Classical Kantorovich operators revisited

Ana-Maria Acu\textsuperscript{1}, Heiner Gonska\textsuperscript{2}

Abstract

The main object of this paper is to improve some of the known estimates for classical Kantorovich operators. A quantitative Voronovskaya-type result in terms of second moduli of continuity which improves some previous results is obtained. In order to explain non-multiplicativity of the Kantorovich operators a Chebyshev-Gr"uss inequality is given. Two Gr"uss-Voronovskaya theorems for Kantorovich operators are considered as well.

Keywords: Kantorovich operators, Voronovskaya theorem, rate of convergence, Chebyshev-Gr"uss inequality, Gr"uss-Voronovskaya theorem.

Mathematics Subject Classification (2010): 41A10, 41A25, 41A36.

1 Introduction

In 1930 L.V. Kantorovich \cite{KANT} introduced a significant modification of the classical Bernstein operators given by

\[ K_n(f; x) = (n + 1) \sum_{k=0}^{n} p_{n,k}(x) \int_{\frac{k+1}{n+1}}^{\frac{k+2}{n+2}} f(t) \, dt. \]

Here \( n \geq 1, f \in L_1[0, 1], x \in [0, 1] \) and

\[ p_{n,k}(x) = \binom{n}{k} x^k (1 - x)^{n-k}, \quad 0 \leq k \leq n, \]

\[ p_{n,k} \equiv 0, \text{ if } k < 0 \text{ or } k > n. \]

These mappings are relevant since they provide a constructive tool to approximate any function in \( L_p[0, 1], 1 \leq p < \infty \), in the \( L_p \)-norm. For \( p = \infty \), \( C[0, 1] \) has to be used instead of \( L_\infty[0, 1] \).

These classical Kantorovich operators have been attracting a lot of attention since then, but results on them are somehow scattered in the literature. They share this with other relevant variations of the Bernstein-type: Durrmeyer, genuine Bernstein-Durrmeyer and, last but not least, variation-diminishing Schoenberg splines.

In the present note we first collect and improve some of the known estimates by giving quite a precise inequality for \( f \in C^r[0, 1], r \in \mathbb{N} \cup \{0\} \), a new Voronovskaya result in terms of \( \omega_2 \) and a Chebyshev-Gr"uss inequality giving an explanation of their non-multiplicativity. The last part of this article deals with two Gr"uss-Voronovskaya theorems for Kantorovich operators.

Most estimates in this article will be given in terms of moduli of smoothness of higher order. In the background, but not explicitly mentioned, is always the K-functional technique. In this sense we were very much influenced by the work of Zygmund (see, e.g., \cite{Zygmund}), a hardly accessible conference contribution of Peetre \cite{Peetre} and also by the book of Dzyadyk \cite{Dzyadyk}.
2 Some previous results

In this section we collect some results given earlier. Quite a strong general result was given by the second author and Xin-long Zhou \cite{10} in 1995.

Let \( \varphi(x) = \sqrt{x(1-x)} \) and \( P(D) \) be the differential operator given by

\[
P(D)f := (\varphi^2 f')', \quad f \in C^2[0,1].
\]

For \( f \in L_p[0,1], 1 \leq p \leq \infty \), the functional \( K(f, t)_p \) is defined as below

\[
K(f, t)_p := \inf \{ \| f - g \|_p + t^2 \| P(D) g \|_p : g \in C^2[0,1] \}.
\]

Using the above functional in \cite{10} the following theorem was proved.

**Theorem 2.1.** There exists an absolute positive constant \( C \) such that for all \( f \in L_p[0,1], 1 \leq p \leq \infty \), there holds

\[
C^{-1}K(f, n^{-1/2})_p \leq \| f - K_n f \|_p \leq CK(f, n^{-1/2})_p.
\]

Also, in order to characterize the \( K \)-functional used in Theorem 2.1, the next result was given in \cite{10}:

**Theorem 2.2.** We have

\[
K(f, t)_p \sim \omega_\varphi^2(f, t)_p + t^2 E_0(f)_p, \quad 1 < p < \infty,
\]

and

\[
K(f, t)_\infty \sim \omega_\varphi^2(f, t)_\infty + \omega(f, t^2)_\infty.
\]

Here \( \omega(f, t)_p \) is the classical modulus, \( \omega_\varphi^2(f, t)_\infty \) denotes the second order modulus of smoothness with weight function \( \varphi \) and \( E_0(f)_p \) is the best approximation constant of \( f \) defined by

\[
E_0(f)_p = \inf_c \| f - c \|_p.
\]

Moreover, all quantities subscripted by \( \infty \) are taken with respect to the uniform norm in \( C[0,1] \). The following theorem of Păltănea \cite{13} is the key to give a more explicit result in terms of classical moduli for continuous functions. See \cite{8} for details.

**Theorem 2.3.** If \( L : C[0,1] \to C[0,1] \) is a positive linear operator, then for \( f \in C[0,1], x \in [0,1] \) and each \( 0 < h \leq 1/2 \) the following holds:

\[
|L(f; x) - f(x)| \leq |L(e_0; x) - 1| \cdot |f(x)| + \frac{1}{h} |L(e_1 - x; x)| \omega(f; h)
+ \left[ (Le_0)(x) + \frac{1}{2h^2} L((e_1 - x)^2; x) \right] \omega_2(f; h).
\]

The condition \( h \leq 1/2 \) can be eliminated for operators \( L \) reproducing linear functions.
Theorem 2.4. For all \( f \in C[0, 1] \) and all \( n \geq 4 \),
\[
\|K_n f - f\|_\infty \leq \frac{1}{2\sqrt{n}} \omega_1 \left( f; \frac{1}{\sqrt{n}} \right) + \frac{9}{8} \omega_2 \left( f; \frac{1}{\sqrt{n}} \right).
\]

This result can be extended to simultaneous approximation, see again [8].

Theorem 2.5. Let \( r \in \mathbb{N}_0, n \geq 4, f \in C^r[0, 1] \). Then
\[
\|D^r K_n f - D^r f\|_\infty \leq \frac{(r+1)r}{2n} \|D^r f\|_\infty + \frac{r+1}{2\sqrt{n}} \omega_1 \left( D^r f; \frac{1}{\sqrt{n}} \right) + \frac{9}{8} \omega_2 \left( D^r f; \frac{1}{\sqrt{n}} \right).
\]

3 A quantitative Voronovskaya result

This part has its predecessor in a hardly known booklet of Videnskij in which a quantitative version of the well-known Voronovskaya theorem for the classical Bernstein operators can be found (see [15]). This estimate was generalized and improved in [9]. An application for Kantorovich operators was given in [8]. Here we improve it as follows:

Theorem 3.1. For \( n \geq 1 \) and \( f \in C^2[0, 1] \), one has
\[
\left\| \frac{1}{2} \omega_1 \left( f''; \frac{1}{\sqrt{n+1}} \right) \right\|_\infty \leq \frac{2}{3(n+1)} \left( \frac{3}{4} \|f''\|_\infty + \|f'''\|_\infty \right)
+ \frac{9}{32} \left\{ \frac{2}{\sqrt{n+1}} \omega_1 \left( f''; \frac{1}{\sqrt{n+1}} \right) + \omega_2 \left( f''; \frac{1}{\sqrt{n+1}} \right) \right\},
\]
where \( X = x(1-x) \) and \( X' = 1 - 2x, x \in [0, 1] \).

Proof. From [9, Theorem 3] we get
\[
\left| K_n(f; x) - f(x) - K_n(t - x; x) f'(x) - \frac{1}{2} K_n((e_1 - x)^2; x) f''(x) \right|
\leq K_n((e_1 - x)^2; x) \left\{ \frac{|K_n((e_1 - x)^3; x)|}{K_n((e_1 - x)^2; x)} \cdot \frac{5}{6h} \omega_1(f''; h) + \left( \frac{3}{4} + \frac{K_n((e_1 - x)^4; x)}{K_n((e_1 - x)^2; x)} \cdot \frac{1}{16h^2} \right) \omega_2(f''; h) \right\}.
\]

Using the central moments up to order 4 for Kantorovich operators, namely
\[
K_n(t - x; x) = \frac{1 - 2x}{2(n+1)},
\]
\[
K_n((t - x)^2; x) = \frac{1}{(n+1)^2} \left\{ x(1-x)(n-1) + \frac{1}{3} \right\},
\]
\[
K_n((t - x)^3; x) = \frac{1 - 2x}{4(n+1)^3} \left\{ 10x(1-x)n + 2x^2 - 2x + 1 \right\},
\]
\[
K_n((t - x)^4; x) = \frac{1}{(n+1)^4} \left\{ 3x^2(1-x)^2n^2 + 5x(1-x)(1-2x)^2n + x^4 - 2x^3 + 2x^2 - x + \frac{1}{5} \right\},
\]
we obtain
\[
\frac{|K_n((t - x)^3; x)|}{K_n((t - x)^2; x)} \leq \frac{5}{2(n + 1)}; \quad \frac{|K_n((t - x)^4; x)|}{K_n((t - x)^2; x)} \leq \frac{3(n + 2)}{(n + 1)^2}.
\]
Therefore, the following inequality holds
\[
|K_n(f; x) - f(x)| - \frac{1 - 2x}{2(n + 1)} f'(x) - \frac{1}{2} \left[ \frac{x(1 - x)(n - 1)}{(n + 1)^2} + \frac{1}{3(n + 1)^2} \right] f''(x)
\leq \left[ x(1 - x) \frac{n - 1}{(n + 1)^2} + \frac{1}{3(n + 1)^2} \right] \left\{ \frac{25}{12h(n + 1)} \omega_1(f''; h) + \left( \frac{3}{4} + \frac{3(n + 2)}{16h^2(n + 1)^2} \right) \omega_2(f''; h) \right\}
\]
and for \( h = \frac{1}{\sqrt{n + 1}} \) we obtain, after multiplying both sides by \( n \),
\[
n \left| n [K_n(f; x) - f(x)] - \frac{n + 1}{n + 1} \left( \frac{1}{2} - x \right) f'(x) - \frac{1}{2} \left[ x(1 - x) \frac{n(n - 1)}{(n + 1)^2} + \frac{n}{3(n + 1)^2} \right] f''(x) \right|
\leq \frac{9}{32} \left\{ \frac{2}{\sqrt{n + 1}} \omega_1 \left( f''; \frac{1}{\sqrt{n + 1}} \right) + \omega_2 \left( f''; \frac{1}{\sqrt{n + 1}} \right) \right\}.
\]
We can write
\[
n \left| n [K_n(f; x) - f(x)] - \frac{1 - 2x}{2} f'(x) - \frac{1}{2} x(1 - x)f''(x) \right|
\leq nn \left| K_n(f; x) - f(x) \right| - \frac{n + 1}{n + 1} \left( \frac{1}{2} - x \right) f'(x) - \frac{1}{2} \left[ x(1 - x) \frac{n(n - 1)}{(n + 1)^2} + \frac{n}{3(n + 1)^2} \right] f''(x)
\]
\[+ \frac{1 - 2x}{2} \frac{1}{n + 1} f'(x) + \frac{1}{2} x(1 - x) \frac{3n + 1}{(n + 1)^2} f''(x) - \frac{n}{6(n + 1)^2} f''(x) \right|
\leq \frac{9}{32} \left\{ \frac{2}{\sqrt{n + 1}} \omega_1 \left( f''; \frac{1}{\sqrt{n + 1}} \right) + \omega_2 \left( f''; \frac{1}{\sqrt{n + 1}} \right) \right\} + \frac{2}{3(n + 1)} \left( \frac{3}{4} \|f'||_\infty + \|f''||_\infty \right).
\]

4 Chebyshev-Grüss inequality for Kantorovich operators

In a 2011 paper Rusu and the present authors published the following Grüss-type inequality for positive linear operators reproducing constant functions. We give below the improved form of Rusu given in [14]:

**Theorem 4.1.** Let \( H : C[a, b] \to C[a, b] \) be positive, linear and satisfy \( He_0 = e_0 \). Put
\[
D(f, g; x) := H(f; x) - H(f; x) \cdot H(g; x).
\]
Then for \( f, g \in C[a, b] \) and \( x \in [a, b] \) fixed one has
\[
|D(f, g; x)| \leq \frac{1}{4} \tilde{\omega} \left( f; 2\sqrt{H((e_1 - x)^2; x)} \right) \cdot \tilde{\omega} \left( g; 2\sqrt{H((e_1 - x)^2; x)} \right).
\]
Here \( \tilde{\omega} \) is the least concave majorant of the first order modulus \( \omega_1 \) given by
\[
\tilde{\omega}(f; t) = \sup \left\{ \frac{(t - x) \omega_1(f; y) + (y - t) \omega_1(f; x)}{y - x} : 0 \leq x \leq t \leq y \leq b - a, x \neq y \right\}.
\]
Remark 4.1. For an accessible proof of the equality between $\tilde{\omega}$ and a certain $K$-functional used in the proof of the above theorem see [13].

Hence the non-multiplicativity of Kantorovich operators can be explained as in Theorem 4.2. For the classical Kantorovich operators $K_n : C[0,1] \to C[0,1]$ one has the uniform inequality

$$\|K_n(fg) - K_nfK_ng\|_\infty \leq \frac{1}{4} \tilde{\omega} \left(f; 2 \sqrt{\frac{1}{2(n+1)}} \right) \tilde{\omega} \left(g; 2 \sqrt{\frac{1}{2(n+1)}} \right), \quad n \geq 1, \quad (2)$$

for all $f,g \in C[0,1]$.

Proof. The most precise upper bound is obtained if we use the exact representation

$$K_n \left((t-x)^2; x \right) = \frac{1}{(n+1)^2} \left( (n-1)x(1-x) + \frac{1}{3} \right).$$

Close to $x = 0,1$ this shows the familiar endpoint improvement. For shortness we use the estimate

$$K_n \left((t-x)^2; x \right) \leq \frac{1}{2(n+1)}.$$

$\square$

5 Grüss-Voronovskaya theorems

The first Grüss-Voronovskaya theorem for classical Bernstein operators was given by Gal and Gonska [5]. In Theorem 2.1 of this paper a quantitative form was given (see also Theorem 2.5 there). The other examples in [5] deal with operators reproducing linear functions; this is not the case for the Kantorovich mappings. The limit for $K_n$ was identified recently in [2] to be the same as in the Bernstein case, namely

$$f'(x)g'(x)x(1-x), \quad \text{for } f, g \in C^2[0,1].$$

Our first quantitative version is given in

Theorem 5.1. Let $f,g \in C^2[0,1]$. Then for each $x \in [0,1]$

$$\|n [K_n(fg) - K_nf : K_ng] - Xf'g'\|_\infty = \begin{cases} 
    o(1), & f, g \in C^2[0,1], \\
    O \left( \frac{1}{\sqrt{n}} \right), & f, g \in C^3[0,1], \\
    O \left( \frac{1}{n} \right), & f, g \in C^4[0,1].
\end{cases}$$

Proof. We proceed as in [5] by creating first three Voronovskaya-type expressions from the difference in question plus the remaining quantities. Recall that the Voronovskaya limit for Kantorovich operators is

$$\frac{1}{2} (Xf'')' = \frac{1}{2} Xf'''(x) + \frac{1}{2} X'f'(x),$$
where \( X := x(1 - x) \), so \( X' = 1 - 2x \).

For \( f, g \in C^2[0, 1] \) one has

\[
K_n(fg; x) - K_n(f; x)K_n(g; x) - \frac{1}{n}Xf'(x)g'(x)
\]

\[
= K_n(fg; x) - (fg)(x) - \frac{1}{2n}(X(fg))'
\]

\[
- f(x) \left[ K_n(g; x) - g(x) - \frac{1}{2n}(Xg)'ight] - g(x) \left[ K_n(f; x) - f(x) - \frac{1}{2n}(Xf)'ight]
\]

\[
+ [g(x) - K_n(g; x)] [K_n(f; x) - f(x)]
\]

\[
- K_n(f; x)K_n(g; x) - \frac{1}{n}Xf'g' + (fg)(x) + \frac{1}{2n}(X(fg))'
\]

\[
+ f(x) \left[ K_n(g; x) - g(x) - \frac{1}{2n}(Xg)'ight] + g(x) \left[ K_n(f; x) - f(x) - \frac{1}{2n}(Xf)'ight]
\]

\[
- [g(x) - K_n(g; x)] [K_n(f; x) - f(x)] .
\]

The first three lines will be estimated below. First we will show that the sum of the following three lines equals 0.

For the time being we will leave out the argument \( x \). One has

\[
- K_nf \cdot K_ng - \frac{1}{n}Xf'g' + fg + \frac{1}{2n}(X'(fg)' + X(fg)'' - X''f + X(fg)')
\]

\[
+ fK Ng - fg - \frac{1}{2n}(X'g' + Xg'') + gKnf - fg - \frac{1}{2n}(X'f' + Xf'')
\]

\[
- [g - K_ng] [K_nf - f]
\]

\[
= -K_nf \cdot K_ng - \frac{1}{n}Xf'g' + fg + \frac{1}{2n}(X'f'g + X'f g') + \frac{1}{2n}(Xf''g + 2f'g' + fg'')
\]

\[
+ fK Ng - fg - \frac{1}{2n}(X'g' + Xg'') + gKnf - fg - \frac{1}{2n}(gX'f' + gXf'')
\]

\[
- gKnf + K_n g \cdot K_nf + fg - fKng = 0.
\]

For the first two lines above we will use the Voronovskaya estimate given earlier, namely that for \( h \in C^2[0, 1] \) one has

\[
\left\| n(K_nh - h) - \frac{1}{2}(Xh)' \right\|_{\infty} \leq \frac{2}{3(n + 1)} \left( \frac{3}{4}\|h''\|_{\infty} + \|h''\|_{\infty} \right)
\]

\[
+ \frac{9}{32} \left\{ \frac{2}{\sqrt{n + 1}} \omega_1 \left( h''; \frac{1}{\sqrt{n + 1}} \right) + \omega_2 \left( h''; \frac{1}{\sqrt{n + 1}} \right) \right\} =: U(h, n).
\]

For the third line we use Theorem 2.4 showing that for \( h \in C^2[0, 1] \) we get

\[
\|K_nh - h\|_{\infty} \leq \frac{1}{2n}\|h''\|_{\infty} + \frac{9}{8n}\|h''\|_{\infty} = O \left( \frac{1}{n} \right).
\]
Collecting these inequalities gives

\[
\|n [K_n(fg) - K_n f \cdot K_n g] - X f' g'\|_\infty \leq U(fg, n) + \|f\|_\infty U(g, n) + \|g\|_\infty U(f, n) + \mathcal{O}\left(\frac{1}{n}\right)
\]

\[
= \begin{cases} 
  o(1), & f, g \in C^2[0, 1], \\
  \mathcal{O}\left(\frac{1}{\sqrt{n}}\right), & f, g \in C^3[0, 1], \\
  \mathcal{O}\left(\frac{1}{n}\right), & f, g \in C^4[0, 1].
\end{cases}
\]

In the following we give a Grüss-Voronovskaya type theorem when \(f\) and \(g\) are only in \(C^1[0, 1]\).

**Theorem 5.2.** Let \(f, g \in C^1[0, 1]\) and \(n \geq 1\). Then there is a constant \(C\) independent of \(n, f, g\) and \(x\), such that

\[
\left\| K_n(fg) - K_n f \cdot K_n g - \frac{X}{n} f' g' \right\|_\infty \leq \frac{C}{n} \left\{ \omega_3 \left( f', n^{-\frac{1}{2}} \right) \omega_3 \left( g', n^{-\frac{1}{2}} \right) \right. \\
+ \|f'\|_\infty \omega_3 \left( g', n^{-\frac{1}{2}} \right) + \|g'\|_\infty \omega_3 \left( f', n^{-\frac{1}{2}} \right) \\
+ \max \left\{ \frac{\|f'\|_\infty}{n^2}, \omega_3 \left( f', n^{-\frac{1}{2}} \right) \right\} \right. \\
\left. \left. \max \left\{ \frac{\|g'\|_\infty}{n^2}, \omega_3 \left( g', n^{-\frac{1}{2}} \right) \right\} \right\}. 
\]

**Proof.** Let

\[
E_n(f, g; x) = K_n(fg; x) - K_n(f; x)K_n(g; x) - \frac{x(1-x)}{n} f'(x)g'(x),
\]

and denote \(C\) a constant independent of \(n, f, g\) and \(x\), which may change its values during the course of the proof.

For \(f, g \in C^1[0, 1]\) fixed and \(u, v \in C^4[0, 1]\) arbitrary, one has

\[
|E_n(f, g; x)| = |E_n(f - u + u, g - v + v; x)| \\
\leq |E_n(f - u, g - v; x)| + |E_n(u, g - v; x)| + |E_n(f - u, v; x)| + |E_n(u, v; x)|. 
\]

Let \(h(x) = x, x \in [0, 1]\). Applying \(\mathcal{H}\) Theorem 4 there exists \(\eta, \theta \in [0, 1]\) such that

\[
K_n(fg; x) - K_n(f; x)K_n(g; x) = f'(\eta)g'(\theta) \left[ K_n(h^2; x) - (K_n(h; x))^2 \right] \\
= f'(\eta)g'(\theta) \left\{ x(1-x) \frac{n}{(n+1)^2} + \frac{1}{12(n+1)^2} \right\}. 
\]

From (3) and (5) we get

\[
|nE_n(f, g; x)| \leq \left[ x(1-x) \frac{n^2}{(n+1)^2} + \frac{n}{12(n+1)^2} + x(1-x) \right] \|f'\|_\infty \|g'\|_\infty \\
\leq 2 \left[ x(1-x) + \frac{1}{24(n+1)} \right] \|f'\|_\infty \|g'\|_\infty. 
\]
Using Theorem 3.1 for \( f \in C^4[0,1] \) we get
\[
\left| n \left[ K_n(f; x) - f(x) \right] - \frac{1}{2} (Xf)'(x) \right| \leq C \frac{1}{n} \left( \| f' \|_\infty + \| f'' \|_\infty + \| f''' \|_\infty + \| f^{(4)} \|_\infty \right).
\]
But, for \( f \in C^n[a,b] \), \( n \in \mathbb{N} \) one has (see [6] Remark 2.15)
\[
\max_{0 \leq k \leq n} \left\{ \| f^{(k)} \| \right\} \leq C \max \left\{ \| f \|_\infty, \| f^{(n)} \|_\infty \right\}.
\]
Therefore,
\[
\left| n \left[ K_n(f; x) - f(x) \right] - \frac{1}{2} (Xf)'(x) \right| \leq C \frac{1}{n} \max \left\{ \| f' \|_\infty, \| f^{(4)} \|_\infty \right\}. \tag{7}
\]
For \( u, v \in C^4[0,1] \) using the same decomposition as in proof of Theorem 3.1, the relation (7) and Theorem 2.4 we get
\[
|E_n(u, v; x)| \leq \left| K_n(uv; x) - (uv)(x) \right| - \frac{1}{2n} (X(uv))' \right| + |u(x)| \left| K_n(v; x) - v(x) \right| + |v(x)| \left| K_n(u; x) - u(x) \right|
\]
\[
\leq \frac{C}{n^2} \max \left\{ \| u' \|_\infty, \| u^{(4)} \|_\infty \right\} \max \left\{ \| v' \|_\infty, \| v^{(4)} \|_\infty \right\}. \tag{8}
\]
From the relations (4), (6) and (8) we obtain
\[
|E_n(f, g; x)| \leq \frac{2}{n} \left[ x(1 - x) + \frac{1}{24(n + 1)} \right] \left\{ \| (f - u)' \|_\infty \| (g - v)' \|_\infty + \| u' \|_\infty \| (g - v)' \|_\infty \right\}
\]
\[
+ \| (f - u)' \|_\infty \| v' \|_\infty \right\} + \frac{C}{n^2} \max \left\{ \| u' \|_\infty, \| u^{(4)} \|_\infty \right\} \max \left\{ \| v' \|_\infty, \| v^{(4)} \|_\infty \right\}. \tag{7}
\]
Using [7] Lemma 3.1 for \( r = 1, s = 2, f_{h,3} = u \) and \( g_{h,3} = v \), for all \( h \in (0,1) \) and \( n \in \mathbb{N} \), it follows
\[
|E_n(f, g; x)| \leq \frac{C}{n} \left\{ \omega_3(f', h) \omega_3(g, h) + \frac{1}{h} \omega_1(f, h) \omega_3(g', h) + \frac{1}{h} \omega_1(g, h) \omega_3(f', h) \right\}
\]
\[
+ \frac{C}{n^2} \max \left\{ \frac{1}{h} \omega_1(f, h), \frac{1}{h} \omega_3(f, h) \right\} \cdot \max \left\{ \frac{1}{h} \omega_1(g, h), \frac{1}{h} \omega_3(g', h) \right\}
\]
\[
\leq \frac{C}{n} \left\{ \omega_3(f', h) \omega_3(g, h) + \| f' \|_\infty \omega_3(g', h) + \| g' \|_\infty \omega_3(f', h) \right\}
\]
\[
+ \frac{C}{n^2} \max \left\{ \| f' \|_\infty, \frac{1}{h^3} \omega_3(f', h) \right\} \cdot \max \left\{ \| g' \|_\infty, \frac{1}{h^3} \omega_3(g', h) \right\}. \tag{8}
\]
Choosing \( h = n^{-\frac{1}{2}} \), we obtain
\[
|E_n(f, g; x)| \leq \frac{C}{n} \left\{ \omega_3 \left( f', n^{-\frac{1}{2}} \right) \omega_3 \left( g', n^{-\frac{1}{2}} \right) \right. \right.
\]
\[
+ \| f' \|_\infty \omega_3 \left( g', n^{-\frac{1}{2}} \right) + \| g' \|_\infty \omega_3 \left( f', n^{-\frac{1}{2}} \right)
\]
\[
+ \max \left\{ \frac{1}{n^2} \omega_3 \left( f', n^{-\frac{1}{2}} \right) \right\} \max \left\{ \frac{1}{n^2} \omega_3 \left( g', n^{-\frac{1}{2}} \right) \right\}. \tag{8}
\]
This implies the theorem.
