Heron Angles, Heron Triangles, and Heron Parallelograms

Walter Wyss

Abstract
Heron angle: both its sine and cosine are rational
Heron triangle: all its sides and area are rational
Heron Parallelogram: all its sides, diagonals and area are rational
We give one-to-one (bijective) parametrizations for all three concepts.

1 Introduction
Special angles, triangles, rectangles, and parallelograms have been studied for ages by Mathematician and Scientists (Pythagoras, Heron, Diophantus, Brahmagupta to mention a few). Parameter representations, some in integers, have been found in all cases [1]. However, there was a lack in retrieving the parameters. Here we give parameter representations that are bijective (one-to-one).

2 Bijective parameter representation of a relation

Theorem 1
let $a, x, y, z$ be real numbers. Given $a$, the relation

$$x^2 + 2axy + y^2 = z^2$$

(1)

has the following bijective parameter representation, with parameters $\lambda, \sigma$

$$x = \frac{\lambda}{1 + a\sigma}(1 - \sigma^2)$$

(2)

$$y = 2\lambda\sigma$$

(3)

$$z = \frac{\lambda}{1 + a\sigma}(1 + 2a\sigma + \sigma^2)$$

(4)

conversely $2\lambda = x + z$, $\sigma = \frac{y}{x + z}$

(5)
Proof. The relation (1) also reads
\[ x^2 + (y + ax)^2 = z^2 + (ax)^2 \]  \hspace{1cm} (6)

According to [2] this relation has the following bijective parameter representation with parameters \(s_1, s_2, \lambda_2\)

\[
\begin{align*}
y + ax &= s_1 + \lambda_2 s_2 \\
ax &= s_1 - \lambda_2 s_2 \\
x &= s_2 - \lambda_2 s_1 \\
z &= s_2 + \lambda_2 s_1
\end{align*}
\]  \hspace{1cm} (7)

Conversely

\[
\begin{align*}
2s_1 &= y + 2ax \\
2s_2 &= x + z \\
2\lambda_2 s_2 &= y
\end{align*}
\]  \hspace{1cm} (8)

Now

\[
ax = a_1 (s_2 - \lambda_2 s_1) = s_1 - \lambda_2 s_2
\]  \hspace{1cm} (9)

resulting in

\[
s_1 = \frac{a + \lambda_2}{1 + a\lambda_2} s_2
\]  \hspace{1cm} (10)

Then

\[
\begin{align*}
x &= s_2 - \lambda_2 \frac{a + \lambda_2}{1 + a\lambda_2} s_2 \\
x &= \frac{s_2}{1 + a\lambda_2} (1 - \lambda_2^2)
\end{align*}
\]  \hspace{1cm} (11)

\[
\begin{align*}
z &= s_2 + \lambda_2 \frac{a + \lambda_2}{1 + a\lambda_2} s_2 \\
z &= \frac{s_2}{1 + a\lambda_2} (1 + 2a\lambda_2 + \lambda_2^2)
\end{align*}
\]  \hspace{1cm} (12)

and

\[
y = 2\lambda_2 s_2
\]  \hspace{1cm} (13)

Finally let \(s_2 = \lambda, \quad \lambda_2 = \sigma\)
Corollary 1

The relation, given $\varepsilon$,

$$m^2 + \varepsilon mn + n^2 = 1$$  \hspace{1cm} (17)

has the following bijective parameter representation, with parameter $\sigma$

$$m = \frac{1 - \sigma^2}{1 + \varepsilon \sigma + \sigma^2}$$  \hspace{1cm} (18)

$$n = \frac{\sigma(2 + \varepsilon \sigma)}{1 + \varepsilon \sigma + \sigma^2}$$  \hspace{1cm} (19)

Conversely

$$\sigma = \frac{n}{1 + m}$$  \hspace{1cm} (20)

Proof. In (2, 3, 4, 5) let $x = m$, $y = n$, $z = 1$, and $2a = \varepsilon$ \hfill $\square$

3 The relation

$$\lambda^2 = \frac{m}{n} \frac{1 - n^2}{1 + m^2}$$  \hspace{1cm} (21)

We have two one-parameter families of fundamental solutions given by

(a) Type I:

$$\lambda = \frac{m}{n}$$  \hspace{1cm} (22)

Then

$$m(1 - m^2) = n(1 - n^2)$$

$$m - n = m^3 - n^3$$

or

$$m^2 + mn + n^2 = 1$$  \hspace{1cm} (23)

This relation has already been considered by Diophantus of Alexandria [3]

According to (17), the relation (23) has the bijective parameter representation with parameter $\sigma$, as

$$m = \frac{1 - \sigma^2}{1 + \sigma + \sigma^2}, \quad n = \frac{\sigma(2 + \sigma)}{1 + \sigma + \sigma^2}, \quad \lambda = \frac{1 - \sigma^2}{\sigma(2 + \sigma)}$$  \hspace{1cm} (24)

conversely

$$\sigma = \frac{n}{1 + m}$$  \hspace{1cm} (25)
(b) Type II:

\[ \lambda = mn \]  \hspace{1cm} (26)

Then

\[ mn^3(1 - m^2) = 1 - n^2 \]
\[ 1 + m^3n^3 = n^2(1 + mn) \]

or

\[ 1 - mn + m^2n^2 = n^2 \]

and then

\[ \left( \frac{1}{n} \right)^2 - m \left( \frac{1}{n} \right) + m^2 = 1 \]  \hspace{1cm} (27)

According to (17), the relation (27) has the bijective parameter representation with parameter \( \sigma \), as

\[ m = \frac{1 - \sigma^2}{1 - \sigma + \sigma^2}, \quad n = \frac{1 - \sigma + \sigma^2}{\sigma(2 - \sigma)}, \quad \lambda = \frac{1 - \sigma^2}{\sigma(2 - \sigma)} \]  \hspace{1cm} (28)

conversely

\[ \sigma = \frac{1}{n(1 + m)} \]  \hspace{1cm} (29)

Example

(a)

\[ \sigma = \frac{1}{2}, \quad m = \frac{3}{7}, \quad n = \frac{5}{7}, \quad \lambda = \frac{3}{5} \]  \hspace{1cm} (30)

(b)

\[ \sigma = \frac{2}{3}, \quad m = \frac{5}{7}, \quad n = \frac{7}{8}, \quad \lambda = \frac{5}{8} \]  \hspace{1cm} (31)

4 Heron angles

Definition 1

1. An angle \( \alpha \) is called a Heron angle if both \( \sin \alpha \) and \( \cos \alpha \) are rational

2. The generator of an angle \( \alpha \) is defined by

\[ m = m(\alpha) = \frac{\sin \alpha}{1 + \cos \alpha} = \tan \left( \frac{\alpha}{2} \right) \]  \hspace{1cm} (32)
Lemma 1
For $0 < \alpha < \pi$, $m(\alpha) > 0$ and is an increasing function of $\alpha$.

Proof. Since $\sin \alpha > 0$ and $-1 < \cos \alpha < 1$ we see from (32) that $m(\alpha) > 0$.

From
\[
\frac{dm(\alpha)}{d\alpha} = \frac{1}{2} \frac{1}{\cos^2 \left( \frac{\alpha}{2} \right)} > 0
\]

we see that $m(\alpha)$ is increasing. \hfill \Box

Lemma 2
Given the generator $m = m(\alpha)$, $0 < \alpha < \pi$, we find
\[
\cos \alpha = \frac{1 - m^2}{1 + m^2}, \quad \sin \alpha = \frac{2m}{1 + m^2}
\]

Proof. From
\[
m^2 = \frac{1 - \cos \alpha}{1 + \cos \alpha}
\]

we find
\[
\cos \alpha = \frac{1 - m^2}{1 + m^2} \quad \text{and then} \quad \sin \alpha = \frac{2m}{1 + m^2}
\]

Observe that the generator of a Heron angle is rational and vice versa. Thus there is a one-to-one relationship between rational numbers and Heron angles. \hfill \Box

5 Heron triangles
For a triangle with sides $u_1, u_2, u_3$ and interior angles $\phi_1, \phi_2, \phi_3$, where $\phi_k$ is the angle opposite $u_k$, $k = 1, 2, 3$

We have
1. The law of sine
\[
\frac{u_1}{\sin \phi_1} = \frac{u_2}{\sin \phi_2} + \frac{u_3}{\sin \phi_3}
\]
2. The law of cosine
\[
u_3^2 = u_1^2 + u_2^2 - 2u_1u_2 \cos \phi_3
\]

with similar relations involving the other sides and angles
3. The area $A$ of the triangle is given by
\[
A = \frac{1}{2} u_1 u_2 \sin \phi_3
\]

and similarly for the other sides and angles.
**Definition 2**

A triangle is called a Heron triangle if all its sides and area are rational. Observe that from (35, 36) all the interior angles are Heron angles. For a Heron triangle we find from (34) and $\phi_1 = \pi - (\phi_2 + \phi_3)$ the representation

\[
\begin{align*}
    u_1 &= \sin(\phi_2 + \phi_3)w \\
    u_2 &= \sin \phi_2 \cdot w \\
    u_3 &= \sin \phi_3 \cdot w
\end{align*}
\]

where $w$ is a rational scaling parameter.

Let now $q$ be the generator of $\phi_2$, $p$ the generator of $\phi_3$, i.e.

\[
\begin{align*}
    \sin \phi_2 &= \frac{2q}{1 + q^2}, \quad \cos \phi_2 = \frac{1 - q^2}{1 + q^2} \\
    \sin \phi_3 &= \frac{2p}{1 + p^2}, \quad \cos \phi_3 = \frac{1 - p^2}{1 + p^2}
\end{align*}
\]

Then

\[
\sin \phi_1 = \sin(\phi_2 + \phi_3) = \sin \phi_2 \cos \phi_3 + \cos \phi_2 \sin \phi_3 = \frac{2q(1 - p^2)}{(1 + q^2)(1 + p^2)} + \frac{2p(1 - q^2)}{(1 + q^2)(1 + p^2)}
\]

Introduce the new rational scaling parameter $v$ by

\[
w = \frac{1}{2}(1 + p^2)(1 + q^2)v
\]

Then we have the representation, with $p > 0, q > 0, v > 0$ and $pq < 1$

\[
\begin{align*}
    u_1 &= (p + q)(1 - pq)v \\
    u_2 &= q(1 + p^2)v \\
    u_3 &= p(1 + q^2)v \\
    A &= pq(p + q)(1 - pq)v^2
\end{align*}
\]

This representation has the three parameters $p, q, v$. We now can retrieve these parameters from $u_1, u_2, u_3, A$ as follows:
From
\[
\begin{align*}
\sin \phi_3 &= \frac{4A}{2u_1u_2} \\
\cos \phi_3 &= \frac{u_1^2 + u_2^2 - u_3^2}{2u_1u_2} \\
1 + \cos \phi_3 &= \frac{(u_1 + u_2)^2 - u_3^2}{2u_1u_2}
\end{align*}
\] (48, 49, 50)

we find the generator
\[
p = \frac{\sin \phi_3}{1 + \cos \phi_3} = \frac{4A}{(u_1 + u_2)^2 - u_3^2}
\] (51)

and similarly
\[
q = \frac{\sin \phi_2}{1 + \cos \phi_2} = \frac{4A}{(u_1 + u_3)^2 - u_2^2}
\] (52)

The scaling factor \( v \) is then given by
\[
v = \frac{u_3}{p(1 + q^2)}
\] (53)

This is our one-to-one relationship.

**Example**

\( u_1 = 9, \quad u_2 = 10, \quad u_3 = 17, \quad A = 36 \)
\( p = 2, \quad q = \frac{1}{4}, \quad v = 8 \)

**6 Heron parallelograms**

A parallelogram has sides \( u_1, u_2 \) and diagonals \( u_3, u_4 \).

**Definition 3**

(a) A parallelogram with its sides and diagonals being rational is called a rational parallelogram.

(b) A rational parallelogram with rational area is called a Heron parallelogram.

In [4] we found a bijective parameter representation for rational parallelograms.
Parameters \( u > 0, \quad 0 < m < 1, \quad 0 < n < 1 \) and all rational
\[ u_1 = (1 - mn)u \quad (54) \]
\[ u_2 = (m + n)u \quad (55) \]
\[ u_3 = [1 + mn - (n - m)]u \quad (56) \]
\[ u_4 = [1 + mn + (n - m)]u \quad (57) \]

Conversely
\[ 4u = u_4 + u_3 + 2u_1 \quad (58) \]
\[ m = \frac{u_4 + u_3 - 2u_1}{u_4 - u_3 + 2u_2} \quad (59) \]
\[ n = \frac{u_4 - u_3 + 2u_2}{u_4 + u_3 + 2u_1} \quad (60) \]

Not let \( \phi \) be the angle between the sides \( u_1, u_2 \). According to the law of cosine we find
\[ \cos \phi = \frac{u_1^2 + u_2^2 - u_3^2}{2u_1u_2} = \frac{2(u_1^2 + u_2^2) - 2u_3^2}{4u_1u_2} \quad (61) \]

From the parallelogram equation
\[ 2(u_1^2 + u_2^2) = u_3^2 + u_4^2 \quad (62) \]
we get
\[ \cos \phi = \frac{u_1^2 - u_2^2}{4u_1u_2} = \frac{(u_4 - u_3)(u_4 + u_3)}{4u_1u_2} \]
\[ \cos \phi = \frac{(n - m)(1 + mn)}{(n + m)(1 - mn)} \quad (63) \]

Now the area \( A \) of a parallelogram is given by
\[ A = u_1u_2 \sin \phi \quad (64) \]
where
\[ \sin^2 \phi = 1 - \cos^2 \phi \]
\[ \sin^2 \phi = \frac{4mn(1-m^2)(1-n^2)}{(n+m)^2(1-mn)^2} \]
\[ \sin^2 \phi = \frac{4n^2(1-m^2)^2}{(n+m)^2(1-mn)^2} \cdot \frac{m(1-n^2)}{n(1-m^2)} \quad (65) \]
or according to (21) with
\[ \chi^2 = \frac{m(1-n^2)}{n(1-m^2)} \]
we have
\[ \sin \phi = \frac{2n(1 - m^2)}{(n + m)(1 - mn)} \lambda \] (66)

The generator \( p \) of the angle \( \phi \) is given by
\[ p = \frac{\sin \phi}{1 + \cos \phi} \]

where
\[ 1 + \cos \phi = \frac{(n + m)(1 - mn) + (n - m)(1 + mn)}{(n + m)(1 - mn)} \]

Therefore
\[ p = \lambda \] (68)

The area is now given by
\[ A = 2\lambda n(1 - m^2)u^2 \] (69)

Now, a Heron parallelogram with sides \( u_1, u_2 \), diagonals \( u_3, u_4 \) and area \( A \) is parameterized by

0 < \( m < 1 \), \ 0 < \( n < 1 \), \ u > 0, \ \lambda > 0 \ with \ \lambda^2 = \frac{m(1 - n^2)}{n(1 - m^2)} \] (70)

For a type I Heron parallelogram, we have the relation (22) and thus the bijective parameter \( \sigma \). From (24, 25, 70) we find

0 < \( \sigma < 1 \) (71)

For a type II Heron parallelogram, we have the relation (26) and thus the bijective parameter \( \sigma \). From (28, 29, 70) we find

\[ \frac{1}{2} < \sigma < 1 \] (72)

Observe that Heron parallelograms cover the case of Heron triangles with a rational median.

Finally, we have the relations

**Type I :**
\[ \lambda = \frac{m}{n} = \frac{2u_2 + u_3 - u_4}{2u_2 - u_3 + u_4} \]

**Type II :**
\[ \lambda = mn = \frac{u_3 + u_4 - 2u_1}{u_3 + u_4 + 2u_1} \] (73)
Example

Type I : From (30)
\[
\begin{align*}
    m &= \frac{3}{7}, \quad n = \frac{5}{7}, \quad \lambda = \frac{3}{5}, \quad u = \frac{49}{2} \\
    u_1 &= 17, \quad u_2 = 28, \quad u_3 = 25, \quad u_4 = 39, \quad A = 420
\end{align*}
\] (74)

Type II : From (31)
\[
\begin{align*}
    m &= \frac{5}{7}, \quad n = \frac{7}{8}, \quad \lambda = \frac{5}{8}, \quad u = 56 \\
    u_1 &= 21, \quad u_2 = 89, \quad u_3 = 82, \quad u_4 = 100, \quad A = 1680
\end{align*}
\] (75)
