < c_2 < 1 \). By Lemma 4.2, there exists \( x_1 \in \mathcal{H}_1 \) such that \( \|x_1\| = 1 \) and \( \|X_+ x_1\| \geq c_2 \). Set \( f_1 = X_+ x_1 \). Denote by \( \psi_{x_1} \) the function from Corollary 2.1 applied to \( T_1 \) and \( x_1 \). By Lemma 4.1,

\[
(6.1) \quad |f_1| \leq \|X_+ \| KC_{\text{pol},T_1} |\psi_{x_1}| \quad \text{a.e. on } \mathbb{T}.
\]

Since \( f_1 \in H^2 \), we have \( \int \log |\psi_{x_1}| dm > -\infty \). Taking into account Remark 2.3, we can assume that \( \psi_{x_1} \) is outer. Put \( g_1 = f_1 / \psi_{x_1} \). Then \( g_1 \in H^\infty \).
Acting as in Proposition 4.4, we obtain that
\begin{equation}
\|g_1\|_\infty > c_3.
\end{equation}
Namely, if \(|f_1| \leq c_3|\psi_{x_1}|\) a.e. on \(\mathbb{T}\), then
\begin{equation}
c_2^2 \leq \|X_+x_1\|^2 = \|f_1\|^2 = \int_{\mathbb{T}} |f_1|^2 dm \leq \int_{\mathbb{T}} c_3^2 |\psi_{x_1}|^2 dm \leq c_3^2,
\end{equation}
because \(\int_{\mathbb{T}} |\psi_{x_1}|^2 dm \leq 1\), a contradiction with the choice of \(c_2\) and \(c_3\).

Set \(N = \bigvee_{k \geq 0} T_1^k x_1\), \(T_0 = T_1|_N\), and \(X_0 = X_+|_N\). Taking into account that \(S|_{\text{clos}X_+N}\cong S\) and deleting on the inner factor of \(f_1\), we can assume that \(g_1\) is outer and we accept that \(X_0\) realizes the relation \(T_0 \prec S\). By Corollary 2.1, Remark 2.3, and Lemma 6.1 there exists \(Y_0 \in \mathcal{L}(H^2, \mathcal{N})\) such that \(\|Y_0\| \leq KC_{\text{pol}, T_1}\), \(Y_0\) realizes the relation \(S \prec T_0\), and \(X_0Y_0 = g_1(S)\).

Clearly \(T_0 \in \mathcal{L}(\mathcal{N})\) satisfies the assumption of Theorem 1.1. We prove Theorem 1.1 for \(T_0\) and obtain estimates of \(\|W\|\) and \(\|Z\|\) for \(W\) and \(Z\) constructed in the proof of Theorem 1.1.

If \(|g_1| \geq c_3\) a.e. on \(\mathbb{T}\), then set \(W = Y_0\). We have \(W^{-1} = \frac{1}{g_1(S)}X_0\) and
\begin{equation}
\|W\||\|W^{-1}\| \leq (1 + c) K C_{\text{pol}, T_1}^2. \quad \text{Therefore, we assume that}
\end{equation}
\begin{equation}
m(\{\zeta \in \mathbb{T} : |g_1(\zeta)| \geq c_3\}) < 1.
\end{equation}

Applying Proposition 4.7 to \(T_0\), \(Y_0\), \(X_0\), and \(g_1\), we obtain
\begin{equation}
T \in \mathcal{L}(\mathcal{N} \oplus H^2) \quad \text{and} \quad X \in \mathcal{L}(\mathcal{N} \oplus H^2, L^2(\mathbb{T})).
\end{equation}
Taking into account the estimates of \(\|Y_0\|\), of \(\|g_1\|_\infty\) by (6.1), and evident inequality \(C_{\text{pol}, T_0} \leq C_{\text{pol}, T_1}\), we obtain that
\begin{equation}
C_{\text{pol}, T} \leq \sqrt{K^2 + 2C_{\text{pol}, T_1}} \quad \text{and} \quad \|X\| \leq C_{\text{pol}, T_1} \sqrt{K^2 C_{\text{pol}, T_1}^2 + 1}.
\end{equation}

Since \(T_0\) is of class \(C_{10}\), we have \(\tau = 0\), \(X_+^* = Y_0 \oplus I_{H^2}\), and \(XX^* = g_1(U_T)\). Therefore, \(g = g_1\) and \(h_{01} = h_0\), where \(g\) and \(h_{01}\) are defined in (5.3) and (5.8), respectively (\(h_0\) will be chosen below; \(g\) and \(h_{01}\) will be used in (5.42)).

We replace (5.5) by
\begin{equation}
\sigma = \{\zeta \in \mathbb{T} : |g_1(\zeta)| < c_3\}.
\end{equation}
It allows to improve the estimate of \(\|Z\|\) constructed in the end of Theorem 1.1. By (6.3) and (6.2), \(0 < m(\sigma) < 1\).

Set \(h_0(\zeta) = 1\) (\(\zeta \in \mathbb{T}\)). Define \(x_0\) as in (5.14). Namely, set \(x_0 = X_+^* \chi_{\sigma}\).

Take \(0 < \varepsilon_0, \gamma_0, \delta_0 < 1\) and apply Proposition 4.5 as in the proof of Theorem 1.1. The first inequality in (5.5) and the choice of \(\delta_0\) in the proof of Theorem 1.1 was used to apply Lemmas 4.6 and 4.3 and obtain that \(\psi_n\) constructed by Corollary 2.1 applied to \(\varphi_n(T)x_0\) satisfy (5.19). In the case \(T_0 \sim S\) considered now (5.20) implies
\begin{equation}
\int_{\sigma} \log |\psi_n| dm > -\infty \quad \text{for every} \quad n \in \mathbb{N}.
\end{equation}
Take \(t_0 > 0\) and set
\begin{equation}
|\psi_{\lambda m}| = \begin{cases} |\psi_n| & \text{on} \quad \sigma, \\ \max(|\psi_n|, t_0) & \text{on} \quad \mathbb{T} \setminus \sigma. \end{cases}
\end{equation}
Then $\psi_{0n}$ satisfy (5.19) for all $n \in \mathbb{N}$. Repeat the remaining part of the proof of Theorem 1.1 with $\psi_{0n}$ instead of $\psi_n$. We obtain the constants $C_1$, $C_2$, the function $\alpha$ defined as in (5.42) which satisfies (5.47) and intertwining transformations $W$ and $Z$ with the following estimates:

$$C_1 = \frac{\|X\|}{KC_{\text{pol},T}(1 + \varepsilon_0)} \leq \frac{1}{(1 + \varepsilon_0)},$$

because $\|X\| \leq KC_{\text{pol},T_1} \leq KC_{\text{pol},T};$

$$C_2 \leq K^2C_{\text{pol},T}(1 + \varepsilon_0) \frac{(2(1 + c_1^2))^{1/2}}{1 - c_1} \max\left(1 + \sum_{n \geq 2} \xi_n^2\right)C_1, 1 + \xi)$$

$$+ KC_{\text{pol},T_1} \left(1 + \sum_{n \geq 2} \xi_n^2\right);$$

$$\|W\| \leq C_2; \quad \|Z\| \leq \left\|\frac{1}{\alpha}\right\| \|X\|.$$

Choosing $c_1$, $\varepsilon_0$, $\{\xi_n\}_{n \in \mathbb{N}}$ close to 0 and $c_3$, $\gamma_0$, $\delta_0$ close to 1, taking into account that $\varepsilon_0 \leq \varepsilon_00$, the definition (5.25) of $\xi$, the estimates before (5.48) and (5.49), the choice of $\sigma$ by (6.5), and (6.4), we obtain the conclusion of the theorem. □

**Remark 6.7.** There exist operators $T$ which satisfy the assumptions of Theorem 1.1 and have non-trivial factorization of the form $\left(\begin{array}{cc} C_1 & * \\ \emptyset & C_0 \end{array}\right)$, see [SFBK, Sec. IX.2]. Therefore, to obtain estimates of the norms of intertwining transformations in terms of $C_{\text{pol},T}$, a separate consideration of operators of class $C_{10}$ is needed in the present construction.

**Proof of Corollary 1.2.** We have $T = T_a + T_s$, where $T_a$ is a.c. and $T_s$ is similar to a singular unitary operator, see [M] or [K3]. Since there is no nonzero transformation intertwining a.c. and singular unitaries, we conclude that $T_a \prec U_T$. Let $x$ be from Lemma 6.5 applied to $T_a$ (with $\sigma = T$). Set

$$\mathcal{N}_0 = \bigvee_{k \geq 0} T^k_a x.$$

Then $\mathcal{N}_0 \in \text{Lat} T$, $T|_{\mathcal{N}_0}$ is a cyclic a.c. polynomially bounded operator and $T|_{\mathcal{N}_0} \prec U_T$. By Lemma 6.3, $(T|_{\mathcal{N}_0})^{(a)} \cong U_T$. Let

$$T|_{\mathcal{N}_0} = \left(\begin{array}{cc} T_0 & * \\ \emptyset & T_1 \end{array}\right),$$

where $T_0$ and $T_1$ are of classes $C_0$ and $C_1$, respectively, see Introduction and [K1]. By [K1, Theorem 3], $T_1^{(a)} \cong (T|_{\mathcal{N}_0})^{(a)}$. Since $T|_{\mathcal{N}_0}$ is cyclic and a.c., we have $T_1$ is cyclic and a.c., too. By Theorem 1.1 applied to $T_1$, there exists $\mathcal{M}_1 \in \text{Lat} T_1$ such that $T_1|_{\mathcal{M}_1} \approx S$. By Lemma 6.4, there exists $\mathcal{M} \in \text{Lat} T$ such that $T_1|_{\mathcal{M}} \sim S$. It remains to apply Theorem 6.6 to $T|_{\mathcal{M}}$. □
