L–SPACE SURGERIES ON 2-COMPONENT L–SPACE LINKS

BEIBEI LIU

ABSTRACT. In this paper, we analyze L-space surgeries on two component L–space links. We show that if one surgery coefficient is negative for the L–space surgery, then the corresponding link component is an unknot. If the link admits very negative (i.e. $d_1, d_2 \ll 0$) L–space surgeries, it is the Hopf link. We also give a way to characterize the torus link $T(2, 2l)$ by observing an L–space surgery $S_{d_1, d_2}(L)$ with $d_1d_2 < 0$ on a 2-component L–space link with unknotted components. For some 2-component L–space links, we give explicit descriptions of the L–space surgery sets.

1. INTRODUCTION

Heegaard Floer homology is an invariant for closed, oriented 3-manifolds, defined using Heegaard diagram by Ozsváth and Szabó [16]. From the viewpoint of this invariant, L–spaces are the simplest three-manifolds. An L–space is a rational homology sphere such that the free rank of its Heegaard Floer homology equals the order of its first singular homology group. Boyer, Gordon and Watson recently conjectured that for closed, oriented and prime three-manifolds, left-orderability of the fundamental groups indicates that the manifold is not an L–space [2, 6, 7, 21], and this was confirmed for graph manifolds. Ozsváth and Szabó proved that if the three-manifold $M$ admits an cooriented taut foliation, it is not an L–space [14].

A link in $S^3$ is an L–space link if all sufficiently large surgeries on all components of the link are L–spaces. This indicates that $S^3_{d_1, \ldots, d_n}(L)$ are L–spaces for the L–space link $L = L_1 \cup \cdots \cup L_n$, with $d_i \gg 0$ for all $i$. It is very hard to determine whether $S^3_{d_1, \ldots, d_n}(L)$ is an L–space for other integral surgery coefficients $d_1, \ldots, d_n$. For L–space knots $K$ in $S^3$, the integral surgery $S^3_d(K)$ is an L–space if and only if $d \geq 2g(K) - 1$ [19 Proposition 9.6]. For multiple-component links, Manolescu and Ozsváth constructed the truncated surgery complex [12]. It starts with an infinitely generated complex. There are six ways to truncate this complex to a finitely generated but rather complicated complex depending on the signs of the surgery coefficients and the determinant of the surgery matrix. Y. Liu described the truncated surgery complex very explicitly for 2-component L–space links in [11]. It is simpler compared to the truncated surgery complex for general 2-component links, and it is possible to determine if a single surgery on the link is an L–space. However, the characterization of integral or rational L–space surgeries on 2-component L–space links is still not well-understood.

Gorsky and Némethi proved that the set of L–space surgeries for most algebraic links is bounded from below and determined this set for integral surgeries along torus links [5]. Rasmussen has shown that certain torus links, satellites by algebraic links, and iterated satellites by torus links have fractal-like regions of rational L–space surgery slopes [22].

In this paper, we analyze the integral surgeries $S^3_{d_1, d_2}(L)$ for any 2-component L–space link $L = L_1 \cup L_2$. Note that whether a link $L$ is an L–space link does not depend on the orientation of $L$. However, Manolescu-Ozsváth surgery complex depends on the orientation of $L$. In this paper, we orient all 2-component L–space links such that they have nonnegative linking numbers. For such links, we have the $H$-function $H_L(s)$ which is a link invariant
defined on some 2-dimensional lattice \( \mathbb{H}(L) \) and takes values in nonnegative integers, see Section 2.1. If there exists a lattice point \( s = (s_1, s_2) \in \mathbb{H}(L) \) such that \( H_L(s) = H_L(s_1, s_2 + 1), H_L(s) > H_L(s_1 + 1, s_2) \) and one of \( H_L(s_1, \infty), H_L(\infty, s_2) \) equals 0, we say the link is a type (A) link. Otherwise, we say the link is type (B). For example, the Whitehead link is type (A), and all algebraic links are type (B) [5].

**Theorem 1.1.** Suppose that \( L = L_1 \cup L_2 \) is a type (A) L–space link. If \( S_{d_1, d_2}^3(L) \) is an L–space, then \( d_1 > 0, d_2 > 0 \) and \( \det \Lambda > 0 \).

For type (A) L–space links, the region for L–space surgeries is bounded from below. For type (B) L–space links, the region for L–space surgeries is more complicated, and it may be unbounded. For example, the torus link \( T(4, 6) \) has unbounded L–space surgery set (see [5], Figure 1]). We analyze the very positive or very negative surgeries \( S_{d_1, d_2}^3(L) \) where \( d_i \gg 0 \) or \( d_i \ll 0 \) for type (B) links.

**Theorem 1.2.** Let \( L = L_1 \cup L_2 \) be a type (B) L–space link. If \( S_{d_1, d_2}^3(L) \) is an L–space with \( d_1 \gg 0, d_2 \ll 0 \), then \( L_2 \) is an unknot.

For algebraic links, Gorsky and Némethi proved a stronger result by a very different method.

**Theorem 1.3.** [5, Theorem 1.3.2] Suppose that \( L = L_1 \cup L_2 \) is an algebraic link with two components. Then \( S_{d_1, d_2}^3(L) \) is an L–space for \( d_1 \gg 0 \) and \( d_2 \ll 0 \) if and only if \( L_2 \) is an unknot.

**Theorem 1.4.** Let \( L = L_1 \cup L_2 \) be a nontrivial 2-component L–space link. If \( S_{d_1, d_2}^3(L) \) is an L–space for \( d_1 \ll 0 \) and \( d_2 \ll 0 \), then \( L \) is the Hopf link.

Next, we consider 2-component L–space links with unknotted components.

**Theorem 1.5.** Let \( L = L_1 \cup L_2 \) be an L–space link with unknotted components and linking number \( l \). If \( S_{d_1, d_2}^3(L) \) is an L–space for \( d_1 d_2 < 0 \), then \( L \) is the torus link \( T(2, 2l) \).

This gives a characterization of the torus link \( T(2, 2l) \).

For type (A) L–space links \( L \), the region for possible L–space surgeries is in the first quadrant, but it is still not clear which surgery is an L–space. We consider 2-component L–space links with vanishing linking numbers.

Based on the \( H \)-function of the link \( L \), we define:

\[
(1.1) \quad b_1(L) = \min \{ [s_1 - 1] \mid H(s_1, s_2) = H(\infty, s_2) \text{ for all } s_2 \}.
\]

\( b_2(L) \) is similarly defined. If the context is clear, we write \( b_i(L) \) as \( b_i \) for simplicity.

**Theorem 1.6.** [5, Theorem 5.1] Assume that \( L \) is a nontrivial L–space link with unknotted components and linking number zero. Then \( S_{d_1, d_2}^3(L) \) is an L–space if and only if \( d_1 > 2b_1 \) and \( d_2 > 2b_2 \).

For general 2-component L–space links with vanishing linking numbers, \( b_i \geq g(L_i) - 1 \) for \( i = 1, 2 \). We indicate the possible L–space regions of such links as follows.

**Theorem 1.7.** Let \( L = L_1 \cup L_2 \) be an oriented L–space link with linking number zero. Suppose that \( b_i = g_i - 1 \) for \( i = 1, 2 \) where \( g_i \) is the genus of the knot \( L_i \). Then \( S_{d_1, d_2}^3(L) \) is an L–space if and only if \( d_1 > 2b_1 \) and \( d_2 > 2b_2 \).

**Theorem 1.8.** Let \( L = L_1 \cup L_2 \) be an oriented nontrivial L–space link with linking number zero. Suppose that \( b_i \geq g_i \) for \( i = 1 \) or 2. The possible L–space surgeries are indicated in Figure 7. The green color indicated the region of L–space surgeries. Points in the red regions won’t give L–space surgeries, and the white regions are points for possible L–space surgeries.
If the symmetrized Alexander polynomial of the 2-component L–space link \( L \) satisfies some additional properties, we have a more precise description of the set of L–space surgeries.

A lattice point \( s = (s_1, s_2) \in \mathbb{H}(\mathcal{L}) \) is called maximal if \( H_{\mathcal{L}}(s) = 1, H_{\mathcal{L}}(s + 1, s_2) = H_{\mathcal{L}}(s_1, s_2 + 1) = 0. \)

**Theorem 1.9.** Let \( L = L_1 \cup L_2 \) be an L–space link with \( b_1 = s_1 \) and \( b_2 = s'_2 \) for maximal lattice points \((s_1, s_2)\) and \((s'_1, s'_2)\). Suppose that the coefficients of \( t_1^{-s_1-1/2}t_2^{-s_2+1/2} \) and \( t_1^{s_1+1/2}t_2^{-s'_2-1/2} \) in the symmetrized Alexander polynomial \( \Delta_{\mathcal{L}}(t_1, t_2) \) are nonzero. Then \( S_{d_1, d_2}^3(\mathcal{L}) \) is an L–space if and only if \( d_1 > 2b_1 \) and \( d_2 > 2b_2. \)

For example, the Whitehead link satisfies the assumption in Theorem 1.9. Furthermore, if the link \( L = L_1 \cup L_2 \) satisfies the assumption in Theorem 1.9, the cable link \( L_{p,q} = L_1(p,q) \cup L_2 \) also satisfies the assumption where \( p,q \) are coprime positive integers with \( q/p \) sufficiently large and \( L_{p,q} \) denotes the \((p,q)\)-cable of \( L_1 \). Note that \( L_{p,q} \) is also an L–space link if \( L \) is an L–space link [1].

**Theorem 1.10.** Suppose that \( L \) is an L–space link that satisfies the assumption in Theorem 1.9. Then \( S_{d_1, d_2}^3(\mathcal{L}_{p,q}) \) is an L–space if and only if \( d_1 > 2b_1(\mathcal{L}_{p,q}) \) and \( d_2 > 2b_2(\mathcal{L}_{p,q}) \).

**Remark 1.11.** The constants \( b_1(\mathcal{L}_{p,q}) \) and \( b_2(\mathcal{L}_{p,q}) \) can be obtained from \( b_1(\mathcal{L}) \) and \( b_2(\mathcal{L}) \), see Lemma 4.28.

**Corollary 1.12.** Let \( Wh = L_1 \cup L_2 \) denote the Whitehead link and \( Wh_{cab} = L_{(p_1,q_1)} \cup L_{(p_2,q_2)} \) be the cable link where \( L_{(p_i,q_i)} \) is the \((p_i,q_i)\)-cable of \( L_i \) and \( p_i,q_i \) are coprime positive integers with \( q_i/p_i \) sufficiently large. The surgery manifold \( S_{d_1, d_2}^3(Wh_{cab}) \) is an L–space if and only if \( d_i \geq p_i q_i + p_i - q_i - 1 \) for \( i = 1,2. \)

The main ingredient of the proofs is Manolescu-Ozsváth truncated surgery complex. For a 2-component L–space link \( L = L_1 \cup L_2 \), the subcomplexes \( \mathcal{Q}_s^{00}, \mathcal{Q}_s^{01}, \mathcal{Q}_s^{10} \) and \( \mathcal{Q}_s^{11} \) are used to keep track of the filtration information induced by the link \( L \), its sublinks \( L_1, L_2 \) and \( \emptyset \). We construct a CW-complex corresponding to this truncated surgery complex. More precisely, we associate a 2-dimensional cell to \( \mathcal{Q}_s^{00} \), a 1-dimensional cell to \( \mathcal{Q}_s^{01} \) or \( \mathcal{Q}_s^{10} \) and a 0-dimensional cell to \( \mathcal{Q}_s^{11} \). The singular homology of the CW complex corresponds to the generators of the free part of \( HF^-(S_{d_1, d_2}^3(\mathcal{L}), \mathcal{S}) \). If the surgery \( S_{d_1, d_2}^3(\mathcal{L}) \) is an L–space, we should be able to locate the generator of \( HF^-(S_{d_1, d_2}^3(\mathcal{L}), \mathcal{S}) \). For example, if \( d_1 \ll 0, d_2 \ll 0 \), the CW complex corresponding to the truncated surgery complex in each Spin^c structure is a square. It is contractible, so its singular homology is generated by a class of a 0-cell. Then
the generator of $HF^{-}(S_{d_{1},d_{2}}^{3}(\mathcal{L}),s)$ is $H_{*}(\mathfrak{X}^{1})$ for some $s \in \mathbb{H}(\mathcal{L})$. For details, see Section 3 and 8. This will give restrictions to the differentials in the surgery complex, which is related to the $H$-function.

Organization of the paper. In Section 2.1 we give the definition and properties of the $H$-function for oriented links. In Section 2.2 we give the definition and properties of L–space links and give a way to compute the $H$-function of L–space links in terms of their Alexander polynomials. In Section 3 we review the truncated surgery complex introduced by Manolescu and Ozsváth [12] and associate to it a CW complex. In Section 4.1 we discuss type (A) L–space links and prove Theorem 1.1. In Section 4.2 we discuss type (B) L–space links and prove Theorem 1.2, Theorem 1.4 and Theorem 1.5. In Section 4.3 we discuss L–space links with vanishing linking numbers and describe the possible L–space surgery sets. In Section 4.4 we give explicit descriptions of L–space surgery sets for some 2-component L–space links, and prove Theorem 1.9, Theorem 1.10 and Corollary 1.12.

Notation and Conventions. In this paper, all 2-component links are oriented such that the linking number is nonnegative. We use $l$ to denote the linking number and $\Lambda$ to denote the surgery matrix

$$\Lambda = \begin{pmatrix} d_{1} & l \\ l & d_{2} \end{pmatrix}. $$

We use $\mathcal{L}$ to denote links in $S^{3}$ and $L_{1}, \cdots, L_{n}$ to denote the link components in the same link. We denote vectors in $\mathbb{R}^{n}$ by bold letters. For two vectors $u = (u_{1}, \cdots, u_{n})$ and $v = (v_{1}, \cdots , v_{n})$, we write $u \geq v$ if $u_{i} \geq v_{i}$ for all $1 \leq i \leq n$, and $u \succ v$ if $u \geq v$ and $u \neq v$. Let $e_{i}$ denote a vector in $\mathbb{R}^{n}$ where the $i$-th entry is 1 and other entries are 0. For a subset $B \subset \{ 1, \cdots , n \}$, let $e_{B} = \sum_{i \in B} e_{i}$. Let $\Delta_{\mathcal{L}}(t_{1}, \cdots , t_{n})$ denote the symmetrized Alexander polynomial of $\mathcal{L}$. Throughout this paper, we work over the field $F = \mathbb{Z}/2\mathbb{Z}$.

Acknowledgements. I deeply appreciate Eugene Gorsky for his support and useful suggestions during this project. I am grateful to Allison Moore for helpful discussions, and I also want to thank Jacob Rasmussen for pointing out that the Thurston polytope characterizes the torus link $T(2,2l)$. The project is partially supported by NSF grant DMS-1700814.

2. The $H$-function and L–space links

2.1. The $H$-function. Ozsváth and Szabó associated chain complexes $CF^{-}(M), \hat{CF}(M)$ to an admissible Heegaard diagram for a closed oriented connected 3-manifold $M$ [17], and these give three-manifold invariants $HF^{-}(M)$ and $\hat{HF}(M)$. A nullhomologous link $\mathcal{L} = L_{1} \cup \cdots \cup L_{n}$ in $M$ defines a filtration on the chain complex $CF^{-}(M)$. For links in $S^{3}$, this filtration is indexed by an $n$-dimensional lattice $\mathbb{H}(\mathcal{L})$ which is defined as follows:

**Definition 2.1.** For an oriented link $\mathcal{L} = L_{1} \cup \cdots \cup L_{n} \subset S^{3}$, define $\mathbb{H}(\mathcal{L})$ to be the affine lattice over $\mathbb{Z}^{n}$:

$$\mathbb{H}(\mathcal{L}) = \bigoplus_{i=1}^{n} \mathbb{H}_{i}(\mathcal{L}), \quad \mathbb{H}_{i}(\mathcal{L}) = \mathbb{Z} + \frac{lk(L_{i}, \mathcal{L} \setminus L_{i})}{2},$$

where $lk(L_{i}, \mathcal{L} \setminus L_{i})$ denotes the linking number of $L_{i}$ and $\mathcal{L} \setminus L_{i}$.

Given $s = (s_{1}, \cdots , s_{n}) \in \mathbb{H}(\mathcal{L})$, the *generalized Heegaard Floer complex* $\mathfrak{X}^{-}(\mathcal{L},s) \subset CF^{-}(S^{3})$ is the $\mathbb{F}[|U|]$-module defined to be a subcomplex of $CF^{-}(S^{3})$ corresponding to the filtration indexed by $s$ [12]. The link Floer homology $HFL^{-}(\mathcal{L},s)$ is the homology of the associated complex with respect to this filtration, and is a module over $\mathbb{F}[|U|]$. For more details, see [11, 12].
By the large surgery theorem \[ \text{[12, Theorem 12.1]}, \] the homology of \( \mathfrak{A}^-(L, s) \) is isomorphic to the Heegaard Floer homology of a large surgery on the link \( L \) equipped with some Spin\(^c\) structure as a \( \mathbb{F}[[U]] \)-module. Thus the homology of \( \mathfrak{A}^-(L, s) \) is a direct sum of one copy of \( \mathbb{F}[[U]] \) and some \( U \)-torsion submodule.

**Definition 2.2.** [1] Definition 3.9] For an oriented link \( L \subset S^3 \), we define the \( H \)-function \( H_L(s) \) by saying that \(-2H_L(s)\) is the maximal homological degree of the free part of \( H_*(\mathfrak{A}^-(L, s)) \) where \( s \in \mathbb{H}(L) \).

**Remark 2.3.** We sometimes write \( H_L(s) \) as \( H(s) \) for simplicity if there is no confusion.

We list several properties of the \( H \)-function as follows.

**Lemma 2.4.** [1 Proposition 3.10] For an oriented link \( L \subset S^3 \), the \( H \)-function \( H_L(s) \) takes nonnegative values, and \( H_L(s - e_i) = H_L(s) \) or \( H_L(s - e_i) = H_L(s) + 1 \) where \( s \in \mathbb{H}(L) \).

**Lemma 2.5.** [1 Proposition 3.12] For an oriented link \( L = L_1 \cup \cdots \cup L_n \subset S^3 \) and \( s = (s_1, \ldots, s_n) \in \mathbb{H}(L) \),

\[
H_L(s_1, \ldots, s_{n-1}, \infty) = H_{L \setminus L_n}(s_1 - \text{lk}(L_1, L_n)/2, \ldots, s_{n-1} - \text{lk}(L_{n-1}, L_n)/2)
\]

where \( \text{lk}(L_i, L_n) \) denotes the linking number of \( L_i \) and \( L_n \) for \( i = 1, 2, \ldots, n - 1 \).

**Remark 2.6.** We use the convention that \( H_L(\infty, \ldots, \infty) = 0 \).

2.2. \( L \)-space links. In [18], Ozsváth and Szabó introduced the concept of \( L \)-spaces.

**Definition 2.7.** A 3-manifold \( Y \) is an \( L \)-space if it is a rational homology sphere and its Heegaard Floer homology has minimal possible rank: for any Spin\(^c\)-structure \( s \), \( HF^-(Y, s) = \mathbb{F} \) and \( HF^-(Y, s) \) is a free \( \mathbb{F}[U] \)-module of rank 1.

**Definition 2.8.** [1 11] An \( n \)-component link \( L \subset S^3 \) is an \( L \)-space link if there exists \( 0 < p \in \mathbb{Z}^n \) such that the surgery manifold \( S_q(L) \) is an \( L \)-space for any \( q \geq p \).

The following properties of \( L \)-space links will be used in this paper.

**Theorem 2.9.** [11] (a) Every sublink of an \( L \)-space link is an \( L \)-space link.

(b) A link is an \( L \)-space link if for all \( s \) one has \( H_*(\mathfrak{A}^-(L, s)) = \mathbb{F}[[U]] \).

**Lemma 2.10.** [11 Lemma 2.5] Let \( L = L_1 \cup \cdots \cup L_n \) be a link with \( n \) components, and \( L' = L - L_1 \). Let \( \Lambda \) be the framing matrix of \( L \) for the surgery \( S^3_{d_1, \ldots, d_n}(L) \), and denote by \( \Lambda' \) the restriction of \( \Lambda \) on \( L' \). Suppose \( S^3_{d_1, \ldots, d_n}(L) \) and \( S^3_{d_2, \ldots, d_n}(L') \) are both \( L \)-spaces. Then,

1. Case I: if \( \det(\Lambda) \cdot \det(\Lambda') > 0 \), then for all \( k > 0 \), \( S^3_{d_1+k,d_2,\ldots,d_n}(L) \) is an \( L \)-space;
2. Case II: if \( \det(\Lambda) \cdot \det(\Lambda') < 0 \), then for all \( k > 0 \), \( S^3_{d_1-k,d_2,\ldots,d_n}(L) \) is an \( L \)-space.

For \( L \)-space links, the \( H \)-function can be computed from the Alexander polynomial. One can write [11]:

\[
\chi(H_{FL}^-(L, s)) = \sum_{B \subset \{1, \ldots, n\}} (-1)^{|B|-1} H_L(s - e_B).
\]

The Euler characteristic \( \chi(H_{FL}^-(L, s)) \) was computed in [20],

\[
\tilde{\Delta}(t_1, \ldots, t_n) = \sum_{s \in \mathbb{H}(L)} \chi(H_{FL}^-(L, s)) t_1^{s_1} \cdots t_n^{s_n}
\]

where \( s = (s_1, \ldots, s_n) \) and

\[
\tilde{\Delta}_L(t_1, \ldots, t_n) := \begin{cases} (t_1 \cdots t_n)^{1/2} \Delta_L(t_1, \ldots, t_n) & \text{if } n > 1, \\ \Delta_L(t)/(1 - t^{-1}) & \text{if } n = 1. \end{cases}
\]
Note that we regard \(1 \over 1 - t^{-1}\) as an infinite power series in \(t^{-1}\). The Alexander polynomial \(\Delta_L(t_1, \cdots, t_n)\) is normalized so that it is symmetric about the origin.

One can use (2.1) to compute the \(H\)-function of \(L\) by using the values of the \(H\)-function for sublinks as the boundary conditions. In this paper, we mainly consider links with one and two components.

For \(n = 1\), the equation (2.1) has the form:
\[(2.3) \quad \chi(HFL^-(L, s)) = H(s - 1) - H(s).\]
It is not hard to see that if \(L\) is an unknot, \(H(s) = \frac{s - |s|}{2}\).

The genus of a knot \(L\) is defined as:
\[g(L) = \min\{\text{genus}(F) \mid F \subset S^3 \text{ is an oriented, embedded surface with } \partial F = L\}.\]

**Lemma 2.11.** Let \(L\) be an \(L\)-space knot. Then \(H(s) = 0\) if and only if \(s \geq g(L)\) where \(s \in \mathbb{Z}\).

**Proof.** Let \(\Delta_L(t) = \sum_{a \in \mathbb{Z}} a_s t^s\) denote its symmetrized Alexander polynomial. We claim that \(g(L) = \max\{s \mid a_s \neq 0\}\). Recall that
\[\Delta_L(t) = \sum_{s \in \mathbb{Z}} \chi(HFK(L, s)) \cdot t^s\]
where \(HFK(L, s)\) is a knot invariant from the Heegaard Floer package [13], and [14, Theorem 1.2]
\[g(L) = \max\{s \mid HFK(L, s) \neq 0\}\]
Hence, \(g(L)\) is the top degree of \(t\) in \(\Delta_L(t)\). Observe that the top degrees of \(t\) in \(\Delta_L(t)\) and \(\hat{\Delta}_L(t)\) are the same. By (2.3):
\[H(s - 1) - H(s) = 0, \text{ for all } s \geq g, \quad H(g - 1) - H(g) = a_g \neq 0.\]
By Lemma 2.4 and the boundary condition \(H(\infty) = 0\), we have
\[H(s) = 0 \text{ for all } s \geq g, \text{ and } H(s) \geq 1 \text{ for all } s \leq g - 1.\]

For 2-component \(L\)-space links \(L = L_1 \cup L_2\), (2.1) has the form,
\[(2.4) \quad \chi(HFL^-(L, s)) = -H(s_1 - 1, s_2 - 1) + H(s_1 - 1, s_2) + H(s_1, s_2 - 1) - H(s_1, s_2),\]
and we have \(H(s_1, \infty) = H_1(s_1 - l/2)\) and \(H(\infty, s_2) = H_2(s_2 - l/2)\) where \(H_1, H_2\) denote the \(H\)-functions of \(L_1, L_2\) respectively, and \(l\) is the linking number.

For general \(L\)-space links \(L\), the \(H\)-function satisfies the following conjugation symmetry.

**Lemma 2.12.** [11, Lemma 5.5] For an oriented \(n\)-component \(L\)-space link \(L \subset S^3\), the \(H\)-function satisfies \(H_L(-s) = H_L(s) + \sum_{i=1}^n s_i\) where \(s = (s_1, \cdots, s_n) \in \mathbb{H}(L)\).

**Corollary 2.13.** For an oriented 2-component link \(L = L_1 \cup L_2 \subset S^3\) with linking number \(l\), one has
\[H(-s_1, -s_2) - H(\infty, -s_2) = H(s_1, s_2) - H(\infty, s_2 + l) + s_1 - l/2.\]

**Proof.** By Lemma 2.5 and Lemma 2.12 we have:
\[H(-s_1, -s_2) - H(\infty, -s_2) = H(s_1, s_2) + s_1 + s_2 - H_2(-s_2 - l/2) = H(s_1, s_2) + s_1 + s_2 - H_2(s_2 + l/2) - s_2 - l/2 = H(s_1, s_2) - H(\infty, s_2 + l) + s_1 - l/2.\]
The surgeries on the link $\mathcal{L}$ do not depend on its orientation, so whether a link $\mathcal{L}$ is an $L$–space link does not depend on orientations. However, the $H$–function of $\mathcal{L}$ depends on its orientation.

**Proposition 2.14.** Let $\mathcal{L} = L_1 \cup L_2$ be an oriented 2-component $L$–space link with linking number $l$, and $\mathcal{L}' = -L_1 \cup L_2$ be the link obtained from $\mathcal{L}$ by reversing the orientation of $L_1$. Then for any $(s_1, s_2) \in \mathbb{H}(\mathcal{L}')$

$$H_{\mathcal{L}'}(s_1, s_2) = H_{\mathcal{L}}(s_1, s_2) - s_1 - l/2.\)$$

**Proof.** Since $\mathcal{L}$ is an $L$–space link, $\mathcal{L}'$ is also an $L$–space link. Let $\phi(s_1, s_2) = H_{\mathcal{L}}(-s_1, s_2) - s_1 - l/2$. It suffices to prove that $\phi$ satisfies (2.4) and the boundary condition that $\phi(s_1, \infty) = H_{-L_1}(s_1 + l/2)$ and $\phi(\infty, s_2) = H_{L_2}(s_2 + l/2)$. We check the boundary condition first. Recall that the Alexander polynomial of the knot $-L_1$ is obtained from the Alexander polynomial of $L_1$ by substituting $t^{-1}$ for $t$. Then $-L_1$ and $L_1$ have the same symmetrized Alexander polynomial and both of them are $L$–space knots. By (2.3), $H_{-L_1}(s_1) = H_{L_1}(s_1)$ for all $s_1 \in \mathbb{Z}$. Then

$$\phi(s_1, \infty) = H_{\mathcal{L}}(-s_1, \infty) - s_1 - l/2 = H_{L_1}(-s_1 - l/2) - s_1 - l/2 = H_{L_1}(s_1 + l/2) = H_{-L_1}(s_1 + l/2).$$

The proof of $\phi(\infty, s_2) = H_{L_2}(s_2 + l/2)$ is similar by observing that

$$H(-s_1, s_2) = H(s_1, -s_2) + s_1 - s_2.$$

Now we check that $\phi(s_1, s_2)$ satisfies (2.4). Note that $\Delta_{\mathcal{L}'}(t_1, t_2) = -\Delta_{\mathcal{L}}(t_1^{-1}, t_2)$. Assume that $\Delta_{\mathcal{L}'}(t_1, t_2) = \sum a_{s_1, s_2} t_1^{s_1} t_2^{s_2}$, and $\Delta_{\mathcal{L}}(t_1, t_2) = \sum b_{s_1, s_2} t_1^{s_1} t_2^{s_2}$. Then $a_{s_1, s_2} = -b_{-s_1, s_2}$. By (2.2), $\chi(HFL^-(\mathcal{L}', (s_1, s_2))) = a_{s_1-1/2, s_2-1/2}$, and $\chi(HFL^-(\mathcal{L}, (s_1, s_2))) = b_{s_1-1/2, s_2-1/2}$. Observe that

$$-\phi(s_1 - 1, s_2 - 1) + \phi(s_1 - 1, s_2) + \phi(s_1, s_2 - 1) - \phi(s_1, s_2) = -H_{\mathcal{L}}(-s_1 + 1, s_2 - 1) + H_{\mathcal{L}}(-s_1 + 1, s_2) + H_{\mathcal{L}}(-s_1, s_2 - 1) - H_{\mathcal{L}}(-s_1, s_2) = -\chi(HFL^-(\mathcal{L}, (-s_1 + 1, s_2))) - b_{-s_1+1/2, s_2-1/2} = a_{s_1-1/2, s_2-1/2} = \chi(HFL^-(\mathcal{L}', (s_1, s_2))).$$

Thus, $H_{\mathcal{L}'}(s_1, s_2) = H_{\mathcal{L}}(-s_1, s_2) - s_1 - l/2$. \qed

3. **Surgery complex and truncations**

3.1. **Truncated surgery complexes for 2-component L–space links.** We first review the Manolescu–Ozsváth link surgery complex $[12]$ for oriented links $\mathcal{L} = L_1 \cup L_2$.

For any sublink $M \subset \mathcal{L}$, set $N = \mathcal{L} - M$. We choose an orientation on $M$ (possibly different from the one induced from $\mathcal{L}$), and denote the corresponding oriented link by $\hat{M}$. One defines the map

$$\psi^\hat{M} : \mathbb{H}(\mathcal{L}) \to \mathbb{H}(N)$$

as in [12]. The map $\psi^\hat{M}$ depends only on the $i$–summand $\mathbb{H}_i(\mathcal{L})$ of $\mathbb{H}(\mathcal{L})$ corresponding to $L_i \subset N$. Each of $L_i$’s appears in $N$ with a index $j_i$, so there is a corresponding summand $\mathbb{H}_{j_i}(N)$ of $\mathbb{H}(N)$. Set

$$\psi_i^\hat{M} : \mathbb{H}_i(\mathcal{L}) \to \mathbb{H}_{j_i}(N), \quad s_i \mapsto s_i - \frac{lk(L_i, \hat{M})}{2}.$$

Then define $\psi_i^\hat{M}$ to be the direct sum of the maps $\psi_i^\hat{M}$ precomposed with the relevant factors.
For sublinks \( M \subset \mathcal{L} \) with orientation induced from \( \mathcal{L} \), we use \( \mathcal{H}^{\mathcal{L}-M} \) to denote the Heegaard diagram of \( \mathcal{L}-M \) obtained from \( \mathcal{H}^\mathcal{L} \) by forgetting the 2 basepoints on the sublink \( M \). The diagram \( \mathcal{H}^{\mathcal{L}-M} \) is associated with the generalized Floer complex \( \mathfrak{A}^-(\mathcal{H}^{\mathcal{L}-M}, \psi^\mathcal{M}(s)) \).

For the general 2-component link \( \mathcal{L} \), we describe the chain complex and its differential in detail. We write

\[
\Lambda = \begin{pmatrix} d_1 & l \\ l & d_2 \end{pmatrix},
\]

as the surgery matrix where \( l \) denotes the linking number and \( d_1, d_2 \) denote the surgery coefficients.

For a link \( \mathcal{L} = L_1 \cup L_2 \), a two digit binary superscript is used to keep track of which link components are forgotten. Let \( \mathfrak{A}_s^{00} = \mathfrak{A}^-(\mathcal{H}^\mathcal{L}, \mathfrak{s}) \), \( \mathfrak{A}_s^{01} = \mathfrak{A}^-(\mathcal{H}^{L_1-L_2}, s_1 - l/2) \), \( \mathfrak{A}_s^{10} = \mathfrak{A}^-(\mathcal{H}^{L_2-L_1}, s_2 - l/2) \) and \( \mathfrak{A}_s^{11} = \mathfrak{A}^-(\mathcal{H}^{L_1-L_2}, 0) \) where \( \mathfrak{s} = (s_1, s_2) \in \mathbb{H}(\mathcal{L}) \). Let

\[
C_s = \bigoplus_{\epsilon_1, \epsilon_2 \in \{0, 1\}} \mathfrak{A}_{s}^{\epsilon_1 \epsilon_2}.
\]

The surgery complex is defined as

\[
C(\mathcal{H}^\mathcal{L}, \Lambda) = \prod_{s \in \mathbb{H}(\mathcal{L})} C_s.
\]

The differential in the complex is defined as follows. Consider sublinks \( \emptyset, \pm L_1, \pm L_2 \) and \( \pm L_1 \pm L_2 \) where \( \pm \) denotes whether or not the orientation of the sublink is the same as the one induced from \( \mathcal{L} \). Based on [12], we have the following maps, where \( \Phi_\emptyset^\mathfrak{s} \) is the internal differential on any chain complex \( \mathfrak{A}_{s}^{\epsilon_1 \epsilon_2} \).

\[
\begin{align*}
\Phi_{s}^{L_1} : \mathfrak{A}_s^{00} &\to \mathfrak{A}_s^{10}, & \Phi_{s}^{-L_1} : \mathfrak{A}_s^{00} &\to \mathfrak{A}_s^{10}, \\
\Phi_{s}^{L_2} : \mathfrak{A}_s^{00} &\to \mathfrak{A}_s^{01}, & \Phi_{s}^{-L_2} : \mathfrak{A}_s^{00} &\to \mathfrak{A}_s^{01}, \\
\Phi_{s}^{L_1} : \mathfrak{A}_s^{01} &\to \mathfrak{A}_s^{11}, & \Phi_{s}^{-L_1} : \mathfrak{A}_s^{01} &\to \mathfrak{A}_s^{11}, \\
\Phi_{s}^{-L_2} : \mathfrak{A}_s^{10} &\to \mathfrak{A}_s^{11}, & \Phi_{s}^{-L_2} : \mathfrak{A}_s^{10} &\to \mathfrak{A}_s^{11},
\end{align*}
\]

(3.1)

where \( \Lambda_{i} \) is the \( i \)-th column of \( \Lambda \). We did not write the maps \( \Phi_{s}^{\pm L_1 \pm L_2} \) in detail since we will focus on \( L \)-space links and these maps vanish for 2-component \( L \)-space links. Let

\[
D_s = \Phi_\emptyset^{\mathfrak{s}} + \Phi_{s}^{\pm L_1} + \Phi_{s}^{\pm L_2} + \Phi_{s_1}^{L_1} + \Phi_{s_2}^{L_2} + \Phi_{s}^{\pm L_1 \pm L_2},
\]

and let \( D = \prod_{s \in \mathbb{H}(\mathcal{L})} D_s \). Then \( (C(\mathcal{H}^\mathcal{L}, \Lambda), D) \) is the Manolescu-Ozsváth surgery complex.

**Lemma 3.1.** [12, Lemma 10.1] There exists a constant \( b \in \mathbb{N} \) such that for any \( i = 1, 2 \), and for any sublink \( M \subset L \) not containing the component \( L_i \), the chain map

\[
\Phi_{s_1}^{L_i} : \mathfrak{A}^-(\mathcal{H}^{L-M-L_i}, \mathfrak{s}) \to \mathfrak{A}^-(\mathcal{H}^{L-M-L_i}, \mathfrak{s}),
\]

induces an isomorphism on homology provided that either

- \( s \in \mathbb{H}(\mathcal{L}) \) is such that \( s_i > b \), and \( L_i \) is given the orientation induced from \( L \); or
- \( s \in \mathbb{H}(\mathcal{L}) \) is such that \( s_i < -b \), and \( L_i \) is given the orientation opposite to the one induced from \( L \).

**3.2. Perturbed Surgery Formula.** Up to homotopy equivalence, one can replace every complex \( \mathfrak{A}_{\epsilon_1 \epsilon_2} \) \( \epsilon_1, \epsilon_2 = 0 \text{ or } 1 \) by its chain homotopy type and replace every differential map \( \Phi_{s}^{L_i} \) by its homotopy type. Then the Manolescu-Ozsváth surgery complex becomes a **perturbed surgery formula** [11]. More concretely, for a 2-component \( L \)-space link \( \mathcal{L} \), we replace the complexes \( \mathfrak{A}_{\epsilon_1 \epsilon_2} \) by

\[
H_s(\mathfrak{A}_{\epsilon_1 \epsilon_2}^{s}) \cong \mathbb{F}[U].
\]
We replace the edge maps $\Phi_{s}^{L_{i}}$ as follows:

$$
\begin{align*}
\Phi_{s_{1}, s_{2}}^{L_{1}} &= UH(s_{1}, s_{2}) - H(\infty, s_{2}), \\
\Phi_{s_{1}, s_{2}}^{-L_{1}} &= UH(-s_{1}, -s_{2}) - H(\infty, -s_{2}), \\
\Phi_{s_{1}, s_{2}}^{L_{2}} &= UH(s_{1}, s_{2}) - H(-s_{1}, \infty), \\
\Phi_{s_{1}, s_{2}}^{-L_{2}} &= UH(-s_{1}, -s_{2}) - H(-s_{1}, \infty),
\end{align*}
$$

(3.2)

where $H(s_{1}, s_{2}), H_{1}(s_{1})$ and $H_{2}(s_{2})$ are $H$-functions of $\mathcal{L}, L_{1}$ and $L_{2}$, respectively.

\[\text{Figure 2.}\]

We denote the perturbed complex as $\bar{C}(\Lambda)$, and it is chain homotopy equivalent to the original chain complex $C(\mathcal{H}, \Lambda)$ as $\mathbb{F}[[U]]$-modules. Hence, $H_{*}(\bar{C}(\Lambda)) \cong HF^{*}(S^{3}_{\Lambda}(\mathcal{L}))$ as an $\mathbb{F}[[U]]$-module [11] [12].

The surgery complex splits as a direct sum corresponding to Spin$^{c}$-structures. Recall that for the surgery matrix $\Lambda$ associated to $\mathcal{L}$, there is an identification: Spin$^{c}(S^{3}_{\Lambda}(\mathcal{L})) = \pi(\mathcal{L})/H(L, \lambda)$, where $H(L, \lambda)$ is the lattice spanned by $\Lambda$ [12].

Now we review the truncated perturbed surgery complex. We refer the reader to [11] [12] for details. The constant $b$ in Lemma 3.1 determines a parallelogram $Q$ in the plane, with vertices $P_{1}, P_{2}, P_{3}, P_{4}$ counterclockwise labelled, satisfying the following condition: The point $P_{1}$ has the coordinate $(x_{1}, y_{1})$ such that

$$
\begin{align*}
x_{1} &> b, \quad x_{2} < -b, \quad x_{3} < -b, \quad x_{4} > b, \\
y_{1} &> b, \quad y_{2} > b, \quad y_{3} < -b, \quad y_{4} < -b.
\end{align*}
$$

We also require that every edge of $Q$ is either parallel to the vector $\Lambda_{1}$ with length greater than $||\Lambda_{1}||$ or parallel to $\Lambda_{2}$ with length greater than $||\Lambda_{2}||$. The way of doing truncation is not unique. We follow the way Y. Liu did in [11]. One can choose the parallelogram $Q$ to be centered at the origins as follows. Let

$$
\{P_{1}, P_{2}, P_{3}, P_{4}\} = \left\{\frac{i_{0}\Lambda_{1} + j_{0}\Lambda_{2}}{2}, \frac{-i_{0}\Lambda_{1} + j_{0}\Lambda_{2}}{2}, \frac{i_{0}\Lambda_{1} - j_{0}\Lambda_{2}}{2}, \frac{-i_{0}\Lambda_{1} - j_{0}\Lambda_{2}}{2}\right\},
$$

with $i_{0}, j_{0}$ being positive integers, such that (3.3) holds.

Instead of using the constant $b$ to truncate the surgery complex, one can also use different constants $b_{1}, b_{2} \in \mathbb{N}$ to truncate the complex in vertical and in horizontal directions. Then
\( \Phi^{\pm L}_{\psi^{+M}(s)} \) induces an isomorphism on homology whenever \( |s_i| > b'_i \) and \( L_i \) has the orientation corresponding to the sign of \( s_i \) for \( i = 1, 2 \). Let \( b_i \) be the minimal number among the choices of \( b'_i \). For 2-component \( L \)-space links \( \mathcal{L} \), we can use (3.2) to define \( b_i \) in terms of the \( H \)-function.

**Definition 3.2.** For an oriented 2-component \( L \)-space link \( \mathcal{L} \) with linking number \( l \), we define:
\[
\begin{align*}
b_1(\mathcal{L}) &= \min\{\lfloor s_1 - 1 \rfloor \mid H(s_1, s_2) = H(\infty, s_2) \text{ for all } s_2\}, \\
b_2(\mathcal{L}) &= \min\{\lfloor s_2 - 1 \rfloor \mid H(s_1, s_2) = H(s_1, \infty) \text{ for all } s_1\}.
\end{align*}
\]

Fix the surgery matrix \( \Lambda \). Now we review the finitely generated surgery complex after truncation in the \( \text{Spin}^c \)-structure \( u \in \mathbb{H}(\mathcal{L})/H(\mathcal{L}, \Lambda) \). For details, see [11]. Let \( S^{\epsilon_1 \epsilon_2} \) denote the collection of summands \( \mathcal{A}^{\epsilon_1 \epsilon_2} \) of the truncated surgery complex in the \( \text{Spin}^c \)-structure \( u \) where \( \epsilon_1, \epsilon_2 = 0 \) or 1.

Suppose 
\[ s = \theta_1 \Lambda_1 + \theta_2 \Lambda_2 \in u, \quad P_1 = a_1 \Lambda_1 + a_2 \Lambda_2. \]

Denote
\[
\begin{align*}
A_1 &= [-\theta_1 - |a_1|], & A_2 &= [-\theta_1 + |a_1|], \\
B_1 &= [-\theta_2 - |a_2|], & B_2 &= [-\theta_2 + |a_2|].
\end{align*}
\]

Based on the signs of \( d_1, d_2 \) and \( \det \Lambda \), there are six cases for the truncated regions.

**Case 1:** \( d_1 > 0, d_2 > 0, \det(\Lambda) > 0 \).
\[
\begin{align*}
S^{00}(\Lambda, u) &= u \cap Q, & S^{10}(\Lambda, u) &= u \cap Q \cap (Q + \Lambda_1), \\
S^{01}(\Lambda, u) &= u \cap Q \cap (Q + \Lambda_2), & S^{11}(\Lambda, u) &= u \cap Q \cap (Q + \Lambda_1 + \Lambda_2).
\end{align*}
\]

**Case 2:** \( d_1 < 0, d_2 < 0, \det(\Lambda) > 0 \).
\[
\begin{align*}
S^{00}(\Lambda, u) &= u \cap Q, & S^{01}(\Lambda, u) &= u \cap \{Q \cup (Q + \Lambda_1)\}, \\
S^{01}(\Lambda, u) &= u \cap \{Q \cup (Q + \Lambda_2)\}, & S^{11}(\Lambda, u) &= u \cap \{Q \cup (Q + \Lambda_1) \cup (Q + \Lambda_2) \cup (Q + \Lambda_1 + \Lambda_2)\}.
\end{align*}
\]

**Case 3:** \( d_1 > 0, d_2 < 0 \).
\[
\begin{align*}
S^{00}(\Lambda, u) &= u \cap Q, & S^{10}(\Lambda, u) &= u \cap \{Q \cap (Q + \Lambda_1)\}, \\
S^{01}(\Lambda, u) &= u \cap \{Q \cup (Q + \Lambda_2)\}, & S^{11}(\Lambda, u) &= u \cap \{(Q \cup (Q + \Lambda_2) \cap (Q \cap (Q + \Lambda_2)) + \Lambda_1)\}.
\end{align*}
\]

**Case 4:** \( d_1 < 0, d_2 > 0 \).
\[
\begin{align*}
S^{00}(\Lambda, u) &= u \cap Q, & S^{10}(\Lambda, u) &= u \cap \{Q \cup (Q + \Lambda_1)\}, \\
S^{01}(\Lambda, u) &= u \cap \{Q \cap (Q + \Lambda_2)\}, & S^{11}(\Lambda, u) &= u \cap \{(Q \cap (Q + \Lambda_2) \cup (Q \cap (Q + \Lambda_2)) + \Lambda_1)\}.
\end{align*}
\]

**Case 5:** \( l > 0, \det(\Lambda) < 0 \).
\[
\begin{align*}
S^{00}(\Lambda, u) &= u \cap Q, & S^{10}(\Lambda, u) &= (u \cap Q \cap (Q + \Lambda_1)) \cup T^{10}, \\
S^{01}(\Lambda, u) &= (u \cap Q \cap (Q + \Lambda_2)) \cup T^{01}, & S^{11}(\Lambda, u) &= u \cap Q \cap (Q + \Lambda_1 + \Lambda_2),
\end{align*}
\]

where \( T^{10} = \{s + A_2 \Lambda_1 + B_1 \Lambda_2\}, T^{01} = \{s + A_1 \Lambda_1 + B_2 \Lambda_2\} \).

**Case 6:** \( l < 0, \det(\Lambda) < 0 \).
\[
\begin{align*}
S^{00}(\Lambda, u) &= u \cap Q \cap (Q - \Lambda_1 - \Lambda_2), \\
S^{10}(\Lambda, u) &= (u \cap Q \cap (Q - \Lambda_1)) \cup T^{10}, & S^{01}(\Lambda, u) &= (u \cap Q \cap (Q - \Lambda_2)) \cup T^{01}, & S^{11}(\Lambda, u) &= u \cap Q.
\end{align*}
\]
where $T^{10} = s + A_1\Lambda_1 + B_2\Lambda_2, T^{01} = s + B_1\Lambda_2 + A_1\Lambda_1$.

Denote 

$$\tilde{C}^\epsilon_{1\epsilon_2}(\Lambda, u) = \bigoplus_{s \in \mathbb{Z}} \bigoplus_{j \in \mathbb{Z}, s+i\Lambda_1+j\Lambda_2 \in S^1(s)} \mathbb{A}^\epsilon_{s+i\Lambda_1+j\Lambda_2},$$

where $\epsilon_1, \epsilon_2 \in \{0, 1\}$.

The truncated complex is defined as 

$$\tilde{C}(\mathcal{H}, \Lambda, u) = \bigoplus_{\epsilon_1, \epsilon_2 \in \{0, 1\}} \tilde{C}^\epsilon_{1\epsilon_2}(\Lambda, u).$$

The differential is obtained by restricting $D$ to $\tilde{C}(\mathcal{H}, \Lambda, u)$. Up to homotopy equivalence, we simply regard $\mathbb{A}^\delta_{s+i\Lambda_1+j\Lambda_2}$ as its homotopy type $\mathbb{F}[[U]]$ and the differentials as the ones defined in (3.3). It is homotopy equivalent to $(\mathcal{C}(\mathcal{H}^L, \Lambda, u), D)$. Hence the homology of the truncated perturbed complex is isomorphic to $HF^{-}(S^3(\Lambda), u)$ up to some grading shift. Since we are working on truncated surgery complexes from here on, it suffices to consider polynomials over $\mathbb{F}$.

By putting $U = 0$, we get the chain complex of $\mathbb{F}$-vector spaces $\tilde{C}(\Lambda, u)$ whose homology is isomorphic to $\tilde{HF}(S^3(\Lambda), u)$. Note that the differential $\Phi^\pm_{s|L}$ will be replaced by $\tilde{\Phi}_s^\pm_{L}$, which should be either 0 or 1 from $\mathbb{F}$ to $\mathbb{F}$.

3.3. The associated CW-complexes. In this section, we associate a finite rectangular CW-complex to the truncated surgery complex. We refer the reader to [3, Section 3.3] for more details. Each $\mathbb{A}^{00}_{s}$ in the truncated surgery complex corresponds to a 2-cell. Each $\mathbb{A}^{10}_{s}$ and $\mathbb{A}^{01}_{s}$ corresponds to a 1-cell, and each $\mathbb{A}^{11}_{s}$ corresponds to a 0-cell with the boundary map specified by (3.2).

According to the different signs of $d_1, d_2$ and $\det \Lambda$, there are six cases for the truncation process described in Section 3.2. In all these cases, the associated CW-complex is a rectangle $R$ on a square lattice, with some parts of the boundary erased. Consider the chain complex $C$ generated by the squares, edges, and vertices of $R$ over $\mathbb{F}$ with the usual differential $\partial$. Then the homology of $C$ is isomorphic to the homology of $R$ relative to the erased parts of the boundary. More precisely, we will have the following three situations:

(a) For case 1 in Section 3.2, the CW-complex $R$ is a rectangle with all 1-cells and 0-cells on the boundary erased as shown in Figure 3. Then $(R, \partial R) \cong (S^2, pt)$. Therefore $H_2(C, \partial) \cong \mathbb{F}$ is generated by the sum of all 2-cells, and all other homologies vanish.

(b) For case 2 in Section 3.2, the CW-complex $R$ is a rectangle with none of the cells erased in Figure 3. Then $R$ is contractable, so $H_0(C, \partial) \cong \mathbb{F}$ is generated by the class of a 0-cell, and all other homologies vanish.

(c) For other 4 cases in Section 3.2, the CW complex $R$ is a rectangle with some 1-cells and 0-cells erased on the boundary in Figure 3. Then $R$ relative to the erased cells is homotopy equivalent to $(S^1, pt)$. Therefore, $H_1(C, \partial) \cong \mathbb{F}$ is generated by the class of any path connecting erased boundaries, and all other homologies vanish.

Figure 3.
We associate a \((2 - \epsilon_1 - \epsilon_2)\)-dimensional cell in \(C\) to \(\mathbb{A}_s^{\epsilon_1 \epsilon_2}\) for \(\epsilon_1, \epsilon_2 \in \{0, 1\}\). One can construct a chain map from the truncated surgery complex \(\tilde{C}(\mathcal{H}, \Lambda, u)\) to the cell-complex \(C\), see [3] Section 4. Each cell \(\square\) in \((C, \partial)\) corresponds to a copy of \(\mathbb{F}[U] \cong H_*(\mathbb{A}_s^{\epsilon_1 \epsilon_2})\) generated by some element \(z(\square)\) where the cell \(\square\) is associated to \(\mathbb{A}_s^{\epsilon_1 \epsilon_2}\). We denote the homological grading of \(z(\square)\) by \(\deg(\square)\). Recall that \(U\) has homological grading \(-2\). Then the degree of \(z(\square)U^k \in H_*(\mathbb{A}_s^{\epsilon_1 \epsilon_2})\) equals \(\deg(\square) - 2k\), and we call \(z(\square)U^k\) the graded lift of the cell \(\square\) of degree \(\deg(\square) - 2k\).

**Theorem 3.3.** [3] Corollary 4.3] The free part of the homology \(H_*(\tilde{C}(\mathcal{H}, \Lambda, u), D)/\text{Tors}\) is generated by the graded lifts of representatives of homology classes in \(H_*(C, \partial)\). Two classes are equivalent if and only if they have the same degree and lift the same homology class.

Recall that \(\tilde{C}(\mathcal{H}, \Lambda, u) = \bigoplus_{\epsilon_1, \epsilon_2} \tilde{C}^{\epsilon_1 \epsilon_2}(\Lambda, u)\). Up to homotopy equivalence, we can regard \(\tilde{C}^{\epsilon_1 \epsilon_2}(\Lambda, u) = \bigoplus_{i \in \mathbb{Z}} \bigoplus_{j \in \mathbb{Z}+iA_1+jA_2 \in S^{1+2}} H_*(\mathbb{A}_s^{\epsilon_1 \epsilon_2})\).

**Corollary 3.4.**
(a) If \(d_1 > 0, d_2 > 0, \det(\Lambda) > 0\), then the free part of \(HF^-(S_{d_1, d_2}^3(\mathcal{L}), u)\) is generated by a chain in \(\tilde{C}^{00}(\Lambda, u)\).
(b) If \(d_1 < 0, d_2 < 0, \det(\Lambda) > 0\), then the free part of \(HF^-(S_{d_1, d_2}^3(\mathcal{L}), u)\) is generated by a chain in \(\tilde{C}^{11}(\Lambda, u)\).
(c) For the rest of the cases, the free part of \(HF^-(S_{d_1, d_2}^3(\mathcal{L}), u)\) is generated by a chain in \(\tilde{C}^{01}(\Lambda, u) \oplus \tilde{C}^{10}(\Lambda, u)\).

**Proof.** The proof is straightforward by using the surgery theorem \(HF^-(S_{d_1, d_2}^3(\mathcal{L}), u) \cong H_*(\tilde{C}(\mathcal{H}, \Lambda, u))\) [12] and Theorem 3.3. \(\square\)

Recall that \(\hat{H}F(S_{d_1, d_2}^3(\mathcal{L}), u)\) is isomorphic to the homology of the chain complex of \(\mathbb{F}\)-vector spaces \(\tilde{C}(\Lambda, u)\) which is obtained from \(\tilde{C}(\mathcal{H}, \Lambda, u)\) by putting \(U = 0\) [11]. Suppose that \(H_*(\mathbb{A}_s^{\epsilon_1 \epsilon_2}) \cong \mathbb{F}[U]\) is generated by \(z_s^{\epsilon_1 \epsilon_2}\) as a \(\mathbb{F}[U]\)-module. We let \(\hat{\mathbb{A}}_s^{\epsilon_1 \epsilon_2} \cong \mathbb{F}\) denote the vector space generated by \(z_s^{\epsilon_1 \epsilon_2}\). Then \(\tilde{C}(\Lambda, u) = \bigoplus_{\epsilon_1, \epsilon_2} \tilde{C}^{\epsilon_1 \epsilon_2}(\Lambda, u)\) where \(\hat{\mathbb{A}}_s^{\epsilon_1 \epsilon_2}\).

**Corollary 3.5.** For a 2-component \(L\)-space link \(\mathcal{L} = L_1 \cup L_2\) with linking number \(l\), suppose that \(S_{d_1, d_2}^3(\mathcal{L})\) is an \(L\)-space. For any \(\text{Spin}^c\)-structure \(u\), we have:

(a) If \(d_1 > 0, d_2 > 0, \det(\Lambda) > 0\), then \(\hat{H}F(S_{d_1, d_2}^3(\mathcal{L}), u) \cong \mathbb{F}\) is generated by a chain in \(\tilde{C}^{00}(\Lambda, u)\).
(b) If \(d_1 < 0, d_2 < 0, \det(\Lambda) > 0\), then \(\hat{H}F(S_{d_1, d_2}^3(\mathcal{L}), u)\) is generated by a chain in \(\tilde{C}^{11}(\Lambda, u)\).
(c) For the rest of the cases, \(\hat{H}F(S_{d_1, d_2}^3(\mathcal{L}), u)\) is generated by a chain in \(\tilde{C}^{01}(\Lambda, u) \oplus \tilde{C}^{10}(\Lambda, u)\).

**Proof.** If \(S_{d_1, d_2}^3(\mathcal{L})\) is an \(L\)-space, \(HF^-(S_{d_1, d_2}^3(\mathcal{L}), u) \cong \mathbb{F}[U]\). Note that \(\hat{H}F(S_{d_1, d_1}^3(\mathcal{L}), u)\) is obtained from \(HF^-(S_{d_1, d_2}^3(\mathcal{L}), u) \cong \mathbb{F}[U]\) by putting \(U = 0\). By Corollary 3.3 the tower \(\mathbb{F}[U]\) is generated by a chain in \(\tilde{C}^{00}(\Lambda, u)\), in \(\tilde{C}^{11}(\Lambda, u)\) or in \(\tilde{C}^{01}(\Lambda, u) \oplus \tilde{C}^{10}(\Lambda, u)\). Without loss of generality, we assume the chain is in \(\tilde{C}^{00}(\Lambda, u)\), and it is written as:

\[z_{s_1}^{00} + z_{s_2}^{00} + \cdots + U z_{u}^{00}\]
where \( z_u^{00} \) is a chain in \( \tilde{C}^{00}(\Lambda, u) \). By putting \( U = 0 \), the generator becomes \( z_{s_1}^{00} + z_{s_2}^{00} + \cdots \) which is a chain in \( \tilde{C}^{00}(\Lambda, u) \), and it generates \( \tilde{HF}(S^3_{d_1,d_2}(\mathcal{L}), u) \).

4. L–SPACE SURGERIES ON 2-COMPONENT L–SPACE LINKS

In this section, we start with type (A) 2-component L–space links, and the proof of Theorem 1.1.

4.1. Type (A) 2-component L–space links. Recall that a 2-component L–space link \( \mathcal{L} = L_1 \cup L_2 \) is type (A) if there exists a lattice point \( s = (s_1, s_2) \in \mathbb{H}(\mathcal{L}) \) such that \( H_L(s) > H_L(s_1, s_2 + 1), H_L(s) > H_L(s_1 + 1, s_2) \) and one of \( H_L(\infty, s_2), H_L(s_1, \infty) \) equals 0. Otherwise, it is called a type (B) link. This lattice point is a very good point in the convention of [5], and they proved Theorem 1.1 for very good points. We give another method to prove it here.

**Proof of Theorem 1.1** By Theorem 2.9 \( L_1 \) and \( L_2 \) are both L–space knots. Then \( H_{L_i}(s_i) = 0 \) if and only if \( s_i \geq g_i \) for \( i = 1, 2 \) where \( g_i \) is the genus of \( K_i \) by Lemma 2.11. Without loss of generality, we assume \( H_L(s_1, \infty) = 0 \). By Lemma 2.5 \( H_L(s_1, \infty) = H_{L_1}(s_1 - l/2) = 0 \). Then \( s_1 - l/2 \geq g_1 \) by Lemma 2.11 which indicates that \( s_1 \geq l/2 + g_1 \).

Recall that \( \Phi^{L_1}_s = U^{H(s_1,s_2)-H(\infty,s_2)} \). By Lemma 2.4 \( H(s_1, s_2) > H(s_1 + 1, s_2) \geq H(\infty, s_2) \). So

\[
H(s_1, s_2) - H(\infty, s_2) > 0.
\]

Let \( U = 0 \). We have \( \widehat{\Phi}^{L_1}_s = 0 \). Similarly, we can prove \( \widehat{\Phi}^{L_2}_s = 0 \). The map \( \Phi^{L_1}_s \) equals \( U^{H(-s_1,-s_2)-H(\infty,-s_2)} \). By Lemma 2.13

\[
H(-s_1, -s_2) - H(\infty, -s_2) = H(s_1, s_2) - H(\infty, s_2 + l) + s_1 - l/2.
\]

In this paper, we orient the link \( \mathcal{L} \) so that the linking number \( l \) is nonnegative. Then \( H(s_1, s_2) > H(\infty, s_2 + l) \) by Lemma 2.4 Combining with \( s_1 \geq l/2 + g_1 \), we have

\[
H(-s_1, -s_2) - H(\infty, -s_2) > 0.
\]

Hence, \( \widehat{\Phi}^{L_1}_s = 0 \). For the map \( \Phi^{L_2}_s = U^{H(-s_1,-s_2)-H(-s_1,\infty)} \), we have

\[
H(-s_1, -s_2) - H(-s_1, \infty) = H(s_1, s_2) - H(s_1 + l, \infty) + s_2 - l/2.
\]

Similarly, we have \( H(s_1 + l, \infty) \leq H(s_1, \infty) = 0 \) and

\[
H(s_1, s_2) + s_2 - l/2 \geq H(\infty, s_2) + 1 + s_2 - l/2 = H_2(s_2 - l/2) + 1 + s_2 - l/2 = H_2(l/2 - s_2) + 1 > 0.
\]

Hence, \( \widehat{\Phi}^{L_2}_s = 0 \). Then \( \mathfrak{A}_s^{00} \) is the generator of \( \tilde{HF}(S^3_{d_1,d_2}(\mathcal{L}), u) \). By Corollary 3.5 this is possible only when \( d_1 > 0, d_2 > 0 \) and \( \det \Lambda > 0 \).

**Lemma 4.1.** For a 2-component L–space link \( \mathcal{L} = L_1 \cup L_2 \) with linking number \( l \), \( b_i(\mathcal{L}) \geq g_i - 1 + l/2 \) where \( g_i \) is the genus of \( L_i \) and \( i = 1, 2 \).

**Proof.** By definition 3.2, \( b_1 = \min\{[s_1 - 1] \mid H(s_1, s_2) = H(\infty, s_2) \text{ for all } s_2\} \). Then \( H(s_1, \infty) = H(\infty, \infty) = 0 \) for all \( s_1 > b_1 \). By Lemma 2.5 \( H(s_1, \infty) = H_{L_1}(s_1 - l/2) = 0 \) for all \( s_1 > b_1 \). Then Lemma 2.11 implies that \( s_1 - l/2 \geq g_1 \). If the linking number \( l \) is even, then \( s_1 \in \mathbb{Z} \). By replacing \( s_1 \) by \( b_1 + 1 \), we have

\[
b_1 \geq g_1 - 1 + l/2.
\]

If \( l \) is odd, we let \( s_1 = b_1 + 1/2 \). Then

\[
b_1 \geq g_1 - 1/2 + l/2.
\]

In both cases, we have \( b_1 \geq g_1 - 1 + l/2 \). The argument for \( b_2 \) is similar.
Corollary 4.2. Let $L = L_1 \cup L_2$ be an $L$–space link. Suppose $b_i \geq g_i + l/2$ for $i = 1$ or 2. If $S^3_{d_1,d_2}(L)$ is an $L$–space, then $d_1 > 0, d_2 > 0$ and $\det \Lambda > 0$.

Proof. Without loss of generality, we assume that $b_1 \geq g_1 + l/2$. Suppose that the linking number $l$ is even. Then $(b_1, \infty) \in \mathbb{H}(L)$, and $H(b_1, \infty) = H_1(b_1 - l/2) = 0$. By the definition of $b_1$ (see Definition 3.2), there exists $y$ such that

$$H(b_1, s_2) = H(b_1 + 1, s_2), \quad \text{and} \quad H(b_1, y) \neq H(b_1 + 1, y),$$

for all $s_2 > y$. Assume that $H(b_1, y + 1) = H(b_1 + 1, y + 1) = a$ for some $a \geq 0$. Then $H(b_1 + 1, y) = a$ or $a + 1$. If it equals $a + 1$, then $H(b_1, y) = a + 2$ which contradicts to Lemma 2.3. Hence,

$$H(b_1, y) = a + 1, \quad H(b_1, y + 1) = H(b_1 + 1, y) = H(b_1 + 1, y + 1) = a.$$

Then the link $L$ is type (A). By Theorem 1.1 if $S^3_{d_1,d_2}(L)$ is an $L$–space, $d_1 > 0, d_2 > 0$ and $\det \Lambda > 0$.

If $l$ is odd, then $(b_1 - 1/2, \infty) \in \mathbb{H}(L)$ and $b_1 \geq g_1 + l/2 + 1/2$. So $H(b_1 - 1/2, \infty) = H_1(b_1 - 1/2 - l/2) = 0$. The rest of the argument is the same as the one in the case that $l$ is even. □

Proposition 4.3. A 2-component $L$–space link $L$ is type (A) if and only if $b_i \geq g_i + l/2$ for $i = 1$ or 2.

Proof. The “if ” part can be seen from the proof of Corollary 4.2. For the “only if ” part, we assume that the link is type (A). Then there exists a lattice point $(s_1, s_2) \in \mathbb{H}(L)$ such that $H(s_1, \infty) = 0, H(s_1, s_2) > H(s_1 + 1, s_2)$ and $H(s_1, s_2) > H(s_1, s_2 + 1)$. So $s_1 \leq b_1$.

Note that $H(s_1, \infty) = H_1(s_1 - l/2) = 0$. By Lemma 2.11, we have $s_1 - l/2 \geq g_1$. This implies $b_1 \geq g_1 + l/2$. □

Definition 4.4. For a 2-component $L$–space link $L = L_1 \cup L_2$, a lattice point $(s_1, s_2) \in \mathbb{H}(L)$ is called a maximal lattice point if $H(s_1, s_2) = 1, H(s_1 + 1, s_2) = H(s_1, s_2 + 1) = 0$.

We refer the readers to [10] for more details about maximal lattice points. If there exists a maximal lattice point $(s_1, s_2)$ for $L$, then $b_i \geq s_i$ for $i = 1, 2$. Note that $H(s_1, \infty) \leq H(s_1, s_2 + 1) = 0$. Then $H(s_1, \infty) = H_1(s_1 - l/2) = 0$, which indicates that $s_1 \geq g_1 + l/2$.

By Proposition 4.3, $L$ is type (A).

Lemma 4.5. Assume that $L = L_1 \cup L_2$ is a type (A) $L$–space link. If $S^3_{d_1,d_2}(L)$ is an $L$–space, then either $S^3_{d_1}(L_1)$ or $S^3_{d_2}(L_2)$ is an $L$–space.

Proof. By Theorem 1.1 if $S^3_{d_1,d_2}(L)$ is an $L$–space, then $d_1 > 0, d_2 > 0$ and $\det \Lambda > 0$. If $L_1$ or $L_2$ is an unknot, the statement is clear. Now we assume that both $L_1$ and $L_2$ are not unknots with genera $g_1, g_2 \geq 1$. Suppose that $S^3_{d_1}(L_1)$ and $S^3_{d_2}(L_2)$ are not $L$–spaces. Then $d_1 \leq 2g_1 - 2$ and $d_2 \leq 2g_2 - 2$. Pick the lattice point $s = (g_1 - 1 + l/2, g_2 - 1 + l/2) \in \mathbb{H}(L)$.

Note that

$$\Phi_{s_1}^{L_1} = U^{H_1(g_1 - 1 + l/2, \infty)} = U^{H_1(g_1 - 1)}, \quad \Phi_{s_2}^{L_2} = U^{H_2(g_2 - 1)},$$

$$\Phi_{s_1-d_1}^{L_1} = U^{H_1(d_1 - g_1 + 1)}, \quad \Phi_{s_2-d_2}^{L_2} = U^{H_2(d_2 - g_2 + 1)}.$$ 

Since $d_i \leq 2g_i - 2$ for $i = 1, 2, d_i - g_i + 1 \leq g_i - 1$. Hence,

$$H_i(g_i - 1) > 0, \quad H_i(d_i - g_i + 1) > 0,$$

for $i = 1, 2$. Therefore, $\hat{\Phi}_{s_1}^{L_1} = \hat{\Phi}_{s_1-d_1}^{L_1} = 0$ for $i = 1, 2$. This indicates that $\hat{\Phi}_{s_1,s_2}^{L_1}$ is the generator of $HF^{-}(S^3_{d_1,d_2}(L), s)$ which is a chain in $\hat{C}^{11}(\Lambda, s)$ (see Figure 2). However, we
have $d_1 > 0, d_2 > 0$ and $\det \Lambda > 0$. By Corollary 3.5, $\widehat{HF}(S^3_{d_1,d_2}(\mathcal{L}), s)$ is generated by a chain in $\widehat{C}^0(\Lambda, s)$. So we get a contradiction, and either $S^3_{d_1}(L_1)$ or $S^3_{d_2}(L_2)$ is an L–space.

4.2. Type (B) 2-component L–space links. In this section, $\mathcal{L} = L_1 \cup L_2$ denotes a type (B) L–space link. We start with large surgeries (i.e. $d_i \gg 0$ or $d_i \ll 0$) on $\mathcal{L}$.

Lemma 4.6. Let $\mathcal{L} = L_1 \cup L_2$ be a type (B) L–space link. If $S^3_{d_1,d_2}(\mathcal{L})$ is an L–space with $d_1 < -2b_1 - l, d_2 < -2b_2 - l$, then both $L_1$ and $L_2$ are unknots.

Proof. Pick the lattice point $s = (-l/2, l/2 + 1) \in \mathbb{H}(\mathcal{L})$. Since $d_1 < -2b_1 - l, d_2 < -2b_2 - l$, we can choose the parallelogram $Q$ in the plane such that the point $s$ is in $Q$, and other lattice points in the same Spin$^c$ structure are outside of $Q$. Then after truncation, in this particular Spin$^c$ structure, we have the parallelogram in Figure 4 for the truncated surgery complex.

Note that $$\Phi_s^{-L_2} = UH(-s) - H(-s_1, \infty) = UH(s) - H(s_1 + l, \infty) + s_2 - l/2.$$ Here $H(s_1, s_2) \geq H(s_1 + l, s_2) \geq H(s_1 + l, \infty)$ by Lemma 2.4 and $s_2 - l/2 = 1$. Then $\Phi_s^{-L_2} = 0$. We also have $$\Phi_{s_1 + l}^{L_1} = UH_{s_1 + l/2} = UH(0), \quad \Phi_{s_1 + l}^{-L_1} = UH(0).$$ If $L_1$ is not an unknot, then $H_1(0) \neq 0$. Let $U = 0$, we have $\Phi_{s_1 + l}^{L_1} = 0$. Hence $\mathfrak{A}^{01}_{s + \Lambda_2}$ generates $\widehat{HF}(S^3_{d_1,d_2} (\mathcal{L}), s)$ which is a chain in $\widehat{C}^{01}(\Lambda, s)$. However, note that $d_1 < 0, d_2 < 0, \det \Lambda > 0$. By Corollary 3.5, $\widehat{HF}(S^3_{d_1,d_2}(\mathcal{L}), s)$ is generated by a chain in $\widehat{C}^{11}(\Lambda, s)$, which is a contradiction. Hence $L_1$ is an unknot. Similarly, we can prove that $L_2$ is also an unknot.

Proposition 4.7. Let $\mathcal{L} = L_1 \cup L_2$ be a type (B) L–space link. If $S^3_{d_1,d_2}(\mathcal{L})$ is an L–space with $d_1 > 2b_1 + l, d_2 < -2b_2 - l$, then $L_2$ is an unknot.

Proof. Suppose that $S^3_{d_1,d_2}(\mathcal{L})$ is an L–space for $d_1 > 2b_1 + l$ and $d_2 < -2b_2 - l$ and $L_2$ is not an unknot. Consider the lattice point $(s_1, s_2) = (g_1 + l/2, l/2)$. Since $L_2$ is not an unknot, $H_2(0) \geq 1$. Then $H(g_1 + l/2, l/2) \geq H(\infty, l/2) = H_2(0) \geq 1$. Since $d_1 > 2b_1 + l$ and $d_2 < -2b_2 - l$, we can truncate the surgery complex to be Figure 5 in the spin$^c$-structure.
represented by \((g_1 + l/2, l/2)\). Then \(\hat{\Phi}_{g_1 + l/2, l/2} = 0\) since the pair of vertical sides in the truncated surgery complex are erased. Observe that

\[ \hat{\Phi}_{g_1 + l/2, l/2} = U H(g_1 + l/2, l/2) - H(g_1 + l/2, \infty) \]

By Corollary 2.13, \(H(g_1, l/2) - H(g_1 + 3l/2, \infty) = 0\) since \(\hat{\Phi} = 0\). Hence, \(\hat{\Phi}_{g_1 + l/2, l/2} = 0\), and \(\hat{\Phi}_{u} = H(s_1, s_2) - H(-s_1, -s_2)\) generates \(\hat{HF}(S^3_{d_1, d_2}(L), (g_1 + l/2, l/2))\) as in Figure 5. By Corollary 3.5, this is possible only when \(d_1 > 0, d_2 > 0\) and \(\det \Lambda > 0\). So we get a contradiction, and \(L_2\) is an unknot.

\[\blacksquare\]

**Remark 4.8.** The similar result holds for the component \(L_1\).

![Figure 5. Truncated surgery complex](image)

**Corollary 4.9.** Let \(L = L_1 \cup L_2\) be an \(L\)-space link. If \(S^3_{d_1, d_2}(L)\) is an \(L\)-space with \(d_1 > 2b_1 + l, d_2 < 0\), then \(L_2\) is an unknot.

**Proof.** By Lemma 4.1, \(b_1 \geq g_1 - 1 + l/2\). Then \(d_1 > 2b_1 \geq 2g_1 - 2\). So \(d_1 \geq 2g_1 - 1\). Hence \(S^3_{d_1}(L_1)\) is an \(L\)-space. By the surgery induction (Lemma 2.10), \(S^3_{d_1, d_2 - k}(L)\) is an \(L\)-space for any \(k > 0\). Note that \(d_2 - k < -2b_2 - l\) for sufficiently large \(k\). So \(S^3_{d_1, d_2 - k}(L)\) is an \(L\)-space for \(d_2' = -2b_2 - l\) and \(d_1 > 2b_1 + l\). By Proposition 4.7, \(L_2\) is an unknot.

\[\blacksquare\]

![Figure 6. L-space surgeries](image)
Corollary 4.10. Suppose \( L = L_1 \cup L_2 \) is an L–space link such that both components are not unknots. Then the possible L–space surgeries are indicated by the white regions in Figure 6.

Proof. It is straight-forward from Lemma 4.6 and Corollary 4.9.

Example 4.11. The torus link \( L = T(4,6) \) is 2-component L–space link with linking number 6. Both of the knot components are right-handed trefoils. Its L–space surgery set is contained in the white region indicated in Figure 6, and is unbounded from below. We refer the readers to [5, Figure 1] for the details.

Now, we characterize the torus link \( T(2,2l) \). The torus link \( T(2,2l) \) is a 2-component L–space link with unknotted components and linking number \( l \geq 1 \). The Hopf link admits negative L–space surgeries (i.e \( d_1 \ll 0, d_2 \ll 0 \)) which are connect sums of lens spaces, but the torus links \( T(2,2l) \) with \( l > 1 \) do not admit such L–space surgeries (Proposition 4.12).

Moreover, we prove that large negative surgeries (i.e \( d_i \ll 0 \)) characterize the Hopf link (Corollary 4.13), and the existence of L–space surgeries \( S^3_{d_1,d_2}(L) \) with \( d_1d_2 < 0 \) characterizes the torus link \( T(2,2l) \) with \( l > 1 \) (Theorem 4.14).

![Figure 7. Truncated surgery complex](image)

Proposition 4.12. Let \( L \) be a nontrivial 2-component L–space link with unknotted components and \( l > 1 \). Then \( S^3_{d_1,d_2}(L) \) is not an L–space for \( d_1 < 0, d_2 < 0 \) and \( \det \Lambda > 0 \).

Proof. We first assume that the linking number is even. Then pick the lattice point \((0,0)\in \mathbb{H}(L)\). If \( S^3_{d_1,d_2}(L) \) is an L–space for \( d_1 < 0, d_2 < 0, \det \Lambda > 0 \), by the surgery induction (Lemma 2.10), \( S^3_{d_1-k,d_2-k}(L) \) is also an L–space for any integer \( k > 0 \). By choosing \( k \) sufficiently large, we can truncate the surgery complex in the Spin\( c \) structure of \((0,0)\) as in Figure 7.

Observe that \( \Phi_{0,0}^{L_1} = U^{H(0,0) - H(0,\infty)} \) and \( H(0, \infty) = H_1(-l/2) = l/2 \). We claim that \( H(0,0) = H(0,\infty) = H(\infty,0) = l/2 \). If \( H(0,0) > l/2 \), then \( H(0,0) - H(0,\infty) > 0 \) and \( H(0,0) - H(\infty,0) > 0 \). Hence, \( \Phi_{0,0}^{L_1} = 0 \). This indicates that \( \Phi_{0,0}^{L_1} \) generates \( \overline{HF}(S^3_{d_1-k,d_2-k}(L),0) \). By Corollary 3.5 this is possible only when \( d_1 > 0, d_2 > 0 \) and \( \det \Lambda > 0 \). Hence, \( H(0,0) = l/2 \), and \( \Phi_{0,0}^{L_1} = 1 \). Note that

\[
\Phi_{0}^{\pm L_1} = U^{H(\mp l/2)}, \Phi_{l}^{\pm L_1} = U^{H(\pm l/2)}
\]

for \( i = 1,2 \).
Recall that \( H_i(l/2) = 0 \) and \( H_i(-l/2) > 0 \). Then \( \hat{\Phi}^L_0 = 0, \hat{\Phi}^{-L}_0 = 1, \hat{\Phi}^L_l = 1 \) and \( \hat{\Phi}^{-L}_l = 0 \). Hence, we see that \( \hat{\mathcal{A}}^{11}_{0,0} \) and \( \hat{\mathcal{A}}^{11}_{d_1+l-k,d_2+l-k} \) generate \( \hat{HF}(S^3_{d_1-k,d_2-k}(\mathcal{L}), 0) \) in Figure 7 which contradicts to the assumption that \( S^3_{d_1-k,d_2-k}(\mathcal{L}) \) is an L–space.

Now we suppose that the linking number \( l \) is odd, i.e. \( l \geq 3 \). The argument is very similar. Pick the lattice point \((1/2, 1/2) \in \mathbb{H}(\mathcal{L})\). Similarly, we have

\[
\begin{align*}
\hat{\Phi}^L_{1/2} = \hat{U}H_1(1/2-l/2), & \quad \hat{\Phi}^{-L}_1 = \hat{U}H_1(1/2-l/2), \\
\hat{\Phi}^L_{1/2+l} = \hat{U}H_1(1/2+l/2), & \quad \hat{\Phi}^{-L}_1 = \hat{U}H_1(-1/2-l/2).
\end{align*}
\]

Hence \( \hat{\Phi}^L_{1/2} = \hat{\Phi}^{-L}_{1/2+l} = 0 \). Therefore, \( \hat{\mathcal{A}}^{11}_{1/2,1/2} \) and \( \hat{\mathcal{A}}^{11}_{1/2+l,1-k,1/2+d_2+l-k} \) generate the homology \( \hat{HF}(S^3_{d_1-k,d_2-k}(\mathcal{L}), (1/2, 1/2)) \) which is a contradiction. Hence \( S^3_{d_1,d_2}(\mathcal{L}) \) is not an L–space for \( d_1 < 0, d_2 < 0, \det \Lambda > 0 \).

\[
\begin{array}{c|c|c|c|c|c|c|c|c}
\cdots & 3 & 2 & 1 & 0 & 0 & \cdots \\
3 & 2 & 1 & 0 & & & \\
\vdots & \vdots & \vdots & : & H(s_1, s_2) = 0 \\
\cdots & 3 & 2 & 1 & 0 & 0 & \cdots \\
\cdots & 3 & 2 & 1 & 1 & 1 & \cdots \\
\vdots & \vdots & \vdots & : & \\
\end{array}
\]

\textbf{Figure 8.} The H-function \( H(\mathcal{L}) \)

\textbf{Corollary 4.13.} Suppose that \( \mathcal{L} = L_1 \cup L_2 \) is a nontrivial 2-component L–space link. If \( S^3_{d_1,d_2}(\mathcal{L}) \) is an L–space with \( d_1 < -2b_1 - l, d_2 < -2b_2 - l \), then \( \mathcal{L} \) is the Hopf link.

\textbf{Proof.} By Lemma 4.6 both \( L_1 \) and \( L_2 \) are unknots. There is an L–space surgery with \( d_1 < 0, d_2 < 0 \) and \( \det \Lambda > 0 \). By Proposition 4.12 the linking number \( l \) is 0 or 1. If the linking number is 0, \( S^3_{d_1,d_2}(\mathcal{L}) \) is an L–space if and only if \( d_1 > 2b_1 \) and \( d_2 > 2b_2 \) [3 Theorem 5.1]. Then the linking number must be 1. Note that \( H(s_1, \infty) = H_1(s_1 - 1/2) = 0 \) and \( H(\infty, s_2) = H_2(s_2 - 1/2) = 0 \) for all \( s_1 > 0, s_2 > 0 \). The link \( \mathcal{L} \) has no maximal lattice point since it is type (B). Then \( H(s_1, s_2) = 0 \) for all \( (s_1, s_2) \in \mathbb{H}(\mathcal{L}) \) and \( (s_1, s_2) \geq 0 \).

By Lemma 2.12 \( H(-s_1, -s_2) = H(s_1, s_2) + s_1 + s_2 \) for all \( (s_1, s_2) \in \mathbb{H}(\mathcal{L}) \) and \( (s_1, s_2) \geq 0 \). It is not hard to see the H-function of \( \mathcal{L} \) is as shown in Figure 8 by Lemma 2.4. The Alexander polynomial for the Hopf link is 1. By (2.2) and (2.4), one can compute the H-function of the Hopf link is the same as the one in Figure 8. This indicates that they have the same Thurston polytope [9], and the Thurston polytope lies on a line of slope 1 passing through the origin. Then there exists an annulus representing the homology class \((-1, 1) \in H_2(S^3, \mathcal{L}; \mathbb{Z})\) whose boundary components are longitudes for the corresponding link components. Hence \( \mathcal{L} \) is the Hopf link.

\[
\square
\]
Theorem 4.14. Let $L = L_1 \cup L_2$ be an $L$-space link with unknotted components and linking number $l$. If $S^3_{d_1,d_2}(L)$ is an $L$-space for $d_1d_2 < 0$, then $L$ is the torus link $T(2,2l)$.

Proof. Without loss of generality, assume that $S^3_{d_1,d_2}(L)$ is an $L$-space for $d_1 > 0$ and $d_2 < 0$. Then $L$ is type (B) and there are no maximal lattice points. Note that both $L_1$ and $L_2$ are unknots, so $S^3_{d_1}(L)$ is also an $L$-space. By the surgery induction (Lemma 2.10), $S^3_{d_1,d_2}(L)$ is also an $L$-space for $d_1' > 0$ and $d_2' < 0$.

We first suppose that the linking number $l > 0$ is even. In the Spin$^c$ structure $(0,0)$, we can truncate the surgery complex to be a square with a pair of sides erased as in Figure 5. Then $\hat{\Phi}_{L,0}^{\pm L_2} = 0$. Note that

$$\Phi_{0,0}^{\pm L_2} = U^{H(0,0) - H(0,\infty)}.$$ 

Since $L_1$ is unknot, then $H(0, \infty) = H_1(-l/2) = l/2$. We claim that $H(0,0) = l/2$. Otherwise, $H(0,0) - H(0,\infty) > 0$ and $\Phi_{0,0}^{L_2} = 0$. So $\mathcal{M}_{0,0}$ generates $\widehat{HF}(S^3_{d_1,d_2}(L), (0,0))$.

By Corollary 3.5, this is only possible when $d_1' > 0$, $d_2' > 0$, which is a contradiction. Hence $H(\infty,0) = H(0,0) - H(0,\infty) = l/2$.

We claim the $H$-function of $L$ is the same as the $H$-function of the torus link $T(2,2l)$. By Lemma 2.4, $H(0,s_2) = H(s_1,0) = l/2$ for all $s_1, s_2 \geq 0$. Note that $H(-(s_1,\infty)) = H_1(-s_1 - l/2) = s_1 + l/2$ for all $s_1 > 0$. Then $H(s_1,s_2) = H(s_1,\infty)$ for all $s_1 \leq 0$, $s_2 \geq 0$ by Lemma 2.4. By a similar argument, we can prove that $H(s_1,s_2) = H(\infty,s_2)$ for all $s_1 \geq 0$, $s_2 \leq 0$.

Now we analyze the $H$-function in the first quadrant (i.e $s_1 > 0$, $s_2 > 0$). Observe that $H(s_1,\infty) = 0$ for all $s_1 \geq l/2$ and $H(s_1,\infty) = l/2 - s_1$ for $0 \leq s_1 < l/2$ since $H(s_1,\infty) = H_1(s_1 - l/2)$ and $L_1$ is an unknot. The similar result holds for $H(\infty,s_2)$. Since $L$ is type (B), $H(s_1,s_2) = 0$ for all $s_1 \geq l/2$, $s_2 \geq l/2$. By Lemma 2.4 we have

$$H(s_1,s_2) = H(s_1,\infty)$$

for $0 \leq s_1 \leq l/2$, $s_2 \geq l/2$,

$$H(s_1,s_2) = H(\infty,s_2)$$

for $0 \leq s_2 \leq l/2$, $s_1 \geq l/2$.

Now we just need to discuss the values of the $H$-function in the square region $\{(s_1,s_2) | 0 \leq s_1 \leq l/2, 0 \leq s_2 \leq l/2\}$.

The values of the $H$-function at the boundary are already known. We claim that the diagonal value $H(k,k) = l/2 - k$. For the Spin$^c$ structure $(k,k)$, we can truncate the surgery complex in this Spin$^c$ structure to be the square as shown in Figure 5. Then

$$\Phi_{k,k}^{L_2} = U^{H(k,k) - H(k,\infty)}, \quad \Phi_{k,k}^{-L_2} = U^{H(-k,-k) - H(-k,\infty)} = U^{H(k,k) - H(k,l+\infty) + k - l/2}.$$ 

If $S^3_{d_1,d_2}(L)$ is an $L$-space, $\Phi_{k,k}^{L_2} = 1$ or $\Phi_{k,k}^{-L_2} = 1$ by a similar argument. This indicates that

$$H(k,k) = H(k,\infty) = H_1(k - l/2) = l/2 - k$$

or

$$H(k,k) = H(k + l,\infty) - k + l/2 = H_1(k + l/2) - k + l/2 = l/2 - k.$$ 

Thus in both cases $H(k,k) = l/2 - k$. Note that $H(k,l/2) = H(l/2,k) = l/2 - k$. Hence,

$$H(s_1,k) = H(k,s_2) = l/2 - k$$

for all $k \leq s_1 \leq l/2$, $k \leq s_2 \leq l/2$.

By Corollary 2.13, the values of $H$-function in the third quadrant are determined by its values in the first quadrant. Therefore, the $H$-function of $L$ is the same as the one of the torus link $T(2,2l)$. This means that they have the same Thurston polytope [9], and the Thurston polytope lies on a line of slope 1 passing the origin. Then there exists an annulus representing the homology class $(-1,1)$ whose boundary components are longitudes for the corresponding link components. Hence $L$ is the torus link $T(2,2l)$. 
4.3. L–space surgeries on L–space links with vanishing linking numbers. In this section, we discuss 2-component L–space links \( \mathcal{L} = L_1 \cup L_2 \) with vanishing linking number. With this additional assumption, some results in Section 4.1 and Section 4.2 can be strengthened.

Lemma 4.13 is strengthened as follows:

**Proposition 4.15.** [3 Proposition 5.6] Suppose that \( \mathcal{L} \) is an L–space link with linking number zero. If \( S^3_{d_1,d_2} (\mathcal{L}) \) is an L–space, then either \( S^3_{d_1} (L_1) \) or \( S^3_{d_2} (L_2) \) is an L–space.

We strengthen Corollary 4.9 proving that \( \mathcal{L} \) is the disjoint union of \( L_1 \) and an unknot:

**Proposition 4.16.** Suppose the link \( \mathcal{L} = L_1 \cup L_2 \) is an L–space link with vanishing linking number. If \( S^3_{d_1,d_2} (\mathcal{L}) \) is an L–space for \( d_1 > 2b_1 \) and \( d_2 < 0 \), then \( \mathcal{L} = L_1 \sqcup U \) where \( U \) is an unknot.

**Proof.** By Corollary 4.9, \( L_2 \) is an unknot. Next, we prove that \( H(s_1, s_2) = H_1(s_1) + H_2(s_2) \) where \( H_1, H_2 \) are the L–functions of \( L_1, L_2 \) respectively. By a similar argument to the one in Corollary 4.9, we assume that \( S^3_{d_1,d_2} (\mathcal{L}) \) is an L–space with \( d_1 > 2b_1, d_2 < -2b_2 \). Then in each Spin\(^c\) structure \((s_1, s_2)\), we can truncate the surgery complex to be the square with a pair of sides erased as shown in Figure 5. So \( \Phi_{s_1,s_2} = 0 \).

Suppose that \( s_2 > 0 \). Then

\[
H(-s_1, -s_2) - H(-s_1, \infty) = H(s_1, s_2) - H_1(s_1) + s_2 > 0.
\]

Hence \( \Phi_{s_1,s_2} = 0 \). We claim that \( \Phi_{s_1,s_2} = 1 \). Otherwise, \( \Phi_{s_1,s_2}^{00} \) generates \( \tilde{H}F(S^3_{d_1,d_2} (\mathcal{L}), s) \) which is a contradiction by a similar argument to the one in Proposition 4.7. Recall that \( \Phi_{s_1,s_2} = U^{H(s_1,s_2) - H(s_1,\infty)} \). So \( \Phi_{s_1,s_2} = 1 \) indicates that:

\[
H(s_1, s_2) = H(s_1, \infty) = H_1(s_1),
\]

for all \( s_2 > 0 \).

Suppose that \( s_2 = 0 \). Then

\[
H(s_1, s_2) - H_1(s_1) = H(-s_1, s_2) - H_1(-s_1).
\]

This indicates that \( \Phi_{s_1,0} = \Phi_{s_1,0} \). By a similar argument, we prove that they equal 1. Hence, \( H(s_1, 0) = H(s_1, \infty) = H_1(s_1) \).

Now we consider the case that \( s_2 < 0 \). By Lemma 2.4 \( H(-s_1, s_2) - H(-s_1, \infty) \geq 0 \). Then

\[
H(-s_1, -s_2) - H_1(-s_1) = H(s_1, s_2) - H_1(s_1) + s_2 \geq 0.
\]

So \( H(s_1, s_2) - H_1(s_1) \neq 0 \) and \( \Phi_{s_1,s_2} = 0 \). By a similar argument, one has \( \Phi_{s_1,s_2} = 1 \). This indicates that

\[
H(-s_1, -s_2) - H(-s_1, \infty) = 1.
\]

Hence \( H(s_1, s_2) - H_1(s_1) = -s_2 \). Recall that \( L_1 \) is an unknot. So \( H_2(s_2) = (|s_2| - s_2)/2 \), and \( H(s_1, s_2) = H_1(s_1) + H_2(s_2) \).

By [2.4], the Alexander polynomial \( \Delta_{\mathcal{L}}(t_1,t_2) \) vanishes. Then the Thurston polytope of \( \mathcal{L} \) is the same as that of \( L_1 \sqcup U \), which is an interval on the \( s_1 \)-axis connecting \( (-g(L_1), 0) \) and \( (g(L_1), 0) \). The Thurston norm in \((0,1)\) direction is 0, and in \((1,0)\) direction is \( g(L_1) \). It is not hard to use the definition of Thurston norm and the computation of Euler characteristics of surfaces to prove: \( L_1 \) and \( L_2 \) bound pairwise disjoint surfaces with genera \( g(L_1) \) and 0 in \( S^3 \), respectively. Hence, \( \mathcal{L} \) is the disjoint union of \( L_1 \) and \( U \).
Next, we discuss positive L-space surgeries on 2-component L-space links with linking number zero.

**Lemma 4.17.** Assume that \( \mathcal{L} = L_1 \cup L_2 \) is a nontrivial L-space link with vanishing linking number. If \( S^3_{d_1,d_2}(\mathcal{L}) \) is an L-space for \( d_1 > 0, d_2 > 2b_2 \), then \( d_1 > b_1 \).

**Proof.** By definition 3.2, \( b_1 = \min\{s_1 - 1 \mid H(s_1, s_2) = H(\infty, s_2) \) for all \( s_2 \}. Since the linking number is 0, \( \mathbb{H}(\mathcal{L}) \cong \mathbb{Z}^2 \). Then there exists a lattice point \((b_1, s_2) \in \mathbb{H}(\mathcal{L}) \) such that \( H(b_1, s_2) > H(\infty, s_2) = H_2(s_2) \). Since \( d_2 > 2b_2 \), we can truncate the surgery complex in the Spin\(^c\) structure \((s_1, s_2)\) as shown in Figure 9. Observe that \( \Phi_{b_1,s_2}^{L_1} = \Phi_{b_1,s_2}^{L_2} = 0 \) since \( H(b_1, s_2) > H_2(s_2) \). Suppose that \( s_1 = b_1 - d_1 \geq 0 \). Then \( H(-s_1, -s_2) - H_2(s_2) = H(s_1, s_2) - H_2(s_2) + s_1 > 0 \) since \( H(s_1, s_2) \geq H(b_1, s_2) = H_2(s_2) \) by Lemma 2.4. This indicates that \( \Phi_{s_1,s_2}^{L_1} = 0 \). From Figure 9 we see that \( \Phi_{s_2}^{L_2} = 0 \). So \( \Phi_{b_1,s_2}^{0} \) and \( \Phi_{b_1,s_2}^{10} \) are both generators of \( \widehat{HF}(S^3_{d_1,d_2}(\mathcal{L}), (b_1, s_2)) \), which contradicts to our assumption that \( S^3_{d_1,d_2}(\mathcal{L}) \) is an L-space. Hence, \( b_1 - d_1 < 0 \).

\[
\begin{array}{c}
\Phi_{b_1,s_2}^{L_1} \\
\Phi_{b_1,s_2}^{L_2} \\
\Phi_{b_1,s_2}^{0} \\
\Phi_{b_1,s_2}^{10} \\
\end{array}
\]

**Figure 9.** Truncated surgery complex

\( \square \)

**Lemma 4.18.** Suppose that \( \mathcal{L} = L_1 \cup L_2 \) is a nontrivial L-space link with vanishing linking number and \( L_2 \) is an unknot. If \( S^3_{d_1,d_2}(\mathcal{L}) \) is an L-space for \( d_1 > 0, d_2 > b_2 \), then \( d_1 > 2b_1 \).

**Proof.** Suppose that \( d_1 \leq 2b_1 \). Pick the lattice point \((b_1, 0)\). Since \( d_2 > b_2 \), we can truncate the surgery complex in the Spin\(^c\) structure \((b_1, 0)\) to the rectangle with the boundary erased as in Figure 9. Then \( \Phi_{b_1,0}^{L_2} = 0 \). We claim that \( H(b_1, 0) \neq 0 \). Otherwise, by Lemma 2.4, \( H(b_1, 0) = 0 \) implies \( H(b_1, s_2) = H_2(s_2) \) for any \( s_2 \). This contradicts to the definition of \( b_1 \). Then \( \Phi_{b_1,0}^{L_1} = U H(b_1, 0) - H_2(0) \) implies that \( \Phi_{b_1,0}^{L_1} = 0 \). Observe that
\[
\Phi_{b_1,d_1,0}^{-L_1} = U H(d_1 - b_1, 0) - H_2(0) = U H(d_1 - b_1, 0).
\]
If \( d_1 \leq 2b_1 \), then \( d_1 - b_1 \leq b_1 \). So \( H(d_1 - b_1, 0) \geq H(b_1, 0) > 0 \). Hence \( \Phi_{b_1,d_1,0}^{-L_1} = 0 \). Combining with \( \Phi_{b_1,0}^{L_1} = 0 \), we prove that \( \Phi_{b_1,0}^{L_1} \) is the generator of \( \widehat{HF}(S^3_{d_1,d_2}(\mathcal{L}), (b_1, 0)) \), which contradicts to Corollary 3.5 and the assumption that \( d_1 > 0, d_2 > 0, \det \Lambda > 0 \).

\( \square \)

**Lemma 4.19.** Let \( \mathcal{L} = L_1 \cup L_2 \) be a nontrivial L-space link with vanishing linking number. If \( S^3_{d_1,d_2}(\mathcal{L}) \) is an L-space for \( d_1 > 0, d_2 > 2b_2 \), then \( d_1 \geq 2g_1 - 1 \).

**Proof.** If \( L_1 \) is an unknot, this is straightforward. Suppose that \( L_1 \) is not an unknot and \( d_1 \leq 2g_1 - 2 \). Pick the lattice point \((g_1 - 1, s_2)\) such that \( H_2(s_2) = 0 \) and \( H(g_1 - 1, s_2) > 0 \). This is possible since \( H(g_1 - 1, s_2) \geq H(g_1 - 1, \infty) > 0 \). Since \( d_2 > 2b_2 \), we can truncate the surgery complex in each Spin\(^c\) structure as shown in Figure 9. Observe that
\[
g_1 - 1 - d_1 \geq -g_1 + 1.
\]
Let \( s_1 = g_1 - 1 - d_1 \). Then \( s_1 \geq -g_1 + 1 \), and
\[
H(-s_1, -s_2) - H_2(-s_2) = H(s_1, s_2) - H_2(s_2) + s_1 \geq H(s_1, \infty) + s_1 = H_1(-s_1) > 0.
\]
Note that $H(g_1 - 1, s_2) - H_2(s_2) > 0$. Hence $\hat{\Phi}_{g_1 - 1, s_2} = \hat{\Phi}_{g_1 - 1 - d_1, s_2} = 0$. This indicates that $\hat{\Phi}_{g_1 - 1, s_2}$ is the generator of $HF(S^3_{d_1, d_2}(L_1), (g_1 - 1, s_2))$, which is a contradiction by a similar argument as before. Therefore, $d_1 \geq 2g_1 - 1$. 

For a 2-component L–space link with vanishing linking number, $b_i \geq g_i - 1$ for $i = 1$ and 2 by Lemma 4.1. We discuss L–space surgeries for such links based on the comparison of $b_i$ and $g_i - 1$.

**Theorem 4.20.** Let $L = L_1 \cup L_2$ be a 2-component L–space link with vanishing linking number. Suppose that $b_i = g_i - 1$ for $i = 1$ and 2. Then $S^3_{d_1, d_2}(L)$ is an L–space if and only if $d_1 > 2b_1$ and $d_2 > 2b_2$.

**Proof.** Since $b_i = g_i - 1$, $L_i$ is not an unknot for $i = 1, 2$ and $2g_i - 1 = 2b_i + 1$. By Proposition 4.15 if $S^3_{d_1, d_2}(L)$ is an L–space, then $(d_1, d_2)$ must be in one of the regions 1, 2, 3, 4, 5, 6, 7 in Figure 10. For points $(d_1, d_2)$ in region 4, $S^3_{d_1, d_2}(L)$ is an L–space by large surgery formula. We use the green color for the region 4. By Proposition 4.16 points in regions 1, 2, 6, 7 won’t give L–space surgeries since both of the components $L_1$ and $L_2$ are not unknots. By Lemma 4.19 points in regions 3 and 5 don’t give L–space surgeries. Hence $S^3_{d_1, d_2}(L)$ is an L–space if and only if $d_1 \geq 2g_1 - 1$ and $d_2 \geq 2g_2 - 1$ in this case. 

**Figure 10.** $b_1 = g_1 - 1, b_2 = g_2 - 1$

**Figure 11.** L-space surgeries for $L$

**Theorem 4.21.** Let $L$ be a 2-component L–space link with vanishing linking number. Suppose that $b_i \geq g_i$ for $i = 1$ or 2. The possible L–space surgeries are indicated by the white and green colored regions in Figure 11.
Then imply explicitly. They all have maximal lattice points, hence are type (A) L–space links. 2-component L–space links with explicit descriptions of L–space surgeries. 4.4. S

give L–space surgeries by the similar argument to the one in Case (I). For points (d

Proof. If \( b_i \geq g_i \) for \( i = 1 \) or \( 2 \), the link is type (A) by Proposition 4.3. If \( S_{d_1,d_2}(\mathcal{L}) \) is an L–space, then \( d_1 > 0, d_2 > 0 \). Based on the comparisons of \( b_i \) and \( 2g_i - 1 \), we separate the discussion into three cases as shown in Figure 11. In each figure, we use lines to separate the first quadrant into 16 regions. In Case (I), we suppose that \( b_i > 2g_i - 1 \) for \( i = 1 \) and \( 2 \) as shown in Figure 11. If \( (d_1,d_2) \) is in region 4, then \( S_{d_1,d_2}(\mathcal{L}) \) is an L–space by large surgery formula. So we use green color for this region. By Lemma 4.17 and Lemma 4.19, if \( d_i > 2b_i \), then \( d_{i+1} > \max\{b_{i+1}, 2g_{i+1} - 2\} \). This indicated that if \( (d_1,d_2) \) is in one of the regions 1, 2, 12, 16, then \( S_{d_1,d_2}(\mathcal{L}) \) is not an L–space. We use red color to denote these regions. If \( (d_1,d_2) \) is in region 6, 10 or 11, then by surgery induction (Lemma 2.10), \( S_{d_1+k_1,d_2+k_2}(\mathcal{L}) \) is also an L–space for any \( k_1 > 0, k_2 > 0 \), which contradicts the fact that points in regions 2 and 12 don’t give L–space surgeries. Hence no points in these three regions produce L–space surgeries. By Proposition 4.15, points in region 13 also cannot give L–space surgeries. If \( (d_1,d_2) \) is in region 5 or region 9, then by the surgery induction argument, \( S_{d_1+k,d_2}(\mathcal{L}) \) is an L–space for any \( k > 0 \). However, we know that points in regions 6 and 10 cannot produce L–space surgeries which is a contradiction. So we also use red color for these regions to indicate the surgeries corresponding to them are not L–spaces. The similar argument works for the regions 14 and 15. Hence, we get Figure 11 Case (I).

In Figure 11 Case (II), we suppose that \( b_1 < 2g_1 - 1 \) and \( b_2 > 2g_2 - 1 \). The argument for regions 1, 2, 4, 12, 16, 13, 14, 9, 10, 11, 15 is very similar to the argument in Case (I). For points in regions 5 or 6, we cannot use the surgery induction argument. For these points \( (d_1,d_2) \), it is possible that \( S_{d_1,d_2}(\mathcal{L}) \) is an L–space. In Figure 11 Case (III), we suppose that \( b_i \leq 2g_i - 1 \) for both \( i = 1, 2 \). We prove that points in regions shaded by the red color won’t give L–space surgeries by the similar argument to the one in Case (I). For points \( (d_1,d_2) \) in regions 5, 6, 11 and 15, it is possible that \( S_{d_1,d_2}(\mathcal{L}) \) is an L–space.

Corollary 4.22. Assume that \( \mathcal{L} = L_1 \cup L_2 \) is an L–space link with vanishing linking number and \( L_2 \) is unknot. If \( S_{d_1,d_2}(\mathcal{L}) \) is an L–space, then \( (d_1,d_2) \) is in region 4 and 8 in Figure 11.

Proof. If \( L_2 \) is an unknot, we only need to consider Case (I) and Case (II) in Figure 11. It suffices to consider the points in regions 5 and 6. By Lemma 4.18, if \( d_2 > b_2 \), then \( d_1 > 2b_1 \). Hence, \( S_{d_1,d_2}(\mathcal{L}) \) cannot be an L–space for points in regions 5 and 6.

4.4. 2-component L–space links with explicit descriptions of L–space surgeries.

In this section, we describe the L–space surgery set for some 2-component L–space links explicitly. They all have maximal lattice points, hence are type (A) L–space links.

For a 2-component L–space link \( \mathcal{L} \), if there exists a maximal lattice point \( s = (s_1, s_2) \in \mathbb{H}(\mathcal{L}) \), by the definition,

\[
H(s_1, s_2) = 1, \quad H(s_1 + 1, s_2) = H(s_1, s_2 + 1) = H(s_1 + 1, s_2 + 1) = 0.
\]

Then \( \chi(HFL^-(s_1 + 1, s_2 + 1)) = -1 \), and it is the coefficient of the term \( t_1^{s_1+1/2}t_2^{s_2+1/2} \) in the symmetrized Alexander polynomial \( \Delta_\mathcal{L}(t_1,t_2) \) by (2.2) and (2.4).

Proposition 4.23. Suppose that \( \mathcal{L} = L_1 \cup L_2 \) is an L–space link with a maximal lattice point \( (s_1, s_2) \in \mathbb{H}(\mathcal{L}) \), and the coefficient of \( t_1^{s_1-1/2}t_2^{s_2+1/2} \) in the symmetrized Alexander polynomial \( \Delta_\mathcal{L}(t_1,t_2) \) is also nonzero. If \( S_{d_1,d_2}(\mathcal{L}) \) is an L–space with \( d_2 > 2b_2 \), then \( d_1 > 2s_1 \).

Proof. By Theorem 11, if \( S_{d_1,d_2}(\mathcal{L}) \) is an L–space, then \( d_1 > 0, d_2 > 0 \) and \( \det \Lambda > 0 \). Since the coefficient of \( t_1^{s_1-1/2}t_2^{s_2+1/2} \) is nonzero, \( \chi(HFL^-(-s_1, s_2 + 1)) = \pm 1 \). We first assume
Corollary 4.26. Proof. The “if” part is straightforward by large surgery formula. Now we prove the “only if” part. Since there exist maximal lattice points for the link \( \mathcal{L} \), it is type (A). By Lemma 4.15 if \( S_{d_1,d_2}(\mathcal{L}) \) is an L–space, then either \( S_{d_1}(L_1) \) or \( S_{d_2}(L_2) \) is an L–space. Without loss of generality, we assume that \( S_{d_1}(L_1) \) is an L–space. By the surgery induction (Lemma 2.10), \( S_{d_1,d_2}(\mathcal{L}) \) is an L–space for all \( k \geq 0 \). If \( d_1 \leq 2s_1 \), then \( S_{2s_1,d_2}(\mathcal{L}) \) is also an L–space. We can truncate the surgery complex to the rectangle with sides erased as in Figure 9 in the Spin structure (\( s_1, s_2 \)). Note that

\[
\Phi_{s_1,s_2} = U H(s_1,-s_2) - H(\infty,s_2), \quad \Phi_{-s_1,s_2} = U H(s_1,-s_2) - H(\infty,-s_2) = U H(-s_1,s_2) - H(\infty,s_2 + l) - s_1 + 1/2.
\]

Here \( H(\infty, s_2 + l) \leq H(\infty, s_2) \leq H(s_1 + 1, s_2) = 0 \). So

\[
H(s_1, -s_2) - H(\infty, -s_2) = H(-s_1, s_2) - s_1 + l/2 \geq H(-s_1, \infty) + 1 - s_1 + l/2 = H_1(-s_1 - l/2) - s_1 + l/2 + 1 = H_1(s_1 + l/2) + l + 1 > 0.
\]

Hence, \( \hat{\Phi}_{s_1,s_2} = \hat{\Phi}_{-s_1,s_2} = 0 \). This indicates that \( \hat{\Phi}_{s_1,s_2} \) generates \( \hat{H}(S_{d_1,d_2}(\mathcal{L}), (s_1, s_2)) \), contradicting to Corollary 3.5. Thus, we have \( d_1 > 2s_1 \).

Next we consider the case that \( \chi(HFL^-(s_1,s_2 + 1)) = -1 \). Then

\[
H(-s_1 - 1, s_2) = b + 1, \quad H(-s_1, s_2) = H(-s_1, s_2 + 1) = H(-s_1 - 1, s_2 + 1) = b,
\]

for some \( b \geq 0 \). By Lemma 2.10, \( S_{d_1+s_2+1,d_2}(\mathcal{L}) \) is an L–space. By a similar argument, we have

\[
\hat{\Phi}_{s_1,s_2} = \hat{\Phi}_{-s_1-1,s_2} = 0,
\]

which contradicts to Corollary 3.5 by a similar argument. Hence, \( d_1 > 2s_1 \).

Remark 4.24. The similar result holds for \( d_2 \).

Corollary 4.25. Suppose that \( \mathcal{L} = L_1 \cup L_2 \) is an L–space link with \( b_1 = s_1 \) for some maximal lattice point \( (s_1, s_2) \in \mathbb{H}(\mathcal{L}) \), and the coefficient of \( t_1^{-s_1-1/2} t_2^{s_2+1/2} \) in the symmetrized Alexander polynomial \( \Delta_{\mathcal{L}}(t_1,t_2) \) is also nonzero. If \( S_{d_1,d_2}(\mathcal{L}) \) is an L–space with \( d_2 > 2b_2 \), then \( d_1 > 2b_1 \).

Proof. It is straightforward from Proposition 4.23.

Corollary 4.26. Let \( \mathcal{L} = L_1 \cup L_2 \) be an L–space link with \( b_1 = s_1 \) and \( b_2 = s_2' \) for some maximal lattice points \( (s_1, s_2) \) and \( (s_1', s_2') \). Suppose that the coefficients of \( t_1^{-s_1-1/2} t_2^{s_2'+1/2} \) and \( t_1^{s_1'+1/2} t_2^{-s_2'-1/2} \) in the symmetrized Alexander polynomial \( \Delta_{\mathcal{L}}(t_1,t_2) \) are nonzero. Then \( S_{d_1,d_2}(\mathcal{L}) \) is an L–space if and only if \( d_1 > 2b_1 \) and \( d_2 > 2b_2 \).

Proof. The “if” part is straightforward by large surgery formula. Now we prove the “only if” part. Since there exist maximal lattice points for the link \( \mathcal{L} \), it is type (A). By Lemma 4.15 if \( S_{d_1,d_2}(\mathcal{L}) \) is an L–space, then either \( S_{d_1}(L_1) \) or \( S_{d_2}(L_2) \) is an L–space. Without loss of generality, we assume that \( S_{d_1}(L_1) \) is an L–space. By the surgery induction (Lemma 2.10), \( S_{d_1,d_2}(\mathcal{L}) \) is an L–space for any \( k \geq 0 \). So \( S_{d_1,2b_2+1}(\mathcal{L}) \) is an L–space. By Corollary 4.25, \( d_1 > 2b_1 \). Similarly, we obtain that \( d_2 > 2b_2 \). Hence, \( d_1 > 2b_1 \) and \( d_2 > 2b_2 \).
Lemma 4.28. Let $L = L_1 \cup L_2$ of $L7a3$ is a 2-component L–space link with linking number 0, where $L_1$ is the right-handed trefoil and $L_2$ is the unknot [11]. Its Alexander polynomial equals

$$\Delta_L(t_1, t_2) = -(t_1^{1/2} - t_1^{-1/2})(t_2^{1/2} - t_2^{-1/2})(t_2 + t_2^{-1}).$$

In [10 Example 4.4], we compute its $H$-function, and get $b_1 = 0$ and $b_2 = 1$. Its Alexander polynomial satisfies the assumptions in Corollary 4.26. Hence $S^3_{d_1, d_2}(L)$ is an L–space if and only if $d_1 > 0, d_2 > 2$.

In the rest of the section, we consider cables on links $L$ which satisfy the assumptions in Corollary 4.26. Let $L = L_1 \cup \cdots L_n \subset S^3$ be an L–space link. Let $p, q$ be the coprime positive integers. The link $L_{p, q} = L_{(p, q)} \cup L_2 \cup \cdots \cup L_n$ is an L–space link if $q/p$ is sufficiently large [11 Proposition 2.8].

Given coprime positive integers $p, q$, define the map $T: \mathbb{R} \to \mathbb{R}$ as:

$$T(s) = ps + (p - 1)(q - 1)/2.$$

Lemma 4.28. Let $L = L_1 \cup L_2$ denote an L–space link, and $L_{p, q}$ denote its cable link where $p, q$ are coprime positive integers with $q/p$ sufficiently large. Then $b_2(L_{p, q}) = b_2(L)$ and

$$b_1(L_{p, q}) = \begin{cases} T(b_1(L) + 1) - 1 & \text{if } L \text{ is type (B) or it is type (A) and } l \text{ is even,} \\ T(b_1(L) + 1/2) - 1/2 & \text{if } L \text{ is type (A) and } l \text{ is odd.} \end{cases}$$

Proof. By Lemma 4.11 $b_1(L) \geq g(L_1) - 1 + l/2$. We first suppose that $b_1(L) \geq g(L_1) + l/2$.

If $b_1(L) = g(L_1) + l/2$, then there exists a lattice point $(s_1, s_2) \in \mathbb{H}(L)$ such that

$$H(s_1, s_2) = a + 1, H(s_1 + 1, s_2) = H(s_1 + 1, s_2 + 1) = H(s_1 + 1, s_2) = a$$

where $a \geq 0$, and $s_1 = b_1$ or $b_1 - 1/2$ depending on the parity of the linking number. Then $\chi(HFL^{-}(s_1 + 1, s_2 + 1)) = -1$, and it is the coefficient of the term $t_1^{s_1+1}t_2^{s_2+1}$ in $\Delta_L(t_1, t_2)$. By the definition of $b_1$, it is also not hard to see that the coefficients of $t_1^{y_1}t_2^{y_2}$ are 0 in $\Delta_L(t_1, t_2)$ for all $(y_1, y_2) \succ (s_1 + 1, s_2 + 1)$.

Recall that the Alexander polynomial of the cable link $L_{p, q}$ is computed by Turaev in [23 Theorem 1.3.1],

$$\Delta_{L_{p, q}}(t_1, t_2) = \Delta_L(t_1^{p}, t_2) \frac{t_1^{pq/2} - t_1^{-pq/2}}{t_1^{q/2} - t_1^{-q/2}}.$$

Then

$$\tilde{\Delta}_{L_{p, q}}(t_1, t_2) = \frac{1/2 - p/2}{1/2 - q/2} \Delta_L(t_1, t_2) \frac{t_1^{pq/2} - t_1^{-pq/2}}{t_1^{q/2} - t_1^{-q/2}}.$$

Here $\frac{t_1^{pq/2} - t_1^{-pq/2}}{t_1^{q/2} - t_1^{-q/2}}$ is a Laurent polynomial of degree $pq/2 - q/2$.

Observe that $T(s) = ps + (1/2 - p/2) + (pq - q)/2$. We claim that the coefficients of $t_1^{y_1}t_2^{y_2}$ in $\tilde{\Delta}_L(t_1, t_2)$ are 0 for all $y > s$ if and only if for all $y \succ (T(s_1), s_2)$, the coefficients of $t_1^{y_1}t_2^{y_2}$ are 0 in $\Delta_{L_{p, q}}(t_1, t_2)$. The proof can be found in [10 Theorem 4.7], and we don’t repeat the argument here. By the claim, the coefficients of the terms $t_1^{y_1}t_2^{y_2}$ in $\tilde{\Delta}_{L_{p, q}}(t_1, t_2)$ are 0 for all $y_1 \succ (T(s_1) + 1)$ and the coefficient of the term $t_1^{T(s_1) + 1}t_2^{s_2 + 1}$ is $-1$. So $b_1(L_{p, q}) = [T(s_1) + 1 - 1]$.
Now we assume that $b_1(\mathcal{L}) = g(L_1) - 1 + l/2$. We claim that $b_1(\mathcal{L}_{p,q}) = g(L_{p,q}) - 1 + lp/2$. Note that the linking number of $\mathcal{L}_{p,q}$ is $pl$. Recall that the Alexander polynomial of the cable knot $L_{p,q}$ is computed by Turaev in [23, Theorem 1.3.1],

$$(4.4) \quad \Delta_{\mathcal{L}_{p,q}}(t) = \frac{\Delta_{L_1}(t^p)(t^{1/2} - t^{-1/2})}{tp/2 - t^{-p/2}} \cdot \frac{tpq/2 - t^{-pq/2}}{tp/2 - t^{-q/2}}.$$ 

Here we are multiplying $\Delta_{L_1}(t^p)$ by a Laurent polynomial of degree $T(0)$.

It is not hard to see that for any L–space knot $K$, $g(K)$ is the top degree of the symmetrized Alexander polynomial of $K$ from the proof of Lemma 2.11. Then the monomial with the highest degree term in $\Delta_{L_1}(t)$ is $tg(L_1)$. By (4.4), the highest degree term in $\Delta_{\mathcal{L}_{p,q}}(t)$ is $t^{g(L_1)p+(p-1)(q-1)/2} = T(g(L_1))$. Since $b_1(\mathcal{L}) = g(L_1) - 1 + l/2$, the coefficients of the terms $t^{s_1}t^{s_2}$ in $\Delta_{\mathcal{L}}(t_1,t_2)$ are 0 for all $s_1 > g(L_1) + l/2$. By (4.3), the coefficients of terms $t^{y_1}t^{y_2}$ in $\Delta_{\mathcal{L}_{p,q}}(t_1,t_2)$ are 0 for all $y_1 > T(g(L_1) + l/2) = T(g(L_1)) + pl/2$. This indicates that $b_1(\mathcal{L}_{p,q}) = T(b_1(\mathcal{L})) + lp/2 - 1$. Note that $b_1(\mathcal{L}) = g(L_1) - 1 + l/2$. It is easy to see that $b_1(\mathcal{L}_{p,q}) = T(b_1(\mathcal{L}) + 1) - 1$.

\[ \Box \]

**Lemma 4.29.** Let $\mathcal{L}$ be a 2-component L–space link. The maximal lattice points $(s_1, s_2) \in \mathbb{H}(\mathcal{L})$ are one-to-one correspondence to the maximal lattice points $(T(s_1 + 1) - 1, s_2) \in \mathbb{H}(\mathcal{L}_{p,q})$ of the cable link $\mathcal{L}_{p,q}$.

**Proof.** The maximal lattice point $(s_1, s_2)$ has the property that $H(s_1, s_2) = 1$ and $H(s_1 + 1, s_2) = H(s_1 + 1, s_2 + 1) = 0$. It is not hard to check that a lattice point $(s_1, s_2) \in \mathbb{H}(\mathcal{L})$ is maximal if and only if $s_i \geq g_i + l/2$ for $i = 1, 2$, $\chi(HFL^-(s_1 + 1, s_2 + 1)) = -1$ and $\chi(HFL^-(y_1, y_2)) = 0$ for all $(y_1, y_2) > (s_1 + 1, s_2 + 1)$.

We first prove that if $(s_1, s_2) \in \mathbb{H}(\mathcal{L})$ is a maximal lattice point, then $(T(s_1 + 1) - 1, s_2) \in \mathbb{H}(\mathcal{L}_{p,q})$ is a maximal lattice point. In the proof of Lemma 4.28, we see that $g(L_{p,q}) = T(g(L_1))$, and $\chi(HFL^-(y'_1, y'_2)) = 0$ for all $(y'_1, y'_2) > (T(s_1 + 1), s_2 + 1)$. Note that $T(s_1 + 1) - 1 = ps_1 + p + (p-1)(q-1)/2 - 1$. Since $s_1 \geq g(L_1) + l/2$ and $p > 1$, $T(s_1 + 1) - 1 \geq T(g(L_1)) + lp/2$. By (4.3), $\chi(HFL^-(T(s_1 + 1), s_2 + 1)) = -1$. Hence $(T(s_1 + 1) - 1, s_2) \in \mathbb{H}(\mathcal{L}_{p,q})$ is a maximal lattice point if $(s_1, s_2) \in \mathbb{H}(\mathcal{L})$ is a maximal lattice point. The converse also holds. If $(s'_1, s'_2) \in \mathbb{H}(\mathcal{L}_{p,q})$ is a maximal lattice point, by (4.3), there exists a lattice point $(s_1, s_2) \in \mathbb{H}(\mathcal{L})$ such that $T(s_1 + 1) - 1 = s'_1$. By a similar argument, $\chi(HFL^-(s_1 + 1, s_2 + 1)) = -1$ and $\chi(HFL^-(y_1, y_2)) = 0$ for all $(y_1, y_2) > (s_1 + 1, s_2 + 1)$. It suffices to prove that $s_1 \geq g(L_1) + l/2$. Since $T(s_1 + 1) - 1 \geq T(g(L_1)) + lp/2$, we have $s_1 \geq g(L_1) + l/2 - 1$. If $s_1 = g(L_1) - 1 + l/2$, either $H(s_1, s_2) = H(s_1 + 1, s_2) = 1, H(s_1 + 1, s_2 + 1) = 0$, or there exists a maximal lattice point $(y_1, y_2) \in \mathbb{H}(\mathcal{L})$ such that $(y_1, y_2) > (s_1, s_2)$. In the former case, $\chi(HFL^-(s_1 + 1, s_2 + 1)) = 0$, which contradicts to the property $\chi(HFL^-(s_1 + 1, s_2 + 1)) = -1$. The latter case contradicts to the property that $\chi(HFL^-(y_1, y_2)) = 0$ for all $(y_1, y_2) > (s_1 + 1, s_2 + 1)$. Hence, $(s_1, s_2) \in \mathbb{H}(\mathcal{L})$ is a maximal lattice point of $\mathcal{L}$.

\[ \Box \]

**Lemma 4.30.** Suppose that $\mathcal{L} = L_1 \cup L_2$ is an L–space link with a maximal lattice point $s = (s_1, s_2) \in \mathbb{H}(\mathcal{L})$ such that the coefficient of $t_1^{s_1}t_2^{s_2}$ in $\Delta_{\mathcal{L}}(t_1, t_2)$ is nonzero. Then the coefficient of $t_1^{-(s_1+1)+1/2}t_2^{s_2+1/2}$ in $\Delta_{\mathcal{L}_{p,q}}(t_1, t_2)$ is also nonzero corresponding the maximal lattice point $(T(s_1 + 1) - 1, s_2) \in \mathbb{H}(\mathcal{L}_{p,q})$.

**Proof.** By Lemma 4.29 $(T(s_1 + 1) - 1, s_2) \in \mathbb{H}(\mathcal{L}_{p,q})$ is a maximal lattice point of $\mathcal{L}_{p,q}$. It suffices to prove that the coefficient of $t_1^{-(s_1+1)+1/2}t_2^{s_2+1/2}$ is nonzero in $\Delta_{\mathcal{L}_{p,q}}(t_1, t_2)$. Note that
(4.3) can be written as:
\[ \Delta_{\mathcal{L}_{p,q}}(t_1, t_2) = t_1^{1/2-p/2} \Delta_{\mathcal{L}}(t_1^{p/2}, t_2)(t_1^{q(p-1)/2} + t_1^{q(p-3)/2} + \cdots + t_1^{q(p-1)/2}). \]

Then
\[-T(s_1 + 1) + 1 = -ps_1 - p - (p - 1)(q - 1)/2 + 1 = 1/2 - p/2 - ps_1 - q(p - 1)/2.\]

So we need to check that the term is not cancelled in \( \Delta_{\mathcal{L}_{p,q}}(t_1, t_2) \). Assume that there exists a term \( t_1^k t_2^l \) in \( \Delta_{\mathcal{L}}(t_1, t_2) \) such that
\[ 1/2 - p/2 + px + q(p - k)/2 = 1/2 - p/2 - ps_1 - q(p - 1)/2 \]
for some \( k \in \{1, 3, 5, \ldots, 2p - 1\} \). Simplifying this equation, we get
\[ (x + s_1)p = -q(p - k)/2 - q(p - 1)/2 = -q(p - l - 1) \]
where \( k = 2l + 1 \) and \( l \in \{0, 1, \ldots, p - 1\} \). Note that \( p \) and \( q \) are coprime, and \( 0 \leq p - l - 1 \leq p - 1 \). So the only solution to (4.5) is \( x = -s_1 \). Hence, the term \( t_1^{-T(s_1 + 1) + 1} t_2^{s_1 + 1} \) has nonzero coefficient in \( \Delta_{\mathcal{L}_{p,q}}(t_1, t_2) \).

\[ \square \]

**Theorem 4.31.** Let \( \mathcal{L} = L_1 \cup L_2 \) be an \( L \)-space link with \( b_1 = s_1 \) and \( b_2 = s_2' \) for some maximal lattice points \((s_1, s_2)\) and \((s_1', s_2')\). Suppose that the coefficients of \( t_1^{-s_1-1/2} t_2^{s_1+1/2} \) and \( t_1^{s_1'+1/2} t_2^{s_2'-1/2} \) in the symmetrized Alexander polynomial \( \Delta_{\mathcal{L}}(t_1, t_2) \) are nonzero. Then \( S_{d_1, d_2}^3(\mathcal{L}_{p,q}) \) is an \( L \)-space if and only if \( d_1 > 2b_1(\mathcal{L}_{p,q}), d_2 > 2b_2(\mathcal{L}_{p,q}) \) for all cable link \( \mathcal{L}_{p,q} \).

**Proof.** This is straightforward from Lemma 4.30 and Corollary 4.20. \[ \square \]

**Proof of Corollary 1.12.** The Whitehead link \( Wh \) is an \( L \)-space link with vanishing linking number. Its Alexander polynomial is as follows:
\[ \Delta(t_1, t_2) = -(t_1^{1/2} - t_1^{-1/2})(t_2^{1/2} - t_2^{-1/2}). \]

By (2.2) and (2.4), the \( H \)-function has the following values:

<table>
<thead>
<tr>
<th>2</th>
<th>1</th>
<th>0</th>
<th>0</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>3</td>
<td>2</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>4</td>
<td>3</td>
<td>2</td>
<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>

So there is a maximal lattice point \((0, 0)\) in \( H(Wh) \) and \( b_1(Wh) = b_2(Wh) = 0 \). It is easy to check that the Whitehead link satisfies the assumptions in Theorem 4.31. By Theorem 4.31, \( S_{d_1, d_2}^3(Wh_{cab}) \) is an \( L \)-space if and only if \( d_1 > 2b_1(Wh_{cab}) \) and \( d_2 > 2b_2(Wh_{cab}) \). By (4.4), \( b_i(Wh_{cab}) = p_i + (p_i - 1)(q_i - 1)/2 - 1 \) for \( i = 1, 2 \). Hence \( S_{d_1, d_2}^3(Wh_{cab}) \) is an \( L \)-space if and only if \( d_i > p_iq_i + p_i - q_i - 1 \) for \( i = 1, 2 \).
