WEIGHTED MOORE-PENROSE INVERSES OF ARBITRARY-ORDER TENSORS

RATIKANTA BEHERA *, SANDIP MAJI *, AND R. N. MOHAPATRA †

Abstract. We explore the singular value decomposition and full rank decomposition of arbitrary-order tensors using reshape operation. Here the treatment of arbitrary-order is a straightforward task due to the nature of the isomorphism between arbitrary-order tensor spaces and matrix spaces. It is an extension of the work on square tensors [M. Brazell, N. Li, C. Navasca and C. Tamon, SIAM J. Matrix Anal. Appl. 34(2), (2013), pp. 542-570] to tensors of arbitrary-order. Within the framework of this paper, the Moore-Penrose and weighted Moore-Penrose inverse for arbitrary-order tensors via the Einstein product is defined. Further, we elaborate on this theory by producing a few identities involving the weighted Moore-Penrose inverses of tensors. We then obtain some necessary and sufficient conditions of the reverse-order law for weighted Moore-Penrose inverses of arbitrary-order tensors.

Key words. Moore-Penrose inverse, Tensor, Matrix, Einstein product, Reverse order law.

1. Introduction.

1.1. Background and motivation. Tensors or hypermatrix are multidimensional generalizations of vectors and matrices, and have attracted tremendous interest in recent years [19, 24, 28, 27, 29]. Indeed, multilinear systems are closely related to tensors and such systems are encountered in a number of fields of practical interest, i.e., signal processing [22, 31, 10], scientific computing [1] [30, 5], data mining [9], data compression and retrieval of large structured data [11, 6]. Further, the Moore-Penrose inverse of tensors plays an important role in solving such multilinear systems [2, 17, 33] and the reverse-order law for the Moore-Penrose inverses of tensors yields a class of interesting problems that are fundamental in the theory of generalized inverses of tensors [26]. In view of these, multilinear algebra is gaining more and more attention from researchers [17, 1, 24, 20, 22], specifically, the recent findings in [2, 5, 16, 26, 32, 33], motivate us to study this subject in the framework of arbitrary-order tensors.

Let \( C^{I_1 \times \cdots \times I_N} (R^{I_1 \times \cdots \times I_N}) \) be the set of order \( N \) and dimension \( I_1 \times \cdots \times I_N \) tensors over the complex (real) field \( C (R) \). Let \( A \in C^{I_1 \times \cdots \times I_N} \) be a multiway array with \( N \)-th order tensor, and \( I_1, I_2, \ldots, I_N \) be dimensions of the first, second, \ldots, \( N \)-th way, respectively. Indeed, a matrix is a second order tensor, and a vector is a first order tensor. We refer to \( R^{m \times n} \) as the set of all \( m \times n \) matrices with real entries. Note that throughout the paper, tensors are represented in calligraphic letters like \( \mathcal{A} \), and the notation \((A)_{i_1, \ldots, i_N} = a_{i_1, \ldots, i_N}\) represents the scalars. Each entry of \( \mathcal{A} \) is denoted by \( a_{i_1, \ldots, i_N} \). The Einstein product \((12)\) \( \mathcal{A} * \mathcal{B} \in C^{I_1 \times \cdots \times I_M \times K_1 \times \cdots \times K_L} \) of tensors \( \mathcal{A} \in C^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N} \) and \( \mathcal{B} \in C^{J_1 \times \cdots \times J_N \times K_1 \times \cdots \times K_L} \) is defined by the operation \( *_N \) via

\[
(A*_N B)_{i_1 \ldots i_M j_1 \ldots j_N} = \sum_{j_1 \ldots j_N} a_{i_1 \ldots i_M j_1 \ldots j_N} b_{j_1 \ldots j_N k_1 \ldots k_L}.
\]

The Einstein product is not commutative but associative, and distributes with respect to tensor addition. Further, cancellation does not work but there is a multiplicative

identity tensor $I$. This type of product of tensors is used in the study of the theory of relativity \cite{12} and also in the area of continuum mechanics \cite{21}.

On the other hand, one of the most successful developments in the world of linear algebra is the concept of Singular Value Decomposition (SVD) of matrices \cite{3}. This concept gives us important information about a matrix such as its rank, an orthonormal basis for the column or row space, and reduction to a diagonal form \cite{34}. Recently this concept is also used in low rank matrix approximations \cite{13,15,35}. Since tensors are natural multidimensional generalizations of matrices, there are many applications involving arbitrary-order tensors. Further, the problem of decomposing tensors is approached in a variety of ways by extending the SVD, and extensive studies have exposed many aspects of such decomposition and its applications (see for example \cite{8,19,20,22,31,23}). However, the existing framework of SVD of tensor appears to be insufficient and/or inappropriate in several situations. The aim of this paper is to present a proper generalization of the SVD of arbitrary-order tensors under Einstein tensor product. In fact, the existing form \cite{5} of the SVD is well suited for square tensors, which is defined as follows:

**Definition 1.1.** (Definition 2.8, \cite{5}): The transformation defined as:

\[
(A)_{ijj} \xrightarrow{f} (A)_{i+(j-1)I}[i+(j-1)I]
\]

where $\mathcal{T}_{I,J,I,J}(R) = \{A \in \mathcal{R}^{I \times J \times I \times J} : \det(f(A)) \neq 0\}$. In general for any even order tensor, the transformation is defined as; $f : \mathcal{T}_{I_1,...,I_N,J_1,...,J_N}(R) \rightarrow \mathcal{M}_{I_1 \times J_1 \times I_2 \times J_2 \times \cdots \times I_N \times J_N}(R)$

\[
(A)_{i_1...i_Nj_1...j_N} \xrightarrow{f} (A)[i_1+\sum_{k=2}^{N}(i_k-1) \prod_{l=1}^{k-1}I_l][j_1+\sum_{k=2}^{N}(j_k-1) \prod_{l=1}^{k-1}J_l]
\]

Using the above Definition and Theorem 3.17 in \cite{5}, we obtain the SVD of a tensor $A \in \mathcal{R}^{I_1 \times J_1 \times I_2 \times J_2 \times \cdots \times I_N \times J_N}$, which can be extended only to any square tensor, i.e., for $A \in \mathcal{R}^{I_1 \times I_2 \times \cdots \times I_N \times J_1 \times J_2 \times \cdots \times J_N}$. Extension of the SVD for an arbitrary-order tensor using this method \cite{5} is impossible, since $f$ is not a homomorphism for even-order and/or arbitrary-order tensors. In fact, the Einstein product is not defined for the following two even-order tensors, $A \in \mathcal{R}^{I_1 \times I_2 \times J_1 \times J_2}$ and $B \in \mathcal{R}^{I_1 \times I_2 \times J_1 \times J_2}$, i.e., $A \ast_B B$ is not defined. Similar predication occurs in \cite{23} for arbitrary-order tensors. In order to get the homomorphism (defined in Lemma 3.1 part (2) in \cite{5} and the map $\phi$ defined in Section 2.2 in \cite{23}) the tensor should be a square tensor, i.e., $A \in \mathcal{R}^{I_1 \times I_2 \times \cdots \times I_N \times J_1 \times J_2 \times \cdots \times J_N}$. Therefore, our aim in this paper is to find the SVD for any arbitrary order tensors using reshape operation, which is discussed in the next section.

In addition, recently there has been increasing interest in analyzing inverses and generalized inverses of tensors based on different tensor products \cite{17,5,33}. The representations and properties of the ordinary tensor inverse were introduced in \cite{5}. This interpretation is extended to the Moore-Penrose inverse of tensors in \cite{33} and investigated for a few characterizations of different generalized inverses of tensors via Einstein product in \cite{2}. Appropriately, Behera and Mishra \cite{2} posed the open question: “Does there exist a full rank decomposition of tensors? If so, can this be used to compute the Moore-Penrose inverse of a tensor?” Liang and Zheng \cite{23} investigated this question, however, it is not suitable for arbitrary-order tensor, as the map $\phi$ defined in Section 2.2 is not a homomorphism. Therefore, it is appropriate to
employ an isomorphism map, to get a proper full rank decomposition of an arbitrary-order tensor. The *reshape* operation provides a natural tool to deal this problem, which is discussed in the next Section.

Recently, Panigrahy and Mishra [23] investigated the Moore-Penrose inverse of a product of two tensors via Einstein product. Using such theory of Einstein product, Stanimirovic, et al. [32] also introduced some basic properties of the range and null space of multidimensional arrays, and the effective definition of the tensor rank, termed as reshaping rank. In this respect, Panigrahy et al. [26] obtained a few necessary and sufficient conditions for the reverse order law for the Moore-Penrose inverses of tensors, which can be used to simplify various tensor expressions that involve inverses of tensor products. Corresponding representations of the weighted Moore-Penrose inverse [10] of an even-order tensor was introduced at this juncture.

In this paper, we study the weighted Moore-Penrose inverse of an arbitrary-order tensor. This paper extends the nice study of Brazell, Navasca, and Tamon [5] to arbitrary order. This study can lead to the enhancement of the computation of SVD and full rank decomposition of arbitrary-order tensor using *reshape* operation. With that in mind, we discuss some identities involving the weighted Moore-Penrose inverses of tensors and then obtain a few necessary and sufficient conditions of the reverse order law for the weighted Moore-Penrose inverses of arbitrary-order tensors via the Einstein product.

**1.2. Outline.** We organize the paper as follows: In the next subsection, we introduce some notations and definitions which are helpful in proving the main results of this paper. In Section 2, we provide the main results of the paper. In order to do so, we introduce SVD and full rank decomposition of an arbitrary-order tensor using reshape operation. Within this framework, the Moore-Penrose and the generalized weighted Moore-Penrose inverse for arbitrary-order tensor is defined. Furthermore, we obtain several identities involving the weighted Moore-Penrose inverses of tensors via Einstein product. The Section 3 contains a few necessary and sufficient conditions of the reverse-order law for the weighted Moore-Penrose inverses of tensors.

**1.3. Notations and definitions.** For convenience, we first briefly explain a few essential facts about the Einstein product of tensors, which are found in [2] [5] [33]. For a tensor $A = (a_{i_1 \cdots i_M j_1 \cdots j_N}) \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$, the tensor $B = (b_{j_1 \cdots j_N i_1 \cdots i_M}) \in \mathbb{C}^{J_1 \times \cdots \times J_N \times I_1 \times \cdots \times I_M}$ is said to be conjugate transpose of $A$, if $b_{j_1 \cdots j_N i_1 \cdots i_M} = \overline{a_{i_1 \cdots i_M j_1 \cdots j_N}}$ and $B$ is denoted by $A^\ast$. When $b_{j_1 \cdots j_N i_1 \cdots i_M} = a_{i_1 \cdots i_M j_1 \cdots j_N}$, $B$ is the transpose of $A$, denoted by $A^\top$. The definition of a diagonal tensor was introduced as a square tensor in [5] (Definition 3.12) and as an even-order tensor in [33]. Here we introduce arbitrary-order diagonal tensor, as follows:

**Definition 1.2.** A tensor $D \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$ with entries $d_{i_1 \cdots i_M j_1 \cdots j_N}$ is called a diagonal tensor if $d_{i_1 \cdots i_M j_1 \cdots j_N} = 0$, when $i_1 + \sum_{k=2}^{M}(i_k - 1) \prod_{i=1}^{k-1} I_i \neq [j_1 + \sum_{k=2}^{N}(j_k - 1) \prod_{j=1}^{k-1} J_j]$. Now we recall the definition of an identity tensor below.

**Definition 1.3.** (Definition 3.13, [3]) A tensor $I_N \in \mathbb{C}^{J_1 \times \cdots \times J_N \times J_1 \times \cdots \times J_N}$ with entries $(I_N)_{i_1 i_2 \cdots i_N j_1 j_2 \cdots j_N} = \prod_{k=1}^{N} \delta_{i_k j_k}$, where

$$\delta_{i_k j_k} = \begin{cases} 1, & i_k = j_k, \\ 0, & i_k \neq j_k. \end{cases}$$

is called a unit tensor or identity tensor. Note that throughout the paper, we denote $I_M$, $I_L$ and $I_R$ as identity tensors in the space $\mathbb{C}^{I_1 \times \cdots \times I_M \times I_1 \times \cdots \times I_M}$, $\mathbb{C}^{K_1 \times \cdots \times K_L \times K_1 \times \cdots \times K_L}$
and $\mathbb{C}^{H_1 \times \cdots \times H_R \times H_1 \times \cdots \times H_R}$ respectively. Further, a tensor $O$ denotes the zero tensor if all the entries are zero. A tensor $A \in \mathbb{C}^{I_1 \times \cdots \times I_N \times I_1 \times \cdots \times I_N}$ is Hermitian if $A = A^*$ and skew-Hermitian if $A = -A^*$. Further, a tensor $A \in \mathbb{C}^{I_1 \times \cdots \times I_N \times I_1 \times \cdots \times I_N}$ is unitary if $A^* \cdot A^* = A, $ and idempotent if $A \cdot A = A$. In the case of tensors of real entries, Hermitian, skew-Hermitian and unitary tensors are called symmetric (see Definition 3.16, [5]), skew-symmetric and orthogonal (see Definition 3.15, [5]) tensors, respectively. Next we present the definition of the reshape operation, which was introduced earlier in [32]. This is a more general way of rearranging the entries in a tensor (it is also a standard Matlab function), as follows:

**Definition 1.4.** (Definition 3.1, [32]): The 1-1 and onto reshape map, rsh, is defined as: $\text{rsh}: \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N} \rightarrow \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$ with

\[
\text{rsh}(A) = A = \text{reshape}(A, I_1 \cdots I_M, J_1 \cdots J_N)
\]

where $A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$ and the matrix $A \in \mathbb{C}^{I_1 \times I_M \times J_1 \times \cdots \times J_N}$. Further, the inverse reshaping is the mapping defined as: $\text{rsh}^{-1}: \mathbb{C}^{I_1 \times I_M \times J_1 \times \cdots \times J_N} \rightarrow \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$ with

\[
\text{rsh}^{-1}(A) = A = \text{reshape}(A, I_1, \cdots, I_M, J_1, \cdots, J_N).
\]

where the matrix $A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$ and the tensor $A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$. Further, Lemma 3.2 in [32] defined the rank of a tensor, $A$, denoted by $\text{rshrank}(A)$ as

\[
\text{rshrank}(A) = \text{rank(rsh}(A)).
\]

Continuing this research, Stanimirovic et. al. in [32] discussed the homomorphism properties of the rsh function, as follows,

**Lemma 1.5.** (Lemma 3.1 [32]): Let $A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$ and $B \in \mathbb{C}^{J_1 \times \cdots \times J_N \times K_1 \times \cdots \times K_L}$ be given tensors. Then

\[
\text{rsh}(A \cdot B) = \text{rsh}(A) \cdot \text{rsh}(B) = AB \in \mathbb{C}^{I_1 \times I_M \times K_1 \cdots K_L}
\]

where $A = \text{rsh}(A) \in \mathbb{C}^{I_1 \times I_M \times J_1 \cdots J_N}, B = \text{rsh}(B) \in \mathbb{C}^{J_1 \cdots J_N \times K_1 \cdots K_L}$.

An immediate consequence of the above Lemma is the following:

\[
A \cdot B = rsh^{-1}(AB), \text{ i.e., } rsh^{-1}(AB) = rsh^{-1}(A) \cdot rsh^{-1}(B).
\]

Existence of SVD of any square tensor is discussed in [5]. Using this framework, Jun and Wei [16] defined Hermitian positive definite tensors, as follows:

**Definition 1.6.** (Definition 1, [16]): For $P \in \mathbb{C}^{I_1 \times \cdots \times I_N \times I_1 \times \cdots \times I_N}$, if there exists a unitary tensor $U \in \mathbb{C}^{I_1 \times \cdots \times I_N \times I_1 \times \cdots \times I_N}$ such that

\[
P = U \cdot D \cdot U^*,
\]

where $D \in \mathbb{C}^{I_1 \times \cdots \times I_N \times I_1 \times \cdots \times I_N}$ is a diagonal tensor with positive diagonal entries, then $P$ is said to be a Hermitian positive definite tensor. Further, Jun and Wei [16] defined the square root of a Hermitian positive definite tensor, $P$, as follows:

\[
P^{1/2} = U \cdot D^{1/2} \cdot U^*
\]

where $D^{1/2}$ is the diagonal tensor, which obtained from $D$ by taking the square root of all its diagonal entries. Notice that $P^{1/2}$ is always non-singular and its inverse is denoted by $P^{-1/2}$. 
we now recall the definition of the range and the null space of arbitrary order tensors.

Definition 1.7. (Definition 2.1 [32]): The null space and the range space of a tensor $A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$ are defined as follows:

$$\mathcal{N}(A) = \{ \mathcal{X} : A \ast_N \mathcal{X} = 0 \in \mathbb{C}^{I_1 \times \cdots \times I_M} \}, \quad \text{and} \quad \mathcal{R}(A) = \{ A \ast_N \mathcal{X} : \mathcal{X} \in \mathbb{C}^{J_1 \times \cdots \times J_N} \}$$

It is easily seen that $\mathcal{N}(A)$ is a subspace of $\mathbb{C}^{J_1 \times \cdots \times J_N}$ and $\mathcal{R}(A)$ is a subspace of $\mathbb{C}^{I_1 \times \cdots \times I_M}$. In particular, $\mathcal{N}(A) = \{ 0 \}$ if and only if $A$ is left invertible via $\ast_M$ operation and $\mathcal{R}(A) = \mathbb{C}^{J_1 \times \cdots \times J_M}$ if and only if $A$ is right invertible via $\ast_N$ operation.

2. Main results. Mathematical modeling of problems in science and engineering typically involves solving multilinear systems; this becomes particularly challenging for problems having an arbitrary-order tensor. However, the existing framework on Moore-Penrose inverses of arbitrary-order tensor appears to be insufficient and/or inappropriate. It is thus of interest to study the theory of Moore-Penrose inverse of an arbitrary-order tensor via the Einstein product.

2.1. Moore-Penrose inverses. One of the most widely used methods is the SVD to compute Moore-Penrose inverse. Here we present a proper generalization of the SVD via the Einstein product.

Lemma 2.1. Let $A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$ with $\text{rshrank}(A) = r$. Then the SVD for tensor $A$ has the form

$$A = U \ast_M D \ast_N V^*$$

where $U \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_M}$ and $V \in \mathbb{C}^{J_1 \times \cdots \times J_N \times J_1 \times \cdots \times J_N}$ are unitary tensors, and $D \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$ is a diagonal tensor, defined by

$$(D)_{i_1 \cdots i_M j_1 \cdots j_N} = \begin{cases} \sigma_i > 0, & \text{if } I = J \in \{1, 2, \ldots, r\}, \\ 0, & \text{otherwise} \end{cases}$$

where $I = [i_1 + \sum_{k=2}^M (i_k - 1) \prod_{l=1}^{k-1} I_l]$ and $J = [j_1 + \sum_{k=2}^N (j_k - 1) \prod_{l=1}^{k-1} J_l]$.

Proof. Let $A = \text{rsh}(A) \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$. In the context of the SVD of the matrix $A$, one can write $A = UDV^*$, where $U \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_M}$ and $V \in \mathbb{C}^{J_1 \times \cdots \times J_N \times J_1 \times \cdots \times J_N}$ are unitary matrices and $D \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$ is a diagonal matrix with

$$(D)_{I, J} = \begin{cases} \sigma_i > 0, & \text{if } I = J \in \{1, 2, \ldots, r\}, \\ 0, & \text{otherwise} \end{cases}$$

From relations (1.7) and (1.8), we can write

$$A = \text{rsh}^{-1}(A) = \text{rsh}^{-1}(UDV^*)$$

$$= \text{rsh}^{-1}(U) \ast_M \text{rsh}^{-1}(D) \ast_N \text{rsh}^{-1}(V^*) = U \ast_M D \ast_N V^*$$

where $U = \text{rsh}^{-1}(U)$, $V = \text{rsh}^{-1}(V)$ and $D = \text{rsh}^{-1}(D)$. Further, $U \ast_M U^* = \text{rsh}^{-1}(U)U^* = \text{rsh}^{-1}(I) = I_M$ and $V \ast_N V^* = \text{rsh}^{-1}(V)V^* = \text{rsh}^{-1}(I) = I_N$ gives $A = U \ast_M D \ast_N V^*$, where $U$ and $V$ are unitary tensors and $D$ diagonal tensor. □

Remark 2.2. Here the Eq. (2.2) followed from the homomorphism property of reshape map [32]. However, the authors of in [24] proved the Theorem 3.2 in different way, which is acceptable only for a square tensors.
Continuing this study, we recall the definition of the Moore-Penrose inverse of tensors in $\mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$ via the Einstein product, which was introduced in [23] for arbitrary-order.

**Definition 2.3.** Let $A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$. The tensor $X \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$ satisfying the following four tensor equations:

\[(1) \ A^* A X = A; \]
\[(2) \ X^* A X = X; \]
\[(3) \ (A^* X)^* = A^* X; \]
\[(4) \ (X^* A)^* = X^* A, \]

is called the Moore-Penrose inverse of $A$, and is denoted by $A^\dagger$.

Further, similar to the proof of Theorem 3.2 in [33], we have the existence and uniqueness of the Moore-Penrose inverse of an arbitrary-order tensor in $\mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$, as follows.

**Theorem 2.4.** The Moore-Penrose inverse of an arbitrary-order tensor, $A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$ exists and is unique.

By straightforward derivation, the following results can be obtained, which also hold (Lemma 2.3 and Lemma 2.6) in [2] for even-order tensor.

**Lemma 2.5.** Let $A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$. Then

\[(a) \ A^* = A^\dagger A^\ast A = A^\ast A^\ast A^\dagger; \]
\[(b) \ A = A^\ast A^\ast A^\dagger (A^\ast)^\dagger; \]
\[(c) \ A^\dagger = (A^\ast A^\ast)^\dagger (A^\ast)^\dagger. \]

From [22], we present the relation of range space of multidimensional arrays which will be used to prove next Lemma.

**Lemma 2.6.** (Lemma 2.2, [32]) Let $A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$, $B \in \mathbb{C}^{I_1 \times \cdots \times I_M \times K_1 \times \cdots \times K_L}$. Then $\mathcal{R}(B) \subseteq \mathcal{R}(A)$ if and only if there exists $U \in \mathbb{C}^{I_1 \times \cdots \times I_M \times K_1 \times \cdots \times K_L}$ such that $B = A^* U$.

We now discuss the important relation between range and Moore-Penrose inverse of an arbitrary order tensor, which are mostly used in various section of this paper.

**Lemma 2.7.** Let $A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$ and $B \in \mathbb{C}^{I_1 \times \cdots \times I_M \times K_1 \times \cdots \times K_L}$. Then

\[(a) \ \mathcal{R}(B) \subseteq \mathcal{R}(A) \leftrightarrow A^\ast_B A^\dagger_B B = B; \]
\[(b) \ \mathcal{R}(A) = \mathcal{R}(B) \leftrightarrow A^\ast_B A^\dagger_B = B \ast_L B^\dagger_B; \]
\[(c) \ \mathcal{R}(A) = \mathcal{R}((A^\dagger)^\ast) \text{ and } \mathcal{R}(A^\dagger) = \mathcal{R}(A^\ast). \]

**Proof.** (a) Using the fact that $\mathcal{R}(A^\ast_B U) \subseteq \mathcal{R}(A)$ for two tensors $A$ and $U$ in appropriate order, one can conclude $\mathcal{R}(B) \subseteq \mathcal{R}(A)$ from $A^\ast_B A^\dagger_B B = B$. Further, using Lemma 2.6, we conclude $B = A^\ast_B A^\dagger_B$ from $\mathcal{R}(B) \subseteq \mathcal{R}(A)$, where $\mathcal{P} \in \mathbb{C}^{J_1 \times \cdots \times J_N \times K_1 \times \cdots \times K_L}$. Hence, $A^\ast_B A^\dagger_B = A^\ast_B A^\dagger_B A^\ast_B \mathcal{P} = B$.

(b) From (a), we have $\mathcal{R}(A) = \mathcal{R}(B)$ if and only if $A^\ast_B A^\dagger_B B = B$ and $B \ast_L B^\dagger_B = A = A^\ast_B A^\dagger_B$. Then $A^\ast_B A^\dagger_B = B \ast_L B^\dagger_B$.

(c) Using the Lemma 2.6 [(b),(c)], one can conclude that $\mathcal{R}(A) \subseteq \mathcal{R}((A^\dagger)^\ast)$ and $\mathcal{R}((A^\dagger)^\ast) \subseteq \mathcal{R}(A)$ respectively. This follows $\mathcal{R}(A) = \mathcal{R}((A^\dagger)^\ast)$. Further, replacing $A$ by $A^\ast$ and using the fact $(A^\ast)^\dagger = (A^\dagger)^\ast$ we obtain $\mathcal{R}(A) = \mathcal{R}(A^\dagger)$. \qed

Using the fact that $\mathcal{R}(A^\ast_B B) \subseteq \mathcal{R}(A)$ for two tensors $A$ and $B$ and the Definition-2.3, we get,

\[(2.3) \ \mathcal{R}(A^\ast_B B \ast_L B^\dagger_B) = \mathcal{R}(A^\ast_B B), \]
where \( A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N} \) and \( B \in \mathbb{C}^{J_1 \times \cdots \times J_N \times K_1 \times \cdots \times K_L} \). Further, using the method as in the proof of Lemma 2.7, one can prove the next Lemma.

**Lemma 2.8.** Let \( A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N} \) and \( B \in \mathbb{C}^{K_1 \times \cdots \times K_L \times J_1 \times \cdots \times J_N} \). Then

(a) \( \mathcal{R}(B^*) \subseteq \mathcal{R}(A^*) \Leftrightarrow B \ast_N A^t \ast_M A = B \),
(b) \( \mathcal{R}(A^*) = \mathcal{R}(B^*) \Leftrightarrow A^t \ast_M A = B^t \ast_L B \),
(c) \( \mathcal{R}(A \ast_N B^t) = \mathcal{R}(A \ast_N B^*) \).

**2.2. Weighted Moore-Penrose inverse.** Weighted Moore-Penrose inverse of even-order tensor, \( A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_K} \) was introduced in [16], very recently. Here we have discussed weighted Moore-Penrose inverse for an arbitrary-order tensor via Einstein product, which is a special case of generalized weighted Moore-Penrose inverse.

**Definition 2.9.** Let \( A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N} \), and a pair of invertible and Hermitian tensors \( M \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_M} \) and \( N \in \mathbb{C}^{J_1 \times \cdots \times J_N \times J_1 \times \cdots \times J_N} \). A tensor \( Y \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_M} \) is said to be the *generalized weighted Moore-Penrose inverse* of \( A \) with respect to \( M \) and \( N \), if \( Y \) satisfies the following four tensor equations

\[
\begin{align*}
(1) & \quad A \ast_N X \ast_M A = A; \\
(2) & \quad X \ast_M A \ast_N X = X; \\
(3) & \quad (M \ast_M A \ast_N X)^* = M \ast_M A \ast_N X; \\
(4) & \quad (N \ast_N X \ast_M A)^* = N \ast_N X \ast_M A.
\end{align*}
\]

In particular, when both \( M, N \) are Hermitian positive definite tensors, the tensor \( Y \) is called the *weighted Moore-Penrose inverse* of \( A \) and denote by \( A^{M,N}_W \). However, the generalized weighted Moore-Penrose inverse \( \mathcal{Y} \) does not always exist for any tensor \( A \), as shown below with an example.

**Example 2.10.** Consider tensors \( A = (a_{ijk}) \in \mathbb{R}^{2 \times 3 \times 2} \) and \( M = (m_{ijkl}) \in \mathbb{R}^{2 \times 3 \times 2 \times 3} \) with \( N = (n_{ijk}) \in \mathbb{R}^{2 \times 2} \) such that

\[
a_{ij1} = \begin{pmatrix} 1 & 0 & 1 \\ -1 & 2 & 1 \end{pmatrix}, \quad a_{ij2} = \begin{pmatrix} 2 & 0 & 3 \\ 2 & 0 & 1 \end{pmatrix} \quad \text{and} \quad N = \begin{pmatrix} 2 & 0 \\ 0 & -1 \end{pmatrix}
\]

with

\[
m_{ij11} = \begin{pmatrix} 2 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \quad m_{ij12} = \begin{pmatrix} 0 & 2 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \quad m_{ij13} = \begin{pmatrix} 0 & 0 & 1 \\ 0 & 0 & 0 \end{pmatrix},
\]
\[
m_{ij21} = \begin{pmatrix} 0 & 0 & 0 \\ -1 & 0 & 0 \end{pmatrix}, \quad m_{ij22} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 1 & 0 \end{pmatrix}, \quad m_{ij23} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 3 \end{pmatrix},
\]

Then we have

\[
A^T \ast_2 M \ast_2 A = \begin{pmatrix} 9 & 12 \\ 12 & 16 \end{pmatrix},
\]

This shows \( A^T \ast_2 M \ast_2 A \) is not invertible. Further, suppose the generalized weighted Moore-Penrose inverse \( Y \in \mathbb{R}^{2 \times 3 \times 2} \) of the given tensor \( A \) is exist, then by using relation (1) and relation (3) of Definition 2.9, we have

\[
(2.4) \quad A \ast_1 Y \ast_2 M^{-1} \ast_2 Y^T \ast_1 A^T \ast_2 M \ast_2 A = A.
\]
Further, since \((A^T *_2 A)^{-1} *_1 A^T *_2 A = I\), so \(A\) is left cancellable, now (2.4) becomes

\[
\mathcal{Y} *_2 \mathcal{M}^{-1} *_2 \mathcal{Y}^T *_1 A^T *_2 \mathcal{M} *_2 A = I,
\]

this follows that \(A^T *_2 \mathcal{M} *_2 A\) is invertible, which is a contradiction. At this point one may be interested to know when does the generalized weighted Moore-Penrose inverse exist? The answer to this question is explained in the following theorem.

**Theorem 2.11.** Let \(A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}\). If both \(M \in \mathbb{C}^{I_1 \times \cdots \times I_M \times I_1 \times \cdots \times I_M}\) and \(N \in \mathbb{C}^{J_1 \times \cdots \times J_N \times J_1 \times \cdots \times J_N}\) are Hermitian positive definite tensors. Then generalized weighted Moore-Penrose inverse of an arbitrary-order tensor \(A\) exists and is unique, i.e., there exist a unique tensor \(X \in \mathbb{C}^{J_1 \times \cdots \times J_N \times I_1 \times \cdots \times I_M}\), such that,

\[
X = A_{M \times N} = N^{-1/2} \ast_N (M^{1/2} \ast_M A \ast_N N^{-1/2})^\dagger \ast_M M^{1/2}
\]

where \(M^{1/2}\) and \(N^{1/2}\) are square roots of \(M\) and \(N\) respectively, satisfy all four relations of Definition 2.9.

One can prove the above Theorem 2.11 using Theorem-1 in [16] and Theorem 2.4. Further, it is known that identity tensors are always Hermitian and positive definite, therefore, for any \(A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}\), \(A_{I_M \times I_N}^\dagger\) exists and \(A_{I_M \times I_N}^\dagger = A^\dagger\), which is called the Moore-Penrose inverse of \(A\). Specifically, if we take \(M = I_M\) or \(N = I_N\) in Eq. (2.6), then the following identities are hold.

**Corollary 2.12.** Let \(A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}\). Then

(a) \(A_{M \times N}^\dagger = (M^{1/2} \ast_K A)^\dagger \ast_K M^{1/2}\),

(b) \(A_{I_M \times I_N}^\dagger = N^{-1/2} \ast_M (A \ast_M N^{-1/2})^\dagger\).

Using the Definition 2.9 and following the Lemma 2 in [16] one can write \((A_{M \times N}^\dagger)_{N \times M}^\dagger = A\) and \((A_{M \times N}^\dagger)^\ast = (A^\dagger)_{N \times M}^\dagger\), where \(A\) is an arbitrary-order tensor.

Now we define weighted conjugate transpose of a arbitrary-order tensor, as follows.

**Definition 2.13.** Let \(M \in \mathbb{C}^{I_1 \times \cdots \times I_M \times I_1 \times \cdots \times I_M}\) and \(N \in \mathbb{C}^{J_1 \times \cdots \times J_N \times J_1 \times \cdots \times J_N}\) are Hermitian positive definite tensors, the weighted conjugate transpose of \(A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}\) is denoted by \(A_{N \times M}^\#\) and defined as \(A_{N \times M}^\# = N^{-1} \ast_N A^* \ast_M M\).

Next we present the properties of the weighted conjugate transpose of any arbitrary-order tensor, \(A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}\), as follows.

**Lemma 2.14.** Let \(A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}\), \(B \in \mathbb{C}^{J_1 \times \cdots \times J_N \times K_1 \times \cdots \times K_L}\) and Hermitian positive definite tensors \(M \in \mathbb{C}^{I_1 \times \cdots \times I_M \times I_1 \times \cdots \times I_M}\), \(P \in \mathbb{C}^{K_1 \times \cdots \times K_L \times K_1 \times \cdots \times K_L}\) and \(N \in \mathbb{C}^{J_1 \times \cdots \times J_N \times J_1 \times \cdots \times J_N}\). Then

(a) \((A_{N \times M}^\#)_{M \times N}^\# = A\),

(b) \((A \ast_N B)_{P \times M}^\# = B_{P \times N}^\# \ast_N A_{N \times M}^\#\).

Adopting the result of Lemma 2.14 b) and the definition of the weighted Moore-Penrose inverse, we can write the following identities.

**Lemma 2.15.** Let \(A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}\), and \(M \in \mathbb{C}^{I_1 \times \cdots \times I_M \times I_1 \times \cdots \times I_M}\), \(N \in \mathbb{C}^{J_1 \times \cdots \times J_N \times J_1 \times \cdots \times J_N}\) are Hermitian positive definite tensors. Then

(a) \((A_{M \times N}^\#)_{N \times M}^\# = (A_{M \times N}^\dagger)_{N \times M}^\dagger\),

(b) \(A = A_{N \times M}^\# A_{N \times M}^\# A_{M \times N}^\# (A_{N \times M}^\#)^\dagger = (A_{M \times N}^\dagger)^\dagger\),

(c) \(A_{M \times N}^\# A_{N \times M}^\# A_{N \times N}^\# A_{M \times M}^\# A_{N \times M}^\# = A_{N \times N}^\# A_{N \times M}^\# A_{N \times M}^\# A_{M \times M}^\# A_{N \times M}^\#\).

Using the Lemma 3.17 in [26] on two invertible tensors \(B \in \mathbb{C}^{I_1 \times \cdots \times I_M \times I_1 \times \cdots \times I_M}\) and \(C \in \mathbb{C}^{J_1 \times \cdots \times J_N \times J_1 \times \cdots \times J_N}\), one can write the following identities

\[
(B^\# A)^\dagger \ast_M B^\# A = A^\dagger \ast_M A \quad \text{and} \quad A \ast_N C \ast_N (A \ast_N C)^\dagger = A \ast_N A^\dagger.
\]
where $A$ is the arbitrary-order tensor, i.e., $A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$. Further, using Eq. (2.7) and Corollary 2.12, we get the following results.

**Lemma 2.16.** Let $A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$, and $M \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$, $N \in \mathbb{C}^{J_1 \times \cdots \times J_N \times J_1 \times \cdots \times J_N}$ be a pair of Hermitian positive definite tensors. Then

(a) $\overline{A}_{M, I_N} \ast_M A = \left(\overline{M}^{1/2} \ast_M A\right)^\dagger \ast_M \overline{M}^{1/2} \ast_M A = \overline{A}^\dagger \ast_M A$,

(b) $A \ast_N \overline{A}_{I_M, N} = A \ast_N \overline{N}^{-1/2} \ast_N \left(A \ast_N \overline{N}^{-1/2}\right)^\dagger = A \ast_N A^\dagger$,

(c) $\left(\overline{A}_{M, I_N}\right)^\dagger = \overline{M}^{1/2} \ast_M \left[A^\ast \ast_M \overline{M}^{1/2}\right]^\dagger$,

(d) $\left(\overline{A}_{I_M, N}\right)^\dagger = \left(\overline{N}^{-1/2} \ast_N A^\ast\right)^\dagger \ast_N \overline{N}^{-1/2}$.

The considerable amount of conventional and important facts with the properties concerning the range space of arbitrary-order tensor, the following theorem obtains the well-formed result.

**Theorem 2.17.** Let $U \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$, $V \in \mathbb{C}^{J_1 \times \cdots \times J_N \times K_1 \times \cdots \times K_L}$. Let $M \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_M}$ and $N \in \mathbb{C}^{K_1 \times \cdots \times K_L \times J_1 \times \cdots \times J_N}$ be a pair of Hermitian positive definite tensors. Then

\[
(U \ast_N V)^\dagger_{M, N} = \left((U_{M, I_N})^\dagger \ast_N U_{I_M, N} V^\dagger_{I_M, I_N} U^\dagger_{I_M, I_N} \ast_L (U \ast_N V_{I_M, I_N})^\dagger \right)^{1/2}_{M, N}.
\]

**Proof.** Let $X = (U^\dagger)^\ast \ast_N V$ and $Y = U \ast_N (V^\dagger)^\ast$. From Lemma 2.8(c) we get

$\mathfrak{R}(X^\ast) = \mathfrak{R}((U \ast_N V)^\ast)$ and $\mathfrak{R}(Y) = \mathfrak{R}(U \ast_N V)$.

Further, using Lemma 2.8(b) and Lemma 2.7(b) along with the fact $(V^\dagger)^\ast = V \ast_L V^\dagger \ast_N (V^\dagger)^\ast$, we obtain,

\[
X^\dagger \ast_M (V^\dagger \ast_N U^\dagger) \ast_L Y^\dagger = X^\dagger \ast_M (U^\dagger)^\ast \ast_N V \ast_L V^\dagger \ast_N (V^\dagger)^\ast \ast_L Y^\dagger = X^\dagger \ast_M X \ast_L V^\dagger \ast_N (V^\dagger)^\ast \ast_L Y^\dagger = (U \ast_N V)^\dagger \ast_M Y \ast_L Y^\dagger = (U \ast_N V)^\dagger.
\]

Replacing $U$ and $V$ by $M^{1/2} \ast_M U$ and $V \ast_L N^{-1/2}$ respectively on the above result, we get

\[
((M^{1/2} \ast_M U)^\ast \ast_N (V \ast_L N^{-1/2})^\dagger)^\dagger = \left(\left(M^{1/2} \ast_M U\right)^\dagger \ast_N V \ast_L N^{-1/2}\right)^\dagger \ast_M \left(\left(M^{1/2} \ast_M U\right)^\dagger \ast_N (V \ast_L N^{-1/2})^\dagger\right)^\dagger = M^{-1/2} \ast_M (U_{M, I_N})^\dagger \ast_N V \ast_L N^{-1/2} \ast_M M^{-1/2} \ast_M (U_{M, I_N})^\dagger \ast_N (V^\dagger_{I_M, I_N}) \ast_L N^{1/2} \ast_L (U^\dagger_{I_M, I_N}) \ast_N V \ast_L N^{-1/2}.
\]

Substituting the above result in Eq. (2.7), we get the desired result.  

Further, in connection with range space of arbitrary-order tensor, the following Theorem collects some useful identities of weighted Moore-Penrose inverses.

**Theorem 2.18.** Let $U \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$, $V \in \mathbb{C}^{J_1 \times \cdots \times J_N \times K_1 \times \cdots \times K_L}$ and $W \in \mathbb{C}^{K_1 \times \cdots \times K_L \times H_1 \times \cdots \times H_R}$. If $A = U \ast_N V \ast_L W$, where $M \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_M}$ and $N \in \mathbb{C}^{K_1 \times \cdots \times K_L \times H_1 \times \cdots \times H_R}$ are Hermitian positive definite tensors. Then

(a) $A^\dagger_{M, N} = A_{M, N}^\dagger \ast_L V^\dagger \ast_N V \ast_L Y_{M, I_N}^\dagger$, where $X = (U \ast_N V \ast_L W)^\dagger \ast_M A$ and $Y = A \ast_R (\overline{V}^\dagger \ast_L V \ast_N W)^\dagger$,

(b) $A^\dagger_{M, N} = A_{I_M, N}^\dagger \ast_L V^\dagger \ast_N V \ast_L Y_{M, I_N}^\dagger$, where $X = (U \ast_N (V^\dagger)^\ast \ast_M A$ and $Y = A \ast_R (\overline{V}^\dagger)^\ast \ast_L V \ast_N W)^\dagger$. 

Proof. (a) From Eq. (2.6) we have

$$A_{MN}^1 = N^{-1/2} R[(U* N V*L W_1)]^T M^{1/2},$$

where $U_1 = M^{1/2} * M U$ and $W_1 = W * R N^{-1/2}$. On the other hand, by Eq. (2.3), we have

$$\mathcal{R}(X^t) = \mathcal{R}[\{(V^* N V*L V^t)^* N (U* N V*L V^t)^* M \{ (U* N V*L V^t)^* \} \} ^T] = \mathcal{R}(A^*) \text{ and } \mathcal{R}(Y) = \mathcal{R}(A).$$

Also by Lemma 2.7(c), we get

$$\mathcal{R}[(X^t)^*] \subseteq \mathcal{R}[\{(U* N V*L V^t)^* \}] = \mathcal{R}[\{(U* N V*L V^t)^* \}] \text{ and } \mathcal{R}(Y^t) \subseteq \mathcal{R}(V^t N V*L W).$$

Thus, by using Lemma 2.7(a),(b) and Lemma 2.8(a),(b), we have

$$X^t N V*L Y^t = X^t N (U* N V*L V^t)^* M (U* N V*L V^t)^* N V*L (V^t N V*L W) * R (V^t * N V*L W)^* N Y^t$$

(2.8)

$$= A^T * M Y^t.$$

Replacing $U$ by $U_1$ and $W$ by $W_1$ in Eq. (2.8) and then using Lemma 2.16(a),(b), we get

$$A_{MN}^1 = N^{-1/2} R [(U* N V*L V^t)^* M M^{1/2} A R N^{-1/2}]^* N V*L$$

$$= N^{-1/2} R [(U* N V*L V^t)^* M M^{1/2} A R N^{-1/2}]^* N V*L [M^{1/2} M A R (V^* N V*L W)^* N Y^t]$$

$$= X^t_{MN} N V*L Y^t_{MN}. L$$

(b) Following the Lemma 2.5(a) and Eq. (2.3), we get

$$\mathcal{R}(A) = \mathcal{R}(Y) \text{ and } \mathcal{R}(X^t) = \mathcal{R}[\{(V^* N V*L W)^* * L (U* N (V^t)^* )^* M \{ (U* N (V^t)^* ) \} \} ^T] = \mathcal{R}(A^*).$$

Also by using Lemma 2.7(c)

$$\mathcal{R}[(X^t)^* \subseteq \mathcal{R}[\{(U* N (V^t)^* )^* \}] \text{ and } \mathcal{R}(Y^t) \subseteq \mathcal{R}(V^t * * L W).$$

Further using Lemma 2.7(a),(b) and Lemma 2.8(a),(b), we obtain

$$X^t * L V^* N V*L V^* N Y^t = X^t * L [U* N (V^t)^* ]^* M (U* N (V^t)^* ]^* L V^* N V*L V^* N$$

$$= X^t * L [U* N (V^t)^* ]^* M A R [ (V^t)^* * L W]$$

(2.9)

$$= X^t * L [U* N (V^t)^* ]^* M A R [ (V^t)^* * L W]^T$$

$$= A^T * M A R [ (V^t)^* * L W]^T = A^T.$$

Let $U_1 = M^{1/2} * M U$, $W_1 = W * R N^{-1/2}$ and $A_1 = U_1 * N V*L W_1$. Then using Eq. (2.9) and the Lemma 2.16[(a),(b)], we can write

$$A_1^t = [(U* N (V^t)^* )^* M A_1] * L V^* N V*L V^* N [A_1 R (V^t)^* * L W]$$

$$= [(U* N (V^t)^* )^* M A R N^{-1/2}] * L V^* N V*L V^* N [M^{1/2} A R (V^t)^* * L W].$$

Therefore, $A_{MN}^1 = N^{-1/2} R A_1^T * M M^{1/2} = X^t_{MN} N V*L V^* N Y^t_{MN}$. □

**Theorem 2.19.** Let $U \in C^{I_1 \times \cdots \times I_M \times \cdots \times I_N}$, $V \in C^{J_1 \times \cdots \times J_K \times \cdots \times K_L}$ and $W \in C^{H_1 \times \cdots \times H_R \times \cdots \times H_U}$. Also let $M \in C^{I_1 \times \cdots \times I_M \times \cdots \times I_M}$ and $N \in C^{I_1 \times \cdots \times I_M \times \cdots \times I_M}$ be a pair of Hermitian positive definite tensors. Then
\[ (a) \quad (U \ast_N V \ast_L W)_{M,N}^\dagger = [(U_{M,I,N})^\dagger \ast_N V \ast_L W]_{M-1,N}^\dagger \ast_M (U_{M,I,N})^\dagger \ast_N V \ast_L \\
\quad (W_{I,L,N})^\dagger \ast_R (U \ast_N V \ast_L (W_{I,L,N})^\dagger |_{M,N-1}; \\
(b) \quad (U \ast_N V \ast_L W)_{M,N}^\dagger = [(U \ast_N V)_{M,I,L}^\dagger \ast_N V \ast_L W]_{M-1,N}^\dagger \ast_M (U \ast_N V)_{M,I,L} \ast_L \\
\quad V^\dagger \ast_N [(V \ast_L W)_{I,L,N}^\dagger \ast_R (U \ast_N (V \ast_L W)_{I,L,N}^\dagger)]_{M,N-1}. \]

**Proof.** (a) Let \( \mathcal{A} = U \ast_N V \ast_L W \), \( \mathcal{X} = (U^\dagger)^\ast \ast_N V \ast_L W \) and \( \mathcal{V} = U \ast_N V \ast_L (W^\dagger)^\ast \). Using Lemma 2.8(c), we get
\[ \Re(\mathcal{X}^\ast) = \Re(\mathcal{A}^\ast) \quad \text{and} \quad \Re(\mathcal{V}) = \Re(\mathcal{A}). \]

Further, using the fact that \( \mathcal{V}^\dagger = W^\dagger \ast_N (W^\dagger)^\ast \ast_N V^\ast \), and Lemma 2.7(b) and Lemma 2.8(b), we can write,
\[ \mathcal{X}^\ast \ast_M (U^\dagger)^\ast \ast_N V \ast_L (W^\dagger)^\ast \ast_R \mathcal{V}^\dagger = \mathcal{X}^\dagger \ast_M (U^\dagger)^\ast \ast_N V \ast_L W \ast_R W^\dagger \ast_L (W^\dagger)^\ast \ast_R \mathcal{V}^\dagger = A^\ast \ast_M \mathcal{V} \mathcal{R} \mathcal{V}^\dagger = A^\dagger. \]

Using the above result to \( [(M^{1/2} \ast_M U) \ast_N V \ast_L (W \ast_R N^{-1/2})] \) and following the Lemma 2.16(c),(d), we get,
\[ (U \ast_N V \ast_L W)_{M,N}^\dagger = N^{-1/2} \ast_R [[(M^{1/2} \ast_M U)]^\dagger \ast_N V \ast_L W \ast_R N^{-1/2}] \ast_M [(M^{1/2} \ast_M U)]^\dagger \ast_N V \ast_L \\
\quad (W \ast_R N^{-1/2}) \ast_R [M^{1/2} \ast_M U \ast_N V \ast_L \{(W \ast_R N^{-1/2})\}] \ast_M M^{1/2} \\
\quad = N^{-1/2} \ast_R [M^{-1/2} \ast_M (U_{M,I,N})^\dagger \ast_N V \ast_L W \ast_R N^{-1/2}] \ast_M M^{-1/2} \ast_M (U_{M,I,N})^\dagger \ast_N V \ast_L W \ast_R N^{-1/2} \ast_M M^{1/2} \\
\quad = [U_{M,I,N}]^\dagger \ast_N V \ast_L W \ast_M M^{-1} \ast_M (U_{M,I,N})^\dagger \ast_N V \ast_L (W_{I,L,N}^\dagger)^\ast (W_{I,L,N}^\dagger)^\ast R \ast_M M^{-1/2} \\
\quad = \{U_{M,I,N}^\dagger \ast_N V \ast_L W \ast_M M^{-1} \ast_M (U_{M,I,N})^\dagger \ast_N V \ast_L (W_{I,L,N}^\dagger)^\ast (W_{I,L,N}^\dagger)^\ast R \}
\]

(b) Let \( \mathcal{A} = U \ast_N V \ast_L W \), \( \mathcal{X} = [(U \ast_N V)^\dagger]^\ast \ast_L W \) and \( \mathcal{V} = U \ast_N [(V \ast_L W)^\dagger]^\ast \). Using Lemma 2.8(c), we get
\[ \Re(\mathcal{X}^\ast) = \Re(\mathcal{A}^\ast) \quad \text{and} \quad \Re(\mathcal{V}) = \Re(\mathcal{A}). \]

From Lemma 2.3(a), one can write \( [(V \ast_L W)^\dagger]^\ast = (V \ast_L W)^\ast_R (V \ast_L W)^\dagger)^\ast_N [(V \ast_L W)^\dagger]^\ast \). Further using Lemma 2.7(b) and Lemma 2.8(b), we obtain
\[ \mathcal{X}^\ast \ast_M [(U \ast_N V)^\dagger]^\ast \ast_L V^\dagger \ast_N [(V \ast_L W)^\dagger]^\ast \ast_R \mathcal{V}^\dagger = \mathcal{X}^\dagger \ast_M [(U \ast_N V)^\dagger]^\ast \ast_L V^\dagger \ast_N V \ast_L W \ast_R (V \ast_L W)^\dagger \ast_N [(V \ast_L W)^\dagger]^\ast \ast_R \mathcal{V}^\dagger = \mathcal{X}^\dagger \ast_M \mathcal{X} \ast_R (V \ast_L W)^\dagger \ast_N [(V \ast_L W)^\dagger]^\ast \ast_R \mathcal{V}^\dagger = A^\dagger \ast_M U \ast_N [(V \ast_L W)^\dagger]^\ast \ast_R \mathcal{V}^\dagger = A^\dagger. \]

Replacing \( U \) and \( W \) by \( M^{1/2} \ast_M U \) and \( W \ast_R N^{-1/2} \) respectively on the above result, we have
\[ [(M_{1/2} \ast_M U) \ast_N V \ast_L (W \ast_R N^{-1/2})]^\dagger \]
\[ = [(M_{1/2} \ast_M U \ast_N V)^\dagger]^\ast \ast_L W \ast_R N^{-1/2} \ast_M [(M_{1/2} \ast_M U \ast_N V)^\dagger]^\ast \ast_L \mathcal{V}^\dagger \ast_N (V \ast_L W \ast_R N^{-1/2})^\dagger \ast_R [M_{1/2} \ast_M U \ast_N \{(V \ast_L W \ast_R N^{-1/2})\}] \ast_M M^{-1/2} \ast_M [(U \ast_N V)_{M,I,L}^\dagger \ast_L W \ast_R N^{-1/2}] \ast_M M^{-1/2} \ast_M [(U \ast_N V)_{M,I,L}^\dagger \ast_L \mathcal{V}^\dagger \ast_N (V \ast_L W)_{I,L,N}^\dagger]^\ast \ast_R N^{-1/2} \ast_R [M_{1/2} \ast_M U \ast_N \{(V \ast_L W)_{I,L,N}^\dagger\}]^\ast \ast_R N^{1/2}. \]
Substituting the above result in Eq. (2.9), one can get the desired result. □

**Theorem 2.20.** Let $U \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$, $V \in \mathbb{C}^{J_1 \times \cdots \times J_M \times K_1 \times \cdots \times K_L}$ and $W \in \mathbb{C}^{K_1 \times \cdots \times K_L \times H_1 \times \cdots \times H_R}$. If $A = U \ast N \ast V \ast L \ast W$, and $M \in \mathbb{C}^{I_1 \times \cdots \times I_M \times I_1 \times \cdots \times I_M}$, $N \in \mathbb{C}^{H_1 \times \cdots \times H_R \times H_1 \times \cdots \times H_R}$ be a pair of Hermitian positive definite tensors. Then

$$A_{M,N}^{\dagger} = \chi_{I_1,N}^{\dagger} \ast N \ast V \ast L \ast Y_{M,I_L}^{\dagger},$$

where $X = U^{\dagger} \ast M \ast A$ and $Y = A \ast R \ast W^{\dagger}$.

**Proof.** Let $U_1 = M^{1/2} \ast M \ast U$ and $W_1 = W \ast R \ast N^{-1/2}$. It is known, from Eq. (2.9),

$$A_{M,N}^{\dagger} = N^{-1/2} \ast R \ast (U_1 \ast N \ast V \ast L \ast W_1)^{\dagger} \ast R \ast N^{-1/2}.$$

Now, using Eq. (2.3), we have $\Re(A^{\ast}) = \Re((U \ast N \ast V \ast L \ast W)^{\ast} \ast N \ast (U^{\ast})^{\dagger}) = \Re(A^{\ast})$ and $\Re(Y^{\ast}) = \Re(A^{\ast})$. Also, from Lemma 2.7 (c), we have

$$\Re((X^{\ast})^{\ast}) = \Re(X^{\ast}) \subseteq \Re(U^{\dagger}) = \Re(U^{\ast}) \ast \Re(Y^{\ast}) = \Re(W \ast R \ast W^{\dagger} \ast L \ast (U \ast N \ast V)^{\ast}) \subseteq \Re(W).$$

Using Lemma 2.16 [(a),(b)] and Lemma 2.8 [(a),(b)], we get

$$X^{\ast} \ast N \ast V \ast L \ast Y^{\dagger} = X^{\ast} \ast N \ast U^{\dagger} \ast M \ast U \ast V \ast L \ast W \ast R \ast W^{\dagger} \ast L \ast Y^{\dagger}$$

(1.10)

$$= A^{\dagger} \ast N \ast V \ast L \ast Y^{\dagger} = A^{\dagger}.$$

Using Lemma 2.16 [(a),(b)]) one can conclude

$$(U_1 \ast N \ast V \ast L \ast W_1)^{\dagger} = [U_1^{\dagger} \ast *M \ast M \ast A \ast R \ast N^{-1/2}]^{\dagger} \ast N \ast V \ast L \ast M^{1/2} \ast M \ast A \ast R \ast N^{-1/2} \ast R \ast W_1^{\dagger}$$

$$= [U_1^{\dagger} \ast M \ast A \ast R \ast N^{-1/2}]^{\dagger} \ast N \ast V \ast L \ast M^{1/2} \ast M \ast A \ast R \ast W^{\dagger}].$$

Hence, $A_{M,N}^{\dagger} = N^{-1/2} \ast R \ast [U_1^{\dagger} \ast M \ast A \ast R \ast N^{-1/2}]^{\dagger} \ast N \ast V \ast L \ast M^{1/2} \ast M \ast A \ast R \ast W^{\dagger} = \chi_{I_1,N}^{\dagger} \ast N \ast V \ast L \ast Y_{M,I_L}^{\dagger}$.

Hence the proof is complete. □

Further, using Lemma 2.16 [(a),(b)] and Eq. (2.6), and Eq. (2.10) we have

**Corollary 2.21.** Let $U \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$, $V \in \mathbb{C}^{J_1 \times \cdots \times J_M \times K_1 \times \cdots \times K_L}$ and $W \in \mathbb{C}^{K_1 \times \cdots \times K_L \times H_1 \times \cdots \times H_R}$. Let $A = U \ast N \ast V \ast L \ast W$. Let $M \in \mathbb{C}^{I_1 \times \cdots \times I_M \times I_1 \times \cdots \times I_M}$, $N \in \mathbb{C}^{H_1 \times \cdots \times H_R \times H_1 \times \cdots \times H_R}$, $P \in \mathbb{C}^{J_1 \times \cdots \times J_M \times J_1 \times \cdots \times J_N}$ and $Q \in \mathbb{C}^{K_1 \times \cdots \times K_L \times K_1 \times \cdots \times K_L}$ are Hermitian positive definite tensors. Then the weighted Moore-Penrose inverse of $A$ with respect to $M$ and $N$ satisfies the following identities:

(a) $A_{M,N}^{-1} = (U_{M,P}^{\dagger} \ast N \ast V \ast L \ast (A \ast R \ast W \ast Q)_{P,Q}^{\dagger})^{\dagger} \ast M \ast Q$.

(b) $A_{M,N}^{-1} = [(U \ast N \ast V \ast L \ast (P_{M,R}^{\dagger} \ast N \ast V \ast L \ast (A \ast R \ast W \ast Q)_{P,Q}^{\dagger})^{\dagger}]_{P,Q}^{\dagger} \ast M \ast Q$.

### 2.3. The full rank decomposition

The tensors and their decompositions originally appeared in 1927 [17]. The idea of decomposing a tensor as a product of tensors with a more desirable structure may well be one of the most important developments in numerical analysis such as the implementation of numerically efficient algorithms and the solution of multilinear systems [19, 20, 21, 18]. As part of this section, we focus on the full rank decomposition of a tensor. Unfortunately, it is very difficult to compute tensor rank. But the authors of [32] introduced an useful and effective definition of the tensor rank, termed as reshaping rank. With the help
of reshaping rank. We present one of our important results, full rank decomposition of an arbitrary-order tensor.

**Theorem 2.22.** Let \( A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N} \). Then there exist a left invertible tensor \( F \in \mathbb{C}^{I_1 \times \cdots \times I_M \times H_1 \times \cdots \times H_R} \) and a right invertible tensor \( G \in \mathbb{C}^{H_1 \times \cdots \times H_R \times J_1 \times \cdots \times J_N} \) such that

\[
(2.11) \quad A = F \ast_R G,
\]

where \( \text{rshrank}(F) = \text{rshrank}(G) = \text{rshrank}(A) = r = H_1 \cdots H_R \). This is called the full rank decomposition of the tensor \( A \).

**Proof.** Let the matrix \( A = \text{rsh}(A) \in \mathbb{C}^{I_1 \cdots I_M \times J_1 \cdots J_N} \). Then we have, \( \text{rank}(A) = r \). Suppose that the matrix \( A \) has a full rank decompositions, as follows,

\[
(2.12) \quad A = FG,
\]

where \( F \in \mathbb{C}^{I_1 \cdots I_M \times H_1 \cdots H_R} \) is a full column rank matrix and \( G \in \mathbb{C}^{H_1 \cdots H_R \times J_1 \cdots J_N} \) is a full row rank matrix. From Eq. (2.11) and Eq. (2.12) we obtain

\[
(2.13) \quad \text{rhs}^{-1}(A) = \text{rhs}^{-1}(FG) = \text{rhs}^{-1}(F) \ast_R \text{rhs}^{-1}(G),
\]

where \( F = \text{rsh}^{-1}(F) \in \mathbb{C}^{I_1 \cdots I_M \times H_1 \cdots H_R} \) and \( G = \text{rsh}^{-1}(G) \in \mathbb{C}^{H_1 \cdots H_R \times J_1 \cdots J_N} \), it follows that

\[
A = F \ast_R G,
\]

where \( F \in \mathbb{C}^{I_1 \cdots I_M \times H_1 \cdots H_R} \) is the left invertible tensor and \( G \in \mathbb{C}^{H_1 \cdots H_R \times J_1 \cdots J_N} \) is a right invertible tensor.

**Remark 2.23.** Here, the Eq. (2.13) follows from the homomorphism property, whereas, the authors of in [23] proved the Theorem 3.6 in a hypocritical way, which is acceptable only for a square tensors. Using the full rank decomposition of tensors, the authors of in [23] computed the Moore-Penrose inverse of a tensor, as follows

**Lemma 2.24.** (Theorem 3.7, [23]) If the full rank decomposition of a tensor \( A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N} \) is given as Theorem 2.22 then

\[
(2.14) \quad A^\dagger = G^\ast \ast_R (F^\ast \ast_M A \ast_N G^\ast)^{-1} \ast_R F^\ast.
\]

Now, the following theorem expressed the weighted Moore-Penrose inverse of a tensor \( A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N} \) in form of the ordinary tensor inverse.

**Theorem 2.25.** If the full rank decomposition of a tensor \( A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N} \) is given by Eq. (2.11), then the weighted Moore-Penrose inverse of \( A \) can be written as

\[
A^\dagger_{M,N} = N^{-1} \ast_N G^\ast \ast_R (F^\ast \ast_M M^\ast \ast_M A \ast_N N^{-1} \ast_N G^\ast)^{-1} \ast_R F^\ast \ast_M M,
\]

where \( M \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_M} \) and \( N \in \mathbb{C}^{J_1 \times \cdots \times J_N \times J_1 \times \cdots \times J_N} \) are Hermitian positive definite tensors.

**Proof.** From Eq. (2.11), we have

\[
A^\dagger_{M,N} = N^{-1/2} \ast_N (M^{1/2} \ast_M A \ast_N N^{-1/2})^\dagger \ast_M M^{1/2} = N^{1/2} \ast_N B^\dagger \ast_M M^{1/2},
\]

where \( B = (M^{1/2} \ast_M F)^\ast_R (G^\ast N^{-1/2}) \), and \( M \) & \( N \) are Hermitian positive definite tensors. Here \( B \) is in the form of full rank decomposition, as both \( M^{1/2} \) and \( N^{1/2} \) are invertible. Now, from Lemma 2.24 we get

\[
B^\dagger = (G^\ast N^{-1/2})^\ast_R [(M^{1/2} \ast_M F)^\ast_M (M^{1/2} \ast_M F)^\ast_R (G^\ast N^{-1/2})^\ast_N (G^\ast N^{-1/2})^\ast_R (M^{1/2} \ast_M F)^\ast\]
\[
= N^{-1/2} \ast_N G^\ast \ast_R (F^\ast \ast_M M^\ast \ast_M A \ast_N N^{-1} \ast_N G^\ast)^{-1} \ast_R F^\ast \ast_M M^{1/2}.
\]
\[ A^\dagger_{M,N} = N^{-1} * N G^* R (F^* M M A^* N N^{-1} * N G^*)^{-1} * R F^* M M. \]

In particular when the arbitrary-order tensor, \( A \) is either left invertible or right invertible, we have the following results.

**Corollary 2.26.** Let a tensor \( A \in C^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N} \) has the full rank decomposition.

(a) If the tensor \( A \) is left invertible, then \( A^\dagger_{M,N} = N^{-1} * N (A^* M M A^* N N^{-1})^{-1} * N A^* M M; \)
(b) If the tensor \( A \) is right invertible, then \( A^\dagger_{M,N} = N^{-1} * N A^* M (M M A^* N N^{-1} A^*)^{-1} * M M \).

It is easy to see that the full rank factorizations of a tensor \( A \in C^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N} \) are not unique: if \( A = F * R G \) is one full rank factorization, where \( F \in C^{I_1 \times \cdots \times I_M \times H_1 \times \cdots \times H_R} \) is the left invertible tensor and \( G \in C^{H_1 \times \cdots \times H_R \times J_1 \times \cdots \times J_N} \) is the right invertible tensor, then there exist an invertible tensor \( P \) of appropriate size, such that, \( A = (F * R P) * R (P^{-1} * R G) \) is another full rank factorization. The following Theorem represents the result.

**Theorem 2.27.** Let \( A \in C^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N} \) with \( rshrank(A) = r = H_1 H_2 \cdots H_R \). Then \( A \) has infinitely many full rank decompositions. However if \( A \) has two full rank decompositions, as follows,

\[ A = F * R G = F_1 * R G_1, \]

where \( F, F_1 \in C^{I_1 \times \cdots \times I_M \times H_1 \times \cdots \times H_R} \) and \( G, G_1 \in C^{H_1 \times \cdots \times H_R \times J_1 \times \cdots \times J_N} \), then there exists an invertible tensor \( B \) such that

\[ F_1 = F * R B \quad \text{and} \quad G_1 = B^{-1} * R G. \]

Moreover,

\[ F_1^\dagger = (F * R B)^\dagger = B^{-1} * R F^\dagger \quad \text{and} \quad G_1^\dagger = (B^{-1} * R G)^\dagger = G^\dagger * R B. \]

**Proof.** Suppose the tensor, \( A \in C^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N} \) has two full rank decompositions, as follows,

\[ (2.15) \quad A = F * R G = F_1 * R G_1 \]

where \( F, F_1 \in C^{I_1 \times \cdots \times I_M \times H_1 \times \cdots \times H_R} \) and \( G, G_1 \in C^{H_1 \times \cdots \times H_R \times J_1 \times \cdots \times J_N} \). Then

\[ F * R G \uparrow N G_1^\dagger = F_1 * R G_1 \uparrow N G_1^\dagger. \]

Substituting \( M = I_M \) and \( N = I_N \) in Corollary 2.26(b) we have, \( G_1 \uparrow N G_1^\dagger = I_R \).

Therefore, \( F_1 = F * R (G \uparrow N G_1^\dagger) \), similarly we can find \( G_1 = (F_1^\dagger M F)^\dagger * R G \).

Let \( rsh(G) = G = reshape(G, r, J_1 \cdots J_N) \) and \( rsh(G_1) = G_1 = reshape(G_1, r, J_1 \cdots J_N) \). Then

\[ rsh(G \uparrow N G_1^\dagger) = GG_1^\dagger \in C^{r \times r} \]

and

\[ r = rshrank(F_1) = rshrank(F_1^\dagger) \leq rshrank(G \uparrow N G_1^\dagger) = rank(GG_1^\dagger) \leq r \]

Hence \( GG_1^\dagger \) is invertible as it has full rank. This concludes \( G \uparrow N G_1^\dagger = rsh^{-1}(GG_1^\dagger) \) is invertible. Similarly \( F_1^\dagger M F \) is also invertible. Let \( B = G \uparrow N G_1^\dagger \) and \( C = F_1^\dagger M F \).

Then

\[ C * R B = F_1^\dagger * M F * R G \uparrow N G_1^\dagger = F_1^\dagger * M F_1 * R G_1 \uparrow N G_1^\dagger = I_R \]
is equivalent to \( C = B^{-1} \). Therefore
\[
\mathcal{F}_1 = \mathcal{F}_R B \quad \text{and} \quad \mathcal{G}_1 = B^{-1} \ast_R G.
\]

Further
\[
\mathcal{F}_1^\dagger = ((\mathcal{F}_R B)^* \ast_M \mathcal{F}_R B)^{-1} \ast_R (\mathcal{F}_R B)^* = B^{-1} \ast_R (\mathcal{F}_R B)^{-1} \ast_R B^* \ast_R F^* = B^{-1} \ast_R (\mathcal{F}_R B)^{-1} \ast_R F^* = B^{-1} \ast_R B^\dagger.
\]

Similarly \( \mathcal{G}_1^\dagger = \mathcal{G}_R^\dagger B \).

**3. Reverse order law.** In this section, we present various necessary and sufficient conditions of the reverse-order law for the weighted Moore-Penrose inverses of tensors. The first result obtained below addresses the sufficient condition for reverse-order law of tensor.

**Theorem 3.1.** Let \( A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N} \) and \( B \in \mathbb{C}^{J_1 \times \cdots \times J_N \times K_1 \times \cdots \times K_L} \). Let \( M \in \mathbb{C}^{I_1 \times \cdots \times I_M \times 1 \times \cdots \times I_M} \) and \( N \in \mathbb{C}^{K_1 \times \cdots \times K_L \times 1 \times \cdots \times K_L} \) be a pair of Hermitian positive definite tensors. If \( R(B) = R(A^*) \), then
\[
(A \ast_N B)^\dagger_{M,N} = B_{L,N}^\dagger A_{M,I} \ast_N A_{M,N}^\dagger.
\]

**Proof.** Let \( X = A^\dagger \ast_M A \ast_N B \) and \( Y = A \ast_N B \ast_L B^\dagger \). By using Lemma 2.7(c), we get
\[
R((X^\dagger)^*) = R((A^\dagger \ast_M A)^* \ast_N B) \subseteq R(A^*)
\]
and
\[
R(Y^\dagger) = R(B \ast_L B^\dagger \ast_N A^*) \subseteq R(B).
\]

Similarly, from Eq. (2.3) we have
\[
R(X^*) = R(B^* \ast_N A^* \ast_M (A^*)^\dagger) = R((A \ast_N B)^*) \quad \text{and} \quad R(Y) = R(A \ast_N B).
\]

Further, from Lemma 2.7(a), (b) and Lemma 2.8(a), (b), we obtain
\[
X^\dagger \ast_N Y^\dagger = X^\dagger \ast_N X \ast_L B^\dagger \ast_N Y^\dagger = (A \ast_N B)^\dagger \ast_M Y \ast_N Y^\dagger = (A \ast_N B)^\dagger,
\]
i.e.,
\[
(A \ast_N B)^\dagger = (A^\dagger \ast_M A \ast_N B)^\dagger \ast_M (A \ast_N B \ast_L B^\dagger)^\dagger.
\]

Let \( A_1 = M^{1/2} \ast_M A \) and \( B_1 = B \ast_L N^{-1/2} \). Using the Lemma 2.16(a),(b), we get
\[
X = A_1^\dagger \ast_M A_1 \ast_N B \quad \text{and} \quad Y = A \ast_N B_1 \ast_L B_1^\dagger.
\]

Now, replacing \( A \) and \( B \) by \( A_1 \) and \( B_1 \) respectively on Eq. (3.1), we get
\[
(A_1 \ast_N B_1)^\dagger = (X \ast_L N^{-1/2})^\dagger \ast_N (M^{1/2} \ast_M Y)^\dagger.
\]

Thus from corollary 2.12, we can conclude
\[
(A \ast_N B)^\dagger_{M,N} = N^{-1/2} \ast_L (A_1 \ast_N B_1)^\dagger \ast_M M^{1/2} = X^\dagger_{I_N,N} \ast_N Y^\dagger_{M,I_N}.
\]

From the given condition and Lemma 2.7(b),(c), we have \( B \ast_L B^\dagger = A^\dagger \ast_M A \), i.e.,
\[
A = A \ast_N B \ast_L B^\dagger = Y \quad \text{and} \quad B = A^\dagger \ast_M A \ast_N B = X.
\]
Hence, \((A * N B)^\dagger_{M,N} = B^\dagger_{P,N} * N A^\dagger_{M,P}\).

Further, using Theorem 3.30 in [26] one can write a necessary and sufficient condition for reverse order law for arbitrary-order tensors, i.e., for \(A \in \mathbb{C}^{J_1 \times \cdots \times J_M \times J_1 \times \cdots \times J_N}
\)
and \(B \in \mathbb{C}^{J_1 \times \cdots \times J_N \times K_1 \times \cdots \times K_L}\). Then \((A * N B)^\dagger = B^\dagger * N A^\dagger\) if and only if
\[A^\dagger * M A * N B * L B^\dagger * N A^\dagger, \quad \text{and} \quad B * L B^\dagger * N A^\dagger * M A * N B = A^\dagger * M A * N B.\]

Now, utilizing the above result and the fact of Lemma 2.7(a),(c), we conclude a beautiful result for necessary and sufficient condition for Moore-Penrose inverse of arbitrary-order tensor, as follows.

**Lemma 3.2.** Let \(A \in \mathbb{C}^{J_1 \times \cdots \times J_M \times J_1 \times \cdots \times J_N}\) and \(B \in \mathbb{C}^{J_1 \times \cdots \times J_N \times K_1 \times \cdots \times K_L}\). The Reverse order law hold for Moore-Penrose inverse, i.e., \((A * N B)^\dagger = B^\dagger * N A^\dagger\) if and only if
\[\mathcal{R}(A^\dagger * M * N B) \subseteq \mathcal{R}(B) \quad \text{and} \quad \mathcal{R}(B * L B^\dagger * N A^\dagger) \subseteq \mathcal{R}(A^\dagger).\]

The primary result of this paper is presented next under the impression of the properties of range space of arbitrary-order tensor.

**Theorem 3.3.** Let \(A \in \mathbb{C}^{J_1 \times \cdots \times J_M \times J_1 \times \cdots \times J_N}\), \(B \in \mathbb{C}^{J_1 \times \cdots \times J_N \times K_1 \times \cdots \times K_L}\), \(M \in \mathbb{C}^{J_1 \times \cdots \times J_M \times J_1 \times \cdots \times J_M}\), \(N \in \mathbb{C}^{J_1 \times \cdots \times J_N \times K_1 \times \cdots \times K_L}\), and \(P \in \mathbb{C}^{J_1 \times \cdots \times J_N \times J_1 \times \cdots \times J_N}\) are three Hermitian positive definite tensors. Then
\[(A * N B)^\dagger_{M,N} = B^\dagger_{P,N} * N A^\dagger_{M,P}\]
if and only if
\[\mathcal{R}(A^\dagger_{P,M} * N B) \subseteq \mathcal{R}(B) \quad \text{and} \quad \mathcal{R}(B * L B^\dagger_{N,P} * N A^\dagger_{P,M}) \subseteq \mathcal{R}(A^\dagger_{P,M}).\]

**Proof.** From equation (2.6), we have \((A * N B)^\dagger_{M,N} = B^\dagger_{P,N} * N A^\dagger_{M,P}\) if and only if
\[N^{-1/2} * L (M^{1/2} * M A * N B * L N^{-1/2})^\dagger * M M^{1/2}
\]
\[N^{-1/2} * L (P^{1/2} * N B * L N^{-1/2})^\dagger * N P^{1/2} * N P^{-1/2} * N (M^{1/2} * M A * N P^{-1/2})^\dagger * M M^{1/2},\]

is equivalent to, if and only if
\[(\hat{A} * N \hat{B})^\dagger = \hat{B}^\dagger * N \hat{A}^\dagger,\]
where \(\hat{A} = M^{1/2} * M A * N P^{-1/2}\) and \(\hat{B} = P^{1/2} * N B * L N^{-1/2}\). From Lemma 3.2, we have
\[(A * N B)^\dagger_{M,N} = B^\dagger_{P,N} * N A^\dagger_{M,P}\]
if and only if
\[(3.2) \quad \mathcal{R}(\hat{A}^\dagger * M \hat{A} * N \hat{B}) \subseteq \mathcal{R}(\hat{B}) \quad \text{and} \quad \mathcal{R}(\hat{B} * L \hat{B}^\dagger * N \hat{A}^\dagger) \subseteq \mathcal{R}(\hat{A}^\dagger),\]
which equivalently if and only if
\[\mathcal{R}(P^{1/2} * N A^\dagger_{P,M} * M A * N B * L N^{-1/2}) \subseteq \mathcal{R}(P^{1/2} * N B * L N^{-1/2})\]
and
\[\mathcal{R}(P^{1/2} * N B * L B^\dagger_{N,P} * N A^\dagger_{P,M} * M M^{-1/2}) \subseteq \mathcal{R}(P^{1/2} * N A^\dagger_{P,M} * M M^{-1/2}).\]

Hence, \((A * N B)^\dagger_{M,N} = B^\dagger_{P,N} * N A^\dagger_{M,P}\) if and only if
\[\mathcal{R}(A^\dagger_{P,M} * M A * N B) \subseteq \mathcal{R}(B) \quad \text{and} \quad \mathcal{R}(B * L B^\dagger_{N,P} * N A^\dagger_{P,M}) \subseteq \mathcal{R}(A^\dagger_{P,M}).\]
This completes the proof.

As a corollary to Theorem 3.3, we present another reverse order law for the weighted Moore-Penrose inverse of arbitrary-order tensor.

**Corollary 3.4.** Let $A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$, $B \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$. Let $M \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$, $N \in \mathbb{C}^{K_1 \times \cdots \times K_L \times K_1 \times \cdots \times K_L}$ and $P \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$ are three Hermitian positive definite tensors. Then

\[
(A * N B)^{†}_{M,N} = B^{†}_{P,N} * N A^{†}_{M,P}
\]

if and only if

\[
\]

and

\[
\]

**Proof.** From Theorem 3.3, Eq. (3.2) and Lemma 2.7(a), we have

\[
(A * N B)^{†}_{M,N} = B^{†}_{P,N} * N A^{†}_{M,P}
\]

if and only if

\[
(A^{#}_{P,M} * M A * N B)^{†}_{M,N} = (P^{1/2} * N B * L N^{-1/2})^{†}_{L} (P^{1/2} * N B * L N^{-1/2})^{†}_{N} P^{1/2} * N A^{#}_{P,M} * M A * N B * L N^{-1/2}
\]

and

\[
= P^{1/2} * N A^{#}_{P,M} * M A * N B * L N^{-1/2}
\]

and

\[
(P^{1/2} * N A^{#}_{P,M} * M A^{-1/2})^{†}_{N} (P^{1/2} * N A^{#}_{P,M} * M A^{-1/2})^{†}_{N} P^{1/2} * N B * L B^{#}_{N,P} * N A^{#}_{P,M} * M A^{-1/2}
\]

and

\[
= P^{1/2} * N B * L B^{#}_{N,P} * N A^{#}_{P,M} * M A^{-1/2},
\]

i.e., if and only if

\[
\]

and

\[
[(M^{1/2} * M A * N P^{-1/2})^{†}_{M} (M^{1/2} * M A * N P^{-1/2})^{†}_{M} P^{1/2} * N B * L B^{#}_{N,P} * N A^{#}_{P,M} * M A^{-1/2}
\]

and

\[
= P^{1/2} * N B * L B^{#}_{N,P} * N A^{#}_{P,M} * M A^{-1/2},
\]

i.e., if and only if

\[
\]

and

\[
\]

This completes the proof.

**Theorem 3.5.** Let $A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$, $B \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$. Let $M \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$, $N \in \mathbb{C}^{K_1 \times \cdots \times K_L \times K_1 \times \cdots \times K_L}$ and $P \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}$ are positive definite Hermitian tensors. Then

\[
(A * N B)^{†}_{M,N} = B^{†}_{P,N} * N A^{†}_{M,P}
\]

if and only if

\[
(A^{#}_{M,P} * M A * N B)^{†}_{P,N} = B^{†}_{P,N} * N A^{†}_{M,P} * M A
\]

and

\[
\]
Proof. Suppose, \((A_N B)^{\dagger}_{M,N} = B^{\dagger}_{P,N} * N A^{\dagger}_{M,P}\). Now one can write
\[
\]
Further we can write
\[
\]
Also,
\[
\begin{align*}
[\mathcal{P} * N (A^{\dagger}_{M,P} * M A_N B)]^* & = [(\mathcal{P} * N A^{\dagger}_{M,P} * M A_N B)^{*}]^{*} \\
\end{align*}
\]
and
\[
\begin{align*}
[N^{\dagger} L (B^{\dagger}_{P,N} * N A^{\dagger}_{M,P} * M A)]^* & = [N^{\dagger} L (B^{\dagger}_{P,N} * N A^{\dagger}_{M,P} * M A)]^*

\end{align*}
\]
Hence,
\[
\]

By similar arguments one can also show that, \((A_N B * L B^{\dagger}_{P,N})^{\dagger}_{P,N} = B^{\dagger}_{L} B^{\dagger}_{P,N} A^{\dagger}_{M,P}\).

Conversely, For proving converse, first we prove a identity.
From Eq. (2.6) and Eq. (3.1) we have,
\[
(A_N B)^{\dagger}_{M,N} = N^{-1/2}_{L} (M^{\dagger}_{1/2} * M A_N B^{\dagger}_{(P^{1/2} * N B^{\dagger}_{L} N^{-1/2})} * M M^{1/2})

\quad = N^{-1/2}_{L} (M^{\dagger}_{1/2} * M A_N B^{\dagger}_{L} N^{-1/2}) * N (P^{\dagger}_{1/2} * N B^{\dagger}_{L} N^{-1/2}) * M M^{1/2}

\quad = N^{-1/2} (M^{\dagger}_{1/2} A_N B^{\dagger}_{L} * M A_N B^{\dagger}_{L} N^{-1/2}) * N (P^{\dagger}_{1/2} * N B^{\dagger}_{L} N^{-1/2}) * M M^{1/2}

\]

Further, using the given hypothesis and above identity, we can write
\[

\quad = B^{\dagger}_{P,N} * N A^{\dagger}_{M,P} * M A.
\]

This completes the proof. □

In the next theorem, we develop the characterization for the weighted Moore-Penrose inverse of the product of arbitrary-order tensors \(A\) and \(B\), as follows.

**Theorem 3.6.** Let \(A \in C_{J_1 \times \cdots \times J_M}^{l_1 \times \cdots \times l_M} \), \(B \in C_{J_1 \times \cdots \times J_M}^{k_1 \times \cdots \times k_M} \). Let \(M \in C_{J_1 \times \cdots \times J_M}^{l_1 \times \cdots \times l_M} \), \(N \in C_{K_1 \times \cdots \times K_M}^{l_1 \times \cdots \times k_M} \) and \(P \in C_{J_1 \times \cdots \times J_M}^{k_1 \times \cdots \times k_M} \) are three Hermitian positive definite tensors. Then
\[
(A_N B)^{\dagger}_{M,N} = (B^{\dagger})_{P,N} * N (A^{\dagger})_{M,P}.
\]
where \( A_1 = A \ast_N B_1 \ast_L (B_1)^\dagger_{P,N} \) and \( B_1 = A_{M,P} \ast_M \ast N B \).

*Proof.*

(3.3) \[
A \ast_N B = A \ast_N A_{M,P} \ast_M A \ast_N B = A \ast_N B_1
\]

\[
= A \ast_N B_1 \ast_L (B_1)^\dagger_{P,N} \ast_N B_1 = A_1 \ast_N B_1.
\]

\[
A_{M,P} \ast_M A_1 = A_{M,P} \ast_M A \ast_N A_{M,P} \ast_M A \ast_N B \ast_L (B_1)^\dagger_{P,N}
\]

\[
(3.4)
= B_1 \ast_L (B_1)^\dagger_{P,N}.
\]

\[
A_{M,P} \ast_M A_1 = A_{M,P} \ast_M A_1 \ast_N (A_1)^\dagger_{M,P} \ast_M A_1
\]

\[
= B_1 \ast_L (B_1)^\dagger_{P,N} \ast_N (A_1)^\dagger_{M,P} \ast_M A_1.
\]

From (3.4) and (3.5), we have

\[
P \ast_N B_1 \ast_L (B_1)^\dagger_{P,N} = [P \ast_N B_1 \ast_L (B_1)^\dagger_{P,N}] \ast_N P^{-1} \ast_N [P \ast_N (A_1)^\dagger_{M,P} \ast_M A_1].
\]

Therefore,

\[
P \ast_N B_1 \ast_L (B_1)^\dagger_{P,N} = [P \ast_N B_1 \ast_L (B_1)^\dagger_{P,N}]^*
\]

\[
= P \ast_N (A_1)^\dagger_{M,P} \ast_M A_1 \ast_N B_1 \ast_L (B_1)^\dagger_{P,N}
\]

\[
= P \ast_N (A_1)^\dagger_{M,P} \ast_M A_1.
\]

Hence

(3.5) \[
B_1 \ast_L (B_1)^\dagger_{P,N} = (A_1)^\dagger_{M,P} \ast_M A_1 = A_{M,P} \ast_M A_1.
\]

Let \( X = A \ast_N B \) and \( Y = (B_1)^\dagger_{P,N} \ast_N (A_1)^\dagger_{M,P}. \) Using (3.3) and (3.4) we obtain

\[
X \ast_L Y \ast_M X = A \ast_N B \ast_L (B_1)^\dagger_{P,N} \ast_M (A_1)^\dagger_{M,P} \ast_N A_1 \ast_N B_1
\]

\[
= A_1 \ast_N B_1 \ast_L (B_1)^\dagger_{P,N} \ast_N B_1 \ast_L (B_1)^\dagger_{P,N} \ast_N B_1 = X,
\]

\[
Y \ast_M X \ast_L Y = (B_1)^\dagger_{P,N} \ast_N B_1 \ast_L (B_1)^\dagger_{P,N} \ast_N B_1 \ast_L (B_1)^\dagger_{P,N} \ast_N (A_1)^\dagger_{M,P} = Y,
\]

\[
M \ast_M X \ast_L Y = M \ast_M A_1 \ast_N (A_1)^\dagger_{M,P} \ast_M A_1 \ast_N (A_1)^\dagger_{M,P} = (M \ast_M X \ast_L Y)^*
\]

and

\[
N \ast_L Y \ast_M X = N \ast_L (B_1)^\dagger_{P,N} \ast_N B_1 \ast_L (B_1)^\dagger_{P,N} \ast_N B_1 = (N \ast_L Y \ast_M X)^*.
\]

Hence, \( X_{M,P} = Y, \) i.e., \( (A \ast_N B)^\dagger_{M,P} = (B_1)^\dagger_{P,N} \ast_N (A_1)^\dagger_{M,P}. \) We shall present the following example as a confirmation of the above theorem.

**Example 3.7.** Let \( A_1 = A \ast_2 B_1 \ast_1 (B_1)^\dagger_{P,N} \) and \( B_1 = A_{M,P} \ast_1 A \ast_2 B, \) where \( A = (a_{ijk}) \in \mathbb{R}^{3 \times 2^4}, B = (b_{ijk}) \in \mathbb{R}^{2^4 \times 3}, M = (m_{ij}) \in \mathbb{R}^{3 \times 3}, N = (n_{ij}) \in \mathbb{R}^{3 \times 3} \) and \( P = (p_{ijkl}) \in \mathbb{R}^{2^4 \times 2^4 \times 4} \) such that
\begin{align*}
a_{ij1} &= \begin{pmatrix} -1 & 2 \\ 1 & -1 \\ 0 & 1 \end{pmatrix}, \quad a_{ij2} = \begin{pmatrix} 1 & 0 \\ 0 & 0 \\ 1 & 0 \end{pmatrix}, \quad a_{ij3} = \begin{pmatrix} 2 & 0 \\ 1 & 1 \\ 0 & 0 \end{pmatrix}, \quad a_{ij4} = \begin{pmatrix} 3 & 2 \\ 1 & -1 \\ 0 & 1 \end{pmatrix}, \\
b_{ij1} &= \begin{pmatrix} -1 & 2 & 1 & 1 \\ 0 & 1 & 1 & 0 \end{pmatrix}, \quad b_{ij2} = \begin{pmatrix} 0 & 1 & 1 & 1 \\ 1 & 1 & 0 & 1 \end{pmatrix}, \quad b_{ij3} = \begin{pmatrix} 0 & 1 & 1 & 1 \\ 1 & 1 & 0 & 1 \end{pmatrix}, \\
M &= \begin{pmatrix} 3 & 0 & 1 \\ 0 & 2 & 0 \\ 1 & 0 & 2 \end{pmatrix}, \quad N = \begin{pmatrix} 1 & 1 & 0 \\ 1 & 2 & 0 \\ 0 & 0 & 1 \end{pmatrix}, \\
p_{ij11} &= \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \quad p_{ij12} = \begin{pmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix} \quad p_{ij13} = \begin{pmatrix} 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{pmatrix}, \quad p_{ij14} = \begin{pmatrix} 1 & 0 & 0 & 3 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 1 & 0 \end{pmatrix} \\
p_{ij21} &= \begin{pmatrix} 0 & 0 & 1 & 0 \\ 2 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \quad p_{ij22} = \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & 2 & 2 & 1 \\ 0 & 2 & 2 & 1 \end{pmatrix} \quad p_{ij23} = \begin{pmatrix} 0 & 0 & 0 & 1 \\ 0 & 2 & 5 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \quad p_{ij24} = \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 1 \end{pmatrix}.
\end{align*}

Then \( A_1 = \langle \tilde{a}_{ijk} \rangle \in \mathbb{R}^{3 \times 2 \times 4}, \quad B_1 = \langle \tilde{b}_{ijk} \rangle \in \mathbb{R}^{2 \times 4 \times 3}, \quad (A_1)^T_{M,p} = (x_{ijk}) \in \mathbb{R}^{2 \times 4 \times 3} \) and \( (B_1)^T_{p,N'} = (y_{ijk}) \in \mathbb{R}^{3 \times 2 \times 4} \) such that

\begin{align*}
\tilde{a}_{ij1} &= \begin{pmatrix} -1 & 2 \\ 0 & -1 \\ 0 & 1 \end{pmatrix}, \quad \tilde{a}_{ij2} = \begin{pmatrix} 1 & 0 \\ 0 & 1 \\ 1 & 0 \end{pmatrix}, \quad \tilde{a}_{ij3} = \begin{pmatrix} 2 & 0 \\ 1 & 1 \\ 0 & 0 \end{pmatrix}, \quad \tilde{a}_{ij4} = \begin{pmatrix} 3 & 2 \\ 1 & -1 \\ 0 & 1 \end{pmatrix}, \\
\tilde{b}_{ij1} &= \begin{pmatrix} -0.3450 & 1.0728 & 0.7438 & 0.4134 \\ -0.2067 & 1.1965 & -0.4265 & -0.8661 \end{pmatrix}, \quad \tilde{b}_{ij2} = \begin{pmatrix} -0.3319 & 1.7409 & 1.0320 & 0.4483 \\ -0.2242 & 1.1004 & -0.3217 & -0.5167 \end{pmatrix}, \\
\tilde{b}_{ij3} &= \begin{pmatrix} 1.5109 & 4.0568 & 0.2402 & -0.6376 \\ 0.3188 & 1.2533 & 0.0873 & -0.3755 \end{pmatrix}, \quad x_{ij1} = \begin{pmatrix} -0.2052 & -0.1339 & 0.1514 & 0.1194 \\ -0.0597 & -0.1616 & 0.0247 & 0.1936 \end{pmatrix}, \\
x_{ij2} &= \begin{pmatrix} 0.0218 & 0.4469 & 0.1470 & 0.0582 \\ -0.0291 & 0.5066 & -0.1587 & -0.4178 \end{pmatrix}, \quad x_{ij3} = \begin{pmatrix} 0.4236 & 0.9360 & -0.0146 & -0.2038 \\ 0.1019 & 0.2271 & 0.0553 & -0.0378 \end{pmatrix}, \\
y_{ij1} &= \begin{pmatrix} 0.4783 & -1.6522 \\ -0.5217 & 1.3478 \\ 0.1304 & -0.0870 \end{pmatrix}, \quad y_{ij2} = \begin{pmatrix} -0.5217 & 0.6522 \\ 0.4783 & -0.3478 \\ 0.1304 & 0.0870 \end{pmatrix}, \quad y_{ij3} = \begin{pmatrix} -0.3043 & 0.6522 \\ 0.6957 & -0.3478 \\ -0.1739 & 0.0870 \end{pmatrix}, \\
y_{ij4} &= \begin{pmatrix} -0.7826 & -1.6522 \\ 1.2174 & 1.3478 \\ -0.3043 & -0.0870 \end{pmatrix}.
\end{align*}
Thus
\[
(A \ast_N B)_{M,N}^\dagger = \begin{pmatrix}
-0.4738 & 0.6522 & -0.0435 \\
0.5217 & -0.3478 & -0.0435 \\
-0.1304 & 0.0870 & 0.2609
\end{pmatrix} = (B_1)_{P,N}^\dagger \ast_N (A_1)_{M,P}^\dagger.
\]

Hence \((A \ast_N B)_{M,N}^\dagger = (B_1)_{P,N}^\dagger \ast_N (A_1)_{M,P}^\dagger\)

Further, using the Lemma 4 in [10] on an arbitrary-order tensor \(A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}\) with Hermitian positive definite tensors \(M \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}\) and \(N \in \mathbb{C}^{J_1 \times \cdots \times J_N \times J_1 \times \cdots \times J_N}\) one can write the following identity
\[
(3.6) \quad \mathfrak{R}(A_{M,N}^\dagger \ast_M A) = \mathfrak{R}(A_{N,M}^\#)
\]

Using the above identity, a sufficient condition for the reverse order law for weighted Moore-Penrose inverse of tensor is presented next.

**Corollary 3.8.** Let \(A \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times J_N}\), \(B \in \mathbb{C}^{I_1 \times \cdots \times J_N \times K_1 \times \cdots \times K_L}\). Let \(M \in \mathbb{C}^{I_1 \times \cdots \times I_M \times J_1 \times \cdots \times I_M}\), \(N \in \mathbb{C}^{I_1 \times \cdots \times K_1 \times \cdots \times K_L}\) and \(P \in \mathbb{C}^{J_1 \times \cdots \times J_N \times J_1 \times \cdots \times J_N}\) are positive definite Hermitian tensors. If
\[
\mathfrak{R}(B) \subseteq \mathfrak{R}(A_{P,M}^\#) \quad \text{and} \quad N(B_{N^11/2,P1/2}^\#) \subseteq N(A),
\]

Then
\[
(A \ast_N B)_{M,N}^\dagger = B_{P,N}^\dagger \ast_N A_{M,P}^\dagger.
\]

**Proof.** From Theorem 3.6, we have, \((A \ast_N B)_{M,N}^\dagger = (B_1)_{P,N}^\dagger \ast_N (A_1)_{M,P}^\dagger\), where \(A_1 = A \ast_N B \ast_L (B_1)_{P,N}^\dagger\) and \(B_1 = A_{M,P}^\dagger \ast_M \ast_N B\). From Eq. (3.6) and given hypothesis, we have
\[
\mathfrak{R}(A_{M,P}^\dagger \ast_M A) = \mathfrak{R}(A_{P,M}^\#) \supseteq \mathfrak{R}(B)
\]

So there exists \(P \in \mathbb{C}^{J_1 \times \cdots \times J_N \times K_1 \times \cdots \times K_L}\) such that \(B = A_{M,N}^\dagger \ast_M \ast_N P = B\). Now, \(B_1 = A_{M,N}^\dagger \ast_M \ast_M \ast_N A \ast_N P = B\).

Hence \(A_1 = A \ast_N B \ast_L B_{N^11/2,P1/2}^\dagger\).

Further, we have, \(N(B_{N^11/2,P1/2}^\#) \subseteq N(A)\), which is equivalent to
\[
\mathfrak{R}(P^{-1/2} \ast_N A^*) = \mathfrak{R}(A^*) \subseteq \mathfrak{R}((B_{N^11/2,P1/2}^\#)^*) = \mathfrak{R}((N^{-1/2} \ast_L B^* \ast_N P^{1/2})^*)
\]

Then from Lemma 2.7(a), we have
\[
(A \ast_N P^{-1/2}) \ast_N (N^{-1/2} \ast_L B^* \ast_N P^{1/2})^* \ast_L (N^{-1/2} \ast_L B^* \ast_N P^{1/2}) = A \ast_N P^{-1/2},
\]

which equivalently
\[
(A \ast_N P^{-1/2}) \ast_N ((P^{1/2} \ast_N B \ast_L N^{-1/2}) \ast_L (P^{1/2} \ast_N B \ast_L N^{-1/2}))^* = A \ast_N P^{-1/2},
\]

that is
\[
A \ast_N B \ast_L N^{-1/2} \ast_L (P^{1/2} \ast_N B \ast_L N^{-1/2})^* \ast_N P^{1/2} = A,
\]
Hence, \( (A * N) B \)\( _{M,N}^\dagger \) = \( B \)\( _{N,L} \) \( A \)\( _{M,N}^\dagger \).

We next present another characterization of the product of arbitrary-order tensors, as follows,

**Theorem 3.9.** Let \( A \in \mathbb{C}^{I_1 \times \cdots \times I_M} \) and \( B \in \mathbb{C}^{J_1 \times \cdots \times J_N} \) and \( \mathcal{M} \in \mathbb{C}^{K_1 \times \cdots \times K_L} \), and \( \mathcal{P} \in \mathbb{C}^{L_1 \times \cdots \times L_M} \) are three Hermitian positive definite tensors. Then

\[
(A * N) B \]_{M,N} = (B)_{P,A}^\dagger N(A)_{M,P}^\dagger,
\]

where \( A_1 = A * N B \) and \( B_1 = (A)_{M,P}^\dagger M A_1^* N B \).

**Proof.** Let \( X = A * N B \) and \( Y = (B)_{P,A}^\dagger N(A)_{M,P}^\dagger \). Now we have

\[
\]

Now, using Eq. (3.7), we obtain

\[
X^* L Y^* M X = A_1 * N B_1 * L (B_1)_{P,A}^\dagger N B_1 = X,
\]

\[
Y^* M X^* L Y = (B_1)_{P,A}^\dagger N B_1 * L (B_1)_{P,A}^\dagger N (A)_{M,P}^\dagger = Y,
\]

\[
N^* L Y^* M X = N^* L (B_1)_{P,A}^\dagger N B_1 = (N^* L Y^* M X)^*.
\]

Further, using the following relations

\[
B_1 * L (B_1)_{P,I,L} = (A)_{M,P}^\dagger M A_1 \quad \text{and} \quad B_1 * L (B_1)_{P,I,L} = B_1 * L (B_1)_{P,A}^\dagger N (A)_{M,P}^\dagger M A_1,
\]

we have

\[
(A)_{M,P}^\dagger M A_1 = B_1 * L (B_1)_{P,A}^\dagger.
\]

It concludes that,

\[
M^* X^* L Y = M^* M A_1^* N (A)_{M,P}^\dagger = (M^* M X^* L Y)^*.
\]

From the relations (3.8), (3.11) validates \( Y = X^* M,N \). Hence \( (A * N B)_{M,N}^\dagger = (B)_{P,A}^\dagger N(A)_{M,P}^\dagger \).

This completes the proof.

The significance of the properties of range and null space of arbitrary-order tensors, the last result achieved the sufficient condition for the triple reverse order law of tensor.

**Theorem 3.10.** Let \( U \in \mathbb{C}^{H_1 \times \cdots \times H_M} \) and \( V \in \mathbb{C}^{J_1 \times \cdots \times J_N \times K_1 \times \cdots \times K_L} \) and \( W \in \mathbb{C}^{H_1 \times \cdots \times H_M \times H_1 \times \cdots \times H_R} \) and \( \mathcal{N} \in \mathbb{C}^{H_1 \times \cdots \times H_M} \) be a pair of Hermitian positive definite tensors. If

\[
\mathcal{R}(W) \subseteq \mathcal{R}((U * N V)*) \quad \text{and} \quad \mathcal{R}(U^*) \subseteq \mathcal{R}(V^* L W).
\]

Then

\[
(U * N V * L W)_{M,N}^\dagger = W_{L,N}^\dagger N L V^* N U_{M,N}^\dagger.
\]
Proof. Let $A = U_N V_L W$, $W_1 = (U_N V)^\dagger_M A$ and $U_1 = A_R(V_L W)^\dagger$. From Eq. (2.3), we get

$$\mathcal{R}(U_1) = \mathcal{R}(A) \quad \text{and} \quad \mathcal{R}(W_1^\ast) = \mathcal{R}(A^\ast).$$

Also from Lemma 2.7(c), we get

$$\mathcal{R}[(W_1^\ast)^\ast] = \mathcal{R}(W_1) \subseteq \mathcal{R}[(U_N V)^\dagger] = \mathcal{R}[(U_N V)^\ast]$$

and

$$\mathcal{R}(U_1^\ast) = \mathcal{R}(U_1^\ast) \subseteq \mathcal{R}[(V_L W)^\dagger]^\ast = \mathcal{R}(V_L W).$$

Applying Lemma 2.7(a),(b) and Lemma 2.8(a),(b), we have

$$W_1^\dagger \ast_R V_N U_1^\dagger = W_1^\dagger \ast_R (V_L W)^\dagger \ast_R U_1^\dagger = A_1 \ast_M U_1^\ast_N U_1^\dagger = A^\dagger,$$

which is equivalent to

$$(U_N V_L W)^\dagger = [(U_N V)^\dagger \ast_M A]^\ast_L V_N [A_R(V_L W)^\dagger]^\dagger.$$

Replacing $U$ and $W$ by $M^{1/2}_M U$ and $W_R N^{-1/2}$ in Eq. (3.12) along with using Eq. (2.6) and Lemma 2.16(a),(b) we have

$$A^{\dagger}_{N,M} = N^{-1/2} R[(M^{1/2}_M U_N V)^\dagger \ast_M M^{1/2}_M A_R N^{-1/2}]^\dagger \ast_L V_N [M^{1/2}_M U_1]^\dagger \ast_N M^{1/2}$$

$$= N^{-1/2} R[W_1^\ast_R N^{-1/2}]^\ast_L V_N [M^{1/2}_M U_1]^\dagger \ast_N M^{1/2},$$

$$= (W_1)^\dagger_{L,N} \ast_L V_N^\ast_R (U_1)^\ast_{M,I,N}.$$

Applying Lemma 2.7(a),(c) and Lemma 2.8(a) in the given condition, we get

$$W = (U_N V)^\dagger \ast_M (U_N V)^\dagger_L W = W_1 \quad \text{and} \quad U = U_N (V_L W)^\dagger_R (V_L W)^\dagger = U_1.$$

Hence $(U_N V_L W)^\dagger_{N,M} = W_1^\dagger_{L,N} \ast_L V_N^\ast_R U_1_{M,I,N}. \square$

4. Conclusion. In this paper a novel SVD and full rank decomposition of arbitrary-order tensors using reshape operation is developed. Using this decomposition, we have introduced the Moore-Penrose and general weighted Moore-Penrose inverse for arbitrary-order tensors via the Einstein product. In addition to that, we expressed the weighted Moore-Penrose inverse of a tensor in the form of the ordinary tensor inverse. In this paper, we have also added some results on the range and null spaces of arbitrary order tensors via the Einstein product to the existing theory. In particular, we have focused on the reverse-order laws for weighted Moore-Penrose inverses under the influence of the properties of range and null spaces of arbitrary order tensors. However, various reverse-order laws for weighted Moore-Penrose inverses of arbitrary-order tensor formulas associated with rank and block-tensors is a work currently underway. In future, it will be more interesting to express more identities of weighted Moore-Penrose inverse in terms of the ordinary Moore-Penrose inverse of arbitrary-order tensor.
