We consider two-component fermions with a zero-range interaction both in two and three dimensions and study their spectral functions of bulk and shear viscosities for an arbitrary scattering length. Here the Kubo formulas are systematically evaluated up to the second order in the quantum virial expansion applicable to the high-temperature regime. In particular, our computation of the bulk viscosity spectral function is facilitated by expressing it with the contact–contact response function, which can be measured experimentally under the periodic modulation of the scattering length. The obtained formulas are fully consistent with the known constraints on high-frequency tail and sum rule. Although our static shear viscosity agrees with that derived from the kinetic theory, our static bulk viscosity disagrees. Furthermore, the latter for three dimensions exhibits an unexpected non-analyticity of \( \zeta \sim (\ln a^2)/a^2 \) in the unitarity limit \( a \to \infty \), which thus challenges the “crossover” hypothesis.
The grand canonical trace can be written as a sum of canonical traces \(^{[27]}\). In particular, the partition function reads

\[
Z = \sum_{\text{config}} \exp \left(-\beta \sum_{n=0}^{\infty} N^n \text{tr} \left[ e^{-\beta \mathcal{H}} \right] \right),
\]

where \(\beta \equiv e^{1/\mu}\) is the fugacity and obviously \(Z_0 = 1\). It is convenient to choose the complete set of \(N\)-body states to be momentum eigenstates,

\[
|\sigma_1 p_1, \ldots, \sigma_N p_N\rangle = \frac{1}{\sqrt{N!}} \prod_{n=1}^{N} \hat{\psi}_{\sigma_n p_n}^\dagger |0\rangle,
\]

where \(\hat{\psi}_{\sigma p}^\dagger \equiv L^{-d/2} \int dx e^{ip\cdot x} \hat{\psi}_\sigma^\dagger(x)\) is the Fourier transform of the creation operator in a periodic box of volume \(L^d\). The canonical trace in the \(N\)-body sector is then provided by

\[
\text{tr}_N[\mathcal{O}] = \sum_{\{\sigma\}} \sum_{\{p\}} \langle \sigma_1 p_1, \ldots, \sigma_N p_N | \mathcal{O} | \sigma_1 p_1, \ldots, \sigma_N p_N \rangle.
\]

Also, with the use of the identity operator,

\[
1_N = \sum_{\{\sigma\}} \sum_{\{p\}} |\sigma_1 p_1, \ldots, \sigma_N p_N\rangle \langle \sigma_1 p_1, \ldots, \sigma_N p_N|,
\]

the Hamiltonian \(\mathcal{H}\) can be decomposed into distinct particle number sectors according to

\[
\mathcal{H} = \sum_{N=0}^{\infty} \frac{1}{1_N} \mathcal{H}_N 1_N.
\]
The one-body sector is trivial because the Hamiltonian is
\[ \hat{H}_1 = \sum_{\sigma} \sum_p |\sigma p\rangle \frac{p^2}{2m} |\sigma p\rangle \]  
\hspace{1cm} (7)
and does not involve the interaction. Consequently, the partition function at $O(z)$ is simply provided by
\[ Z_1 = \text{tr}_1[e^{-\beta \hat{H}_1}] = 2 \sum_p e^{-\beta \frac{p^2}{2m}} . \] \hspace{1cm} (8)
On the other hand, the Hamiltonian in the two-body sector is
\[
\hat{H}_2 = \sum_{\sigma, \tau} \sum_{p, q} |\sigma p, \tau q\rangle \frac{p^2 + q^2}{2m} |\sigma p, \tau q\rangle + \sum_{\sigma, \tau} \sum_{p, q} \sum_{p', q'} |\sigma p, \tau q\rangle \delta_{p+q, p'+q} \frac{g}{L^2} \langle \sigma p', \tau q' |.
\] \hspace{1cm} (9)
In order to evaluate the corresponding Boltzmann operator, we write the Hamiltonian as a sum of kinetic and potential energy operators and utilize the identity of
\[ e^{-\beta \hat{H}_2} = \int_{-\infty}^{\infty} \frac{dE}{\pi} e^{-\beta E} \text{Im} \left[ \frac{1}{E - \hat{H}_2 - i0^+} \right] \] \hspace{1cm} (10)
\[ = \int_{-\infty}^{\infty} \frac{dE}{\pi} e^{-\beta E} \text{Im} \left[ \frac{1}{E - \hat{T}_2 - i0^+} \right] \sum_{n=0}^{\infty} \frac{1}{E - \hat{V}_2} \left( \hat{T}_2 - i0^+ \right)^n \frac{1}{E - \hat{T}_2 - i0^+} \right]. \] \hspace{1cm} (11)
Because the summation over $n$ can be performed according to
\[ \sum_{n=0}^{\infty} \hat{V}_2 \left( \frac{1}{E - \hat{T}_2 - i0^+} \right)^n = \sum_{n=0}^{\infty} \sum_{\sigma, \tau} \sum_{p, q} \sum_{p', q'} |\sigma p, \tau q\rangle \delta_{p+q, p'+q} \frac{g}{L^2} \left( \sum_k \frac{1}{E - \frac{(p+q)^2}{4m} - \frac{k^2}{m} - i0^+} \right)^n \langle \sigma p', \tau q' | \] \hspace{1cm} (12)
\[ = \frac{1}{L^2} \sum_{\sigma, \tau} \sum_{p, q} \sum_{p', q'} |\sigma p, \tau q\rangle \delta_{p+q, p'+q} \frac{1}{g} - \frac{1}{L^2} \sum_k \frac{1}{E - \frac{(p+q)^2}{4m} - \frac{k^2}{m} - i0^+} (\sigma p', \tau q' |, \] \hspace{1cm} (13)
the Boltzmann operator is found to be
\[ e^{-\beta \hat{H}_2} = e^{-\beta \hat{H}_2} |_{\text{free}} + e^{-\beta \hat{H}_2} |_{\text{int}}, \] \hspace{1cm} (14a)
with its free and interacting parts provided by
\[ e^{-\beta \hat{H}_2} |_{\text{free}} = \sum_{\sigma, \tau} \sum_{p, q} |\sigma p, \tau q\rangle e^{-\beta \frac{p^2 + q^2}{2m}} \langle \sigma p, \tau q | \] \hspace{1cm} (14b)
and
\[ e^{-\beta \hat{H}_2} |_{\text{int}} = \frac{1}{L^2} \sum_{\sigma, \tau} \sum_{p, q} \sum_{p', q'} |\sigma p, \tau q\rangle e^{-\beta \frac{(p+q)^2}{4m}} \delta_{p+q, p'+q'} \] \hspace{1cm} \times \int_{-\infty}^{\infty} \frac{d\varepsilon}{\pi} e^{-\beta \varepsilon} \text{Im} \left[ \frac{T_2(\varepsilon - i0^+)}{(\varepsilon - \frac{(p+q)^2}{4m} - i0^+)(\varepsilon - \frac{(p'+q')^2}{4m} - i0^+)} \right] \langle \sigma p', \tau q' |, \] \hspace{1cm} (14c)
respectively. Here the integration variable is changed to $\varepsilon = E - (p + q)^2/4m$ and
\[ T_2(\varepsilon - i0^+) \equiv \frac{1}{g} - \frac{1}{L^2} \sum_k \frac{1}{\varepsilon - \frac{k^2}{m} - i0^+} \] \hspace{1cm} (15)
is the two-body scattering $T$-matrix in the center-of-mass frame. We note that Eq. (14) is valid for any complex $\beta$ and the interacting part $\{14c\}$ vanishes when $\sigma = \tau$ for fermions. Consequently, the partition function at $O(z^2)$ is provided by

$$Z_2 = \text{tr}_2[e^{-\beta H_z}] = 2 \sum_{p,q} e^{-\beta z^2/2} - \sum_{p,q} e^{-\beta z^2/2} \delta_{pq} + \frac{1}{L^d} \sum_{K,k} e^{-\beta K^2/2} \int_{-\infty}^{\infty} \frac{dz}{\pi} e^{-\beta z} \text{Im} \left[ \frac{T_2(\varepsilon - i0^+)}{\varepsilon - K^2/2 - i0^+} \right],$$

where $K = p + q$ and $k = (p - q)/2$ are the center-of-mass and relative momenta, respectively.

**B. Thermodynamics**

From the above quantum virial expansion for the partition function, we obtain that for the pressure according to

$$\frac{p}{T} = \frac{\ln Z}{L^d} = \frac{1}{L^d} \left( z Z_1 + z^2 Z_2 - \frac{z^2 Z_2^2}{2} + O(z^3) \right),$$

$$= \frac{2z}{L^d} \sum_p e^{-\beta z^2/2} - \frac{z^2}{L^d} \sum_p e^{-\beta z^2/2} + \frac{z^2}{L^d} \sum_{K,k} e^{-\beta K^2/2} \int_{-\infty}^{\infty} \frac{dz}{\pi} e^{-\beta z} \text{Im} \left[ \frac{T_2(\varepsilon - i0^+)}{\varepsilon - K^2/2 - i0^+} \right] + O(z^3).$$

Finally, by taking the thermodynamic limit, $L^{-d} \sum_p \rightarrow \int dp/(2\pi)^d$, and performing the resulting momentum integrations, we find

$$\frac{p}{T} = \frac{2z}{\lambda_T^d} - \frac{z^2}{2d^2/2 \lambda_T^2} + \frac{2d^2/2 z^2}{2 \Omega_{d-1} \lambda_T^2} \int_{-\infty}^{\infty} \frac{dz}{\pi} e^{-\varepsilon/T} \text{Im} \left[ \frac{m^2 T_2(\varepsilon - i0^+)}{(-m\varepsilon + i0^+)^{2-d/2}} \right] + O(z^3),$$

where $\lambda_T \equiv \sqrt{2\pi/mT}$ is the thermal de Broglie wavelength and $\Omega_{d-1} \equiv (4\pi)^{d/2}/2\Gamma(2-d/2) = 2, 2\pi, 4\pi$ coincides with the surface area of the unit $(d-1)$-sphere for $d = 1, 2, 3$. Similarly, the two-body scattering $T$-matrix in the same limit is found to be

$$T_2(\varepsilon - i0^+) = \frac{\Omega_{d-1}}{m} \frac{d-2}{a^{2-d} - (-m\varepsilon + i0^+)^{d/2-1}},$$

where $a$ is the scattering length introduced via

$$\frac{1}{g} = \frac{ma^{2-d}}{(d-2)\Omega_{d-1}}$$

in the dimensional regularization [28].

The partial derivative of the pressure with respect to the scattering length then leads to the so-called contact density [29-31],

$$C = -\Omega_{d-1} ma^{d-1} \frac{\partial p}{\partial a} = \frac{2d^2/2 z^2}{\lambda_T^2} \int_{-\infty}^{\infty} \frac{dz}{\pi} e^{-\varepsilon/T} \text{Im}[m^2 T_2(\varepsilon - i0^+)] + O(z^3),$$

where the integration by parts following

$$a^{d-1} \frac{\partial T_2(\varepsilon - i0^+)}{\partial a} = -\frac{2(-m\varepsilon + i0^+)^{2-d/2}}{m} \frac{\partial T_2(\varepsilon - i0^+)}{\partial \varepsilon}$$

is utilized. Because the imaginary part of the two-body scattering $T$-matrix is provided by

$$\text{Im}[T_2(\varepsilon - i0^+)] = \theta(a) \frac{2 \Omega_{d-1}}{m^2 a^{1-d}} \pi \delta(z + \frac{1}{ma^2}) + \theta(\varepsilon) \times \left\{ \begin{array}{ll} \frac{2\pi}{m} \ln(m^2 a^2 \varepsilon) + \pi^2 & (d = 2), \\
\frac{4\pi}{m} \sqrt{m\varepsilon} + \frac{\pi}{\sqrt{\varepsilon}} & (d = 3), \end{array} \right.$$

the contact density for $d = 3$ has the analytic expression of [32-33]

$$C = \frac{16\pi z^2}{\lambda_T^2} \left[ 1 + \sqrt{\pi} \frac{1 + \text{erf}(\tilde{a}^{-1})}{\tilde{a}} \exp(\tilde{a}^{-2}) \right] \tilde{a} = \sqrt{2\pi a}/\lambda_T + O(z^3).$$

In particular, it is smooth even in the unitarity limit at $\lambda_T/a = 0$ so as to be consistent with the “crossover” hypothesis [26].
III. BULK VISCOSITY

A. Formulation

We now turn to the quantum virial expansion for viscosity spectral functions. In terms of the stress–stress response function,

\[ \chi_{ij,kl}(\omega) = \int_0^\infty dt e^{i(\omega+i0^+)t} \text{Tr}[\hat{\Pi}_{ij}(t)\hat{\Pi}_{kl}(0)] e^{-\beta(\hat{H}-\mu\hat{N})}, \]  

the spectral functions of bulk and shear viscosities are defined according to \[15\]

\[ \text{Im}\left[ \chi_{ij,kl}(\omega) \right] / \omega = \left[ \zeta(\omega) - \frac{2}{d} \eta(\omega) \right] \delta_{ij}\delta_{kl} + \eta(\omega) \left( \delta_{ik}\delta_{jl} + \delta_{il}\delta_{jk} \right). \]  

Here \( \hat{\Pi}_{ij}(t) = e^{i\hat{H}t}\hat{\Pi}_{ij}e^{-i\hat{H}t} \) is the stress tensor operator in the Heisenberg picture and its trace is directly related to the bulk viscosity spectral function via

\[ \zeta(\omega) = \frac{1}{d^2} \sum_{i,j=1}^d \text{Im}\left[ \chi_{ii,jj}(\omega) \right] \omega. \]  

For two-component fermions described by the Hamiltonian \([1]\), the stress tensor operator assuming the dimensional regularization is provided by \[18, 28\]

\[ \hat{\Pi}_{ij} = -\sum_{\sigma,\tau} \int dx \hat{\psi}^\dagger_{\sigma}(x) \hat{\psi}_{\sigma}(x) + \sum_{\sigma,\tau} \int dx \hat{\psi}^\dagger_{\sigma}(x) \hat{\psi}_{\tau}(x) g^2 \delta_{ij} \hat{\psi}_{\tau}(x) \hat{\psi}_{\sigma}(x). \]  

Its trace is then simplified into

\[ \sum_{i=1}^d \hat{\Pi}_{ii} = 2\hat{H} + \frac{\hat{C}}{\Omega_{d-1} ma^{d-2}}, \]  

where the last term quantifies the conformal symmetry breaking with

\[ \hat{C} = \sum_{\sigma,\tau} \int dx \hat{\psi}^\dagger_{\sigma}(x) \hat{\psi}_{\tau}(x) \frac{(ma)^2}{2} \hat{\psi}_{\tau}(x) \hat{\psi}_{\sigma}(x) \]  

being the contact operator \[34, 36\]. Because the commutator of the Hamiltonian with any operator in the grand canonical average vanishes, the bulk viscosity spectral function turns into the favorite form of

\[ \zeta(\omega) = \frac{1}{(d\Omega_{d-1} ma^{d-2})^2} \text{Im}\left[ \chi_{CC}(\omega) \right] / \omega, \]  

where

\[ \chi_{CC}(\omega) = \int_0^\infty dt e^{i(\omega+i0^+)t} \text{Tr}[\hat{C}(t)\hat{C}(0)] e^{-\beta(\hat{H}-\mu\hat{N})}] \]  

is the contact–contact response function \[28, 37\].

The quantum virial expansion for the bulk viscosity spectral function is thus to evaluate

\[ \chi_{CC}(\omega) = \sum_{N=0}^\infty \frac{z^N}{Z} \int_0^\infty dt e^{i(\omega+i0^+)t} \text{Tr}_N[e^{-\beta(\hat{H}+i\hat{H}t)}\hat{C}e^{-i\hat{H}t}\hat{C} - e^{-\beta(\hat{H}+i\hat{H}t)}\hat{C}e^{i\hat{H}t}\hat{C}]. \]  

Here the contact operator \[31\] can be decomposed into distinct particle number sectors according to

\[ \hat{C} = \sum_{N=0}^\infty \hat{C}_N \hat{N}_N. \]
where nontrivial matrix elements first appear from the two-body sector in the form of

\[
\tilde{C}_2 = \sum_{\sigma, \tau} \sum_{p, q, p', q'} |\sigma p, \tau q\rangle \delta_{p+q, p'+q'} \frac{\langle mg \rangle^2}{\mathcal{L}_d} (\sigma p', \tau q'). \tag{36}
\]

On the other hand, the time evolution operator such as \(e^{-iH_{2t}}\) is obtained from Eq. (14) with the simple replacement of \(\beta \rightarrow \text{it}\). Because the bare coupling constant vanishes as \(mg \rightarrow -2\pi/\ln \Lambda\) for \(d = 2\) and as \(mg \rightarrow -2\pi^2/\Lambda\) for \(d = 3\) in the cutoff regularization with \(|k| < \Lambda\), the free part of the time evolution operator \(e^{-iH_{2t}}|_{\text{free}}\) has vanishing contributions in the limit of \(\Lambda \rightarrow \infty\) when sandwiched by the contact operators. Therefore, only the interacting part of the time evolution operator \(e^{-iH_{2t}}|_{\text{int}}\) has non-vanishing contributions to the contact–contact response function. By utilizing the identity of

\[
g \frac{1}{\mathcal{L}^d} \sum_{k} \frac{1}{\varepsilon - \frac{k^2}{m} - i\varepsilon^+} = 1 - \frac{g}{T_2 (\varepsilon - i\varepsilon^+)} \xrightarrow{\Lambda \rightarrow \infty} 1 \quad (d \geq 2), \tag{37}
\]

we obtain

\[
\text{tr}_2 [e^{-\beta \tilde{H}_2 + iH_{2t}} \tilde{C}_2 e^{-iH_{2t}} \tilde{C}_2] = \sum_K e^{-\beta \frac{K^2}{m}} \int_{-\infty}^{\infty} \frac{d \varepsilon}{\pi} \int_{-\infty}^{\infty} \frac{d \varepsilon'}{\pi} e^{-\beta \varepsilon - \beta \varepsilon'} \text{Im}[mT_2 (\varepsilon - i\varepsilon^+)] \text{Im}[mT_2 (\varepsilon' - i\varepsilon^+)]. \tag{38}
\]

Consequently, the contact–contact response function at \(O(z^2)\) is found to be

\[
\chi_{CC}^{(2)} (\omega) = \frac{1}{\mathcal{L}^d} \sum_{K} e^{-\beta \frac{K^2}{m}} \int_{-\infty}^{\infty} \frac{d \varepsilon}{\pi} \int_{-\infty}^{\infty} \frac{d \varepsilon'}{\pi} e^{-\beta \varepsilon - \beta \varepsilon'} \text{Im}[mT_2 (\varepsilon - i\varepsilon^+)] \text{Im}[mT_2 (\varepsilon' - i\varepsilon^+)], \tag{39}
\]

from which the bulk viscosity spectral function in the thermodynamic limit reads

\[
\zeta (\omega) = \frac{2^{d/2} \pi^2}{(d \Omega_{d-1} a^{d-2})^2 \Lambda_T^2} \frac{1 - e^{-\omega/\tau}}{\omega} \int_{-\infty}^{\infty} \frac{d \varepsilon}{\pi} e^{-\varepsilon/\tau} \text{Im}[mT_2 (\varepsilon - i\varepsilon^+)] \text{Im}[mT_2 (\varepsilon + \omega - i\varepsilon^+)] + O(z^3). \tag{40}
\]

The higher order correction at \(O(z^3)\) is presented in Eq. (A16).

B. Evaluation

Our concise formula for the bulk viscosity spectral function is even under \(\omega \rightarrow -\omega\) and has the high-frequency tail of

\[
\lim_{\omega \rightarrow \infty} \zeta (\omega) = \frac{\mathcal{C}}{(d \Omega_{d-1} a^{d-2})^2} \begin{cases} 
\frac{4\pi^2}{\ln^d |m\omega|} & (d = 2), \\
\frac{4\pi}{|m\omega|^{3/2}} & (d = 3),
\end{cases} \tag{41}
\]

where \(\mathcal{C}\) is the contact density from Eq. (32). This asymptotic form agrees with Refs. [17] for \(d = 2\) and with Ref. [17] for \(d = 2\)\footnote{Although Eq. (62) of Ref. [17] presents a different result for \(d = 2\), the substitution of Eqs. (45), (47) into Eqs. (57), (58) in Ref. [17] indeed leads to the same result as our Eq. (41).}. Also, the integration over \(\omega\) leads to

\[
\int_{-\infty}^{\infty} \frac{d \omega}{\pi} \zeta (\omega) = \frac{2^{d/2} \pi^2}{(d \Omega_{d-1} a^{d-2})^2 \Lambda_T^2} \int_{-\infty}^{\infty} \frac{d \varepsilon}{\pi} \int_{-\infty}^{\infty} \frac{d \omega}{\pi} \frac{\mathcal{P}}{\omega - \varepsilon} e^{-\varepsilon/\tau} \text{Im}[mT_2 (\varepsilon - i\varepsilon^+)] \text{Im}[mT_2 (\omega - i\varepsilon^+)] + O(z^3). \tag{42}
\]

With the use of the Kramers–Kronig relation followed by the identity of

\[
2 \text{Im}[mT_2 (\varepsilon - i\varepsilon^+)] \text{Re}[mT_2 (\varepsilon - i\varepsilon^+)] = \Omega_{d-1} a^{d-1} \frac{\partial}{\partial a} \text{Im}[mT_2 (\varepsilon - i\varepsilon^+)], \tag{43}
\]
we obtain

\[ \int_{-\infty}^{\infty} \frac{d\omega}{\pi} \zeta(\omega) = - \frac{\alpha^{3-d}}{d^2 \Omega_d^2 m} \frac{\partial C}{\partial a}, \]

which is consistent with the sum rule derived in Ref. [15] for \( d = 3 \) and in Ref. [19] for \( d = 2 \). We note that the partial derivative with respect to the scattering length at fixed entropy and particle number is equivalent to that at fixed \( T \) and \( \mu \) to the lowest order in fugacity.

After confirming our formula (40) in light of the known constraints, we are ready to evaluate it more closely. The substitution of Eq. (24) into Eq. (40) leads to

\[ \frac{d^2 \lambda^d_{\nu}}{d^2 z^2} \zeta(\omega) = \frac{1 - e^{-|\omega|/T}}{|\omega|} \frac{2}{ma^2} \left[ \frac{2}{ma^2} \delta(\omega) + \rho_2(|\omega| - \frac{1}{ma}) \theta(|\omega| - \frac{1}{ma}) \right] \theta(a) + \frac{1 - e^{-|\omega|/T}}{|\omega|} \int_0^{\infty} \frac{d\epsilon}{\pi} e^{-\epsilon/T} \rho_2(\epsilon) \theta(\epsilon + |\omega|) + O(z), \]

where the imaginary part of the two-body scattering \( T \)-matrix is normalized according to

\[ \rho_2(\epsilon) = \frac{\text{Im}[m^2 T_2(\epsilon - i0^+)]}{\Omega_d - \sigma^{d-2}} \bigg|_{\epsilon > 0} = \begin{cases} \frac{2\pi}{\ln^2(ma^2\epsilon) + \pi^2} & (d = 2), \\ \frac{\text{sgn}(a)\sqrt{ma^2\epsilon}}{ma^2\epsilon + 1} & (d = 3). \end{cases} \]

The three terms in Eq. (45) correspond to bound–bound, bound–continuum, and continuum–continuum transitions, which contribute to the bulk viscosity spectral function at \( \omega = 0, |\omega| > 1/ma^2 \), and \( \forall\omega \), respectively. Therefore, the first two terms contribute only when the two-body bound state exists, \( a > 0 \), which is always the case for \( d = 2 \). The resulting dynamic bulk viscosity is plotted in Fig. 1 as well as its static limit, \( \zeta \equiv \lim_{\omega \to 0^+} \zeta(\omega) \), which excluding the singular term of \( \delta(\omega)\theta(a) \) is provided by

\[ \lambda^d_{\nu} \zeta = \begin{cases} \frac{2}{\pi} \int_0^{\infty} \frac{d\tilde{\epsilon}}{\pi} e^{-\tilde{\epsilon}^2} \left[ \frac{2\pi}{\ln^2(\epsilon^2\tilde{\epsilon}) + \pi^2} \right]^2 + O(z^3) & (d = 2), \\ \frac{2\sqrt{2\tilde{\epsilon}^2 - 1 + (1 + \tilde{\epsilon}^{-2}) \exp(\tilde{\epsilon}^{-2})\Gamma(0, \tilde{\epsilon}^{-2})}}{9\pi \tilde{\epsilon}^2} + O(z^3) & (d = 3). \end{cases} \]

Here the integration variable is changed to \( \tilde{\epsilon} = \epsilon/T \) and the dimensionless scattering length is introduced via \( \tilde{a} \equiv \sqrt{ma^2} = \sqrt{2\pi a}/\lambda_T \).

The static bulk viscosity for \( d = 2 \) is a smooth function of \( \lambda_T/a > 0 \) and has the asymptotic forms of

\[ \lim_{a \to 0, \infty} \lambda^d_{\nu} \zeta = \frac{2\pi z^2}{\ln^4(e^{-\gamma} \tilde{a}^2)} + O(z^2 \ln^{-6} \tilde{a}^2, z^3). \]
On the other hand, the static bulk viscosity for \( d = 3 \) has the asymptotic forms of

\[
\lim_{a \to 0} \lambda_T^3 \zeta = \frac{2\sqrt{2}z^2}{9\pi} \bar{a}^2 + O(z^2\bar{a}^4, z^3)
\]  

(49)

and

\[
\lim_{a \to \infty} \lambda_T^3 \zeta = \frac{2\sqrt{2}z^2 \ln(1-\gamma \bar{a}^2)}{9\pi \bar{a}^2} + O(z^2\bar{a}^{-4}, z^3),
\]  

(50)

which turns out to exhibit the non-analyticity in the unitarity limit as shown in the right panel of Fig. 1. Our results disagree with the static bulk viscosity derived from the kinetic theory, where reported are \( \lim_{a \to \infty} \lambda_T^3 \zeta = z^2/(12\sqrt{2}\bar{a}^2) \) for \( d = 3 \) \cite{24} and \( \lim_{a \to \infty} \lambda_T^3 \zeta = z^2/(2\pi \ln^4 \bar{a}^2) \) for \( d = 2 \) \cite{25}. The origin of these discrepancies is currently unknown. We also note that the dynamic bulk viscosity for \( d = 3 \) toward the unitarity limit is provided by

\[
\lim_{a \to \infty} \lambda_T^3 \zeta(\omega) = \frac{2\sqrt{2}z^2}{9\pi \bar{a}^2} \frac{2T}{\omega} \sinh\left(\frac{\omega}{2T}\right) K_0\left(\frac{\omega}{2T}\right) + O(z^2\bar{a}^{-3}, z^3),
\]  

(51)

so that the limits of \( \omega \to 0 \) and \( a \to \infty \) do not commute mutually.

The bulk viscosity spectral function can be measured experimentally via the contact–contact response function \cite{33}. When the scattering length is periodically modulated as \( a(t) = a + \delta a \sin(\omega t) \), the linear response theory predicts that the contact density responds according to \cite{28}

\[
C(t) - C_{\text{eq}}[a(t)] = \frac{\text{Im} \chi_{\text{CC}}(\omega)}{\Omega_{d-1} ma^{d-1}} \delta a \cos(\omega t) - \frac{\text{Re} \chi_{\text{CC}}(\omega) - \chi_{\text{CC}}(0)}{\Omega_{d-1} ma^{d-1}} \delta a \sin(\omega t) + O(\delta a^2),
\]  

(52)

where \( C_{\text{eq}}[a] \equiv \text{Tr} [\hat{C} e^{-\beta(H - \mu N)}]/(ZL^d) \) is the contact density in thermodynamic equilibrium for the scattering length \( a \) and \( \chi_{\text{CC}}(-\omega) = \chi_{\text{CC}}^*(\omega) \) is utilized. Then, the thermodynamic identity together with the adiabatic and dynamic sweep theorems \cite{29,31} leads to the energy and entropy densities at the production rates of \cite{28}

\[
T\dot{S}(t) = \dot{\mathcal{E}}(t) - \frac{C_{\text{eq}}[a(t)]}{\Omega_{d-1} ma^{d-1}(t)} \dot{a}(t) = \frac{C(t) - C_{\text{eq}}[a(t)]}{\Omega_{d-1} ma^{d-1}(t)} \dot{a}(t).
\]  

(53)

Therefore, by measuring the contact, energy, or entropy density under the periodic modulation of the scattering length, it is possible in principle to extract the contact–contact response function and thus the bulk viscosity spectral function via Eq. \cite{32}.

IV. SHEAR VISCOSITY

A. Formulation

The shear viscosity spectral function in Eq. \cite{27} is related to the off-diagonal element of the stress tensor operator via

\[
\eta(\omega) = \frac{\text{Im} \chi_{\text{xy},\text{xy}}(\omega)}{\omega},
\]  

(54)

where the stress–stress response function has the quantum virial expansion of

\[
\chi_{\text{xy},\text{xy}}(\omega) = \sum_{N=0}^{\infty} \frac{z^N}{N!} \int \frac{d^d x}{Z} \int_0^\infty dt e^{i(\omega + i\bar{a}) t} \text{Tr}_N [e^{-\beta \hat{H} + i\hat{\Pi}_t} \hat{\Pi}_{\text{xy}} e^{-i\hat{\Pi}_t} \hat{\Pi}_{\text{xy}} - e^{-\beta \hat{H} - i\hat{\Pi}_t} \hat{\Pi}_{\text{xy}} e^{i\hat{\Pi}_t} \hat{\Pi}_{\text{xy}}].
\]  

(55)

The off-diagonal element of the stress tensor operator \cite{29} then reads

\[
\hat{\Pi}_{\text{xy}} = -\sum_\sigma \int d\mathbf{x} \psi_{\sigma}^\dagger(\mathbf{x}) \frac{\partial_x}{m} \psi_{\sigma}(\mathbf{x}) = \sum_{N=0}^{\infty} H_N \hat{\Pi}_{\text{xy}}^{(N)}
\]  

(56)
and its decomposition into one-body and two-body sectors is

\[ \hat{H}^{(1)}_{xy} = \sum_{\sigma} \sum_{p} |\sigma p\rangle \frac{P_x P_y}{m} \langle \sigma p| \]

(57)

and

\[ \hat{H}^{(2)}_{xy} = \sum_{\sigma, \tau} \sum_{p, q} |\sigma p, \tau q\rangle \frac{P_x P_y + q_x q_y}{m} \langle \sigma p, \tau q|, \]

(58)

respectively.

The stress–stress response function at \( O(z) \) is simply provided by

\[ \chi^{(1)}_{xy, xy}(\omega) = -\frac{1}{L^d} \sum_{\sigma, \sigma'} \sum_{p, p'} \sum_{q, q'} e^{-\beta \frac{p^2 + q^2}{2m}} - e^{-\beta \frac{p'^2 + q'^2}{2m}} \langle \sigma p | \hat{\Pi}^{(1)}_{xy} | \sigma' p' \rangle \langle \sigma' p' | \hat{\Pi}^{(1)}_{xy} | \sigma p \rangle \]

(59)

and its contribution to the shear viscosity spectral function is thus

\[ \eta_1(\omega) = \frac{\text{Im}[\chi^{(1)}_{xy, xy}(\omega)]}{\omega} = \frac{2\beta}{L^d} \pi \delta(\omega) \sum_{p} e^{-\beta \frac{p^2}{2m}} \left( \frac{P_x P_y}{m} \right)^2. \]

(60)

It is also straightforward to evaluate the stress–stress response function at \( O(z^2) \),

\[ \chi^{(2)}_{xy, xy}(\omega) = \chi^{(2)}_{xy, xy}(\omega)|_{\text{free}} + \chi^{(2)}_{xy, xy}(\omega)|_{\text{int},} \]

(61)

with the use of the time evolution operator such as \( e^{-i\hat{H}_t} \) obtained from Eq. (14). The free part with only \( e^{-i\hat{H}_t}_|_{\text{free}} \) involved is simply provided by

\[ \chi^{(2)}_{xy, xy}(\omega)|_{\text{free}} = -\frac{1}{L^d} \sum_{\sigma, \sigma'} \sum_{p, q} \sum_{p', q'} \sum_{\tilde{\epsilon}} e^{-\beta \frac{p^2 + q^2}{2m}} - e^{-\beta \frac{p'^2 + q'^2}{2m}} \langle \sigma p | \hat{\Pi}^{(2)}_{xy} | \sigma' p', \tilde{\epsilon} \rangle \langle \sigma' p', \tilde{\epsilon} | \hat{\Pi}^{(2)}_{xy} | \sigma p \rangle. \]

(62)

Its contribution to the shear viscosity spectral function is thus

\[ \eta_2(\omega)|_{\text{free}} = \frac{\text{Im}[\chi^{(2)}_{xy, xy}(\omega)|_{\text{free}}]}{\omega} = \frac{4\beta}{L^d} \pi \delta(\omega) \left( \sum_{p, q} e^{-\beta \frac{p^2 + q^2}{2m}} \left( \frac{P_x P_y}{m} \right)^2 \right)^2 \sum_{\tilde{\epsilon}} \eta_1(\omega). \]

(63)

On the other hand, the interacting part with at least one \( e^{-i\hat{H}_t}|_{\text{int}} \) involved is found to be

\[ \chi^{(2)}_{xy, xy}(\omega)|_{\text{int}} = -\frac{1}{L^d} \sum_{p, q} e^{-\beta \frac{(p^2 + q^2)^2}{4m}} \left( \frac{P_x P_y + q_x q_y}{m} \right)^2 \int_{-\infty}^{\infty} \frac{d\epsilon}{\pi} \frac{e^{-\beta \frac{(\epsilon - \tilde{\epsilon})^2}{4m}} - e^{-\beta \epsilon}}{(\epsilon - \tilde{\epsilon} - i0^+)} \left( \frac{T_2(\epsilon - i0^+)}{(\epsilon - \frac{(p^2 + q^2)^2}{4m} - i0^+)^2} \right) \]

(64)
Its contribution to the shear viscosity spectral function is thus

\[
\eta_2(\omega)_{\text{int}} = \frac{\text{Im}[\chi_{xy,xy}^{(2)}(\omega)]_{\text{int}}}{\omega} \tag{65}
\]

\[
= \frac{1}{L^d} \sum_{\mathbf{K}, \mathbf{k}} e^{-\beta \frac{K^2}{m}} e^{-\beta \frac{k^2}{m}} \left[ \left( \frac{K_x K_y}{2m} \right)^2 + \left( \frac{2k_x k_y}{m} \right)^2 \right] 1 - e^{-\beta \omega} \frac{\text{Im} \left[ \frac{\mathcal{T}_2 \left( \frac{k^2}{m} + \omega - i0^+ \right)}{(-\omega - i0^+)^2} \right]}{\omega} \]

\[
+ \frac{1}{L^d} \sum_{\mathbf{K}, \mathbf{k}} e^{-\beta \frac{K^2}{m}} e^{-\beta \frac{k^2}{m}} \left[ \left( \frac{K_x K_y}{2m} \right)^2 + \left( \frac{2k_x k_y}{m} \right)^2 \right] e^{\beta \omega} - 1 \omega \text{Im} \left[ \frac{\mathcal{T}_2 \left( \frac{k^2}{m} - \omega - i0^+ \right)}{(-\omega - i0^+)^2} \right]
\]

\[
+ \frac{1}{L^d} \sum_{\mathbf{K}, \mathbf{k}, \mathbf{k}'} e^{-\beta \frac{K^2}{m}} e^{-\beta \frac{k^2}{m}} \left[ \frac{K_x K_y}{2m} \right]^2 1 - e^{-\beta \omega} \int_{-\infty}^{\infty} \frac{d\varepsilon}{\pi} e^{-\beta \varepsilon} \text{Im} \left[ \frac{\mathcal{T}_2(\varepsilon - i0^+)}{(\varepsilon - \frac{k^2}{m} - i0^+)(\varepsilon - \frac{k^2}{m} - i0^+)} \right] \text{Im} \left[ \frac{\mathcal{T}_2(\varepsilon + \omega - i0^+)}{(\varepsilon + \omega - \frac{k^2}{m} - i0^+)(\varepsilon + \omega - \frac{k^2}{m} - i0^+)} \right] \right), \tag{66}
\]

where \( \mathbf{K} = \mathbf{p} + \mathbf{q} \) and \( \mathbf{k}^{(l)} = \frac{1}{2} (\mathbf{p}^{(l)} - \mathbf{q}^{(l)}) \) are the center-of-mass and relative momenta, respectively, and the first two terms correspond to the self-energy and Maki–Thompson diagrams and the last term corresponds to the Aslamazov–Larkin diagram. The last term can be further simplified by utilizing the identity of

\[
\frac{1}{L^d} \sum_{\mathbf{k}, \mathbf{k}'} \text{Im} \left[ \frac{\mathcal{T}_2(\varepsilon - i0^+)}{(\varepsilon - \frac{k^2}{m} - i0^+)(\varepsilon - \frac{k^2}{m} - i0^+)} \right] \text{Im} \left[ \frac{\mathcal{T}_2(\varepsilon + \omega - i0^+)}{(\varepsilon + \omega - \frac{k^2}{m} - i0^+)(\varepsilon + \omega - \frac{k^2}{m} - i0^+)} \right]
\]

\[
- \frac{1}{L^d} \sum_{\mathbf{k}} \pi \delta(\varepsilon - \frac{k^2}{m}) \text{Im} \left[ \frac{\mathcal{T}_2(\varepsilon + \omega - i0^+)}{(\omega - i0^+)^2} \right] - \frac{1}{L^d} \sum_{\mathbf{k}} \pi \delta(\varepsilon + \omega - \frac{k^2}{m}) \text{Im} \left[ \frac{\mathcal{T}_2(\varepsilon - i0^+)}{(-\omega - i0^+)^2} \right]
\]

\[
+ \frac{1}{L^d} \sum_{\mathbf{k}} \pi \delta(\omega) \text{Im} \left[ \frac{\mathcal{T}_2(\varepsilon - i0^+)}{(\varepsilon - \frac{k^2}{m} - i0^+)^2} \right], \tag{67}
\]

so that we obtain

\[
\eta_2(\omega)_{\text{int}} = \frac{1}{L^d} \sum_{\mathbf{K}, \mathbf{k}} e^{-\beta \frac{K^2}{m}} e^{-\beta \frac{k^2}{m}} \left[ \left( \frac{K_x K_y}{2m} \right)^2 + \left( \frac{2k_x k_y}{m} \right)^2 \right] 1 - e^{-\beta \omega} \frac{\text{Im} \left[ \frac{\mathcal{T}_2 \left( \frac{k^2}{m} + \omega - i0^+ \right)}{(-\omega - i0^+)^2} \right]}{\omega} \]

\[
+ \frac{1}{L^d} \sum_{\mathbf{K}, \mathbf{k}} e^{-\beta \frac{K^2}{m}} e^{-\beta \frac{k^2}{m}} \left[ \left( \frac{K_x K_y}{2m} \right)^2 + \left( \frac{2k_x k_y}{m} \right)^2 \right] e^{\beta \omega} - 1 \omega \text{Im} \left[ \frac{\mathcal{T}_2 \left( \frac{k^2}{m} - \omega - i0^+ \right)}{(-\omega - i0^+)^2} \right]
\]

\[
+ \frac{\beta}{L^d} \sum_{\mathbf{K}, \mathbf{k}} e^{-\beta \frac{K^2}{m}} e^{-\beta \frac{k^2}{m}} \left[ \frac{K_x K_y}{2m} \right]^2 \pi \delta(\omega) \int_{-\infty}^{\infty} \frac{d\varepsilon}{\pi} e^{-\beta \varepsilon} \text{Im} \left[ \frac{\mathcal{T}_2(\varepsilon - i0^+)}{(\varepsilon - \frac{k^2}{m} - i0^+)^2} \right]. \tag{68}
\]

Finally, by combining Eqs. (66), (63), and (68), taking the thermodynamic limit, and performing the resulting momentum integrations, we find that the shear viscosity spectral function is provided by

\[
\eta(\omega) = \frac{z}{Z} \eta_1(\omega) + \frac{z^2}{Z} \left[ \eta_2(\omega)_{\text{free}} + \eta_2(\omega)_{\text{int}} \right] + O(z^3)
\]

\[
= p \pi \delta(\omega) + \frac{z^2}{\lambda_T^2 \Gamma(2 + d/2)} \frac{(m/2\pi)^{d/2}}{\omega} 1 - e^{-\omega/\varepsilon} \frac{\omega}{\varepsilon} \int_{0}^{\infty} d\varepsilon e^{-\omega/\varepsilon} \varepsilon^{1+d/2} \text{Im} \left[ \frac{\mathcal{T}_2(\varepsilon + \omega - i0^+)}{(-\omega - i0^+)^2} \right]
\]

\[
+ \frac{z^2}{\lambda_T^2 \Gamma(2 + d/2)} \frac{(m/2\pi)^{d/2}}{\omega} \frac{e^{\omega/\varepsilon} - 1}{\omega} \int_{0}^{\infty} d\varepsilon e^{-\omega/\varepsilon} \varepsilon^{1+d/2} \text{Im} \left[ \frac{\mathcal{T}_2(\varepsilon - \omega - i0^+)}{(-\omega - i0^+)^2} \right] + O(z^3), \tag{69}
\]

where \( p \) in the first term is the pressure from Eq. [19] and the integration variable is changed to \( \varepsilon = k^2/m \).
B. Evaluation

Our concise formula for the shear viscosity spectral function is even under \( \omega \to -\omega \) and has the high-frequency tail of

\[
\lim_{\omega \to -\infty} \eta(\omega) = \frac{\pi C}{(4\pi)^{d/2}\Gamma(2 + d/2)|m\omega|^{2-d/2}},
\]

where \( C \) is the contact density from Eq. (22). This asymptotic form agrees with Refs. [16-18] for \( d = 3 \) and with Ref. [17] for \( d = 2 \). Also, the integration over \( \omega \) leads to

\[
\int_{-\infty}^{\infty} \frac{d\omega}{\pi} \eta(\omega) = p - \frac{2z^2 (m/2\pi)^{d/2}}{\lambda_T^d \Gamma(2 + d/2)} \int_{0}^{\infty} d\varepsilon \int_{-\infty}^{\infty} d\omega \varepsilon e^{-\omega/T} e^{1+d/2} \text{Im} \left[ \frac{T_2(\omega - i\varepsilon)}{(\omega - \varepsilon - i\varepsilon)^2} \right] + O(\omega^2).
\]

By performing the integration over \( \varepsilon \) with the divergent piece transposed to the left hand side and utilizing the identity of

\[
\text{Im}[(-m\omega + i\varepsilon)^{d/2-1}T_2(\varepsilon - i\varepsilon)] = a^{2-d} \text{Im}[T_2(\varepsilon - i\varepsilon)],
\]

we obtain

\[
\int_{-\infty}^{\infty} \frac{d\omega}{\pi} \left[ \eta(\omega) - \frac{\pi C}{(4\pi)^{d/2}\Gamma(2 + d/2)|m\omega|^{2-d/2}} \right] = p - \frac{C}{(d-2)\Omega_{d-1}m^{(d-2)}} (d > 2),
\]

which for \( d = 3 \) is consistent with the sum rule derived in Ref. [15] up to the factors in front of \( C \) and in Refs. [16-17].

After confirming our formula (70) in light of the known constraints, we are ready to evaluate its static limit, \( \omega \to 0 \), where Eq. (70) is formally ill-defined and thus requires the resummation. To this end, we write \( \pi\delta(\omega) = \text{Im}(\omega - i\varepsilon)^{-1} \) in the first term and regard the remainder as corrections in a geometric series [16-23]. Consequently, the shear viscosity spectral function is brought into the Drude form of

\[
\eta(\omega) = \text{Im} \left[ \frac{p}{\omega - i\varepsilon - \mathcal{M}(\omega)} \right],
\]

where the memory function is found to be

\[
\mathcal{M}(\omega) = \frac{z^2}{p\lambda_T^d \Gamma(2 + d/2)} \frac{(m/2\pi)^{d/2} 1 - e^{-\omega/T}}{\omega} \int_{0}^{\infty} d\varepsilon e^{-\varepsilon/T} e^{1+d/2} T_2(\varepsilon + \omega - i\varepsilon) - \frac{z^2}{p\lambda_T^d \Gamma(2 + d/2)} \frac{(m/2\pi)^{d/2} e^{\omega/T}}{\omega} \int_{0}^{\infty} d\varepsilon e^{-\varepsilon/T} e^{1+d/2} T_2(\varepsilon - \omega + i\varepsilon) + O(\varepsilon^2).
\]

Because of \( \text{Re}[\mathcal{M}(0)] = 0 \), the static limit is now provided by \( \eta \equiv \lim_{\omega \to 0} \eta(\omega) = p/\text{Im}[\mathcal{M}(0)] \) and the substitution of Eqs. (19) and (24) therein leads to

\[
\frac{1}{\lambda_T^d \eta} = \begin{cases} 
\frac{\pi}{2} \int_{0}^{\infty} d\varepsilon e^{-\varepsilon} \frac{\varepsilon^2}{\ln^2(\tilde{a}\varepsilon) + \pi^2} + O(\varepsilon) & (d = 2), \\
4\sqrt{7} \int_{0}^{\infty} d\varepsilon e^{-\varepsilon} \frac{\varepsilon^3}{\tilde{a}^2 + \pi^2} + O(\varepsilon) & (d = 3).
end{cases}
\]

Here the integration variable is changed to \( \tilde{\varepsilon} = \varepsilon/T \) and the dimensionless scattering length is introduced via \( \tilde{a} \equiv \sqrt{mT}a = \sqrt{2\pi a/\lambda_T} \). Our results agree with the static shear viscosity derived from the kinetic theory both for \( d = 3 \) [20 21] and for \( d = 2 \) [22 23]. Although it is a smooth function of \( \lambda_T/a > 0 \) for \( d = 2 \), we find that the static shear viscosity for \( d = 3 \) exhibits the weak non-analyticity starting with \( \lambda_T^3 \eta \sim (\ln \tilde{a}^2)/\tilde{a}^6 \) in the unitarity limit.

ACKNOWLEDGMENTS

The author thanks Thomas Schäfer for the valuable discussions. He also thanks Tilman Enss and Johannes Hofmann for the correspondences regarding their recent preprints [39 40], which overlap with this work. This work was supported by JSPS KAKENHI Grant Nos. JP15K17727 and JP15H05855.
Appendix A: Bulk viscosity formula at $O(z^3)$

Let us derive the formula for the contact–contact response function at $O(z^3)$, which is to evaluate

$$\chi_{CC}^{(3)}(\omega) = \frac{i}{\hbar^2} \int_0^\infty d\tau e^{i(\omega+\tau)} \text{Tr}_3 [e^{-\beta \hat{H} + i \hat{H}_1 \hat{C}} e^{-i \hat{H}_1 \hat{C}} - e^{-\beta \hat{H} - i \hat{H}_1 \hat{C}} e^{i \hat{H}_1 \hat{C}}].$$

(A1)

The three-body sector is spanned by $|\sigma_1 p_1, \sigma_2 p_2, \sigma_3 p_3\rangle$, which is further decomposed into four subsectors where $\{\sigma_1, \sigma_2, \sigma_3\} = \{\uparrow, \uparrow, \uparrow\}, \{\uparrow, \uparrow, \downarrow\}, \{\uparrow, \downarrow, \downarrow\}, \{\downarrow, \downarrow, \downarrow\}$. The first and last subsectors do not involve the interaction and thus do not contribute to the contact–contact response function. Because the second and third subsectors contribute identically, it is sufficient to consider only the second subsector. By introducing the abbreviated notation,

$$|p_1, p_2; q\rangle \equiv \sqrt{3} |\uparrow \uparrow \uparrow \uparrow \downarrow p_1 \uparrow \downarrow p_2; q\rangle = \frac{1}{\sqrt{2}} \hat{\psi}_\uparrow \hat{\psi}_\uparrow \hat{\psi}_\uparrow \hat{\psi}_\downarrow |0\rangle,$$

(A2)

and utilizing the identity operator,

$$\mathbb{1}_{\uparrow\uparrow\downarrow} = \sum_{p_1, p_2, q} |p_1, p_2; q\rangle \langle p_1, p_2; q|,$$

(A3)

the projection of the Hamiltonian $\mathbb{1}_{\uparrow\uparrow\downarrow}$ and the contact operator $\hat{C}$ onto this subsector leads to

$$\hat{H}_{\uparrow\downarrow\downarrow} \equiv \mathbb{1}_{\uparrow\uparrow\downarrow} \hat{H} \mathbb{1}_{\uparrow\uparrow\downarrow}$$

(A4)

$$= \sum_{p_1, p_2, q} |p_1, p_2; q\rangle \frac{p_1^2 + p_2^2 + q^2}{2m} \langle p_1, p_2; q| + \sum_{p_1, p_2, q, p_1', p_2', q'} |p_1, p_2; q\rangle 2\delta_{p_1, p_1'} \delta_{p_2 + q_{p_1'} + q_{p_1}}, 2\beta L_d \langle p_1', p_2'; q'|$$

(A5)

and

$$\hat{C}_{\uparrow\downarrow\downarrow} \equiv \mathbb{1}_{\uparrow\uparrow\downarrow} \hat{C} \mathbb{1}_{\uparrow\uparrow\downarrow} = \sum_{p_1, p_2, q, p_1', p_2', q'} |p_1, p_2; q\rangle 2\delta_{p_1, p_1'} \delta_{p_2 + q_{p_1'} + q_{p_1}}, \frac{(mg)^2}{L_d} \langle p_1', p_2'; q'|.$$  

(A6)

In order to evaluate the corresponding Boltzmann operator, we write the Hamiltonian as a sum of kinetic and potential energy operators and utilize the identity of

$$e^{-\beta \hat{H}_{\uparrow\downarrow\downarrow}} = \int_{-\infty}^{\infty} \frac{dE}{\pi} e^{-\beta E} \text{Im} \left[ \frac{1}{E - \hat{H}_{\uparrow\downarrow\downarrow} - i0^+} \right]$$

(A7)

$$= \int_{-\infty}^{\infty} \frac{dE}{\pi} e^{-\beta E} \text{Im} \left[ \frac{1}{E - \hat{T}_{\uparrow\downarrow\downarrow} - i0^+} + \sum_{n=0}^{\infty} \frac{1}{E - \hat{T}_{\uparrow\downarrow\downarrow} - i0^+} \hat{V}_{\uparrow\downarrow\downarrow} \left( \frac{1}{E - \hat{T}_{\uparrow\downarrow\downarrow} - i0^+} \hat{V}_{\uparrow\downarrow\downarrow} \right)^n \frac{1}{E - \hat{T}_{\uparrow\downarrow\downarrow} - i0^+} \right].$$

(A8)

Because the summation over $n$ can be performed according to

$$\sum_{n=0}^{\infty} \hat{V}_{\uparrow\downarrow\downarrow} \left( \frac{1}{E - \hat{T}_{\uparrow\downarrow\downarrow} - i0^+} \hat{V}_{\uparrow\downarrow\downarrow} \right)^n \frac{1}{E - \hat{T}_{\uparrow\downarrow\downarrow} - i0^+} \hat{V}_{\uparrow\downarrow\downarrow}$$

$$= \frac{1}{L_d} \sum_{p_1, p_2, q, p_1', p_2', q'} |p_1, p_2; q\rangle 2\delta_{p_1, p_1'} \delta_{p_2 + q_{p_1'} + q_{p_1}}, \hat{T}_2 (E - \frac{p_1^2}{2m} - \frac{(p_2 + q)^2}{4m} - i0^+) \langle p_1', p_2'; q'|$$

$$+ \frac{1}{L_d} \sum_{p_1, p_2, q, p_1', p_2', q'} |p_1, p_2; q\rangle 2\delta_{p_1, p_2} \delta_{p_1 + q_{p_1'} + q_{p_1}}, \hat{T}_2 (E - \frac{p_1^2}{2m} - \frac{(p_2 + q)^2}{4m} - i0^+)$$

$$\times \hat{T}_3 (E - i0^+, p_1 + p_2 + q, p_1', p_1') \hat{T}_2 (E - \frac{p_1^2}{2m} - \frac{(p_2 + q)^2}{4m} - i0^+) \langle p_1', p_2'; q'|,$$

(A9)
the Boltzmann operator is found to be
\[
e^{-\beta \hat{H}_{1+1}} = \sum_{p_1, p_2, q} |p_1, p_2; q\rangle e^{-\beta \frac{p_1^2 + p_2^2 + q^2}{2m}} \langle p_1, p_2; q| \\
+ \frac{1}{L^d} \sum_{p_1, p_2, q} \sum_{p_1', p_2'} |p_1, p_2; q\rangle 2\delta_{p_1, p_1'} \delta_{p_2+q, p_2'} \langle p_1', p_2'; q| \\
\times \int_{-\infty}^{\infty} \frac{dE}{\pi} e^{-\beta E} \text{Im} \left[ \frac{T_2(E - \frac{p_1^2}{2m} - \frac{(p_2+q)^2}{4m} - i0^+)}{(E - \frac{p_1^2 + p_2^2 + q^2}{2m} - i0^+)(E - \frac{p_1^2 + p_2'^2 + q'^2}{2m} - i0^+)} \right] \\
+ \frac{1}{L^d} \sum_{p_1, p_2, q} \sum_{p_1', p_2'} |p_1, p_2; q\rangle 2\delta_{p_1+p_2+q, p_1'+p_2'+q'} \langle p_1', p_2'; q| \\
\times \int_{-\infty}^{\infty} \frac{dE}{\pi} e^{-\beta E} \text{Im} \left[ \frac{T_2(E - \frac{p_1^2}{2m} - \frac{(p_2+q)^2}{4m} - i0^+)}{(E - \frac{p_1^2 + p_2^2 + q^2}{2m} - i0^+)(E - \frac{p_1^2 + p_2'^2 + q'^2}{2m} - i0^+)} \right] .
\]

Here an infinite series,
\[
\hat{T}_3(E - i0^+, K; p_1, p_1') \equiv \frac{1}{E - \frac{p_1^2 + p_1'^2 + (K - p_1 - p_1')^2}{2m} - i0^+} \\
+ \frac{1}{L^d} \sum_{p_1', p_1''} \int_{-\infty}^{\infty} \frac{dE}{\pi} \text{Im} \left[ \frac{T_2(E - \frac{p_1'^2}{2m} - \frac{(K - p_1')^2}{4m} - i0^+)}{(E - \frac{p_1''^2 + p_1'^2 + (K - p_1 - p_1')^2}{2m} - i0^+)(E - \frac{p_1''^2 + p_1'^2 + (K - p_1 - p_1')^2}{2m} - i0^+)} \right] \\
\]

is the three-body scattering $T$-matrix between atom and dimer from incoming $(p_1, K - p_1)$ to outgoing $(p_1', K - p_1')$ momenta and solves the integral equation of Table 12.

\[
\hat{T}_3(E - i0^+, K; p_1, p_1') \\
= -\frac{1}{E - \frac{p_1^2 + p_1'^2 + (K - p_1 - p_1')^2}{2m} - i0^+} \sum_{p_1''} \int_{-\infty}^{\infty} \frac{dE}{\pi} \text{Im} \left[ \frac{T_2(E - \frac{p_1'^2}{2m} - \frac{(K - p_1')^2}{4m} - i0^+)}{(E - \frac{p_1''^2 + p_1'^2 + (K - p_1 - p_1')^2}{2m} - i0^+)(E - \frac{p_1''^2 + p_1'^2 + (K - p_1 - p_1')^2}{2m} - i0^+)} \right] .
\]

With the use of the above Boltzmann operator valid for any complex $\beta$ as well as the identity of Eq. (37), we obtain
\[
\text{tr}_{1+1}[e^{-\beta \hat{H}_{1+1}} \hat{C}_{1+1} e^{-i\hat{H}_{1+1} t \hat{C}_{1+1}}] \\
= \sum_{K, k} e^{-\beta \frac{K^2}{2m}} \int_{-\infty}^{\infty} \frac{d\varepsilon}{\pi} \int_{-\infty}^{\infty} \frac{d\varepsilon'}{\pi} e^{-\beta \varepsilon - i\varepsilon' t} \text{Im} \left[ m^2 T_2(\varepsilon - \frac{3K^2}{4m} - i0^+) \right] \text{Im} \left[ m^2 T_2(\varepsilon' - \frac{3K^2}{4m} - i0^+) \right] \\
+ \frac{1}{L^d} \sum_{K, k} e^{-\beta \frac{K^2}{2m}} \int_{-\infty}^{\infty} \frac{d\varepsilon}{\pi} \int_{-\infty}^{\infty} \frac{d\varepsilon'}{\pi} e^{-\beta \varepsilon - i\varepsilon' t} \text{Im} \left[ m^2 T_2(\varepsilon - \frac{3K^2}{4m} - i0^+) \right] \\
\times \text{Im} \left[ m^2 T_2(\varepsilon' - \frac{3K^2}{4m} - i0^+) \right] \\
+ \frac{1}{L^d} \sum_{K, k} e^{-\beta \frac{K^2}{2m}} \int_{-\infty}^{\infty} \frac{d\varepsilon}{\pi} \int_{-\infty}^{\infty} \frac{d\varepsilon'}{\pi} e^{-\beta \varepsilon - i\varepsilon' t} \text{Im} \left[ m^2 T_2(\varepsilon - \frac{3K^2}{4m} - i0^+) \right] \\
\times \text{Im} \left[ m^2 T_2(\varepsilon' - \frac{3K^2}{4m} - i0^+) \right] \\
+ \frac{1}{L^d} \sum_{K, k, k'} e^{-\beta \frac{K^2}{2m}} \int_{-\infty}^{\infty} \frac{d\varepsilon}{\pi} \int_{-\infty}^{\infty} \frac{d\varepsilon'}{\pi} e^{-\beta \varepsilon - i\varepsilon' t} \text{Im} \left[ m^2 T_2(\varepsilon - \frac{3K^2}{4m} - i0^+) \right] \\
\times \text{Im} \left[ m^2 T_2(\varepsilon' - \frac{3K^2}{4m} - i0^+) \right] ,
\]

where $K = p_1 + p_2 + q$ and $k^{(i)} = p_1^{(i)} - K/3$ are the center-of-mass and relative momenta, respectively, and the integration variables are changed to $\varepsilon^{(i)} = E^{(i)} - K^2/6m$. We also note that $T_3(\varepsilon - i0^+; k, k') \equiv T_3(\varepsilon + \frac{K^2}{6m} - i0^+)$. 

$$i 0^+, K; \frac{\mathbf{k}}{m} + \mathbf{k}, \frac{\mathbf{k}^*}{m} + k')$$ is the three-body scattering $T$-matrix in the center-of-mass frame and is actually independent of $K$. Consequently, the contact–contact response function at $O(z^3)$ is found to be

$$
\chi^{(3)}_{CC}(\omega) = -\frac{2}{L^d} \sum_{K, k} e^{-\beta \frac{k^2}{2m}} \int_{-\infty}^{\infty} \frac{d\varepsilon}{\pi} \int_{-\infty}^{\infty} \frac{d\varepsilon'}{\pi} e^{-\beta \varepsilon} e^{-\beta \varepsilon'} \text{Im} \left[m^2 T_2(\varepsilon - \frac{3k^2}{4m} - i0^+) \right] \text{Im} \left[m^2 T_2(\varepsilon' - \frac{3k^2}{4m} - i0^+) \right] 
$$

$$-\frac{2}{L^d} \sum_{K, k} e^{-\beta \frac{k^2}{2m}} \int_{-\infty}^{\infty} \frac{d\varepsilon}{\pi} \int_{-\infty}^{\infty} \frac{d\varepsilon'}{\pi} e^{-\beta \varepsilon} e^{-\beta \varepsilon'} \text{Im} \left[m^2 T_2(\varepsilon - \frac{3k^2}{4m} - i0^+) \right] 
$$

$$\times \text{Im} \left[m^2 T_2(\varepsilon' - \frac{3k^2}{4m} - i0^+) T_3(\varepsilon' - i0^+; k, k) T_2(\varepsilon - \frac{3k^2}{4m} - i0^+) \right] 
$$

$$-\frac{2}{L^d} \sum_{K, k, k'} e^{-\beta \frac{k^2}{2m}} \int_{-\infty}^{\infty} \frac{d\varepsilon}{\pi} \int_{-\infty}^{\infty} \frac{d\varepsilon'}{\pi} e^{-\beta \varepsilon} e^{-\beta \varepsilon'} \text{Im} \left[m^2 T_2(\varepsilon - \frac{3k^2}{4m} - i0^+) \right] 
$$

$$\times \text{Im} \left[m^2 T_2(\varepsilon' - \frac{3k^2}{4m} - i0^+) T_3(\varepsilon - i0^+; k, k') T_2(\varepsilon - \frac{3k^2}{4m} - i0^+) \right] 
$$

$$-\frac{2}{L^d} \sum_{K, k, k'} e^{-\beta \frac{k^2}{2m}} \int_{-\infty}^{\infty} \frac{d\varepsilon}{\pi} \int_{-\infty}^{\infty} \frac{d\varepsilon'}{\pi} e^{-\beta \varepsilon} e^{-\beta \varepsilon'} \text{Im} \left[m^2 T_2(\varepsilon - \frac{3k^2}{4m} - i0^+) \right] 
$$

$$\times \text{Im} \left[m^2 T_2(\varepsilon - \frac{3k^2}{4m} - i0^+) T_3(\varepsilon' - i0^+; k', k) T_2(\varepsilon' - \frac{3k^2}{4m} - i0^+) \right], \quad (A14)$$

where the overall factor of 2 accounts for the existence of two interfering subsectors and the first term corresponds to the disconnected diagram, the second and third terms correspond to the self-energy diagrams, and the last term corresponds to the Aslamazov–Larkin diagram. Finally, by combining Eq. (39), taking the thermodynamic limit, and performing the resulting momentum integrations, we find that the bulk viscosity spectral function is provided by

$$
\zeta(\omega) = \frac{1}{(d \Omega_{d-1} a^{d-2})^{-2}} \text{Im} \left[ \frac{z^2}{Z} \chi^{(2)}_{CC}(\omega) + \frac{z^3}{Z} \chi^{(3)}_{CC}(\omega) + O(z^4) \right] 
$$

$$= \frac{2^{d/2} \pi^2}{(d \Omega_{d-1} a^{d-2})^{-2} \lambda_T^2} \int_{-\infty}^{\infty} \frac{d\varepsilon}{\pi} e^{-\varepsilon/T} \text{Im}[m T_2(\varepsilon - i0^+)] \text{Im}[m T_2(\varepsilon + \omega - i0^+)] 
$$

$$+ \frac{2 \cdot 3^{d/2} \pi^3}{(d \Omega_{d-1} a^{d-2})^{-2} \lambda_T^2} \int \frac{dk}{(2\pi)^d} \int_{-\infty}^{\infty} \frac{d\varepsilon}{\pi} e^{-\varepsilon/T} \text{Im} \left[m T_2(\varepsilon - \frac{3k^2}{4m} - i0^+) \right] 
$$

$$\times \text{Im} \left[m T_2(\varepsilon + \omega - \frac{3k^2}{4m} - i0^+) T_3(\varepsilon + \omega - i0^+; k, k) T_2(\varepsilon + \omega - \frac{3k^2}{4m} - i0^+) \right] 
$$

$$+ \frac{2 \cdot 3^{d/2} \pi^3}{(d \Omega_{d-1} a^{d-2})^{-2} \lambda_T^2} \int \frac{dk}{(2\pi)^d} \int_{-\infty}^{\infty} \frac{d\varepsilon}{\pi} e^{-\varepsilon/T} \text{Im} \left[m T_2(\varepsilon + \omega - \frac{3k^2}{4m} - i0^+) \right] 
$$

$$\times \text{Im} \left[m T_2(\varepsilon - \frac{3k^2}{4m} - i0^+) T_3(\varepsilon - i0^+; k, k') T_2(\varepsilon - \frac{3k^2}{4m} - i0^+) \right] 
$$

$$+ \frac{2 \cdot 3^{d/2} \pi^3}{(d \Omega_{d-1} a^{d-2})^{-2} \lambda_T^2} \int \frac{dk}{(2\pi)^d} \int_{-\infty}^{\infty} \frac{d\varepsilon}{\pi} e^{-\varepsilon/T} \text{Im} \left[m T_2(\varepsilon + \omega - \frac{3k^2}{4m} - i0^+) \right] 
$$

$$\times \text{Im} \left[m T_2(\varepsilon + \omega - \frac{3k^2}{4m} - i0^+) T_3(\varepsilon + \omega - i0^+; k', k) T_2(\varepsilon + \omega - \frac{3k^2}{4m} - i0^+) \right] + O(z^4), \quad (A15)$$

where the three-body scattering $T$-matrix in the center-of-mass frame solves the integral equation of

$$T_3(\varepsilon - i0^+; k, k') = -\frac{1}{\varepsilon - \frac{\mathbf{k}^2 + \mathbf{k}^2}{m} - i0^+} \int \frac{dk''}{(2\pi)^d} \frac{T_2(\varepsilon - \frac{3k''^2}{4m} - i0^+)}{\varepsilon - \frac{\mathbf{k}^2 + \mathbf{k}^2}{m} + k'' - i0^+} T_3(\varepsilon - i0^+; k'', k'). \quad (A17)$$

The higher order correction at $O(z^3)$ may be useful to better understand the static bulk viscosity in the Kubo
formalism, which is to be investigated in a future study.
